T H E   S I X T Y - S E C O N D   V O L U M E   O F   " T H E   G A R D E N "

**Is dedicated.**

---

---

**L**ORD REDESDALE to many will be better known as Mr. Freeman Mitford, the author of that excellent work "The Bamboo Garden," which has had a great influence for good in the making and altering of modern gardens. Through his enthusiasm the Bamboo has been planted with discretion in the gardens of these isles, and not the Bamboo only, but many plants that have been proved by experiment in Lord Redesdale's garden at Batsford Park to stand the vagaries of our peculiar climate.

It is through the efforts of such amateurs as he that English gardens are undergoing a welcome and delightful change, and that the beautiful things from other lands are having a proper place in their making.

Lord Redesdale was born February 24, 1837, and is the third son of Henry Reveley Mitford, Exbury, Hants, and Georgina Jenning, daughter of the third Earl of Ashburnham, and married in 1874 Clementine, daughter of the seventh Earl of Airlie. Educated at Eton and Christchurch, Oxford, he entered the Foreign Office in 1858, and filled many posts with honour. From 1892 to 1895 he represented South-West Warwickshire in Parliament.

Lord Redesdale was raised to the peerage on the occasion of the Coronation of His Majesty the King.

That Lord Redesdale may be spared many years to work in his garden, and experiment with the flowers he has seen during a long and active life in the service of this country in other lands, is the wish of every reader of this journal.

"The Bamboo Garden," a careful and practical study of a beautiful family, followed a series of papers on the same subject published in THE GARDEN, and gives not merely valuable information about planting and kinds, but is concerned with the economic importance of the Bamboo.

Lord Redesdale is one of the pioneers in modern gardening, and his beautiful garden at Batsford Park is a reflection of his good taste and wide knowledge.

## INDEX.

## A.

- Abutilons, good, 143  
*Acaena Buchananii*, 345  
*Achimenes*, 66, 236; Dazzle, 90  
*Acacia indica*, 39  
*Agapanthus umbellatus* in tubs, 226  
*Ageratum*, 339  
*Akebia quinata*, pruning, 14  
Alder, the, 247  
Alpine flowers at home, 42  
*Alstroemeria aurea*, 373; Mrs. Salter, 56  
*Alstroemerias*, 144  
*Amaryllis Autumn Beauty*, 259  
American notes, 41, 150, 387  
*Amelopelos*, the ubiquitous, 340, 357, 384; Veitchii, 423  
*Andromeda mariana*, 242  
*Androsace laevigata*, 283; propagation of, 284  
*Acenome japonica*, 242  
*Anemones*, the "Alderborough," 229; Wood, 320  
*Anteopteris erecta*, 90  
Annuals, neglected, 125; and perennials for border, 221  
*Antirrhinum ramosum*, 159  
*Antirrhinums*, 255; and China Asters, 218; and Marigolds, 321  
Apple Allington Pippin, 399; Charles Ross, 399; Cornish Aromatic, 210; Coronation, 375, 419; Cox's Orange Pippin, 399; Dr. Harvey, 432; earliest, 133; Gogar Pippin, 26; Kentish Pippin, 433; Norfolk Beauty, 433; Ribston Pippin, 399; Rival, new, 300, 387, 399; Royal Late Cooking, 252; the Wise, 107, 142  
Apple trees, bush, 266; cordon, 363, 420; on their own roots, 99  
Apples, 84 and Pears, early, 117; the best, 260; bush tree, 226; for cold wet soils, 263; for profit, 72  
Apricot, the, 328; St. Ambrose, 321; under glass, 417  
Apricots, 84, 186  
*Aquilegia Stuartii*, 3  
*Arabis alibida* fl.-pl., 166, 194; a. on a wall, 280  
*Araucaria excelsa*, 120  
Arbigland, N. B., a note from, 363  
*Arctotis grandis*, 320  
*Arenaria balearica*, 304, 323  
*Armeria alba superba*, 21  
*Artemisias*, alpine, 247  
*Artichokes*, Globe, 102, 288  
Artist's note-book, an, 63, 113, 146, 165, 365  
*Asclepias curassavica*, 123, 159

*Bulbous plants* for the greenhouse, 198; in quest of 415 in grass land, naturalising, 195; removing, 88  
*Bulbs*, 84, 170; and other plants from abroad, 254; carpeting plants for, 191, 312; for the Royal parks, 123; native, 392  
*Bulbaceae*, a new, 399; a valuable, 357  
*Burnside*, the Rev. F. R., 133

## C.

- Cabbage*, 85, 170, 205, 236, 308; maggot, 72  
*Cabbages, autumn-sown*, 137; spring, 182  
*Cactus*, grafting the, 102  
*Cesalpinia Japonica*, 22, 99  
*Caladiums*, 153  
*Caleocarlia amplexicanlis*, 5; *Burbidgei*, 91, 281, 319  
*Caleocarlia*, 204; herbaceous, 15, 117  
*Callas*, 48, 185  
*Caonassias*, 94  
*Canellias* out of doors, 88; and Palms out of doors, 340  
*Campanula*, a white, in pavement, 254; carpathica, 326; *gargantica hirsuta alba*, 283; mirabilis, 74; pyramidalis, 35, 308; rapunculoides, 144; rotundifolia, 35, 59; Stanfield's hybrid, 93  
*Campanulas*, 34; alpine, 59  
*Canadian fruit* in London, 358  
*Caracaria campaniata*, 374  
*Cannas*, 268; treatment of, 4  
*Capsicums*, 117; and Chillies, 48  
*Cardoons*, 102, 170, 288  
*Carex scaposa*, 321  
*Carnation Alice Ayres*, 124; America, wister, 210; George Maguire, 155, 194, 210; Master F. Wall, new border, 240; the best white, 177  
*Carnations, and Picotees*, 292, 398; at Trent Park, 115; border, 212; dressed, 350; exhibiting, 116; from Dawlish, 21; from seed, 211; hybridising, 55; Malmaison, 34, 101, 288, 338, 373; new, 234; outdoor, 175; seedling, 174; self, 212; Tree, 222; Tree, for winter flowering, 34; white, 134  
*Carpeting plants for bulbs*, 258, 312  
*Carrots*, 118, 185; July-sown, 120  
*Cassia corymbosa*, 366  
*Cattleya labiata*, 384; l. var. *amesiana*, 401; *mariottiana*, 55; *maxima*  $\times$  *Laelia priestantis*, 55; Miss Measures, 114  
*Cattleyas*, the best, 31  
*Cauliflower*, Early Emperor, 386; Sutton's first crop, 422  
*Cauliflowers*, 136, 170, 349  
*Celeriac*, 170, 289  
*Celery*, 15, 102, 205, 289; blanching, 160  
*Celosias*, 274  
*Central Park, Liscard*, 75  
*Centropogon lucayanus*, 238  
*Ceres*, Cape Colony, 376  
*Ceropegia Woodii*, 90, 91  
*Cestrinia Smithii*, 242  
*Cheal*, Mr. Joseph, 190  
*Cherry* crop, the, 30; trees, bush and fan-trained, 28  
*Cherries*, 117; and *Plums*, 330, 357; at Holland House, 40; late dessert, 158; Morello, 186; weeping, 180  
*Chervil*, 332  
*Chicory*, 67, 332  
*Chillies*, 117  
*China Asters and Antirrhinums*, 218

- Chinese Ash*, hardiness of, 140  
*Chirita sinensis*, 188  
*Chenostoma hispida*, 143  
*Choisya ternata*, 26  
*Chrysanthemum*, a new, 369; early-flowering Pompon Mme. Ed. Lefort, 227; exhibition, the American, 123; Golden Sheaf, 399; Horace Martin, early-flowering, 210; Jules Lagrave, 399; Lady Primrose, 369; Miss Mildred Ware, 406; new crimson-flowered Japanese, 321; Norbert Puvez, 210; show at Alexandra Palace, 279; shows, 392; the, 317; uliginosum, 180

# THE GARDEN

No. 1598.—VOL. LXII.]

[JULY 5, 1902.

## A FAMOUS SHOW.

**A**S we recorded last week, what is known as the "Coronation Rose and Flower Show", was held in the grounds adjoining the gardens of Holland House, by kind permission of the Earl and Countess of Ilchester. The weather was perfect, the show itself of great extent, and as beautiful and interesting as any exhibition of recent years; but the scene was shorn of its brightness by the grievous news that has sent a thrill of dismay and sympathy through the British Isles, and, indeed, the whole world.

The news came when the exhibition had just been opened, but too late for any record of it in last week's pages. Sympathetic references were made to the sad news by Mr. Gurney Fowler (in the absence of Sir Trevor Lawrence, Bart.), who presided at the luncheon to the committees on the first day, and by the Dean of Rochester, who was president of the conference on Roses held during the afternoon.

The exhibition, well worthy of the Coronation we all hoped so soon to celebrate, was visited by a large gathering of those deeply interested in horticulture, but the attendance would probably have been larger if His Majesty had not been suddenly laid aside by serious illness. The thoughts of the British Nation and of the nations of the world are directed to the Royal Family in their distress, and especially to Her Gracious Majesty the Queen, who, during the past few weeks has bravely undertaken the social duties of the King, knowing, we fear, that such a catastrophe as a sudden and dangerous sickness might supervene to turn joy to grief and postpone indefinitely a great and solemn celebration.

[It is with great gladness we learn from the last report that His Majesty may be considered out of immediate danger.]

The restfulness of the gardens of Holland House, the quiet and beautiful London home of the Earl and Countess of Ilchester, figured and described last week, and the flowers in the tents were a solace, under the circumstances, to those privileged to visit the exhibition, and a relief from the symbols of a nation's rejoicings in the streets of the Metropolis.

The Royal Horticultural Society's show will be remembered as one of the most remarkable in its history. The exhibits were rare and interesting, and those responsible for the arrangements and carrying out of the details that brought a memorable display to so happy

a conclusion must be heartily thanked for their efforts. The Rev. W. Wilks, the secretary, who is a splendid organiser and keen gardener, his assistant, Mr. Wright, amongst the number, and many others who helped in one capacity or another have reason to look back upon the "Coronation Rose and Flower Show" as an historical event worthily carried out. Of Roses there were few, but this was due to the vagaries of the English climate, not to want of encouragement, but their absence was atoned for by the superb miscellaneous displays from some of the principal nurserymen of the United Kingdom.

## THE ROSE GARDEN OF THE FUTURE.

**O**F all the branches of good work now being done in gardening none has a more hopeful outlook than the future of the Rose garden. Rose gardens there are, and have been for many years, but we may venture to say that the truly beautiful Rose garden has yet to be made.

Not only have the old garden Roses been newly found and put ready to our hands, but by careful and clever hybridisation quantities of beautiful new Roses have been produced. Even in the older days it was not so much that there was no way of escaping from the monotony of the standard or bush Roses, but that the better ways had not been pointed out, and that people in general had not thought of breaking through the narrow bounds. For even then there were the rambling Ayrshires, China Roses, Damask, Cabbage and Moss, and others of the old favourites, but for some reason, which now would be thought absurd, these were not considered Roses for Rose gardens, though it was no doubt because just the best methods of using them had not been made clear.

Now, with the wholesome growth of all good gardening, many new garden Roses have been produced, and now there are not only Roses for beds but Roses for bushy masses, for rambling into trees, for tumbling over banks and boulders, for crowning low walls, and Roses so various in habit that there are kinds to suit gardens that are in immediate connexion with the most refined architecture as well as those of the most modest cottage class.

Moreover it is not only that this wide range of material exists, but owners of gardens are

becoming aware that it should be intelligently and worthily used. Instead of a mental inertness as to the possibilities of the Rose garden there is now widely spread abroad an attitude of alert and intelligent anticipation and a keen desire to use our lovely Roses well.

## MAKING A VINE BORDER.

(Continued from Vol. LXI., page 435.)

By far the most important ingredient in the border is, of course, loam. The top spit of a pasture cut in the early autumn, stacked out of doors (placing a layer of good farmyard manure and a layer of turves alternately), and left outside during the winter, makes an ideal soil for a Vine border. It is, however, not all who are fortunate enough to be able to obtain this. Do not use turves freshly cut, for it may happen that the pasture whence they were taken is full of wireworms, and if these are imported into the Vine border it is a very difficult matter to get rid of them, and the damage they are capable of doing is considerable. If the soil has been exposed throughout the winter, as when it is placed in stacks, as mentioned above, many of these wireworms would perish or escape. Before commencing to make up the border all the soil necessary should be well prepared beforehand. First, chop the turves with a spade into about four or six pieces, then to each cartload of soil add three or four barrows full of brick and mortar rubble broken to about the size of pigeons' eggs. This is an excellent thing to mix in Vine borders, for it not only helps to keep the bulk of soil sweet and porous, but it encourages root action also. Loam varies very much in substance and character, some being quite of a clayey nature, while other again is porous and sandy. The former will, of course, require the addition of more rubble than will the latter. A good sprinkling of coarse river sand is also valuable, especially when the loam is at all heavy. It is also advisable to intermix a small quantity of some good artificial manure (such as Thompson's or Bentley's being good for this purpose); too much, however, especially when first making up the border, brings about most injurious results.

The thorough mixing of the compost must have attention, and to this end one could not do better than adopt the following plan: When all the turves have been chopped, throw the pieces into two heaps about two yards apart; then while two men (one at either heap) return the soil into one heap again, a third admixes the mortar rubble, sand, and manure as the work proceeds. The further mixing which will result from placing the soil in the border should suffice. When the three men are not available spread out the two heaps of soil and over them sprinkle the various other substances, then turn back the heaps into a cone-like form again, and finally turn one into the other. As the soil is gradually placed in the border make it firm by well treading it down. Make the surface higher than it was before, because the new border will be sure to sink to some extent. It should have been mentioned that if the soil were at all dry when the compost was mixed a good watering should have been given to it, not of course sufficient to make it sticky and unworkable, but just to moisten it thoroughly. When the border

is finished, if the layer of turves over the drainage was well watered with a hose-pipe when placed in position, as should be done, and the compost itself watered, then no further application of water will be necessary before planting.

It is very necessary to attend to these two details—the thorough watering of the turves and the moistening of the prepared compost. If the former are dry when placed in position it is almost impossible to soak them through afterwards without saturating the whole border, and even then one may not succeed. Dry turves, especially when covered by other soil, are most difficult to water thoroughly, and if they are allowed to remain dry they will ever be a source of injury to the roots of the Vine. Do not plant the young Vines for several days after the border is ready, when it will have an opportunity of sinking somewhat, and the soil will become settled and altogether in a state more congenial and suitable to the encouragement of growth on the part of the young Vine roots.

There are two kinds of Vine borders, the inside and outside, the one made under cover of the roof, the other outside the viney়. Where Vines are forced for the purpose of producing Grapes early in the season the inside border is advisable, for it is so much more under control than is the outside one, its temperature more nearly equal that of the house than that of the border out of doors could possibly be during the winter months, and therefore is better suited for the early start into activity of the Vine roots. But for Vines that are given practically cool treatment, whether the border be inside or out, does not make a very considerable difference. The inside border being perfectly under control can be correctly treated, but during wet weather for instance the outside border would probably receive a good deal more water than is really required. This can, of course, be protected from excessive wet by means of boards, and from frost by means of coverings of dead Bracken or straw litter. It will be seen, therefore, that, unless Grapes are required very early (say April and May), when an inside border would certainly be advantageous, it does not make any appreciable difference whether the Vine border be inside the house or outside of it, providing, of course, that it is thoroughly well drained and made and composed of the proper material. With reference to the matter of drainage, previously described at length, it should be stated that, whereas in an inside border the drain pipes would slope towards a main drain near the front of the house (the main drain carrying away the water to an outlet), in an outside border the drain pipes should slope away from the house, and, of course, also lead to a main drain along the front of the border connected with an outlet.

A. P. H.

(To be continued.)

## OBITUARY.

### MR. SIMON DELAUX.

WE record with great regret the death of Mr. Simon Délaux, of Toulouse, which we have just heard took place at his residence at St. Martin du Touch, in the Department of the Upper Garonne, on the 5th ult.

When we remember the achievements of the deceased twenty years ago and more to improve the Chrysanthemum, when we also remember the great indebtedness to him that all lovers of that popular flower are under for the many beautiful novelties of Japanese Chrysanthemums that he raised and sent out in the eighties, we feel we should be wanting in respect to the memory of an illustrious worker in horticulture, who very largely contributed to raise the Chrysanthemum to its present high position as a show flower, if we failed to notice the sad event.

The volumes of *THE GARDEN* between 1880 and 1890 contain many references to his work, which at that time was perhaps most keenly appreciated by his English *confiries*. For a long period the seedlings of Mr. Délaux held a position of pre-eminence, in much the same way as those of his great rival (Calvat) have done since.

Growers of twenty years ago will remember the many useful additions that yearly came from Mr. Délaux's nursery, many of them rising to the highest possible position on our show-boards. A few names, all of the Japanese type, occur at once to our mind as indicating Mr. Délaux's success here in England, viz., Mme. Bertier Rendatler, M. Astory, Dr. Macary, Mme. de Sevin, Margot, Source d'Or, Jeanne Délaux, Japonais, Fanny Bouchardat, Bouquet Fait, Hiver Fleuri, Mme. John Laing, M. Freeman, Fernand Féral, M. Délaux Hamlet, and M. William Holmes, all of which, and many more besides, enjoyed a popularity amongst English growers that must have been, as we know it was, highly gratifying to the successful raiser.

Mr. Délaux was also a great raiser of novelties of the early-flowering section, which he did much to improve, and of which there are still many left in cultivation here in England. Such a success as his, of course, brought rivals into the field, so Mr. Délaux's novelties were gradually surpassed in favour, and the modern English grower perhaps scarcely knows him as we knew him in the happy days when the Chrysanthemum fever was first beginning to take a hold upon us.

The writer of this short notice can claim the deceased as his first Continental correspondent on matters relating to the Chrysanthemum, and yet, although the relationship was of the warmest and most friendly character, it was never his good fortune to make Mr. Délaux's personal acquaintance, in spite of the various visits to Continental shows, where almost every other celebrity in the Chrysanthemum world might be seen. The deceased was in his sixty-second year, and was a member of many well-known Continental horticultural societies, at the shows of which he had long exhibited with conspicuous success.—C. H. P.

### THOMAS YOUNG.

THE demise of venerable Thomas Young occurred recently after a protracted illness, from which he had several times rallied so strongly that hopes were entertained for his renewed health. Mr. Young was born in Eastbourne, Sussex, in 1818. He began his career as a gardener on the estate of the Duke of Devonshire. He went from there to Boddegar Hall on the island of Anglesea, North Wales, and thence to the Pine Apple nurseries of Messrs. Henderson. His next position was with Mrs. Lawrence at Ealing Park, and afterwards he was employed at Abernaut Park, Glamorganshire, whence, after fifteen years service, he came to this country in 1870. Throughout his career he gained and maintained a wide knowledge and celebrity as a gardener of high attainments, excelling especially in the difficult branch of Pine Apple growing. Personally he was jovial, hearty, and kindly, a perfect type of the old-time gardener, in love with his profession and honoured by his colleagues. He leaves a widow and a family of seven sons and daughters. Two of the sons, Thomas and John, are engaged in the flower business in New York City, John Young being also secretary of the New York Florists' Club. Two others, William and George, are Rose growers at Clifton, N.J.—*American Florist.*

## TREES AND SHRUBS.

### HARDY AZALEAS AT KEW.

MANY years ago the hardy Azaleas at Kew formed the most attractive spring feature, and though, owing to the increased attention given to hardy plants in general, there are now several other subjects for which the pride of place might be claimed, the Azaleas still hold their own as furnishing one of the most popular displays. The majority of the plants at Kew are old bushes, and consequently the varieties are not of the present day; indeed, some of them probably date from London's time, when an extensive list of hybrid forms was in existence. Most of the older varieties were obtained by the crossing and intercrossing of the North American

*nudiflora* and *A. calendulacea* with *A. pontica* from the Black Sea region, but the introduction of other species has led to the formation of quite a different class; in fact, nearly all the forms met with at the various exhibitions (and which formed such a blaze of colour at the recent Temple show) owe their origin to the more recently introduced *A. chinensis*, or *mollis*, as it is generally called. Besides this the Californian *A. vaseyi* has proved to be a valuable introduction, while the later flowering *A. occidentalis* has been used in the production of varieties that serve to extend the hardy Azalea season. For all this I must confess to a leaning towards some of the older varieties, whose scarlet and orange-scarlet tints are not represented among the members of the *mollis* section. True, if the flowers are looked into individually the newer kinds are far larger and more massive, but the Honeysuckle-like blossoms of some of the older forms present a light and elegant appearance, which is heightened by the pleasing informal outline of a specimen that has been allowed space for its full development. All, new and old alike, are, however, so charming that, given a suitable position, everyone is worthy of a place in most gardens. Their beautiful effect at Kew is heightened by the fact that the space where they are grouped is a large open glade, surrounded for the most part with tall trees, which with their freshly expanded foliage serve from nearly all points as a delightful background for the bright blossoms of the Azaleas. To anyone acquainted with the display that in days gone by used to be furnished by the hardy Azaleas in the nursery of the now long defunct firm of Messrs. Osborn, of Fulham, the extension of London in all directions is answerable for much. Still, with the increased facilities for travelling Kew is much more accessible than was formerly the case, and great numbers take advantage of the Azalea season to visit that delightful portion of the grounds where in close proximity to the Azaleas themselves their near allies the Rhododendrons are also ablaze with colour. One thing not to be overlooked in any notice of hardy Azaleas is their delicious spicy fragrance.

H. P.

## RHODODENDRON RHODORA

(RHODORA CANADENSIS).

THIS is an April flowering shrub that is not grown nearly so much as it might be, but possibly the colour of its flowers has something to do with its unpopularity. The colour is variously described by different authorities, rosy purple being the commonest, but it is more of a magenta or magenta-purple than anything else.

*R. Rhodora* is a native of North America, and forms an upright, deciduous shrub, 3 feet to 4 feet in height, with slender, twiggy wood, clothed with small ovate-lanceolate leaves. The flowers appear in April before the leaves expand, and are borne in terminal clusters of from three to six flowers in each. The calyx is green and inconspicuous, and the corolla divided nearly to the base into three parts, the upper one of which is twice the size of the other two and thrice cleft at the tip.

It is easily forced, plants taken up in February and potted coming into bloom by the middle or end of March if brought on in gentle heat, though the flowers lose somewhat in colour if kept too warm. By simply putting them into a cold house they will flower a fortnight or three weeks earlier than they do outdoors and the colour be quite as deep. Like *Azalea amena*, *R. Rhodora* can only be associated with white or very pale yellow, but it is best arranged in a mass by itself relieved by some light foliage.

The plant grows best on a moist peaty soil, and does not do at all well in a place that is dry or sandy, which probably accounts for the failure to grow it in many places. I have heard it stated that this shrub is not hardy, but I have never seen it injured by frost, the flowers even notwithstanding spring frosts without injury, its only requirement being a cool moist soil and situation. It also succeeds well in partial shade. It is easily propagated by seeds or by layering.

Bagshot, Surrey.

J. CLARK.

### MAMAN COCHET AND ITS WHITE SPORT.

WHEN seen at its best Maman Cochet appears to eclipse all other Tea Roses in beauty. The flower attains a wonderful size. Except for a faulty habit of splitting or producing divided blooms this Rose is unequalled. It is not a cool season Rose, but requires plenty of sun to develop its beauty and to bring out the freshness of colour and yellow shading. At times it fades to a dull rose, but we can well afford to overlook its faulty ways and only remember what a useful all-round variety it is. The growth is splendid, strong and stout shoots being freely produced. I think I prefer to grow this Rose on standard or half-standard Briars. There seems to be a fresher tint of colour in blooms so produced. As a pot Rose Maman Cochet is magnificent, more especially in a cool house. It does not compare with Bridesmaid or Catherine Mermet for forcing or for cutting, but for beauty it surpasses both.

The white or rather creamy white sport is delightful, and when in autumn its lovely blossoms are faintly tinged with blush pink it would be difficult to find another Rose to equal it.

As garden Roses both varieties are almost equal to the Hybrid Teas in vigour; in fact, some rosarians have been disposed to group these two with the Hybrid Teas, but I do not think they would be justified in doing so.

Neither kind should be hard pruned. The flower being so large, it is capable of remarkable development by affording the plants some phosphates such as bone dust, and by adopting a thorough system of disbudding both of flower and shoots.

PHILOMEL.

### NOTES OF THE WEEK.

#### FORTHCOMING EVENTS.

July 8.—Royal Horticultural Society's Committees meet, Drill Hall, Westminster; Dinner of the Horticultural Club at 6 p.m. (guest of the evening, Mr. H. N. Arderne, of The Hill, Claremont, Cape Town); Wolverhampton Horticultural Fête (three days); Gloucester Rose Show; Harrow Rose Show.

July 9.—Beckenham Summer Show; Farmham, Ealing, Formby, Hereford, and Stevenage Rose Shows.

July 10.—Woodbridge Horticultural Show; Bath and Eltham Rose Shows.

July 19.—National Rose Society's Northern Show, Manchester.

July 22.—Royal Horticultural Society's Committees meet, Drill Hall, Westminster; Tibshelf Rose Show.

**The Tree Lupines.**—Considering the ease with which these may be raised from seeds or propagated by cuttings, it is disappointing to find that the Tree Lupines are so little met with in gardens. One hopes, however, that the introduction of some new varieties may help to bring them into further notice in the eyes of garden lovers. Compared with the effect this plant produces, the obstacles to its cultivation and its defects are few. It is true that it is not very hardy, and that it has an unaccountable habit of dying off, even if it has survived several winters. Young plants, however, seem wonderfully hardy, and I think that the old ones which go off are lost mainly through natural decay, for, in this climate at least, the Tree Lupine is not as a rule a long liver. The oldest plant I have ever grown was some five or six years of age, and latterly it had begun to look as if it were time it was replaced by a younger and more vigorous successor. This can be easily done, as a few seeds, sown either under glass in March or in the open in April, if not done as soon as ripe, will give flowering plants in a year or two. In some gardens, indeed, it is hardly necessary to sow seeds, as self-sown seedlings will generally appear in these places to prolong the succession of plants. In June and for some time afterwards there are few more ornamental things in the garden than a large bush covered with its fine spikes of flowers. I prefer to

grow it as an erect bush, and for this purpose it must be fastened to a stake for support. Some again like it best against a wall, while others allow it to grow in an almost prostrate fashion, one which it is inclined to assume if left alone, though it may be pegged down with advantage. The Tree Lupines like a warm and rather sandy soil, and ought to have a sheltered position when grown as a bush, as their branches are very brittle at their junction with the stem. While the typical *Lupinus arboreus* is of a pleasing yellow, there are now a considerable number of other colours and shades. These do not come quite true from seeds, and to preserve any special colour it is well to propagate a few cuttings annually. This is easily effected, either by cuttings of the current year's growth or by the same with a heel of the old wood attached. I prefer the latter, and these strike in a shady border if put in in summer with or without a glass over them. The flowers of the Tree Lupines are described as fragrant, but the odour is a little too overpowering for some when in a confined space. As garden plants these Tree Lupines are remarkably handsome, and the shades of yellow or lilac given by the flowers are often very pleasing, though many prefer the white flowers of the pretty variety named Snow Queen.—S. ARNOTT.

**Ireland—Industrial and Agricultural.**—This the most important work on the economic resources of Ireland issued for many years, is being published under the supervision of the Department of Agriculture and Technical Instruction for Ireland. The material for the work was originally brought together for the purposes of a handbook issued in connexion with the Irish Pavilion at the recent Glasgow Exhibition. The present issue in permanent form is, however, to all intents and purposes, a new work. Over 200 pages of new matter have been added, and the whole book has been thoroughly revised and brought up to date. Messrs. Browne and Nolan, Limited, Nassau Street, Dublin, are the publishers.

**"Hand-list of Herbaceous Plants."**—We have received the second and much enlarged edition of this useful hand-list. These lists, issued by the Director of the Royal Gardens, are of immense value, and it is not surprising to find that they are quickly out of print. The Director's preface contains the following interesting remarks: "The first edition of the Kew Hand-list of Herbaceous Plants having met with a ready sale, has long been out of print. A new edition has been for some time in preparation. Meanwhile the interest of the public in the intelligent cultivation of herbaceous plants, the kindness of numerous correspondents and the aid of other botanical establishments at home and abroad has enormously stimulated the growth and enlarged the scope of the Kew collection. It has been found convenient to include in the present edition the shrubby alpines which are cultivated in the Rock Garden in association with strictly herbaceous species. . . . The total number of distinct named plants enumerated is about 8,000; of these about 1,000 are reckoned as varieties." The price of this edition is 1s. 9d., and only sold at the Royal Gardens.

**Messrs. Sutton and Sons' annual excursion.**—For many years Messrs. Sutton and Sons, Reading, have not only given the whole of their employés a yearly holiday, entirely at their own charges, but have, by the presence of members of the firm and personal supervision of every detail, done everything in their power to make the annual trip a day of perfect enjoyment. The party took their places in the special train for Portsmouth, which left Reading at 7.10, and arrived at Portsmouth Harbour to the minute at 9.15. Accompanying the train were Mr. Martin J. Sutton, J.P., Mr. Arthur W. Sutton, J.P., Mr. Leonard G. Sutton, and Mr. M. H. Foquet Sutton, with members of their families. The promise of the morning was not belied, the weather being most pleasant until about one o'clock. The return train reached Reading at 10.2 p.m., and all went happily homewards, having passed a day of perfect pleasure and relaxation.

**The National Rose Society's Show.**—The annual exhibition in the Inner Temple Gardens took place on Wednesday last,

and a full report is given on another page. It was not a striking display, for the good reason Roses are so late this year that the late exhibitions will be more interesting and the classes better filled than those that are now taking place. The show in the Manchester Royal Botanic Gardens will probably be one of the best of the series; it takes place on Saturday, the 19th inst.

**Mr. A. B. Freeman-Mitford, C.B.**, who has been raised to the peerage, is one of the best known authorities upon the Bamboo, and "The Bamboo Garden," which appeared in 1896, was first published in THE GARDEN. But Mr. Mitford has played many parts. Amongst his works are "Tales of Old Japan" and "The Attaché at Peking," and his garden at Batsford Park, Moreton-in-the-Marsh, is one of the most interesting in England. He is a trustee of the Wallace collection, entered the Foreign Office in 1858, appointed to Peking in 1865, second secretary of Legation in Japan in 1868, secretary to H.M.'s Office of Works from 1874 to 1886, was M.P. for South-West Warwickshire from 1892 to 1895, and has held besides these other offices in his busy and useful life.

**Aquilegia Stuarti.**—The illustration of *A. Stuarti* on page 409 is splendid. I have grown

ROSE MAMAN COCHET.

(Original was more than twice the size of flower represented.)

it well for many years, but never better. I have had 60 or 70 flowers on a plant. Why it is not more extensively grown I cannot imagine, as it is one of the loveliest flowers I know, and is as easily cultivated as the ordinary variety. There is, however, one most important matter respecting its cultivation, and this has induced me to say something about it. It should never be planted when dormant. Autumn planting is bad, and spring planting is also very risky. To ensure success, young plants well established in pots should be secured; if these are planted now they will flower well next season.—AMOS PERRY, Winchmore Hill, London, N.

**Raphiolepis japonica.**—This is now regarded as the correct name of the pretty little shrub so long grown in gardens as *Raphiolepis ovata*, for the introduction of which we are, I believe, indebted to Robert Fortune. It is a very distinct evergreen, naturally of sturdy growth, clothed with very dark green, broadly ovate, stout, and leathery leaves, each from 2 inches to 3 inches long. The flowers, which are just now at their best, are borne in erect terminal panicles. Individually they are somewhat Hawthorn-like, pure white in colour, and pleasantly scented.

The deep green of the foliage serves to intensify the whiteness of the blossoms. This *Raphiolepis* is a well known though not common shrub. It is not sufficiently robust to hold its own with many subjects frequently planted, but where a space is set aside for choice subjects that can be depended upon not to encroach upon their weaker neighbours it is one that can be recommended for such a purpose. A second species, *R. salicifolia*, known as the Indian Hawthorn, needs the protection of a greenhouse, where it usually flowers during the winter months. The white flowers are borne in short terminal panicles, with a reddish centre. Both of the species above mentioned may be struck from cuttings of the half-ripened shoots, put in sandy soil, and placed in a close propagating case with a gentle bottom heat, for, though they usually stand some time, failures as a rule are not many.—H. P.

**Pentapterygium serpens.**—Visitors to Kew during May and June must have often been impressed by the beauty of this charming Himalayan shrub. For many years a large plant stood at the north end of the Cape house, where it never failed to flower freely. On the completion of the Himalayan house it was, however, moved there and planted on a rooerty. It has since grown vigorously, and now makes a fine group, the long, arching shoots clothed with small green leaves and pretty scarlet netted flowers being very pleasing. It was sent to Kew by Mr. Elwes, who found it whilst travelling in the Himalayas about eighteen years ago. In its native habitat it grows on the trunks of trees and in other places where a little light, rich matter, such as decayed leaves, is to be found. It is peculiar by reason of its large, flattened, woody rootstock, from which the slender branches grow. At Kew the branches are 4 feet or 5 feet long; the leaves are small, lanceolate, and thick, the stems covered with a fine brown tomentum, and from the under side the scarlet pendulous blossoms, upwards of an inch long, are borne in profusion. It roots readily from cuttings, and may be grown either in well-drained pots or borders. Like Rhododendrons, it loves rich, loose sweet soil and plenty of fresh water whilst growing. It may be grown in a cold greenhouse or frame, and will flower annually.—T.

**Rhododendron Smithii aureum.**—One of the most beautiful and at the same time one of the most interesting of the Rhododendrons at Kew is this hybrid form, which, though quite an old plant and such a meritorious one, may be sought for in vain in most nurseries. Its parentage, according to the Kew List, is *Rhododendron* seedling crossed with *Azalea sinensis*—that is to say, a hybrid between an evergreen and a deciduous kind. It is of a weak habit of growth and flowers freely when not more than 2 feet high. The flowers, which are borne in rounded clusters, are of a pleasing shade of buff-yellow, with the upper segments marked with orange. Though much the same tints may be found in some of the Azaleas, there is an air of refinement about this hybrid. It is well worthy of being taken up by some of our tree and shrub nurserymen, who all speak of an increased demand for the better class of flowering shrubs. It is not the only hybrid between an evergreen and a deciduous kind, one of the oldest and best known being *R. azaleoides*. According to London this is a hybrid between *R. ponticum* and some species of Azalea with fragrant blossoms. It is as a rule at its best about mid-summer, at which time the bushes are profusely laden with pretty, highly fragrant flowers, which latter feature is very noticeable on a sunny day. The blossoms are not all of the same tint, varying as they do from very pale lilac to a sort of lilac-purple hue, but in most cases the edges of the petals are of a deeper tint than the centre of the flower. The plant naturally forms a compact rounded bush, while the foliage is sub-evergreen in character. Other hybrids of this class are *R. gowenianum* and *R. gemmiferum*, this last bearing very compact rounded heads of blossoms of a deep rosy pink hue.—T.

[*R. Smithii aureum* was very beautiful a few days ago in Mr. Leney's interesting American garden at Saltwood, near Hythe. A large bush of it was laden with flowers.—ED.]

### Mesembryanthemum lacerum.

As a pot plant this fine succulent, when well grown, is at all times pretty and interesting from its pale glaucous keel-crested leaves. The large solitary flowers, 2 inches in diameter, are now open, and are of an unusual shade of chamois-pink, which deepens into orange in the centre of the full-petalled flower, the narrow leaflets of which have the peculiar Catherine wheel-like twirl which may be observed in the flowers of several other species of the genus, Mesembryanthemums—which may be translated into Noon-flowers if it is preferred to avoid the Latin name—used formerly to be very popular, and one or two free-flowering kinds were grown for market by the hundred in Haworth's time. They have fallen into disrepute mainly because their management is not well understood and from a mistaken choice of species.

The one now under notice may be found sometimes in a botanical collection, and not always well grown even there, but otherwise it is seldom met with. It is not perhaps so showy as some of the smaller-flowering kinds, such as the bright mauve-coloured *M. polyanthon* and the orange-scarlet *M. bicolor*, which make up in brilliancy and number for the small size of their flowers, but a two year old plant of *M. lacerum*, pinched back to make it break into several branches and to prevent legginess, or even a potful of last year's cuttings well ripened by full exposure to summer sunshine, will give very satisfactory results. When once fully expanded the flowers remain open, in which particular they resemble those of *M. inclaudens*, but, as their name seems to indicate, most of the species have their set time for opening and closing. As a rule, though it is not a hard and fast one, young plants flower the best, and after the second season had better be discarded. One reason, indeed, why Mesembryanthemums are not so much in favour as they used formerly to be is because it constantly happens that old and worn-out plants are retained which are perfectly useless. Out of 300 or more known species it is not to be wondered at that a good many are not decorative, but there are few plants which will give, under proper treatment, so great an amount of enjoyment in their unique brilliancy of flower and quaintness of leaf form, with a minimum of trouble, as some of the best kinds of this now neglected race of succulents, which are specially valuable for a window, glass porch, or cool greenhouse.—K. L. D.

### Rhododendron indicum var. Hexe.

—Among the large number of varieties of *Rhododendron indicum*—or as it is often called in gardens *Azalea indica*—this is one of the most beautiful, and is very easily cultivated. For the amateur who experiences some difficulty in furnishing a small greenhouse with plants that will stand the winter with little or no fire-heat this plant is to be recommended, as it is almost hardy: the mere protection of a glass roof is sufficient to keep it in a flourishing condition. Grown from cuttings it flowers in quite a small state and increases in width more rapidly than in height. The flowers are hose-in-hose fashioned, nearly 2 inches across, deep rose, and borne in such profusion as to almost smother the plant, the bright green leaves peeping out here and there among the mass of flowers. At Kew it may be seen growing in a border in the Himalayan house, where it makes a bright splash of colour. It flowers equally well planted out or in pots, and is one of the easiest of the Rhododendrons to root from cuttings.

**Treatment of Cannas.**—I have seen so many poor specimens of Cannas growing even in well-managed gardens that I made some enquiries, and I find that many gardeners leave the plants in a rough state under the greenhouse stage all winter and do not divide and pot them up till the spring, while others go to the other extreme and keep the plants growing freely in a warm house which, of course, exhausts them. We began to grow a few plants of Cannas three years ago, and though we did not know their requirements managed to hit on the treatment they seem to like. In October they are taken from the open ground and at once

carefully divided and repotted, keeping them in a cool house all winter, and giving only a little water occasionally. After hardening them off they are planted out in June, and though the soil is naturally poor and the garden draughty, they begin to grow at once, and each plant flowers continually the whole summer. Our original stock has increased to five times the number we started with in 1899.—E. C., Surrey.

### Climbing Roses in the Drip.

—Here *Aglais*, grown on and above a western fence with its boughs hanging down with clusters of bloom, has suffered least of any. The full yellow blooms which come on the bunches have during the last fortnight scarcely felt the drip. They have a lovely Tea Rose scent. Their beauty is enhanced by the dark shiny foliage of Jersey Beauty which has run up alongside, and the two grow with their long shoots entwined, but the latter will not be in bloom for some days. Gustave Regis looks on in the first floor window with its large blooms, and these have scarcely felt the wet. Carmine Pillar which has run up to the eaves is a mass of bloom, but just as it closes every night, it has seldom had its blooms wide open in the day, which spoils the effect somewhat. Crimson Rambler, Psyche, and the single and double Himalayas are not yet thinking of blooming.—J. R. D., *Reigate* (June 25).

**Iris graminea.**—This, a very old species from Austria, can be recommended to those who appreciate Irises of dwarf growth and bright colouring. It forms a tuft of glossy, grass-like leaves a foot high and a foot through, studded with flat violet-purple flowers  $2\frac{1}{2}$  inches to 3 inches across with erect violet standards, paler style branches and gaily pencilled scoop-shaped falls, much resembling the lip of *Epidendrum inversum*, a well-known Jamaican Orchid, the markings being violet on a white ground colour. There is a quiet charm in this little Iris that one generally finds in many species of the bulbous group, and it is safe to say that *Iris graminea* would be greatly appreciated if it did not flower at the same time as the pallida, neglecta, aphylla, and germanica types now almost universally called varieties of *I. germanica*. As it is, one must not neglect *I. graminea* on any account, its form and colour markings being unique. Its wants are simple and easily satisfied—a partially shaded aspect and a moderately stiff soil, not too wet in winter, is all it requires. It is best to plant it where it can remain for years, for like most grassy Irises, it dislikes frequent disturbance.—G. B. MALLETT.

### Notes from North-East Scotland.

In spite of the bad weather we have experienced, all the Brooms, Azaleas, Rhododendrons, and Lilacs have flowered splendidly. Of Lilacs the double white *Mme. Lemoine* has earned an extra good mark. Some years ago I bought a grafted plant of this variety, and soon saw that, as is usual with Lilacs that are grafted, it was not going to do very well. I therefore took some cuttings of the young shoots in the spring. These I placed singly in small pots of sandy soil and plunged them in a bed of moist sand in an intermediate house, where there was a little bottom heat, and covered them with a bell glass. Every cutting struck, they were potted on as required and hardened off, but were wintered in a cool house. They were planted out the following spring as soon as all danger from frost was over. They are now four years old from the cutting, from 5 feet to 6 feet high, and covered with immense bunches of flowers. They get a good dose of liquid manure once or twice every spring. As usual, the first Rose to flower is *Rosa alpina*, a single red-flowered species.—N. B.

**The Book of the Rose.**—“N. B.,” in his article on gardening books, places “The Book of the Rose,” by Foster-Melliar, in his third list of books. I would venture to suggest that it should have gone in the first list. It is eminently practical, and although the author avows that he thinks Roses should be grown for exhibition, still the information given is such as to make me (not an exhibitor) often regret that I had not the book several years before I did. I should have been saved much groping and many disappointments. The chapter on “Manners and Customs” is invaluable, and, as far as I know, unique.—C. L. A.

**Green Asparagus.**—What is usually called "green" Asparagus is much appreciated as a rule, and doubtless its flavour is better than the white, but there is more trouble to get large green Asparagus early in the season, as owing to our erratic climate one cannot expose the growth sufficiently to get the heads thoroughly green, because of severe cold. Whilst the home-grown produce is required in a green state—at any rate, a good portion of the growth—the imported Asparagus is white and not objected to. Although large, it is not nearly so good as the home-grown. Now the difficulty in getting the grass green is that if exposed too long it soon shoots up, and is weakened if left at all long. To get fine heads there should be daily cutting over. Give a liberal depth of soil, the latter not too heavy, and ample room for the plants. I have seen many poor beds of Asparagus because the roots were too near the surface, and, though I do not advise too deep planting or sowing at the start, I give liberal top-dressings afterwards of suitable soil to get fine heads and "grass" of good length.—G. W. M.

**Two good Euphorbias.**—The fine effect of some of the hardy Euphorbias has been specially brought under notice this year, and two of them may well be recalled to the minds of those who have occasion and opportunity for taking somewhat broad views of planting and grouping. A bold mass of *Euphorbia palustris* planted by the waterside was singularly bright in the early days of May, when its flattened heads of green-gold flowers were in perfection. It grows to a height of 2 feet or more, and can be seen from afar lighting up the distant view. The other, *E. Wulfeni*, a fine Dalmatian species, has only found its way within the last year or two into English gardens, and may still be called a new plant. While the flowers of the above-named *E. palustris* are bright green-golden, the immense heads of *E. Wulfeni* may rather be described as golden-green of a peculiarly deep tone. The foliage resembles that of the familiar Caper Spurge (*E. Lathyris*), and the plant grows to a height of from 5 feet to 6 feet. The contrast of the blue-green leaves and the gold-green of the inflorescence is unusual. Few people could see for the first time a well-grown specimen of *E. Wulfeni* with many branches, each crowned with its towering terminal raceme, without pausing to make further acquaintance with so noble a plant, and those who are on the alert for massive subjects to give good pictorial effect will be grateful for so grand an addition to their open air resources. Cuttings strike without much difficulty, and a single stem will give a fine head of bloom not to be despised for some positions in the herbaceous border.—W. DALLMORE.

**Calceolaria amplexicaulis.**—You do well to call attention to this charming plant for use in the garden. The late Mr. Wildsmith knew its value and grew it freely. From there I had it and flowered it annually in masses for many years. Mr. Beckett at Aldenham, too, knows its worth, as he grows a quantity, and perhaps better than any I have seen elsewhere. With him it runs up 4 feet high, and flowers profusely. A few light stakes to support the shoots are necessary.—E. MOLYNEUX.

**Tamarix tetrandra.**—A few weeks ago attention was directed in THE GARDEN to the great beauty of this Tamarisk, and to the fact that its merits are not half enough recognised by planters, probably in many cases at least owing to the fact that it is usually regarded as essentially a seaside plant, whereas it is really equally at home inland. The writer of the above-named article, Mr. Goldring, advocated the planting of this Tamarisk in an isolated lawn group or bed, and so treated there is a grand display of it at Kew; indeed, it forms one of the most beautiful features there among hardy shrubs. The flowers, which are borne in axillary spikes for a considerable distance along the slender shoots, are of a pleasing shade of pink, and seen from a distance are cloud-like. The group at Kew, consisting of a score or so of bushes ranging in height from 4 feet to 6 feet, each specimen just standing clear

of its neighbour, shows this Tamarisk at its best, and it will doubtless be copied by some at least of the visitors who note its great beauty, for this Tamarisk is by no means expensive, and cuttings of it root very readily in a fairly moist soil. When planted in this way the long straggling shoots should be pruned back to keep it in bush form, though there are situations where it is more effective if allowed to go unpruned, such as when in close proximity to water.—H. P.

**Hampstead Heath and the proposed railways.**—Miss Emily Field and Mr. Henry F. Poole, hon. secretaries of the Hampstead Heath Protection Society, write: "The Hampstead Heath Protection Society desire to call public attention to their attitude with reference to the above Bills. They opposed these Bills before the committee of the House of Lords so far as the Bills propose to sanction tunnelling under any part of the Heath, but the committee declined to admit their *locus standi*, and refused to permit their counsel to argue the question. The only course now left open to the Hampstead Heath Protection Society is to take action with a view to ensure a discussion on the Bills when they come before the House of Commons for second reading. They remain convinced that notwithstanding any clauses, however stringent, which may be inserted in the Bills, the construction of an underground railway under the Heath must necessarily lead sooner or later to communications with the surface, either for the purpose of ventilation, or for stations, or for both, which will cause irreparable injury to the Heath. They urge further that Parliament should, in accordance with the recommendation of the Board of Agriculture made in their report of February 25, 1902, require the promoters of the railway to show that it is impossible that any material injury to the surface of the Heath will be caused by the proposed railway.

**Pimelia ferruginea.**—With the introduction of so many soft-wooded, quick-growing greenhouse plants a large number of pretty, slow-growing, woody subjects, which were at one time very popular, have almost dropped out of cultivation. Among these plants are the Pimelias, for although in a few places they are still grown, it is the exception rather than the rule. The one under notice is exceptionally pretty, being of more compact habit than some of the species, and has numerous pairs of small dark green, Box-like leaves and heads of deep pink blossoms in May and June, the heads of flowers being upwards of 1 inch across. In the Temperate house at Kew it may be seen in flower. Like other Pimelias it does not require much heat to grow it. Given a light, airy house, with a cool ash bottom and very little or no fire-heat, except in the very coldest weather, it will thrive. It should be grown in thoroughly drained pots in a mixture of two parts sandy, fibrous peat to one part of good loam, and must on no account be over-potted. Throughout winter watering must be done with great care, as extremes are very detrimental. Like other Pimelias this is a native of Australia.—W. D.

**Waterer's Laburnum.**—Those who only know the ordinary Laburnum of gardens should get Waterer's form. Its correct name is *Laburnum alpinum* var. *Watereri*. Like the common Laburnum the species is an European one, but has a longer and looser inflorescence and shorter, winged seed-pods. In the variety under notice the flower racemes are of exceptional length, averaging 1 foot long and bearing some 50 or more flowers each. There is also a variety of *alpinum* in cultivation called *Parksii*, which bears even longer inflorescences, some having been measured 19 inches in length. In this, however, the flowers are further apart, and it does not flower so freely as Waterer's variety.—B. T.

#### BRITISH-RAISED ROSES.

One of the leading rosarians of the day has compiled the following list at our request: A glance at the subjoined list of British-raised

Roses will, perhaps, surprise those who imagined that we were largely indebted to other lands for new varieties. In this list are the names of many of the favourite varieties of the day, and from all appearances Britain will continue to hold her own and even surpass other countries in this respect. One of the earliest of British-raised Roses is the still popular *Devoniensis*, introduced in 1838, and it was some twenty-four years following that *Beauty of Waltham* appeared. John Hopper, too, was of this same year. The year 1863 was rather a barren year, Lord Macaulay being the best novelty. In 1868 rosarians were delighted with a most brilliant Rose in the Duke of Edinburgh, and five years later by its offspring named after the venerable president of the National Rose Society. One of the first English-raised Hybrid Teas, namely, *Cheshunt Hybrid*, appeared in 1873, and it is remarkable that the same relationship on one side is claimed for this variety as in the case of *Caroline Testout*. We refer to Mme. de Tartas. In 1875 *Star of Waltham* was ushered in, followed the next year by a most useful garden and forcing Rose—*Magna Charta*. In the years 1879 to 1881 were introduced *Duchess of Bedford*, *Lady Sheffield*, *Moss Little Gem*, and *Pride of Waltham*. An epoch-making year was 1882, for it was then that the late

MR. HENRY BENNETT

gave us *Lady Mary Fitzwilliam*, a Rose destined to be the forerunner of a remarkable collection of Roses directly or indirectly, and perhaps unequalled by any other kind as a seed or pollen parent. The same raiser also introduced the lovely *Tea Princess of Wales*. The year 1883 produced *Queen of Queens*, a beautifully formed Hybrid Perpetual of the Victor Verdier race. In 1884 a lovely Hybrid Tea appeared in *Grace Darling* and a very useful Hybrid Perpetual, *Charles Lamb*, but it was reserved for 1885 to produce the sensational Rose of the decade, namely, *Her Majesty*, and the same year the valuable crimson autumnal *Waltham Climbers* were introduced.

From an English point of view Viscountess Folkestone may be described as the Rose of the year 1886, but in 1887 Mr. Bennett produced his masterpiece, *Mrs. John Laing*, a flower as yet unrivalled, and he also gave us a charming show Tea—*Princess Beatrice*. This was also the year of the Earl of Dufferin and Ethel Brownlow. In 1888 appeared *Sir Rowland Hill*, the purple sport of *Charles Lefebvre*, and also *Marchioness of Lorne*, a Rose of undoubtedly merit not yet sufficiently recognised. Until this time we had mainly relied upon French raisers for our choicest Tea novelties, but succeeding years proved that we could produce a few good kinds of this tribe; notably, *Cleopatra*, *Sappho*, and *Souvenir de S. A. Prince* in 1889, and *Medea* in 1891. *White Lady* was shown in 1890, and a break was made in Moss Roses in the form of *Crimson Globe*, a variety fairly well mossed, and in bloom almost of show size. Margaret Dickson was of the year 1891, also *Salamander* and *Mrs. Paul*, all three gold medal Roses. In 1892 appeared that fine dark sport of *Etienne Levet*, namely, *Duke of Fife*, and the very double Hybrid Perpetual Rose *Spenser*.

In 1893 we had the commencement of what has eventually proved to be a very popular race of Roses, namely, the Ramblers. Although of Japanese origin, *Crimson Rambler* was of English introduction, and I question if any cultivated Rose has ever had such a distribution as this one. This same year Messrs. William Paul and Sons' *Corinna*, Mr.

Bennett's Captain Hayward, and Messrs. Dicksons' Marchioness of Londonderry and Jeannie Dickson proved that we were not asleep, and in 1894 Lord Penzance gave us his nine varieties of hybridised Sweet Briars, followed the next year by seven other kinds, all of which have received a warm reception, and acknowledged to be a great boon to our gardens. Clio, Mrs. Sharman Crawford, and Clara Watson yet further gave the year 1894 a very prominent position in our Rose history. In 1895 another remarkable variety appeared, namely, Mrs. W. J. Grant; and Helen Keller, Sylph, and the beautiful Carmine Pillar were also of this year. Tom Wood and Rev. Alan Cheales were the novelties among Hybrid Perpetuals for 1896, and two well-known decorative Roses—Queen Mab and Enchantress—were first distributed this same year. In 1897 a unique Tea Rose in point of colour appeared, namely, Empress Alexandra of Russia. The invaluable climbing sport of Kaiserin Augusta Victoria appeared this year, and two very good Hybrid Perpetuals, namely, Waltham Standard and Laurence Allen.

Three lovely decorative Teas and Hybrid Teas were Ireland's contribution in 1898, namely, Killarney, Beryl, and Meta; whilst from Waltham Cross we received the exhibition Tea M. Ada Carmody and a Hybrid Tea Aurora; and from Cheshunt two very lovely single or semi-double Roses—Dawn and Royal Scarlet. A most useful Hybrid Bourbon was also of this year, namely, Purity, from Messrs. Cooling.

Six first-rate novelties appeared in 1899. Of these three were Hybrid Teas, Tennyson, Bessie Brown, and the splendid Climbing Belle Siebrecht. Tea Roses were enriched by the addition of Mrs. Edward Mawley, and for forcing by Sunrise, and exhibitors welcomed the Hybrid Perpetual Mrs. Cocker as being a good lasting flower, and also Ulster. A very distinct Rugosa atropurpurea appeared this year. A grand forcing Rose, namely, Liberty, was the production of 1900, and three garden Roses, Corallina, Sulphurea, and The Alexandra. A useful Rose, J. B. M. Camm, was also of this year, and a distinct break in garden Roses, the lovely hybrid of Rosa canina, Una. Last year the sensational novelty was Mildred Grant, and a most decided acquisition to show Teas is Boadicea. Decorative Roses were enriched by Mrs. B. R. Cant and Lady Battersea, and the rambler section by Queen Alexandra and The Lion. Three lovely single Teas are certainly a move in the right direction. They are Irish Beauty, Irish Glory, and Irish Modesty. I also thought well of Lady Moyra Beauclerc, Duchess of Portland, Lady Mary Cory, and Lady Clanmorris. This year one must of necessity possess a further acquaintance with its novelties, but Morning Glow and Salmonea have been grandly shown; so, also, have Ben Cant, Lady Roberts, and Alice Lindsell.

I rejoice to notice a desire on the part of our own raisers to depart from the beaten track. Unless a novelty in a show Rose is remarkably good it is not wanted, but our decorative Roses may well be improved and increased. We see in M. Pernet Ducher's Soleil d'Or and in Herr Schmidt's Leuchstern (two Continental novelties) what it is possible to accomplish in this direction, for in the one case we have the old Persian Yellow not only improved, but given also a perpetual-flowering character, and in the other instance *R. multiflora* has given us a charming single that must become a general favourite. The remarkable advance in the improvement of *R. wichuriana*—as, for example, Dorothy Perkins and Alberic Barbier—shows that a graceful race of ramblers is about to be evolved from this trailing species, for they are as beautiful on a pergola as on a rootery or rockery, and surpass all others in grace and rapid growth. These novelties are not of English origin, but there is nothing to hinder our raisers trying their hand on other species and tribes, such as the Scotch Roses, the Moss Rose, the loveliest single Rose grown (Austrian Copper), the Macartney, *R. sinica*, and many other species, not forgetting our own native wilding, *R. canina*. I sincerely hope English raisers will strive to fill up the gaps in our collection, and, above all things, let us have free-growing, free-blooming, and fragrant Roses.

(To be continued.)

## ROSA WICHURIANA AND ITS HYBRIDS.

We are indebted to our American friends for a few useful garden Roses, such as the lovely Dawson Rose, Harrisonii, &c., but more especially for the varieties they have developed from that excellent Japanese species *R. wichuriana*. The type is a creeping Rose, and most useful it is, too, for covering a large area with its fast growing, trailing shoots, plentifully clothed with the brightest foliage imaginable, and in August with immense bunches of single white flowers. But if used simply as a ground trailer much of its beauty is lost. The best plan is to place a few good sized logs in the centre of a bed and allow the growths to creep over them, producing a lovely mound of snowy flowers when other Roses are fading. It is strange that the many hybrids of *R. wichuriana* bloom earlier than the type, and none possess the Ivy-like flat growth in the same degree, although they are most successful to scramble over logs or rockeries. But this is not the

*Pink Roamer* deserves its name, for it will make yards of growth in a season, and when in flower running over an old tree it has a beautiful wild Rose-like effect save in the flower colouring, which is a deep pink. A capital way of seeing this variety to the best advantage is to train it up a 6 feet to 7 feet stake, and then allow the long growths to droop towards the ground; the streamers of blossom moved by every wind have a very telling effect. In this way also it is most useful as a conservatory plant.

*Rene Andre* is one of the latest introductions, and, like Alberic Barbier, a great gain. It resulted from a cross between the type and *Ideal*, the latter giving the double flowers some of its own wonderful colouring.

*Ruby Queen* is a slight departure from the strictly trailing form, although it will cover a considerable space in a year. Its flowers are of the loveliest carmine colour with a distinct white base. The pride of place, however, must be accorded to the latest comer,

*Dorothy Perkins*, which is surely destined to supplant all pink ramblers. It is a true

garden at Kew, one of them, crossed with *R. rugosa*, is like a creeping Penzance Sweet Briar in appearance with large satin rose flowers, and the other a cross with General Jacqueminot, a very distinct pale carmine colour with growth like a Noisette.

PHILOMEL.

## SOME AMERICAN WILD ROSES.

THE wild Rose of our woods is the loveliest flower of June. Lonely and neglected, she is still a queen. The beauty of Rhododendrons and Azaleas may take the eye, but the appeal of the wild Rose is to the heart. Unlike our native Violets, she has a haunting fragrance all her own. Our flora is not rich in species of the Rose. A few kinds are found in profusion in our woods and moist lowlands, and a few, like the wild Dog Rose of England and the Sweet Briar, have found congenial quarters along our roadsides and in our hedgerows.

One of the commonest of our native wild Roses is *Rosa lucida*, or, as our more recent botanical works term it, *Rosa humilis lucida*. This is the Dwarf or Pasture Rose, and has a bushy habit of growth, sometimes attaining the height of 6 feet, but usually only 3 feet or 4 feet in height. It is quite prickly, with slender spines, and has five to seven thin, shining, serrate leaflets. The flowers are solitary and not very freely produced, but they are a clear, tender shade of pink, and have a delightful wild Rose fragrance. This is one of our earliest Roses to bloom.

*Rosa Carolina*, the Swamp Rose, is very abundant in this neighbourhood. It borders all our streams and makes thickets in our marshy lowlands, blooming after the June Roses are past their prime. Sometimes it forms a graceful bush 7 feet or 8 feet in height, but is often of straggling form in its native haunts, where it is crowded by Elderberries, Thorns, and a tangle of other marsh-loving plants.

The leaflets of this Rose are from five to seven in number, sometimes nine, long and slender, and finely serrate. The blossoms are in few-flowered corymbs, and open one at a time, thus prolonging the flowering season for several weeks. The individual flowers are about 3 inches across, and are bright pink. A plant of *Rosa Carolina* under cultivation in good and rather moist soil will spread by underground runners from the root and soon make a fine clump.

The fruit of the Swamp Rose is a bright scarlet, and usually remains plump and unshriveled during the winter months, making a clump of this Rose a very effective ornament to the shrubbery in the cold months.

But our most beautiful wild Rose is *Rosa setigera*, the Prairie Rose. This Rose is often found growing amid shrubs and young trees in our copses and woodlands. In such positions it will climb by the aid of the branches of the trees to the height of 10 feet or 15 feet. It is such a rapid climber that it will often send out shoots 10 feet or 12 feet long in one season. Left to itself, however, and planted in the open, out of reach of any support, it will

ROSA WICHURIANA ON A GRASSY BANK IN MR. MAWLEY'S GARDEN AT BERKHAMSTED.

limit of their usefulness. They make elegant pillars for the supports of pergolas, and also for Weeping Standards or for trellis work.

*Jersey Beauty* still remains one of the best of the hybrids. The large single flowers remind one strongly of those of *R. levigata* in all save colour, which is a creamy white, the buds being pale yellow and quite as pretty as a Tea Rose. The foliage of this variety, next to the type, is the most striking of the set, just as brilliant as the latter, but of a red hue, which it inherits from the Tea variety *Perle des Jardins*. Although the shoots are so Tea-like in appearance they seem to be very hardy for this season, when many of the Tea variety close by were injured by the spring frosts, *Jersey Beauty* and others passed through unscathed.

*Alberic Barbier* promises to be one of the most valuable of the double-flowered kinds. The buds of this are equal to many of the button-hole Teas both in size and in Tea-like colouring, and the foliage is equally as glistening as *Jersey Beauty*.

rambler, growing exactly after the style of Crimson Rambler. The grand trusses of twenty to fifty flowers are very attractive, every little double flower reminding one of the miniature Provence De Meaux only that they are brighter. The colour is a very striking shell pink tint. Even for pot culture it will be invaluable. Certainly nothing in the rambler way has appeared that can be compared to *Dorothy Perkins*, unless it be Leuchstern, and this latter cannot be called a rival because it is single, whereas *Dorothy Perkins* is quite double. The charming colour it doubtless inherits from the pollen parent Mme. Gabriel Luizet, and also in some degree the fragrance. It is a remarkable cross. From all appearances some dark red hybrids of *R. wichuriana* are only a question of time for if they will cross freely with a large Rose such as Mme. Gabriel Luizet they surely will do so with Duke of Edinburgh, Prince Camille de Rohan and the like.

Two beautiful hybrids from the Arnold Arboretum are to be seen in the dell Rose

develop symmetrically on all sides, its slender stems rising 3 feet or 4 feet in the air, and then arching over until their tips reach the ground. It thus forms a veritable fountain of bluish green foliage, covered in July with its charming blossoms, which are conspicuous for their large size and rich rose colour.

This Rose blooms at the same time as *Rosa wichuriana*, and it is very effective when planted in a group of about twelve specimens, far enough apart to allow each to develop naturally, and with the ground between them carpeted with *R. wichuriana* or some of its hybrids. It is also a fine Rose to use in the wild garden, scrambling over evergreens and other little trees. It is one of the most accommodating of Roses, not particular as to soil or situation, doing better than almost any other species in the shade, and very little troubled by insect enemies.

Another good use to make of this beautiful Rose is to plant it at the top of a bank, and allow its long shoots to ramble at will down its sides.

The pretty little *Rosa blanda* is naturalised here, but its home is farther north. It is easily distinguished from the other species we have been considering by its low stature. It is of slender habit of growth, and is seldom found over 3 feet in height. It is almost thornless, and has small, rounded leaflets, from five to seven in number, and pink blossoms that are large and showy for so small a plant. It is found in moist rocky places not farther south than New Jersey.

Very few of our American poets have celebrated the wild Rose in song, but the lady who wrote of the Asters has given us one short lyric in her honour, with which I will close this article.

#### THE WILD ROSE.

I am the wild Rose, lonely is my fate;  
I am a queen, and yet I keep no state;  
My beauty by no minstrel sung or told,  
And all my riches in my heart of gold.  
I am the wild Rose, in the forest dim  
I listen to the sparrow's vesper hymn;  
And silent shed upon the summer air  
The dewy fragrance of my evening prayer.  
My stately sister of the garden close,  
Superb in languid grace, the crowned Rose  
Due greeting sends, and royal messages  
By the light pinions of her courier bees.  
She has her Court, her lords and ladies gay—  
Would I might o'er one loyal heart hold sway  
Yet, come what will, my life shall ne'er be sad,  
For God hath made me beautiful and glad.

DANKE DANDRIDGE.  
Shepherdstown, West Virginia, U.S.A.

#### RECENT PLANT PORTRAITS.

THE first number of the seventeenth volume of *Lindenia* contains portraits of the following four Orchids:

*Lycaste Luciani var. superba*.—This is an exceedingly handsome variety, the petals of which are of a deep shade of rosy purple and the central tube pure white faintly veined with rose colour.

*Cattleya Trianae var. Memoria Lindeni*.—This is a very handsome variety, with petals and sepals whitewashed with rose colour and it has a deep and rich rosy purple lip.

*Cypripedium auriflorum*.—This is a very fine variety of the same parentage as *C. Beeckmannii*, figured in the third volume of this work. Its colours are orange-yellow, the dorsal sepal being edged with white.

*Dendrobium wardianum var. Fascinator*.—This is a most beautiful form of the well-known D.

A SCREEN OF SALMON-PINK RAMBLER PSYCHE IN PAUL AND SON'S NURSERY AT CHESHUNT.  
(This Rose was raised by Mr. George Laing Paul.)

wardianum, with larger flowers and brighter and deeper colouring.

The *Revue de l'Horticulture Belge* for June contains portraits of *Tetratheca ericifolia*, a very pretty and free-blooming greenhouse shrub, which is a native of Australia, and produces numerous branches of rosy purple flowers.

*Dicherisandra (?) thyrsina*.—This is a handsome foliage plant from the Congo region. It has not yet flowered in cultivation, hence the note of interrogation after its first name.

The first number of the *Revue Horticole* for June figures three fibrous-rooted *Begonias*—*Gloire de Lorraiue*, *Caledonia*, and *Hortensia*. These are exceedingly free-blooming, and valuable for the decoration of a warm greenhouse during the dull winter months. The first two named are now well known in our gardens. The third is an intermediate shade of colour. The second number of the same publication for June contains *Pussiflora decipiens*. This is a deep claret-coloured form of *P. quadrangularis* or granadilla. It requires the temperature of a warm house for its successful cultivation.

W. E. GUMBLETON.

#### WORKERS AMONGST THE FLOWERS.

MR. GEORGE PAUL, J.P., V.M.H.

MR. PAUL'S well-known name stands in the world of horticulture in a place of honour as that of one of a great family of Rose growers. In these days especially of awakening

to the new possibilities of beauty in Roses his work is well in the front as a hybridiser and raiser of beautiful new things for the adornment of our gardens. But it is not in the Rose world alone that this eminent horticulturist takes a foremost place. His extensive nurseries of trees, shrubs, and plants, besides the Rose nurseries at Cheshunt, show two salutary forces working in harmony—that of sound commercial enterprise and that of a man with a true love of good plants and beautiful flowers.

Mr. Paul was educated at Tottenham

Academy, and subsequently at a school at Altona, in Germany, where amongst others Mr. Harry Veitch was his schoolfellow. He then went as a pupil to Messrs. Fisher, Holmes, and Co., of Handsworth, where he had the good fortune, under the late Mr. Charles Fisher, of gaining a knowledge and love of hardy plants. In 1860 he joined his father, Mr. George Paul, sen., in his firm, styled then as now "Paul and Son," of Cheshunt, and succeeded to the sole control on his father's death in 1867. The Cheshunt firm already had a reputation for Roses and hardy plants, which has since been more than maintained. When Mr. George Paul came he found some seedling Roses subsequently sent out by the firm as Lord Clyde and Duke of Edinburgh. Encouraged by the success of these he raised and sent out in 1871 the first Hybrid Tea, Cheshunt Hybrid, a well-known kind; and later, continuing the Duke of Edinburgh strain, S Reynolds Hole.

The Shah and Sultan of Zanzibar, raised from the Duke, were distributed in 1873, and the Duke of Connaught in 1876. After twenty-five years these still remain amongst the best dark Roses. John Bright, still the most vivid red, was sent out in 1875, and was followed by a series of climbing sports of which Climbing Victor Verdier was the first. This was followed by Climbing Bessie Johnson and Climbing Pride of Waltham—three of their best pillar Roses.

In 1880 and 1881 Duke of Teck and Brightness of Cheshunt continued and concluded the Edinburgh progeny. Glory of Cheshunt of 1880 was obtained from Charles Lefebvre; Mme. Norman Neruda of 1884 promised to be a July-flowering Rose, as did also its successor, J. B. Haywood; they were not very popular, but they prolonged the Rose season. John D. Pawle of 1889 still stands as one of our best crimson bedding Roses.

Bedding Roses now coming to the front Mr. Paul tried to get varieties of vivid colouring and free continuous habit. Paul's Cheshunt

Scarlet of 1889 was the first of these : it was succeeded by Bacchus in 1895, and in 1898 by Royal Scarlet, all of this class. Some trials with the Bourbons produced Mrs. Paul in 1891, and later, from this variety, the half-double Dawn. In 1883 the distribution of a seedling single Rose, Paul's Single White, was somewhat timidly ventured ; it met with approval, and led to Mr. Paul's sending out, at Mr. Robinson's suggestion, Paul's Single Crimson ; and later on Carmine Pillar, Rugosa America (from Harvard) and its Cheshunt seedling Atropurpurea. The firm's first Rugosa had been Rose-apples ; the latest, not yet distributed, is Rugosa repens, a white Rose creeping on the ground. Una, a fine single from R. Canina, and a Tea, proved beautiful and popular. Alan Cheales and J. B. M. Camm, named after old rosarian friends of the sixties, are amongst Mr. Paul's latest contributions. To his son, Mr. George Laing Paul, belong the new hybridised Roses of the Rambler race—Psyche, The Lion, Wallflower, and Tea Rambler, all of the last three years. Though working mainly in the speciality of his firm, Roses, Mr. Paul has tried some experiments in other classes of plants. By crossing Rhododendron Fortunei with some of the best Catawbiense hybrids good results have been obtained, the varieties Duke of York, Duchess of York, H. M. Arderne, and others having won the Royal Horticultural Society's awards of merit ; he has also done good and successful work among the Azaleas.

Cannas and Amaryllis from Cheshunt figure amongst the certificated varieties of the Royal Horticultural Society, and Phloxes and other herbaceous plants have yielded good results from careful seeding and selection. As an exhibitor for forty years Mr. Paul's records show remarkable success, seventy-one first prizes for Roses in 1872 being a notable example. With the rejection at Cheshunt of the Manetti stock less attention was given to showing the exhibition Roses, but of late years the firm has carried off the leading first prizes for the garden Roses. In pot and indoor Rose culture continued trials have been made, and knowledge in this department has been advanced.

Mr. Paul was a member of the Council of the Royal Horticultural Society at the time of its reconstruction ; he served as juror at the Paris Great Exhibition of 1889 ; he is a Justice of the Peace for Hertfordshire, and represents his division of the parish on the Herts County Council. He was one of the sixty prominent horticulturists who in 1897 received the Victoria Medal of Honour in horticulture. He says of his life : "Looking back at my long garden life I feel the varied interests of the profession—The joys, the triumphs, the laments' of Longfellow were a pleasant retrospect."

**Rudbeckia conspicua.**—This is a valuable hardy plant to grow, especially in a dry season, as it is not affected by drought in the same way as is R. Newmanii. R. conspicua belongs to the hirsuta type, grows 18 inches high, and is exceptionally free flowering ; it has long narrow petals of an intense orange-yellow colour with the usual black disc.—E. M.

## NOTES ON HARDY PLANTS

### NEW HEUCHERAS.

**H**EUCHERA ZABELIANA.—This is a pretty hybrid which originated in Germany, and is a distinct advance. It is nearest to H. sanguinea, not the wretched H. sanguinea of to-day, but the pretty and vigorous plants of bygone years. It forms a close-growing tuft, neater and less woody than H. sanguinea, and produces a multitude of slender, graceful spikes 18 inches high, bearing quantities of rosy pink, bright-looking flowers each the size of the hybrid H. brizoides, though the inflorescence itself is neither so rambling nor so massive. It is, I believe, a hybrid between sanguinea and brizoides,

of that species. The flowers are so numerous that it seems a mistake to speak of them individually ; they remind one of a patch of *Saxifraga umbrosa*. The plant is distinctly a credit to the firm who raised it, for I know full well the great difficulty in getting satisfactory hybrids between Heucheras, especially with H. brizoides as one parent, the green flowers of H. Richardsoni, itself a parent of H. brizoides, asserting themselves in the third and fourth generation with painful persistence. A quantity of hybrid seedlings produced in Messrs. Wallace and Co.'s nurseries at Colchester between several species reveal nothing to approach these two plants in colour and effective habit, despite careful handling and much discretion in selecting the species to employ for the desired end. A second series of hybrid seedlings embracing the most desirable characteristics of H. micrantha and H. sanguinea should, when again crossed, prove more satisfactory.

G. B. MALLETT.

### SCHIZOCODON SOLDANELLOIDES.

THERE are few alpine growers who have not of late years attempted to grow this charming Japanese plant, but it is to be feared that their endeavours have too often resulted in failure if the plant has been grown in the open. I believe that this is largely due to the plants having been recently imported, and that their health has suffered so much in the long journey they have taken that they have never recovered themselves. It is, I believe, a fact that the wholesale selling price in Japan is infinitesimal compared with that at which it is possible to offer a healthy plant in this country. This points to a large percentage of losses, and also to the enfeebled condition of many of the survivors. While this would account for many cases of failure, it is also evident that its requirements in our climate are not sufficiently understood, and that the Schizocodon has wants of its own which we ought to supply if we are to attain the success with it we all desire. A robust plant, when kept in a frame, is not so difficult to grow, but it is to be feared that it will not flower with the freedom we look for, and, after all, alpines in pots are unsatisfactory things, and we ought to strain our skill and ingenuity to discover how they may be cultivated in the open. One of the first to grow the Schizocodon successfully in the open was the late Mr. George F. Wilson, whose loss all hardy plant lovers must deplore, and I can remember the pleasure I experienced when he pointed it out to me in that delightful garden of his at Oakwood, Wisley. It was the first healthy plant I had seen in the open, and it was pleasant to see how happy it looked in its shady position.

Mr. Wilson's success spurred one on to a renewed trial, and by following, to some extent, the same lines, one is gratified to have the charming Schizocodon in health and apparently happy, delighting one with its fascinating flowers, of such a beautiful pink, and fringed like those of a Soldanella. Yet I am not sure that its flowers constitute its greatest charm, for the foliage, with its lovely colouring, is of great beauty, and retains its attractions long after the flowers are over, while it assumes them before the flowers appear.

It is even more beautiful than the Galax and the Shortia in its colour, and many a time have people stopped and expressed their delight with the colour of the foliage. I grow it here in a

MR. GEORGE PAUL, J.P., V.M.H.

in which the rich colour of the former and bold habit of the latter blend to form a charming border plant. Those who use quantities of cut flowers for decoration should find this plant invaluable, whilst one can further recommend it as an improvement on H. sanguinea or its var. splendens in all save colour, the tint of H. zabeliana being slightly paler than either.

*H. brizoides gracillima* is another pretty hybrid of a different stamp to the preceding. It was raised by that firm of clever hybridists, V. Lemoine and Co., by crossing H. micrantha or its var. rosea with H. brizoides, and it resembles H. micrantha in growth. It forms a dense tuft of pale green leafage, and has a myriad of rose-coloured spikes above a foot high, covered with a cloud of pale pink flowers a little larger than those of micrantha, but retaining the light, graceful habit

rockery facing almost due east, but well protected from the cutting winds from that quarter. The "pocket" in which it is planted is about 3 feet above the path, and is shaded from the sun by higher terraces and a few small shrubs on the top. It practically gets little sun. The pocket is filled with peat and sand, with only the smallest quantity of sandy loam, and during dry weather copious supplies of water are given.

S. ARNOTT.

*Carsphorn, by Dumfries, N.B.*

### IRIS SOFARANA MAGNIFICA.

This beautiful *Oncocyclus Iris* was fully described in THE GARDEN of June 14, page 393. It was shown by Messrs. Wallace and Co. at the Temple show, and given a first-class certificate.

### COLOURED PLATE

PLATE 1260.

### ROSE CLEOPATRA (TEA-SCENTED).

MORE than any variety grown, not even excepting Comtesse de Nadaillae, this superb Rose shows the skill of the cultivator. The novice would almost certainly fail with it, for it is one of the worst growers in the whole collection. And yet flowers are frequently seen that excel all other Roses in their grandly pointed centres and large massive petals. Seeing how splendid are its flowers it is rather surprising to learn from Mr. Mawley's list of "Medal Roses," published in "The Rosarian's Year Book" for 1897, that Cleopatra only occupies the ninth position among Tea-scented varieties that have received medals as the best Roses in their class, the eight varieties superseding it being Comtesse de Nadaillae, Souvenir d'Elise Vardon, The Bride, Innocente Pirola, Catherine Mermet, Maréchal Niel, Mme. Cusin, and Mme. Hoste.

Cleopatra is best grown upon half-standard Briars, with stems from 2 feet to 2 feet 6 inches. If required as a dwarf the Briar cutting should be used, but it never produces such massive flowers from dwarfs as it does from half standards. By using the latter the height stated it should not be difficult to thoroughly protect the plants in winter.

It is essential to prune severely to obtain flowers of the highest quality, and as the new growths are so numerous when starting it requires much thinning of the shoots in spring.

Cleopatra is one of those Teas that require generous treatment in the way of manure. Those who grow this variety to the greatest perfection make a practice of digging in some well-decomposed stable manure at the end of November or early in December and in June. When the buds are forming, liquid manure made from good cow manure is given once a week for three or four weeks.

The buds are of great length, of a creamy flesh colour, shaded with rose. It is, however,

THE NEW ONCOCYCLUS IRIS SOFARANA MAGNIFICA.  
(The standards are 2½ inches wide and 4 inches long.)

the splendid shape of the developed flower, rather than the colour, that gives the variety the high position among exhibition Teas.

The flowers from which the coloured plate was prepared were kindly sent by Mr. Frank Cant, Braiswick Nursery, Colchester.

The late Mr. Bennett, to whom rosarians are so deeply indebted for many grand Roses, introduced Cleopatra in 1889. ROSARIAN.

### THE ROSE GARDEN AT KEW.

A DOZEN years ago Roses at Kew were not a special feature, and few people would have thought of paying a special visit for the purpose of inspecting them. Now quite the opposite is the case, for, from the end of May until the end of summer, Roses of all descriptions are to be seen in flower, and many people make an annual pilgrimage to see them.

The collection, as it stood twelve years ago, consisted of a fairly large number of species, a few hybrids, and a few garden varieties. These were taken in hand and added to until the species were as complete as possible, and the garden Roses, Hybrid Perpetuals, Teas, &c., were represented by a good collection of the best sorts. The species, though covering a great deal more ground than formerly, are still to be found in their old position — i.e., the west side of the Pagoda Vista. A favourable position for the garden varieties was found about the Palm house, and climbers were accommodated on poles and chains near the herbaceous ground. To make the collection com-

plete a place was, however, required for hybrids and varieties of the rambling type, which were cultivated in beds here and there about the gardens, and which, to be seen at their best, require to be left in a semi-wild state. In 1895 a favourable site was selected on the east side of the Pagoda Vista near the Pagoda, and it is of this garden that I am writing.

The garden is formed in a valley running north-east and south-west. It is about 120 yards long, and varies considerably in width, the centre being the widest part. In depth it also varies considerably, dipping from the ground level at each end to the centre. Through the middle a wide grass path runs, and from the eastern side of this there are grass walks some 30 yards or so from each end. The sides of the valley are terraced, the soil being held in position by a facing of tree roots placed roots outwards. An irregular outline is gained by bringing the faces of the terraces almost to the edge of the grass walk in some places, while in others they recede, forming large bays. The original soil was very poor, as the position was an old gravel pit some years ago. To remedy this a great deal of gravel was removed and replaced by good clayey soil and manure to a depth of nearly 2 feet.

In planting, the method of grouping so largely adopted at Kew was practised, each bay or terrace being given up to one particular variety. Of species proper very few are now to be found. In the first place more species were planted, but these have been removed as space was required for varieties. The few which remain are extremely pretty ones and worthy of a place in any rose garden.

The principal items in the upkeep of the garden are replanting when the plants become too thick, an annual pruning, a little staking, watering, and keeping clean. Of these items the pruning is the most particular, as it is on this point that failure or success to a great extent depends.

In most cases the pruning is done as soon as flowering is over, and consists in thinning out the old flowering shoots, leaving the young branches the full length for the following year's flowers. This thinning keeps the centres of the plants open and free from dead wood, admits light and air to all parts, and gives the plants a light and graceful appearance. Staking is done with care, as few stakes as possible being used. Crimson Rambler and similar varieties merely have the shoots supported, which would otherwise trail on the ground, the stakes being driven in the ground at as near as possible the same angles at which the branches are growing. For such varieties as the wichuriana set stout Oak branches on which numerous side branches, 1 foot to 2 feet long, have been left are used; on these the long, slender shoots wander at will and arrange themselves in a graceful and natural manner.

The most conspicuous groups in the garden are the following:

Crimson Rambler, a very large semi-circular mass with a frontage of 55 yards. It is so arranged that the whole can be seen, the back plants being higher than the front ones, whilst the branches of the front plants trail over the roots which form the face of the terrace on which the group stands.

Opposite to this are several large groups occupying the central position on the western side. The background is composed of large rambling plants of the Chinese and Japanese species multiflora, together with the pretty Dawson Rose, a semi-

double, pink variety, raised by Mr. Jackson Dawson, of the Arnold Arboretum, by crossing *R. multiflora* with the red H.P. General Jacqueminot. Perched up above the other plants, with its branches trailing over tree roots and other things, this variety makes a lovely picture and one which is much admired.

Below, a large group of the fine *R. rugosa* hybrid Mrs. Anthony Waterer makes a fine mass. It is by far the best of the double reds yet raised from *rugosa*, being very free, of rich colour, and very fragrant. Its other parent is General Jacqueminot. In front of this group and occupying a large bay are numerous varieties of the Scotch Rose, *R. spinosissima*. The two largest growing varieties are *altaica*, 6 feet to 8 feet high, with white flowers 3 inches across, and *hispida* with very spiny stems and sulphur-coloured flowers. In front of these is arranged a selection of the various single and double varieties of *spinossissima*, conspicuous among them being James's Purple, William IV., double pink, &c.

The Siberian yellow-flowered species, *ochroleuca*, is represented by a good sized group, backed up with a mass of the large flowered fragrant *R. moschata*; but by far the prettiest of the yellow flowered species is *R. lutea*, with deep yellow blossoms. This occupies a bay on the same side as *ochroleuca*, but is separated from it by a large mass of Paul's Carmine Pillar, which is seen to great advantage by having a deep green Holly for a support. The red flowered Noisette Feilenberg forms a very large group and flowers throughout the summer. The Prairie Rose, *R. setigera*, forms a large tangled mass; as also does Flora and Blairii No. 2.

*R. wichuriana* and hybrids have a corner to themselves. The type forms a border to the taller growing hybrids, which, as previously stated, are rambling over rough branches. Of the larger and older plants, Manda's Triumph, South Orange Perfection, Jersey Beauty, and Pink Roamer are conspicuous; while of the newer varieties, Paul Transon, *wichuriana rubra*, Auguste Barbier, Alberic Barbier, and Reine Andre are represented. In addition to these there are several unnamed hybrids, of which one raised by crossing *wichuriana* with *rugosa* is the prettiest. The flowers are pink and 3 inches to 4 inches across.

In the north-west corner of the garden an interesting group is composed of a selection of *R. rugosa* hybrids, a group which is of special interest on account of the extreme hardiness of most of the members. Some of the most conspicuous are *Helvetia*, single white; *Blanc de Coubert*, germanica, and *Mme. George Bruant*, double white; *Souv. de Cristophe Cocket*, rose; and *Mme. Charles Fred. Worth*, *Souv. de Pierre Leperdrieux*, *Chedane Guinoisseau*, and *Mikado* various shades of red. A very pretty single red is one which claims *rugosa* and General Jacqueminot for its parents. The flowers are bright red and 2 inches to 3 inches across. Other varieties found in the garden are the yellow double-flowered *lutea* var. *Harrisonii*, *lutea bicolor*, *Psyche*, *Eleanor Berkeley*, *Claire Jacquier*, *Helene*, &c.

The best time to see this garden is from the beginning of June until the end of July, during which time there is always a good display. At the present time (mid-June) the prettiest effects are

made by Carmine Pillar, the yellow previously mentioned, Dawson Rose, *rugosa* hybrids, and the *spinosissima* group. In a fortnight's time these will give place to Crimson Rambler, Feilenberg, *wichuriana* hybrids, &c.

W. DALLIMORE.

## THE FLOWER GARDEN.

### THE DEVELOPMENT OF THE FANCY PANSY.

**W**HAT beautiful Pansies! was the general remark made by visitors as they contemplated the fine fancy varieties staged in such highly developed character by Messrs. Dobbie and Co., florists, Rothesay, at the Temple show. The term "fancy" was applied many years ago to flowers charming in themselves which could not be brought into line with the yellow grounds, the white grounds, and the self-coloured show varieties which are all of English production, flowers very beautiful in themselves and well worthy of cultivation, but amenable to certain properties set forth many years ago and continued to the present day. They are so refined and so distinct from the fancy type, they are generally of vigorous growth, and remarkably free of bloom that it is not to be wondered at they should be rising in popular favour, though the large, gorgeously blotched fancy varieties still dominate in gardens. As they are not restricted

ROSE FLORA IN THE ROSE DELL IN THE ROYAL GARDENS, KEW.

as to character by a schedule of arbitrary properties which govern the English show varieties, anything which can lay claim to form, size, sturdiness of texture, and brilliancy of marking can be comprehended in the fancy section. I am growing a plantation of each this season, and assisted by the moist weather, both are blooming finely. The casual visitor, as might be expected, exhibits floral ecstasies over the large fancy flowers, but as one inheriting the floral traditions of half a century ago the refined show varieties have the greatest attractions for me.

The first beginnings of the fancy Pansy date back to the thirties, when so much was being done in the direction of improving the English varieties. Among the many seedlings raised came a number of striped and blotched flowers, actually non-descripts, judged according to the grounds upon which Pansies were then being selected, and these found favour with some. One man who took a deep interest in them was the late Mr. John Salter, of Chrysanthemum renown, then an amateur residing at Shepherd's Bush, and he raised seedlings and improved them in every possible way. In 1843 he went to Versailles, France, and established himself in business there, naming and sending out fancy Pansies as well as other leading florists' flowers. In 1848 the outbreak of the French Revolution, which led to the abdication of the Orleans family, caused him to leave France, and he came over to England and established himself in business at Hammersmith, and founded the Versailles Nursery, retaining a good deal of his foreign connexion, and he grew and distributed his fancy Pansies, &c. I think it is probable that in the early fifties some of these found their way into the hands of M. Miellez, Lille, for about 1858 this gentleman sent over to England—to Messrs. E. G. Henderson and Son, then at the Wellington Road Nursery, St. John's Wood (the site of which is now a portion of Lord's Cricket Ground)—a batch of greatly improved fancy Pansies, and this firm, doubtful of their ability to do them justice within the range of London fogs and smoke, sent them to my brother, William Dean, then in business at the Bradford Nursery, Shipley, Yorkshire, and in that cool and moist part of the country they were quite at home and grew freely. As I spent one-half of 1859 and the same of 1860 at Shipley I had something to do with the culture and propagation of this very fine and distinct strain. They were seeded from new varieties raised and distributed, and, though the older school of florists frowned upon them, they made steady headway, especially in Scotland. Messrs. Downie, Laird, and Laing went in strongly for their culture, and they also raised and distributed many fine varieties. I think it is possible that before M. Miellez had sent his strain to this country, the late Mr. John Downie was at work along much the same lines as John Salter, and a variety named Dandie Dinmont was one of the most distinguished of Mr. Downie's productions. The point to which we have now reached in the improvement of the flowers was seen in the very fine varieties at the Temple show, the productions of several raisers. It is not, therefore, to be wondered at that these gorgeous fancy Pansies are so much grown for market purposes. They are found on the stalls of the hawkers, and find a ready sale in the streets.

A selection of the finest varieties exhibited by Messrs. Dobbie and Co. is as follows:—

*Jeanie R. Kerr.*—Brown, violet blotches : upper petals yellow, edged with white. A variety of very fine quality.

*Jeanie B. Smith.*—A very fine pure white self, with large dark central blotches.

*John Myles.*—Laced crimson and edged with rosy white; upper petals bright crimson, tinged rosy white.

*Mary Travis.*—Laced creamy white, clear cut, crimson blotches ; top petals purple and white.

*Maroureen.*—Dense violet blotches, edged lemon and magenta ; upper petals lemon, with purple pencilling, and heavily banded with magenta, large and stout.

*Miss A. Brown Douglas.*—A magnificent Pansy, dense black blotches, edged with rosy crimson and

white ; top petals magenta. A very large and perfectly formed flower quite constant in character.

*Mr. Charles Stirling.*—A large deep yellow self, with clean cut circular black blotches. Blooms of great size and perfect form.

*Mr. B. Willbourn.*—Large clear brown-black blotches, laced with primrose : the upper of a bluish drab. A very fine and striking flower.

*Robert C. Allan.*—Dense plum blotches, edged crimson and sometimes white ; upper petals crimson, tipped with white ; large and stout.

*Robert White.*—Glossy black blotches, laced with bright yellow : the upper petals of the same colour ; a large and very fine yellow self.

*Tom Watters.*—One of the very best ; the dense glossy blotches purple on a red ground, the red showing in a glowing circle round the blotches ; the lacing rich yellow ; top petals banded with bright maroon, shot with red.

*Wm. H. Clarke.*—Large glossy black blotches, laced with rich yellow ; top petals yellow, banded with apricot.

*William Maxwell.*—Large circular blue blotches, edged white, and rose on all the petals alike. A very fine and constant variety.

*W. P. A. Smyth.*—Immense bluish purple blotches, edged pale yellow and tinged pinky rose ; upper petals veined with bright purple and yellow. A perfectly formed flower.

There are a large number of varieties in cultivation, probably approaching two hundred, as most growers in the trade send out new varieties. The foregoing select collection is chosen quite irrespective of the raisers, and because they were exhibited at the Temple show in the finest character.

R. DEAN.

#### STANDARD FUCHSIAS.

DEPARTURE from the old massing style of summer flower gardening, and the introduction of arrangements that include base or carpet plants from out of which rise gracefully and not densely tall flowering and foliated plants, have greatly helped the reintroduction of the Fuchsia into flower gardens, and for the purpose named in no respect are plants better than when in standard form. If then, on clean stems, from  $2\frac{1}{2}$  feet to 3 feet in height, with bold massive heads of equal breadth, and full of bloom, they are singularly beautiful objects, and enable all the lower branches and flowers to hang down in pleasing gracefulness without touching or covering up the carpet or base plants beneath. Fuchsias are to be had in so many varieties and with so many diverse habits that in planting any one large bed it is not essential that varieties be limited, if habit or general character be similar. Certainly were the base to be of some white Viola, Petunia, or other suitable covering free-blooming plant, it would be well to limit the selection to dark coloured varieties, or if the base be of some dark hue then white-tubed and sepalled varieties are best. It is not difficult to work up a stock of standard plants. Generally it is best to employ spring-struck cuttings, to grow them on rapidly in warmth, keeping sides pinched to a few leaves, and encouraging the leader to make strong growth. When that, however, shows signs of flowering it is well either to find out the point and take a fresh shoot as leader from the highest leaf bud, or else to hard pinch out the buds, and thus encourage the point of the leader to make a fresh start. Generally the main stems should be fully 4 feet in height before they are finally stopped. Then side shoots for some 12 inches in depth may be encouraged to break strong and thus lay the foundation of a good head. The next spring, if these lateral growths have been moderately shortened back, it should not be difficult, with, say, a couple of pinchings, to form quite dense heads. The following year they can be either planted out into beds thinly, or, as is often done, got into 9-inch or 10-inch pots, and in those plunged into the beds before the carpet or base plants are put out. Whilst thus employing Fuchsias there can be no objection to the use of variety, so long as the plants and flowers harmonise in habit and colour ; it is not well to intermix, as is sometimes seen, such things as Heliotropes, Streptosolens, Plumbagos, Swain-

sonias, &c., as these being rather in pillar than in standard form, are best when by themselves, and if not too freely planted very charming they are. *Solanum Jasminoides* is in the same way very effective, so too are tall plants of *Calceolaria amplexicaulis*, and Ivy-leaf *Pelargoniums*. But none of these can well be made to assume the clean stemmed handsome standard form which Fuchsias give, hence these are best when alone used.

#### LAWNS.

THE recent heavy rains have made lawns look exceptionally green and the grass to grow far too abundantly for the gardener's peace of mind. We have had so many dry parching seasons, when grass has suffered severely from drought and has become literally burnt up, that to have lawns looking so green in June as they now do is a fresh experience, and, to all who admire a nice green lawn, not an unpleasant one : but the keeping of the grass in check, even with the mower in constant use, is very difficult, and especially so is it the case when the grass is dotted with weeds in general and Daisies in particular. Such things are reveling in the moisture, and tell more forcibly than at any other time how much better it is to tackle them during open weather in autumn, winter, and spring, extracting and eradicating them, if slowly, at least surely. Sometimes expressions of admiration for a Daisy-studded lawn are heard, yet probably thoughtlessly made, as these left to develop soon seed, and they scatter their seed far and wide and propagate other Daisies by myriads, so that in time grass, the truest and best of all lawn factors, is crowded out or killed. Just now lawn mowers should be run over the grass twice a week, as June is the great month of Daisy flowering. Such flower removal or destruction as can be done by the use of a Daisy rake is trifling indeed, compared with what a lawn mower can accomplish and where such machines cannot always be employed a scythe can be, and, whilst the rain is so frequent, is a very effective agent of destruction, capable of use at any time of the day. But all experience points to the fact that it is not possible to cleanse a lawn of weeds by such agents as cutting off the flowers or by using chemical sand or other elements. There is no better course than to peg away at weed extraction, mapping out a lawn into small marked areas, and cleaning each portion well before a farther area is dealt with.

#### WINTER-FLOWERING TROPEOLUMS.

I SAW recently in a moderately heated greenhouse two plants of the trailing *Tropaeolum Fire King* then in full bloom, from which the gardener said he had picked hundreds of flowers during the winter. The plants were growing in 10-inch pots, one being placed on the stage at each end of the house, the plant growth being then tied to wires running along just under the roof. Amateurs would find in plants of any of these winter-blooming and trailing *Tropaeolums* most useful flowering material. The plants should be got strong and into pots of the size named early in September. They will then in any ordinary greenhouse and trained as advised, close under the roof, bloom profusely all the winter. Small scarlet-flowered varieties like the one named are best. The more often flowers are gathered the more the plants seem to bloom, but that is doubtless due to the roots becoming somewhat pot-bound with age, thus conducing to free flowering. These plants propagate freely by means of cuttings.

A. D.

#### TSING I, OR CHEUNG HUE ISLAND.

(Continued from Vol. LXXI, page 422.)

I AM afraid that I have unconsciously wandered from Cheung Hue for a few moments, but there is not much difficulty in returning to it again. Very few Orchids were observed, but that must not be taken to mean that the island is deficient in this particular class of plants, as the time at my disposal was only

sufficient to take a very cursory glance at its vegetation. *Phaius grandifolius* and *Goodyera procera* were growing in moist shady places in the woods, and *Habenaria Susanna* in flower on the slopes of the hills in long grass. A plant, of which several specimens were seen, and which was interesting, as it is not found in Hong Kong, was *Clerodendron cyrtophyllum*. It is a shrub 3 feet or 4 feet high, and bears large terminal cymes nearly 1 foot across of greenish white flowers. The flowers are not large, the corolla tube being about half an inch long, and the lobes two lines and one line broad. The leaves are oblong lanceolate, 5 inches to 6 inches in length, on petioles of nearly 2 inches, glabrous on both sides, dark green above and pale green below, with the veins prominent on both surfaces. Growing in the Paddy (Rice) fields *Ceratopteris thalictroides* and *Monochoria vaginalis* were doing well. *Morinda utbellata* with its red fruit looked very pretty trailing over shrubs and boulders. Another climber, and a very common one, too, and one which it is not advisable to handle roughly, unless one has no olfactory organ, is *Paeonia fetida*. It is an old friend, as I first made its acquaintance at Kew. There was a plant in one of the houses trained to one of the rafters, and, of course, it required tying in at times, and on such occasions visitors to this particular house, I have no doubt, blessed the person who first invented handkerchiefs. It is an exceedingly pretty thing when in flower, as the flowers are produced in abundance in cymes towards the end of the branches, the whole forming long, loose, graceful panicles. *Phoenix acaulis*, not by any means aptly named, as it has often stems 5 feet or 6 feet high, was in fruit, its large panicles of orange-coloured drupes making it a very showy plant. *Drymoglossum carnosum* covered the trunks and branches of many trees, and *Gleichenia dichotoma* clothed the hillsides in places. The little yellow-flowered *Utricularia diantha* and *Drosera Loureiri* were thriving together in small swamps. The Castor Oil Plant and *Bryophyllum calycinum* were, as usual, found near habitations. A few other plants noticed in the woods were one or two species of *Calamus*, *Grewia glabrescens*, *Ixora striata*, *Lasianthus chinensis*, and *Callicarpa macrophylla*. A couple of *Ipomoeas* were noticed, *I. digitata* trailing over *Pandanus fascicularis*, and *I. tuberculata* smothering many shrubs in various localities. *Beckea frutescens* was very common in sunny situations on the hillsides, and our old friend *Pteris aquilina* was not at all uncommon on the summits of some of the hills. On the low levels *Cardiospermum Halicacabum* was creeping over low-growing shrubs. There are many islands in the neighbourhood of Hong Kong which would well repay a visit botanically, but the cost of getting to them is prohibitive to ordinary individuals.

W. J. TUTCHER.  
Botanic Gardens, Hong Kong.

#### ROSES FOR DECORATION.

IT is not the grand Roses of the Hybrid Perpetual and Tea kinds only that are beautiful for house decoration; indeed, it may well be a matter of doubt whether the so-called garden Roses are not on the whole the more useful. In the hands of a good decorator they certainly lend themselves to a very great variety of beautiful treatment, for, derived as they are from a large number of species, their ways of growth, habit of inflorescence, and character of foliage show nearly every variety of beauty of which Roses are capable. So we may have arching sprays 3 feet to 4 feet long of the old

and new rambling cluster Roses, beautiful free bunches in several ranges of charming colouring of the more free growing Teas and the Hybrid Teas, closely tufted posies of the pretty Pompons, and large arrangements of the hybrid Sweetbriars and of such grand growers as *Reine Olga de Wurtemburg* and *Mme. Alfred Carrière*.

Nothing is more delightful in their season in our rooms than some of the old garden Roses, the Cabbage and Moss Rose and the double white Rose of cottage gardens, with its variety Maiden's Blush. One old favourite, the pink China or Monthly Rose, well deserves the latter name, for in every month wherein a Rose bloom is possible in England the trusty China may be depended on to give it. Beginning to bloom in May in some sunny corner of sheltered wall, the illustration shows

how it may be cut in good bunches in October, and even in November there may often be blooms still in fair condition.

Another point should be remembered to the credit of the garden Roses, that the great Hybrid Perpetuals, beautiful though they are when freshly gathered, soon lose their beauty in water, and many of the red colourings begin, even the second day, to turn an unpleasant colour. The Teas and Hybrid Teas are much longer lived.

G. J.

#### EDITOR'S TABLE.

##### PINK A. W. PEARCE.

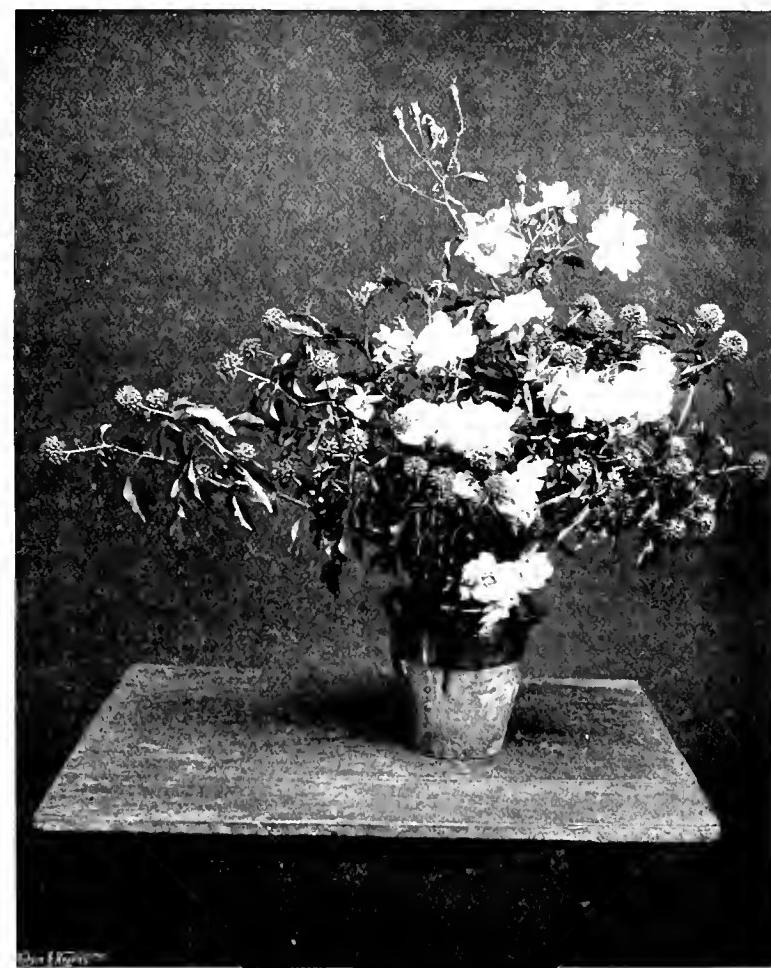

Mr. Ernest Ladham, Shirley Nurseries, near Southampton, sends flowers of this charming Pink; it has very stout and broad petals, pure rose in colour, with a deep crimson base. The stem is strong, and flowers are produced in profusion. It is one of the best Pinks of its colour. Mr. Ladham says both this Pink and

##### PINK SHIRLEY WHITE

are perpetual flowers, and we owe much to Mr. Ladham for raising so many of this race. Shirley White, as the name suggests, is a white flower, held well within the calyx, very sweet scented, and with strong stems. These varieties are, we understand, to be sent out in the autumn.

##### IRIS VIRGINICA.

Mr. Ladham also sends flowers of this pretty purplish lilac Iris with this note: "I. virginica does not seem to be well known. Note the 'fruity' scent (like ripe Plums, I think). The flowers I

AN OCTOBER NOSEGAY OF CHINA ROSES AND IVY.

send are the second opened from the sheath. The plant is very hardy and quite easy to grow.

##### GEUM COCCINEUM PLENUM.

Mr. Ladham also sends an exceptionally fine variety of *G. coccineum*, very double and intense in colour.

##### PYRETHRUM SINGLE AND DOUBLE.

Mr. E. Potten, Camden Nurseries, Cranbrook, Kent, who, it will be remembered, showed recently that beautiful new climbing Rose Dorothy Perkins, sends several beautiful varieties of Pyrethrum, all of good and effective colours. Of the single varieties, James Kelway is as fine as any, a flower of intense crimson colour. A large bunch of this is as good in colour as almost anything from the garden at present; Warrior is a large, pure rose-pink flower, a clear and beautiful colour; Mary Anderson, blush pink; and Queen of May, bright rose, are also very beautiful singles, and should be made note of for grouping in the garden. Mr. Potten sends one double variety, Nancy, the centre of the flower yellowish and the outer petals pink.

##### LILAC FROM CUTTINGS.

I am sending some Lilac blooms; they are from plants (four years old) from cuttings. I had to cut them rather short in the stalk, as I did not wish to spoil some nice young shoots growing close up to the flowers. I am afraid Lilacs do not travel very well, and they have far to go.—N. B.

[A delightful contribution to our table. Mme. Lenoinne was exceptionally beautiful, and we draw attention to the fact that the plants are from cuttings and not grafted. A grafted Lilac is a mistake. We hope those who have suffered from

this evil will take our correspondent's advice to heart and get the shrubs from cuttings.]

We have received the following interesting flowers from Messrs. Thyne and Tatton, Union Street, Dundee, with our correspondents' remarks. They write : "A few blooms of five most interesting and beautiful flowers, each plant of strong and free growth and perfectly hardy."

#### ERIGERON AURANTIACUS.

The bright orange colouring of this useful plant is very welcome. It is very free, of compact growth, 9 inches to 1 foot high, and a worthy addition to all mixed borders and rock gardens. A good form.

#### ONOSMA TAURICUM.

The tubular flowers of golden yellow colouring are very agreeably scented; it is very free, and has evergreen foliage.

#### ASTER PEGEGRINUS.

A lovely flower of light mauve colour, very compact, about 9 inches high, and a decided acquisition.

#### TROLLIUS JAPONICUS FL.-FL.

The flowers of this plant are of a glowing orange, with darker centre; a very showy and effective plant about 1 foot high.

#### RANUNCULUS SPECIOSUS PLENUIS.

Bright double yellow flowers, a very compact and free flowering plant, about 9 inches in height.

ILLICIUM RELIGIOSUM.

[A very interesting contribution to our table of flowers now in beauty in the garden.]

#### ILLICIUM RELIGIOSUM.

"P." sends a flowering shoot of this interesting shrub; its flowers are creamy white, and, as the illustration shows, produced freely. The shoot sent was cut from a bush in the open air in Devonshire. We lately noticed it quite happy in Mr. Leney's interesting American garden at Saltwood, near Hythe.

#### LUPINUS POLYPHYLLUS.

I am sending for your "Editor's Table" two flower-spikes of *Lupinus polyphyllus*, as I thought that you might be interested in their colouring, which is more curious than pretty. They come from a large plant, whose flowers have up to this season been of the normal deep blue, but have all turned out mauve and white this year. Is it possible that the variation may have been caused by the presence in the same border of the annual species, *L. hybridus atrocoeruleus*, which would be in full bloom when the *L. polyphyllus* was flowering for the second time late in August? There was also a bush of *L. arboreus* (the yellow variety) close by.—A. K. DUNDAS, *The Barrows, Charles Hill, Farnham*

[If you are quite sure of the plant having

always previously produced flowers of the normal colour, the examples sent are interesting in their present sportive form, and such instances of complete change are quite rare. There is no possible hope of the change being due to the near presence of the annual kind. Indeed, any cross-bred agency of this kind could but have effect on the seed crop of last year, and therefore in the seedlings resulting therefrom. Are you quite convinced that your original plant has not perished, and that an inferior seedling variation has not gradually and unnoticed grown up near, and is now flowering for the first time? *Lupinus polyphyllus* frequently dies out after, say, a triennial flowering, and a young plant could easily grow up quite near without being noticed. The spikes of bloom sent are so entirely that of an inferior seedling variation that we imagine something like this has taken place. The fact may easily be determined by close inspection of the rootstock 3 inches below ground.]

#### SWEET PEAS AND CORNFLOWERS FROM IRELAND.

Mr. Baylor Hartland sends from Cork a delightful gathering of Sweet Peas and Cornflowers, the former showing a charming range of colouring, with this note: "I send you bunches of Sweet Peas and Cornflowers from seed sown at Aufain in October, 1901. I see by your notes what growers have had to contend with lately, so it may interest them to know what can be done here. The flowers were not specially selected."

#### NEW POPPIES.

Mr. Perry sends from Winchmore Hill two new Poppies, which for size of flower and colouring should be made note of. One is Mrs. Marsh, a large, finely coloured flower orange with a sort of whitish variegation and black base. The colouring is quite distinct, and this variegation is pleasing. Medusa is a large handsome flower of a salmon rose colour, an unusual shade.

#### CORRESPONDENCE.

(*The Editor is not responsible for the opinions expressed by correspondents.*)

#### HARDY CYPRIPEDIUMS.

[To THE EDITOR OF "THE GARDEN."]

**S**IR,—In my notes on these (pages 409-410 of THE GARDEN for June 21) a curious error occurs in a rather important passage. I am made to say "essential" in place of "inimical." Indeed, it was this latter word to which I desired to take exception, and the way in which it was employed by Mr. Mallett when referring to these hardy Cyprpediums in a former issue of THE GARDEN. In this particular instance Mr. Mallett stated in effect that the presence of lime was "inimical" to these plants. My object in directing attention to the word is, primarily, to point out where Mr. Mallett has erred in thus embodying all these hardy Cyprpediums under this remark; and, secondly, to assure your many readers that not only is lime or chalk not only *not inimical*, but that some species are well known for their fondness for calcareous soils. This statement is backed not only by my own practical knowledge of many years but by many others. Take *Cypripedium Calceolus*, for instance. In "Alpine Flowers," over twenty years ago, Mr. W. Robinson writes: "I have never seen this fine plant nearly so well grown as by Mr. James Backhouse of York. He plants it in an eastern-shaded aspect of his rock-work, in rich, deep, fibrous loam, in narrow, well-drained fissures between limestone rocks." Comment on this is needless. No greater authority on hardy plants ever lived than Mr. James Backhouse.

Concerning the same species Mr. A. D. Webster, the well-known authority on British Orchids, writes in his book of this title at page 87: "I have been most successful by using a mixture of strong yellow loam, that of a silty, fibrous nature

is best, freely mixed with sharp river sand and a few pieces of broken limestone, &c." Further on the same authority remarks that the ordinary soil should be removed a certain depth, "half fill the hole thus made with the above compost, on it spread an inch-thick coating of rough sand freely mingled with well broken up limestones, place the plant on this . . . the remaining portion of the hole to be filled up with loam, sand, and pieces of limestone." I cite the experience of these men to prove that, far from being "inimical," limestone is not only regarded as beneficial, but is studiously placed in close proximity to the roots of a species that in Nature has been often found growing on calcareous formations.

What is true of the one species named is true also of other kinds, and if the soil mixture given by Mr. Webster were more often employed for such as *pubescens*, *parviflorum*, *acuale*, and others, a success far more permanent and lasting may often be recorded where failures now ensue.

It is singular that error should have arisen in the most important word of my former note, and though my argument was quite clear and plain in the context, it still may follow that some of your readers will be confused, hence this explanation concerning a group of hardy flowers that should be more cultivated.

E. JENKINS.

#### PRUNING AKEBIA QUINATA.

[To THE EDITOR OF "THE GARDEN."]

SIR,—I note the reference to the pruning of this climber by Mr. Clark (page 389). This is certainly different to my experience. *Akebia quinata* has flowered here on an east wall profusely for the last seventeen years under the following pruning treatment: Cover the space allotted with the strongest shoots, and, when new growth pushes from the eyes or spurs in the spring, do not regulate it, but summer-prune away all superfluous growth before it becomes entangled. It is from spurs that the flowers are produced, and the more these are kept clear the more matured they become and flower correspondingly. When once the allotted space is covered, what can be done with the mass of summer shoots that a healthy plant will produce? The winter is not the best time to cut away such growth. It is too late then for the spurs to ripen.

South Hants.

E. MOLYNEUX.

#### RAPID VINE GROWING.

[To THE EDITOR OF "THE GARDEN."]

SIR,—The note from "A. D." on "Rapid Vine Growing" in THE GARDEN for June 14 presents some features of interest if not of novelty. To what extent this style is adopted in private gardens I am unable to say, but doubtless the growers for profit make an extensive use of it. Taking charge of these gardens in the spring of 1900 it was proposed to remove what viney accommodation there was here and erect new houses. A number of Vine eyes were put in during February in that year at East Thorpe, Reading, for use here. From these a quantity of Vines were grown on, their last shift being into boxes 14 inches square and 6 inches deep. These were finished off in the usual way, and those required for planting were transferred to the borders in April, 1901. They had been pruned to about 2½ feet from the soil, which would allow two bunches each the same year to finish off well. This season the same Vines are carrying six bunches each of good size with every promise of finishing perfectly. The borders are inside, and the average width is only 18 inches, the same in depth, and the Vines did so well that it was not thought advisable to increase the border this year. When comparing notes with Mr. Barks we find that in 1900 he planted strong pot Vines and we had just put in our eyes. In 1900 he took four bunches, and we took two from the Vines; this year he has ten bunches and we have six, with Vines at least a year younger, showing but little difference in the rapidity of the system. The varieties that are accomplishing this are Black Hamburg, Foster's Seedling, and Madresfield

Court. The Vines not required for planting out were not pruned so close down but allowed to remain in the boxes, placed on a stage, and finished off, in the case of Black Hamburgh and Lady Downes' six bunches being allowed, and in that of Black Alicante four bunches each. I think it is possible to do even quicker than this. Some five or six years ago we put in eyes in February and grew them until they required a shift from a 5-inch pot. They were then planted out in a border 18 inches wide and the same in depth, and by the end of the season had made up and finished nice canes. During the winter they were pruned to 5 feet in length, and the next season carried and finished four good bunches, most of them fit for exhibition. These were Black Hamburgh. The following year these Vines carried six bunches without any increase of border space, and were probably better than the previous year. At the end of that season the houses were taken down. The houses in which the Vines are growing are small lean-to ones, with a rafter only 10 feet to 12 feet in length.

Wokefield Park, Berks.

J. WOOLFORD.

### GENISTA MONOSPERMA.

UNDER the name of *Spartium monospermum* this shrub was figured in the *Botanical Magazine*, t. 683, about a century ago. It is not by any means so useful for general purposes as many of the other Genistas, but is a rare and interesting plant and worthy of being included in a general collection of shrubs. It is found

in various parts of Southern Europe, notably in Spain, Portugal, and Sicily. The illustration gives a good idea of its loose, twiggy habit, resembling to some extent a loose growing plant of the white Spanish Broom. It grows to a height of 6 feet or more, and in early spring bears a few simple lanceolate leaves sparingly scattered over the branches; these, however, fall before the flowers open in July. The flowers, which are small and white, with a few reddish spots on the standard and a brown calyx, are crowded together on short stalks from the sides of the branches. The fruits are small and contain but one seed each. It grows under similar conditions to other Genistas, and is increased by means of seeds. In very exposed situations it would probably prove tender, especially when young.

W. DALLIMORE.

## GARDENING OF THE WEEK.

### INDOOR GARDEN.

#### HUMEAS.

**S**EED should be sown now by those who care to have large plants. For smaller plants sow again in August. There is no difficulty whatever in raising the seed or growing the plants, but it must be clearly understood that in all stages of growth they must have unremitting attention. A rule which should be rigidly enforced is that of careful watering, though, as the plant is a rapid grower, it must not suffer for the want of water. If possible afford rain or soft water; hard water will retard their growth. This plant is also especially susceptible to a dry atmosphere. Fill the pots or pans to within half an inch of the top with a light porous compost, and see that the drainage is good. Sow the seed evenly, and sift over it a dusting of fine soil. Place the pans in a moist, warm, shady position, and cover with a sheet of glass, which will check rapid evaporation. When the seedlings have made a little progress they must have as much light and air as they can endure without giving them a check. There are three sorts, all well worth growing, *H. elegans*, *H. purpurea*, and *H. alba*.

#### HERBACEOUS CALCEO-LAKIAS

that are forward enough should be pricked off into pans or round the rims of small pots of sandy soil. Water with care, and shade. When established give air, and daily increase it, as the more air that can safely be given the better.

#### CHINESE PRIMULAS.

Plants in small pots should be moved into larger ones as may be necessary, but never until the pots are well

filled with roots, and always pot firmly. Later batches of seedlings should be potted into small pots. Cinerarias require similar attention. Keep a sharp look out for aphis, to which these are subject. Fumigate on its first appearance. Mildew is sometimes troublesome, especially when the plants are weak. For this pest dust the foliage and soil with flowers of sulphur.

#### THE STOVE.

In this structure there should be frequent damping of the stages and paths to compensate for the rapid evaporation of moisture during hot and dry weather. Many plants, such as Crotons, Acalyphas, and the like, which have filled their pots with roots, will be benefited if repotted. The materials used should be of the best, and suitable to the various subjects, making sure that the drainage is well arranged. Plants for decorative purposes may be kept in small pots and receive frequent applications of weak liquid manure. Many of the stove climbers in large pots or tubs will benefit if given weak liquid manure occasionally. Tie and regulate the young growths of these plants as occasion may require, tying in loosely the shoots so as to permit of their foliage and flowers being effectively displayed.

JOHN FLEMING.

Wexham Park Gardens, Slough.

### THE KITCHEN GARDEN.

#### CELERI.

THE earliest plantings will now be growing away freely, the wet season having favoured the crop. Each plant should be carefully examined and all split leaves and side growths removed. Keep the soil constantly stirred up on the surface, give frequent small doses of artificial manure and soot, and every inducement to make a free, rapid growth. Damp overhead twice daily in fine weather and water freely at the roots.

No time should be lost in completing the planting of the latest sown plants if not already done. It is a capital plan to arrange for the trenches to be got out between the lines of early Peas, the latter affording just sufficient shade to enable the Celery plants to get over their removal quickly. Plant double lines at this season and shorten back the longest leaves if at all drawn. Lift with good balls and plant very firmly.

#### PEAS.

I never remember the Pea crop so late as this year. Owing to the absence of sun the pods do not fill. Those which should have been ready for picking the first week in the present month are not at this date (June 18) nearly fit, but there is every promise of an abundance later on. The latest sowings should be well thinned and securely staked. Apply black sulphur to ward off attacks of mildew.

#### FRENCH BEANS.

Make another good sowing of Canadian Wonder on a south border. A capital Bean also for late work is Wood's Ceotenary, a white podded kind, which is very prolific, of good flavour, and said to be stringless, but in any case it remains a long time before being too old for the table.

#### BROAD BEANS.

All late sowings of these will have to be kept well syringed with insecticide to keep them free from black aphis, which is sure to put in an appearance at this time of year. Strong soft soap and water will answer well, as it is both safe and effectual. Stop the growths in good time, mulch between the rows, and water liberally in dry weather.

#### WINTER GREENS,

such as Broccoli, Kales, Savoys, Brussels Sprouts, and the like should be planted as ground becomes vacant. Broccoli of all kinds should be given exposed positions, the ground made quite firm, and allow good distances between the plants, as the more hardy and solid the growth the more likely are they to come safely through the winter, and, indeed, this applies to all the Brassica tribe, but more especially Broccoli.

#### SPINACH.

Make good sowings on well-prepared ground in

GENISTA MONOSPERMA.

cool parts of the garden and thin out that which is just above the ground. Keep the surface well hoed and apply a little patent manure in showery weather. Good Spinach is generally very difficult to get during July and August when the weather is hot and dry, consequently a little extra trouble is well repaid.

## ENDIVE.

Make further sowings of both Curled and Batavian on the later planted Celery ridges, and thin out the earlier sowing to 1 foot apart. Strenuous efforts will have to be taken to free the crops and produce from weeds, and advantage should be taken on fine days to this end. It is now some years since these have caused so much trouble, for owing to the continuance of showery weather it has been impossible to kill them.

E. BECKETT.

*Aldenham House Gardens, Elstree, Herts.*

## THE FLOWER GARDEN.

## HARDY FLOWERS.

THESE are now so much appreciated and admired that a border of hardy herbaceous plants is essentially a feature and almost indispensable to the successful arrangement of every flower garden. Though some have the idea that after planting there is very little further to be done in connexion with this class of plants, it is a great mistake, for unless the border is attended to both with care and regularity, no matter in what manner it has been arranged, it soon becomes disappointing. At the present moment there is much to be done on the borders, staking some of the taller-growing plants, such as Delphiniums, Hollyhocks, &c., which should be done neatly and effectually, and in pegging down others, such as Verbenas and Phlox Drummondii, thinning out the growths of strong growers, cutting off flowers that are over and keeping the whole border free from weeds. Besides this many plants require a little special

treatment, especially during the abnormally cold wet season experienced up to now. For instance, the Calochortus and Portulaca, which fare so badly when the soil is sodden, and the Eremurus, whose blooms to keep them in perfection should be guarded from the effects of the rain, while in addition arrangements should be always made for filling up gaps that may occur, either by planting out from pits or resowing according to circumstances. The present and next three months to come are wonderfully rich in hardy flowers, and during this time hardy herbaceous borders should be most interesting and attractive. A very pretty sight in one of the borders here is just over through a large mass of

## INCARVILLEA DELAVAYI

having ceased flowering. For three weeks or more this beautiful bright flower has been a charming sight, and was much admired by all who saw it. Last year I saved seed of some of the best flowers and sowed it in January in heat, and now have a fine batch of strong healthy seedlings in 4-inch pots, which I have no doubt will flower in their permanent quarters next season. The Incarvillea I find requires a warm sunny border with not too much moisture in the winter.

HUGH A. PETTEREW.

## THE FRUIT GARDEN.

## THINNING FRUIT.

THIS is a matter that does not always receive the attention it deserves, and far-reaching injury often results from its neglect, as it is not only the quality of the fruit that suffers, but the health of the tree may be seriously impaired by over-cropping. Apricots and Peaches have previously been alluded to, and Apples, Pears, and choice Plums now demand attention. Precise instructions with respect to the extent thinning should be carried to cannot well be given, as so much depends upon the tree's condition, the natural size of its fruit, &c., but in thinning the largest perfect fruits should always be retained, while small and otherwise imperfect ones should be removed. A robust tree will safely mature a much greater weight of fruit than a weakly tree of the same size, and the same remarks apply even to the branches upon a tree. By attending to details of management of this description the balance of growth upon a tree can be in a great degree regulated, and it may be added that necessary thinning should be done early so that needless exhaustion is avoided.

## STRAWBERRIES.

The needful supply of runners, both for planting in open quarters and for potting on for forcing, should as soon as they can be procured be layered in 3-inch pots firmly filled with rich loam and a little fine manure from a spent Mushroom bed. Avoid crowding the plants. Arrange the pots as far away as possible from the parent plants, so that the growth of the young plants is not weakened, and on no account allow them to suffer for want of water. Keep the parent plants also well nourished and surplus runners removed. The strongest runners of one year old plants are the best material to select for layering, and they should be relieved of extending growths and not severed from the parent plants until the pots are well filled with roots. They should be placed upon a bed of ashes in a partially shaded place for a week or so before they are potted in fruiting pots or planted out as the case may be.

## PREPARING FOR PLANTING.

Strawberries should be planted upon land that has been deeply worked some time before. We usually plant our main crop upon a plot that has been trenched in the autumn and heavily manured for early Peas, after it has again been dug and manured as soon as the Pea crop is over. Land treated in this way, if broken over immediately before planting time, is in good condition for planting. A south or west border is, however, found for a plantation of Royal Sovereign and others to supply an early gathering for dessert, and a north border for Latest of All, &c. for late

use. One year old plants produce the largest fruit, and are chiefly depended upon for dessert, and no plants are kept for any purpose after the second year.

## VARIETIES FOR FORCING.

Royal Sovereign, La Grosse Sucrée, Sir Charles Napier, Sir J. Paxton, President, &c., are reliable varieties for this purpose. The first-named, however, although some of the others are better flavoured, is most generally grown. Its handsome appearance and good forcing character cause it to be highly valued. To these may be added for outdoor culture Gunton Park, Late Pine, Dr. Hogg, Waterloo, Latest of All, and British Queen. The latter requires a moderately light soil. Of new varieties Trafalgar, Fillbasket (a heavy copper), Mentmore, and The Laxton, which is to be distributed this season, are handsome varieties, while Antoine de Padoue is valuable for late use.

## THE ACME BLOOM PROTECTOR.

THIS device for protecting the flowers of the Rose, Dahlia, Chrysanthemum, and other plants, the invention of Mr. Richard E. West of Reigate, is of considerable importance to all gardeners, and more particularly to those who grow these flowers for exhibition; to the latter, indeed, it is invaluable. The accompanying illustration of the bloom protector explains itself almost sufficiently, but we may just point out its advantages and its manner of working. In the first place it can be adjusted rapidly in any position, and the galvanised steel spring allows the height to be fixed instantly. Rigidity is secured by a square socket working on a square stick, the former being held firmly against the latter by a galvanised steel spring, thus effectually preventing the protector being blown round by the wind, and doing away also with all liability to bruise the bloom. The protectors only weigh a little over 2oz. each, including socket and frame, so that it is unnecessary to say they are extremely light. They have also the excellent attribute of durability, for they will last for years and may then be re-covered at only a trifling cost. Although the covering material (calico) is not in itself waterproof, experience has proved that the angle at which the protector is made causes the water of the most severe rainstorm to run off at the edge, and not to penetrate the cover and damage the bloom. Mr. Richard E. West, Reigate, Surrey, is the inventor and patentee of this most useful device, and from him fuller particulars can, if necessary, be obtained.

## SOCIETIES.

## ROYAL HORTICULTURAL SOCIETY.

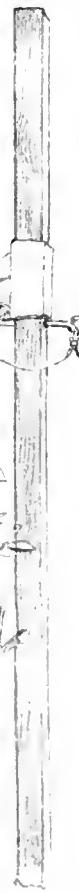

EXHIBITION AT HOLLAND PARK, JUNE 24 AND 25.

THIS was one of the most interesting exhibitions that has ever taken place under the auspices of the society, but marred by the unfortunate illness of His Majesty the King, as recorded elsewhere. The Roses were not plentiful, owing to the season, but Orchids, hardy and indoor flowers were superb.

## ORCHID COMMITTEE.

Present: Harry J. Veitch, Esq. (in the chair), Messrs. James O'Brien, J. Douglas, G. J. Chapman, J. W. Odell, H. Little, F. A. Rehder, H. A. Tracy, W. Boxall, W. H. White, W. H. Young, N. C. Cookson, J. Charlesworth, J. Colman, H. M. Pollett, F. Sander, F. W. Ashton, H. T. Pitt, W. A. Bilney, and J. Cypher.

Messrs. F. Sander and Sons, St. Albans, were awarded a gold medal for one of the finest groups ever shown at an exhibition of the Royal Horticultural Society. Not a single indifferent species or variety was to be found. At the end of the group was a fine plant of Epidendrum prismatocarpum, with eighteen spikes of flowers. The Cattleyas, Lalias, and Laelia-Cattleyas were remarkable both for variety and excellence, the most prominent being Laelia-Cattleya Aphrodite King Edward VII. (Mendelii × purpurata), the sepals and petals almost pure white, the immense lip rich crimson-purple, with yellow in the throat; L.C. canthamiana (Mossiae × purpurata), in numerous varieties; L.C. Our Queen, the sepals and petals of which are almost white, lip white on the outer margins, with a deep blotch of purple covering the central area, shading to yellow in the throat; Cattleya II. G. Selfridge (superba × Aclandiae), showing the influence of the superba parent in the intense

MR. RICHARD WEST'S ACME BLOOM PROTECTOR.

purple marking of the segments; C. Prince Edward (Warscewiczii  $\times$  schilleriana), the influence of both the parents could be distinctly seen in the offspring; and C. Warscewiczii in its finest forms were included. C. Mossiae, both in white and dark forms, was extensively represented. Cochlioda noeziiana, with fourteen spikes of flower, were in striking contrast to the white Odontoglossums which surrounded it. The principal Odontoglossums were O. crispum Princess Helene, the sepals and petals white, faintly tinted with rose on the outer margins, the central area being almost entirely covered with a distinct blotch of bright brown, the lip white, shading to yellow, with numerous brown markings covering the surface; O. c. Imperatrix, the finest Odontoglossum in the show, the outer and basal area white, faintly tinted rose, the central area being covered with rich purple markings, the lip white, yellow on the crest, having a brown blotch in the centre of the lip; O. c. Princess Victoria, a most attractive variety of the O. c. Starlight section, the markings being most prominent on a rose-tinted surface; O. c. Princess Beatrice, which belongs to the O. c. cooksonianum section, with redder brown markings on a white ground; O. harvengtense, which has white, faintly tinted yellow sepals and petals, the petals spotted with brown, the sepals heavily blotched and barred with the same colour. Among the better varieties of Miltonias the most prominent were M. vexillaria Queen Alexandra, with immense white segments, the petals faintly tinted with rose, the lip having three purple lines in front of the yellow disc. M. v. radiata has the sepals and petals pale rose, the lip white, with a large area of purple on the disc, in front of which are radiating purple lines. Several fine Cypridiums were also included.

Messrs. Charlesworth and Co., Heaton, Bradford, were awarded a silver cup for a grand display of finely grown and beautifully arranged Orchids. The back row was filled with splendidly flowered plants of Oncidium macranthum, O. crispum, and O. sardcos. The Cattleyas made a brilliant display, and included such species as C. Mossiae in various shades of colour, Miltonia vexillaria, Cochlioda noeziiana, &c. The hybrids were very interesting, the most prominent being L.-C. Aphrodite alba, with pure white sepals and petals and an intense purple lip; L.-C. Martinetti (Mossiae  $\times$  tenebrosa); several fine varieties of L.-C. canhamiana, including L.-C. Lady Wygram in one of its finest forms; L.-C. Lady Millar (cinnabarinum  $\times$  granulosum), the sepals and petals clear yellow, lip purple, lined with yellow, a most attractive plant; and L.-C. Phœbe (cinnabarinum  $\times$  Mossiae) in various tints of yellow were well represented. L.-C. G. S. Ball (cinnabarinum  $\times$  Schroederae) was also well exhibited. Among the numerous grand forms of Odontoglossums were O. harryano-triumphans, which has the intermediate characteristics of the parents indicated in the name (a remarkable hybrid); O. crispum punctatissimum (Princess Maud), the sepals and petals pale rose tinted, thickly covered with miniature rosy purple spots in the central area of each of the segments, the broad lip white, shading to yellow on the disc, with a large chocolate blotch in the centre, and smaller spotings on the side lobes; and O. Alexandra Regina, a most attractive natural hybrid between O. grande and O. Inglebyi, showing the intermediate characters of both parents. It was certainly one of the finest groups ever staged by the firm.

Mr. J. Cowan, Gateacre, Liverpool, was awarded a silver-gilt Flora medal for a fine group of Odontoglossum crispum, Cypridiums in variety, grand forms of Cattleya Mendelii, C. Mossiae, Lelia digbyana, Lelia tenebrosa, Dendrobium suavisimum, Epidendrum vitellinum, and other Orchids.

Messrs. Stanley, Ashton, and Co., Southgate, N., were awarded a silver-gilt Flora medal for a beautiful group of finely-flowered Odontoglossum crispum. Also shown were many fine varieties of Cattleya Mossiae, C. Mendelii, Lelia tenebrosa, and numerous fine hybrids. Several finely-grown and flowered plants of Mexican Oncidiums were also included.

Messrs. Hugh Low and Co., Bush Hill Park Nursery, Enfield, were awarded a silver-gilt Flora medal for a fine group, consisting of fine varieties of Cattleya Mossiae, including the pure white C. M. Wagnerii. Among the numerous beautiful C. Mendelii was a pure white, with pink blotch in the centre of the lip. C. intermedia alba, with its pure white flowers, Lelia purpurata, and L.-C. canhamiana were well represented, the sensitive-lipped Masdevallia muscosa, with numerous flowers, Vanda Hookerii, V. Miss Agnes Joaquin, and other interesting Orchids were included.

Sir F. Wigan, Bart., was awarded a silver cup for a grand display of rare species, hybrids and varieties. The back row included two grand plants of Sobralia kienastiana, pure white; S. Wiganiana, pale rose-tinted sepals and petals, with a broad rose-tinted lip, in the way of S. Veitchii; C. Mossiae celestis, with a tint of blue on the front lobe of the lip; C. M. Wagnerii, white, except the yellow in the throat; C. Prince Edward (schilleriana  $\times$  Warscewiczii), Lelia-Cattleya Eximia (purpurata  $\times$  Warnerii), L.-C. arnoldiana, and L.-C. canhamiana were well represented. Miltonia vexillaria gigantea, a grand variety, intense rose, with a white area around the disc; Phalaenopsis grandiflora, Thunias, and other Orchids were also included. The group was arranged with Mr. W. H. Young's usual good taste.

J. J. Colman, Esq., Gatton Park, Reigate (gardener, Mr. W. P. Bound), was awarded a silver-gilt Flora medal for a group of beautifully arranged Orchids, consisting of Oncidium macranthum, Odontoglossum crispum, Cattleyas, Miltonias, and Cypridiums in variety.

Sir Trevor Lawrence, Bart. (gardener, Mr. W. H. White), was awarded a cultural commendation for a fine basket of Habenaria rhodochila and Maxillaria securifolia, with ten spikes of flower.

H. Little, Esq., The Barons, Twickenham (gardener, Mr. A. Howard), sent fine varieties of Cattleya Mossiae and Lelia purpurata.

Mr. W. P. Burkinshaw sent one of the finest varieties of Cypridium Godeffroye leucochilum we have seen, the ground colour pale yellow, veined, banded, and blotched with bright brown-purple. The plant carried two flowers.

#### NEW ORCHIDS.

First-class certificates were given to the following:—

*Miltonia rexularia* var. *Queen Alexandra*.—This is a very large and beautiful flower, pure white, except for a pale yellow centre and a few faint markings of pale red just around. The size of the flowers and their purity of colour make this new variety so remarkable. From Messrs. Sander and Sons, St. Albans.

*Laelia-Cattleya Aphrodite King Edward VII*.—A very handsome flower, with broad, drooping petals; the sepals and petals are almost white; the lip is very large, and of a rich purple colour; the throat is yellow, except for some markings of reddish purple below the column. From Messrs. Sander and Sons, St. Albans.

*Miltonia rexularia gigantea*.—This beautiful variety of M. vexillaria has large flowers of a rich rose colour, with a yellow eye and white markings beneath. It is a flower of striking beauty. From Sir Frederick Wigan, Bart., Clare Lawn, East Sheen (Orchid grower, Mr. W. H. Young).

*Sobralia Wiganiana*.—A flower of distinct and delicate colouring; the large broad sepals and petals are nearly white, and

can notice faint purple markings also. From Messrs. Sander and Sons.

*Laelia-Cattleya Martinetti Prince Arthur*.—A lovely variety, with somewhat loose sepals of a lemon colour, tinged with buff; the petals are rosy buff. The lip is very handsome, beautifully frilled, and of a crimson-purple colour. From Messrs. Sander and Sons.

*Odontoglossum Harvengtense Princess Margaret*.—A choice flower heavily marked with bands of chocolate colour upon a very pale sulphur ground. The sepals and petals are fairly broad, the latter being less heavily marked than the former. From Messrs. Sander and Sons.

*Odontoglossum crispum punctatissimum*.—This variety is of the roseum type of punctatissimum, and undoubtedly one of the finest yet flowered of that type. The flower is large; the toothed sepals and petals are prettily and lightly spotted with rose, the markings being heavier on the sepals. The lip is also very good. From Messrs. Charlesworth and Co., Heaton, Bradford, York.

*Zygopetalum rotundata*.—The parents of this bigeneric hybrid are *Aganisia lepidia* and *Zygopetalum Gautieri*. It is a curious and striking flower, with pale green sepals and petals marked with violet. The flat protruding lip is also heavily marked with violet-blue. The flowers are borne in an erect raceme. From Messrs. Sander and Sons.

#### FLORAL COMMITTEE.

Present: W. Marshall, Esq. (chairman), and Messrs. J. F. McLeod, J. Jennings, James Hudson, W. Howe, E. Molyneux

ROSA HISPIDA.

(See page 11.)

the lip is large, of regular form, and of varying shades of rose; the throat is yellow. From Sir Frederick Wigan, Bart.

*Cypripedium Godeffroye leucochilum Hesse variety*.—The dorsal sepal of this somewhat curious-looking flower is small, and the petals are large and long. All are heavily marked with deep red upon cream ground. Exhibited by W. P. Burkinshaw, Esq., Hesse, Hull.

*Cattleya Miss Harris var. superba*.—The parents of this new hybrid are C. Mossiae and C. schilleriana. It is a very richly-coloured flower, the sepals and petals rosy crimson, and the lip a more intense shade still, and slightly tinged with purple. From Messrs. Stanley, Ashton, and Co., Southgate, N.

Awards of merit were given to the following:—

*Cattleya Prince Edward*.—This hybrid was exhibited by Messrs. Sander and Sons, and also by Sir Frederick Wigan, Bart. The parents are C. schilleriana and C. gigas, and the result is a rather large flower, whose sepals and petals are a rich rose, and the lip a deep purple, with a mass of yellow at the base of the throat.

*Odontoglossum Alexandra var. Imperatrix regina*.—This is a striking flower, having stiff and somewhat narrow sepals and petals, with wavy margins, and regularly marked with red, tinges of faint purple being also noticeable. From Messrs. Sander and Sons, St. Albans.

*Odontoglossum Alexandra Her Majesty*.—The raceme exhibited of this variety was a bold and vigorous one, carrying twelve large flowers, with crinkled margins, and white, except for a few blotches on the lower sepals; the petals and sepals of some of the flowers were quite white. From Messrs. Sander and Sons, St. Albans.

*Odontoglossum Alexandra Princess Helene*.—This is a flower of splendid form, with broad sepals and petals, these being marked with large blotches of reddish brown, and one

C. R. Fielder, R. Dean, G. Reuthe, the Rev. F. Page-Roberts, C. Blick, W. P. Thomson, W. J. James, R. W. Wallace, E. H. Jenkins, W. Bain, H. J. Cuthbert, Charles Jeffries, W. Cuthbertson, R. W. Ker, N. F. Barnes, J. H. Pitt, C. W. Knowles, and C. T. Druery.

#### HARDY FLOWERS.

This department, indeed, was a great feature of the show, and gave much pleasure to the large numbers present on the occasion. We can only mention a few of the more prominent kinds.

A very beautiful group was that from Mr. Amos Perry, Winchmore Hill, who, in addition to a great variety of choice and good things, gave the visitors a welcome departure in the exhibiting of many interesting aquatics; indeed, it was a study in water gardening in miniature, large and small glass aquaria doing service for pond, or pool, or basin. We congratulate Mr. Perry for a change as welcome as it was refreshing and natural, as well as in good taste. Space forbids our enlarging further, but we take it much more can yet be done in the same direction. Water Lilies of the newer Marliac and allied kinds occupied shallow tanks at the margin, and at one end the more tender things, such as *Nymphaea stellata* var. N. s. *zanzibarensis* rubra, a gem in this set, and quite a new shade in half hardy kinds. Beyond these were many good aquatic and marsh plants, while such as *Nuphar pumila*, *Thalictroides dealbata*, *Chrysobactron Hookeri*, and the Cape Pond Weed all contributed their quota to the natural beauty of the scene. In the hardy cut flowers Calochorti, Irises, Peonies, Ixias, Tritomas, Double Rackets, Spanish Irises, *Lychis vespertina* plena, and others were shown. A mass of *Dianthus alpinus* were very beautiful. Only a few of the good plants shown are mentioned; it was an exhibit to remember. Why a gold medal was not given we leave others to explain. Silver cup.

Messrs. Wallace, of Colchester, showed a fine group also out of their usual way, the plants being arranged on the turf, and thus better seen. The plants, too, were in the masses, in many instances 2½ feet across, of such things we noted *Hieracium villosum*, *Achillea mongolica*, pure white; *Heucheras*, such as *H. sanguinea* and *H. splendens*, the beautiful *H. buizoides* gracilissima, *Imula glandulosa*, a rich golden yellow; *Paeonies*, Spanish Irises, *Gethera Jamesoni*, *Dictamnus*, the Calochorii, so strong a feature of this firm; *Sparaxis* Fire King, brilliant in its three-fold colouring, and many more. Lilies, too, were very fine, *L. Henryi* and *L. excelsum*, both in superb groups, the former 7 feet high and full of bloom. A gold medal was most worthily given.

Messrs. Paul and Son, Cheshunt, also had a fine display, and here we noted *Lupinus* Snow Queen, *Lychis Flos-cuculi f. pl.*, *Linum arboreum*, yellow; *Campanula mirabilis*, very beautiful with large Canterbury Bell-like flowers; some immense spikes of *Verbascom olympicum*, full of yellow blossoms; double Rockets, hosts of hybrid Columbines, *Orchis foliosa*, the rare *Paeonia Whitleyi* of snowy purity, and a tuft of rich golden anthers in the centre; Gunneras, *Omosma*, *Rodgersia podophylla*, and others equally good and showy. The single white Peony was a notable thing in this exhibit, commanding attention at once.

Mr. M. Prichard, Christchurch, Hants, followed with an excellent collection. The rare *Tropaeolum Leichtlinii*, with orange flowers; *Dianthus annulatus*, *Lupines*, *Senecio Pororicum*, a good yellow composite for damp spots; Irises of many sections, the gorgeous Oriental Poppies, *Orchis maculata*, the beautiful *Papaver pilosum*, *Pyrethrum* in much variety, *Iris Ileander*, very fine; *Coronilla iberica*, and the richly hued *Potentillas* were some in this fine mass of good flowers.

A small group from Mr. A. W. Wade, Colchester, included Poppies, *Ixias*, Spanish Irises, the yellow shaggy Hawkweed *Hieracium villosum*, &c. Silver medal.

Messrs. Jaekman and Sons, Woking, again showed a fine group, including many choice things. *Ramondias* were abundant, as were the Incarvilleas. Spanish Irises were plentiful, and among the more interesting subjects we noted the webbed *Sempervivums*, *Orchis foliosa*, several hardy Cypripediums, the pretty alpine *Lychis*, *L. Lagascae*, *Dianthus cæsius*, *D. Napoleon III.*, with other single and double Pinks; various species of Irises, with *Campanulas*, *Anemones*, and others of much variety. Many bold and showy flowers were also included in this notable lot of material. Silver medal.

Messrs. T. S. Ware, Limited, Feltham, Middlesex, too, had a famous lot of things in great variety. In this case a charming lot of alpines nicely arranged and beautifully fresh were flanked right and left with showy cut exhibits. In the alpines we noted the *Gypsophila*, *Heucheras*, *Dianthus neglectus*, *Echionema persicum*, with pale lilac flowers in club-shaped heads, many *Saxifragas*, *Primulas*, and the like, while in bolder things many fine Lilies, such as *L. Henryi*, *L. rubellum*, the handsome *Ostrowskia magnifica*, with its huge bluish white bells well expanded. *Paeonia albiflora* was in a superb mass, while such as *Dictamnus*, in red and white, *Primula japonica alba*, *Delphiniums*, *Phlox Snowdon*, one of the early set; *Watsonia O'Brien*, Irises in much variety, *Verbascum olympicum*, a golden spike of flowers, were all bold and effective. Then in insectivorous things, *Darlingtonias* and the hardy *Sarracenia*s were well shown, the white group making a most effective and telling display worthy of all credit. A new *Heleneum* in this group is too good to pass by; it is a self crimson-brown of the well known *H. grandicephalum striatum*. Silver Flora medal.

Messrs. Dobbie and Co., Rothsay, showed hybrid Columbines and Violas in much variety, the latter very fresh and beautiful. Silver cup.

Messrs. Barr and Sons, Covent Garden, had a splendid exhibit extending the full side of a large tent. The chief idea was that of flowers in large masses, and in this way we noted Paeonies in a group of 3 feet across, and represented by many lovely kinds; the same thing was repeated in Irises of the Spanish as well as those of *L. spuria* and *L. sibirica*. There were also *Delphiniums*, Oriental and other Poppies, Pinks, single and double: *Lychis haageana*, very fine in various colours; *Phlox ovata*, *Lychis viscaria* *splendens plena*, very fine; and many more far too numerous to mention. There were also many rare things and choice alpines and bulbous plants, each and all worthy of attention from the lover of hardy plants. Silver cup.

Messrs. Kelway and Sons, Langport, had one of their notable displays of Paeonies and *Delphiniums*, the endless variety alone precluding mention of the many individual things. The Paeonies in particular were glorious. Of these we noticed Portia, a singularly good white, and Miss Ada Chambers, satin pink with gold anthers. These were exquisite in their purity and dainty colouring. Silver Flora medal.

The Misses Hopkins, Cheshire, showed a mass of alpines with other dwarf subjects arranged in a bank of moss.

Messrs. J. Laing and Sons had hardy flowers mingling with other plants belonging to the greenhouse. In the former were dwarf Thymes, Irises, dwarf alpine Pinks and Houseleeks, a very interesting display.

Mr. W. J. Godfrey, Exmouth, also set up a large group of cut Poppies, after the manner of those at the Temple show. Some of the colours were very charming. Silver Banksian medal.

#### SWEET PEAS, &c.

The Sweet Peas from that well-known grower Mr. Robert Sydenham, of Birmingham, were quite a feature of the show, and no one has done more of late years to promote the cultivation of the flower and reduce the varieties into something like reasonable limits than he. The flowers represented practically all the best varieties now in gardens, and therefore need not be mentioned by name; they were well set up, and attracted much attention. We hope later on to say more about the Sweet Peas grown by Mr. Sydenham. Silver Banksian medal.

That well-known amateur, Mr. Percy Waterer, of Woking, who is one of the best of private growers of the Sweet Pea also had an interesting collection. Silver Banksian medal.

Anemones of the Alderborough strain, a very beautiful race raised by the exhibitors, Messrs. Reamsbottom, Geashill Nurseries, King's County, Ireland, were conspicuous and much admired. Silver Flora medal.

Messrs. Jones and Son, of Shrewsbury, had a charming collection shown daintily, and represented by such varieties as Lady Giselle Hamilton, a beautiful mauve; Salopian, crimson; Princess of Wales, rose-pink; Duchess of Westminster, soft buff, in all fifty-five varieties, with which were also Spanish Irises, and other flowers, but the Sweet Peas were the chief and most beautiful feature. Silver Flora medal.

Mr. R. C. Notcutt, The Nurseries, Woodbridge, Suffolk, had a beautiful group of hardy flowers in season. We shall have occasion shortly to describe this nursery and the plants in it. The most interesting feature of the display was *Aectotis grandis*, a lovely half-hardy annual, with soft lilac-shaded flowers, not unlike those of the Gerbera in shape; it is a graceful flower, very easily raised, and deserves to be made a good note of. Silver Banksian medal.

Messrs. E. S. Williams and Son, Upper Holloway, had a charming group of alpine flowers, and were given a silver Flora medal. In this group was a mass of that beautiful *Begonia Eileen Willmott*, one of the best of its race.

Messrs. Carter and Co., of High Holborn, also had hardy flowers, not a conventional group, but shown on a little rock garden, a very pleasant and welcome feature; they also had the dwarf Japanese trees in great variety, besides other exhibits noted elsewhere.

Messrs. H. Cannell and Sons, of Swanley, had a tremendous mass of hybrid Aquilegias (Columbines) of tender colours and of the spurred type.

#### TREES AND SHRUBS.

Messrs. Thomas Cripps and Son, Tunbridge Wells Nurseries, Kent, had a remarkably good exhibit of hardy shrubs, consisting for the most part of Japanese Maples, of which they showed a most representative collection. At one end of the display was arranged a group of Messrs. Cripps' handsome new conifer (*Retinospora obtusa* Cripps). In the centre was a splendid specimen 6 feet to 8 feet high, and this was surrounded by numerous smaller ones. This golden conifer when fully exposed to the sun does not burn in the least. It received the Royal Horticultural Society's certificate in September, 1899. Some of the best of the Japanese Maples were *Acer japonicum aureum*, *A. J. laciniatum*, *A. carpinifolium*, *A. palmatum atropurpureum*, *A. p. dissectum*, *A. p. flavescens*, *A. p. purpureum*, *A. p. palmatifidum*, *A. p. roseum marginatum*, *A. p. sanguineum*, *A. p. versicolor*, and *A. p. Duntzugi*. Particularly pretty also were *A. linearifolium gracilis* Cripps, *A. palmatum atropurpureum Tunbridgense*, *A. p. atrosanguineum Fieldii*, all of which are new. These Maples, together with other hardy shrubs, made up a notable display. Silver cup.

Mr. John Russell, Richmond, exhibited a group of miscellaneous hardy trees and shrubs that was remarkable for its good arrangement and choice plants. Towards the back of the group were standard Bays, *Dracennas*, *Acer Negundo variegatum*, *Acer Leopoldi*, *Golden Oaks*, &c., and most conspicuous of all plants in the group was *Dimorphanthus manschuricus foliis argenteis marginatis*, one of the best variegated plants introduced of recent years. Other good things were *Photinia serrulata*, *Elaeagnus macrophylla*, *Raphiolepis cordata*, Tree Irises in great variety, *Osmanthus ilicifolius*, *Golden Elders*, &c., a very pretty edging of *Euonymus latifolius albus*, giving a bright finish to the group. Silver-gilt medal.

Messrs. James Veitch and Sons, Limited, Chelsea, exhibited an excellent group of hybrid Aquilegias in pots, the plants were finely flowered, and the flowers individually of good colouring and size. Immense spikes of *Eremurus robustus* were arranged between the Aquilegias, and Bamboos in tubs surrounded them, and formed an effective bank of greenery. Some of the finest of these specimens were *Arundinaria auricoma*, *Phyllostachys Boryana*, *P. heterocycla*, *P. Heubensis*, *P. aurea*, and *Arundinaria Simoni*. Gold medal.

Messrs. W. Cutbush and Son, Highgate, N., had a remarkably fine display of clipped Yews and Box trees. There must have been altogether several hundreds of these quaint specimens. The tall spiral and pyramidal Yews were arranged at the back of the group, and in front of them the smaller specimens, the Box trees being the more numerous. These were a very pleasing light green, and appeared to be remarkably fresh and healthy. They were clipped into all sorts of shapes, and some of the most effective were those representing arm-chairs, churches, baskets, ships, wheel-barrows, and various birds. Gold medal.

Messrs. J. Heal and Sons, Chawton, Sussex, had an extensive group of trees and shrubs in considerable variety, many of which were in flower, while others were remarkable for their beauty of foliage. Forming a background were purple Beech, *Acer Negundo*, *Golden Elms*, and other tall plants. There were small and effective displays in various parts of the group of such good things as *Abies pungens glauca*, *Kalmia latifolia*, *Thuya occidentalis lutea*, Japanese Maples, *Phoumian tenax*, &c. Other plants well represented were *Cupressus lawsoniana lutea*, *Retinospora plumosa aurea*, *R. p. argentea*, and many other good hardy shrubs and conifers. Silver cup.

Messrs. John Laing and Sons, Forest Hill Nurseries, S.E., exhibited a bright and varied group of miscellaneous shrubs. There were Bamboos in variety, *Golden Oaks*, *Acer Negundo variegatum*, *Kalmia latifolia*, *Golden Ivies*, *Enonymuses*, a number of Rhododendrons in flower, including Mrs. T. Agnew and Silvis, several beautiful Clematises, *Aralias*, Japanese Maples, and others. Silver-gilt Flora medal.

Messrs. W. Fromow and Sons, Chiswick, exhibited an excellent group of Japanese Maples, between which were arranged plants of *Lilium auratum*, the large handsome flowers of which showed well against the dark foliage of the Maples. Silver-gilt Flora medal.

#### FRUIT.

Messrs. Thomas Rivers and Son, Sawbridgeworth, Herts, had an imposing exhibit of fruit trees in pots, including

Cherries, Plums, Peaches, and Nectarines. The Cherry trees were remarkably fine specimens and loaded with fruit. Some of the varieties best represented were Elton, Semis de Bour, Early Rivers, Frogmore Bigarreau, and Governor Wood. The Plum Trees, too, were carrying very heavy crops, particularly Blue Rock, Golden Transparent, and Curlew. No less good were the Peach and Nectarine trees. The latter were represented by the varieties Cardinal and Victoria, and the former by the two new varieties, Duke of York and Prince Edward, both of which are handsome Peaches, and Princess of Wales, which was unusually good, the fruits being of great size. Gold medal.

Messrs. George Bonyard and Co., Maidstone, exhibited a miscellaneous display of fruit trees in pots, dishes of fruit, and shrubs and hardy plants. The pot cherries were bearing good crops of fruit for the size of the trees, and the dishes of Cherries were of excellent quality. They included the varieties Early Rivers', Governor Wood, Frogmore Early Bigarreau, Early Lyons, Purple Guigne, Elton, Guigne d'Amour, Bigarreau de Schrecken, Belle d'Orléans, &c. Many well-flowered Rhododendrons and a great variety of hardy flowers were arranged at the back of and around Messrs. Bonyard's exhibit of fruit. Silver cup.

Mr. S. Mortimer, Rowledge, Farnham, showed a representative collection of Tomatoes, Melons, and Cucumbers in numerous varieties; Cucumber British King, which obtained an award of merit at the recent Temple show, was included. Of Melons there were Ne Plus Ultra, Excellent, The Queen (Royal Favourite x Hero of Lockinge), Progress, Advancer, and others. The extensive collection of Tomatoes included Peachblow, Hipper I., Holmes' Supreme, Sutton's Peerless, Winter Beauty, Duke of York, Abundance (red), Golden Perfection, Sutton's Sunbeam, and Golden Queen (yellow). Silver-gilt Knightian medal.

#### STOVE AND GREENHOUSE PLANTS.

Tuberous-rooted Begonias were splendidly shown by Messrs. B. R. Davis and Sons, Yeovil, Somerset. Both single and double forms were represented, but the handsome double flowers largely predominated. Some of the best double flowers were The Sirdar, crimson; Mrs. Seddon, rose-pink, with white centre; H. J. Jones, The King, General French, St. George, Ben Davis, Pandora, and Hawk. A good single is Jupiter. The flowers in most instances were borne on stout erect footstalks, and the quality generally of a high order of merit. A gold medal was worthily given. We congratulate Messrs. Davis.

From Mr. H. J. Jones, Ryecroft Nursery, Lewisham, S.E., there came a series of groups. Zonal and Ivy-leaved Pelargoniums were freely staged, as were also show and fancy forms in a cut state. These were freely interspersed with Spiracras in variety, and the effect further enhanced by the addition of Ferns, Bamboos, and Palms. Among the Ivy-leaved Pelargoniums, Mrs. Martin, H.M. the King, and Leopard were conspicuous. In the second tent Mr. Jones' group embraced a charming assortment of tuberous Begonias, both double and single forms being represented, while of the show, fancy, and decorative Pelargoniums, with which he has so long been identified, he had some capital plants. Silver Banksian medal.

Messrs. Wood and Son, Wood Green, N., had an exhibit of their new suspending baskets. It was an exhibit to interest every lover of decorations.

A very bright and attractive feature was the display of Mr. H. B. May, Dyson Lane Nurseries, Edmonton. This was large and of a high order of merit. Pelargoniums, both zonal and Ivy forms, were seen represented by well-grown plants of the better-known sorts. This group was supplemented by another smaller one of Ferus, Crotons, and other choice foliage plants, and these were beautifully fresh and clean. Silver-gilt Flora medal.

Messrs. Fisher, Son, and Sibrey, Limited, Handsworth, Sheffield, had a beautiful exhibit. This embraced a large and magnificent group of stove and greenhouse plants, for which this well-known North country firm is famous. The individual plants were remarkable for their freshness and good all-round quality, both form and colour being of a high order of merit. The group was arranged in front in a series of bays, and the plants pleasingly disposed throughout. There were Crotons in variety, each well coloured; Anthuriums, also diverse; Aralias in elegant and graceful forms, and stately Palms, which added considerably to the general effect. Freely interspersed among the foliage plants was a splendid assortment of Orchids, *Cattleya gigas*, *C. Mossiae*, &c., these alone were worthy of inspection, and there were also Cypripediums in varying forms, and *Laelia grandis tenebrosa* in excellent condition. In this group Croton Reidii was very fine. Silver cup.

Mr. James Cypher, Cheltenham, in his charming display, showed an immense quantity of choice plants, and it was somewhat difficult to appreciate the wealth of material available. There were clumps of Asparagus, Ferns, and Orchids, each making an effective display, and Palms, Pandanus, and Aralias were freely disposed. In the ground-work, Heaths, Ferns, and Orchids were everywhere in evidence, lending enchantment to the display. At the back of the group was a large arch, with Ferns and other foliage plants, together with Fuchsias charmingly overhanging, and this was surmounted by a large Palm, giving a good effect to this group. Gold medal.

Another handsome group was set up by Messrs. J. Hill and Sons, Barrowden Nurseries, and this embraced Ferns and other allied plants. Individual plants in this superb display had much to commend them, some magnificent specimens standing out conspicuously. *Leucostegia immersa* was very fine. *Adiantum Farleyense* and *A. macrophyllum* were each well represented, and distinctly charming was a fine specimen of *Adiantum trinquetum*, *Pteris longifolia*, and *P. Mariesii* were among the best of these plants, and one of the most pleasing. *Davallia* was *D. fijensis plumosa*, *Polyodium appendiculatum*, *Gymnocladium Alstoni*, and a fine *Blechnum brasiliense*; each call for special notice. Specially noteworthy also was a grand specimen of *Cibotium Schiedei*. Silver cup.

Retarded Lily of the Valley were beautifully shown by Mr.

W. Iceton, Putney Park Lane, Putney, S.W. This was a very fine sample of these fragrant flowers, the spikes of blossom being strong and sturdy, and the bells large. The group was backed by *Liliums*, *Hydrangea paniculata*, *Acer*s, and *Palms*. Silver Banksian medal.

Mr. Martin R. Smith, Hayes Common (gardener, Mr. C. Blick), had a magnificent group of Carnations, and in this instance the Malmaison type largely predominated. The flowers were remarkable for their size and substance, and the colours were pleasingly diverse. Healthy and vigorous growth characterised the plants, the group charming everyone who saw it. A fine mass of a yellow sort named *Cecilia* was the most conspicuous, chiefly on account of its size and lovely yellow colour. There were also *Yellow Gal*, *Lord Rosebery*, *King Oscar*, *Lady Rose*, *Miss Maud Sullivan*, *Calypso*, and a very chaste sort *Nautilus*. Gold medal.

The Cannas, from Messrs. H. Cannell and Sons, made one of the most gorgeous displays of colour in the whole of the show. The fine display made by this firm at the Temple show was quite equalled on this occasion, and, having more space for the display, the brilliancy of the general effect was most striking. The plants were remarkable for their large flowers, big trusses, and their rich and gorgeous colouring. *Elizabeth Ross* is undoubtedly the best of the spotted sorts, standing out above all others. Splendid self-coloured sorts were also freely exhibited. Sorts deserving notice are Mrs. G. A. Strohlein, rich deep crimson, Duke Ernst, J. Aymard, Hans Werdmuller, and R. F. Hohenlohe. Silver cup.

An interesting exhibit of tufted Begonias was made by Messrs. John Peed and Son, West Norwood, S.E. A large square group of beautifully fresh and healthy plants, containing double flowers chiefly, made an attractive display. The plants were well-arranged and the general effect very pleasing. Silver Flora medal.

Messrs. William Cutbush and Son, Highgate, again excelled. In this instance their group occupied the corner of one of the large tents, and was arranged in triangular form. This huge group of flowering and foliage plants was another of the special features of the show, and well merited the gold medal awarded it. Two large conical groups of Carnations, one of border sorts, and the other of the Malmaison type, occupied prominent positions on either corner, and made an imposing display. Disposed here and there were other smaller conical groups, each containing Carnations and other plants. One of the larger groups contained no less than 300 plants of the lovely yellow Carnation *Cecilia*. The new border Carnation of rich and bright colour, *Herbert J. Cutbush*, was well represented. Groups of *Latania*, *Barnet Bronze* and *L. Barnet Yellow* were conspicuous for their effective display. A very handsome group of *Verbena* Miss *Willmott* also deserves special notice. Among the other good things to be seen in this striking group were colonies of *Erica hybrida* and *E. Cavendishi*, *Kalosanthus coccinea*, and *Calla elliotiana*. At the rear of the group Bamboos and *Palms* with other foliage plants made a pleasing finish.

In the centre of the first tent Messrs. J. Carter and Co., High Holborn, had a handsome group of well-grown *Gloxinias*, interspersed with *Caladium argyrites*, and edged with *Isolepis gracilis*. The flowers were varied in their markings and colour, and the plants were in first-rate condition. At the rear of the group a capital lot of retarded Lily of the Valley assisted to make this a charming display. Silver cup.

From Messrs. Hugh Low and Co., Bush Hill Park, Enfield, a beautiful group of miscellaneous stove and greenhouse plants had much in it to admire, *Palms*, *Pandanus*, *Crotos*, &c., being in charming variety. *Anthuriums*, *Ixoras*, and kindred subjects each contributed to make an interesting display.

A superb group, and exceedingly well-arranged, was set up by Messrs. James Veitch and Sons, Limited, Chelsea, S.W. Occupying one end of the centre of the groups in the first tent, ample opportunity was given to make an effective display.

Messrs. Sutton and Sons, Reading, displayed a collection of *Gloxinias* in quite a novel manner. The plants, many of which were bearing a large number of splendid flowers, were prettily arranged as a square mound, Maidenhair Fern making a groundwork, and a Palm surmounting the centre. The exhibit was covered with a large glass case that served effectively to preserve the plants from dust and wind, with the result that the flowers looked quite as fresh at the close of the exhibition as at the opening. Some of the best varieties included Sutton's Reading Scarlet, Duchess of York, Sutton's Giant, Empress, Sutton's Spotted Hybrids, Her Majesty, Violet Queen, and Duke of York, all of distinct and brilliant colouring. Silver-gilt Flora medal.

#### ROSES.

For a group of Roses placed on the ground in a space not exceeding 400 square feet, the first prize, a gold medal and £10 silver cup, was awarded to Mr. Charles Turner, Slough, who had an admirable group, in which the forms of *R. wichuriana* were largely seen. Of these we noted *Auguste Barbier*, pink; *Alberic Barbier*, white; and *R. André*. In addition were such as *Psyche*, *Crimson Rambler*, *Queen Alexandra*, *Aglia*, *Yellow Rambler*, and the *Dawson Rambler*. A group of *Polyantha* kinds also formed a feature.

The gold medal was also awarded to Messrs. Paul and Son, who took second place in this class with a delightful series of Roses. In this lot we noticed hybrid Briar Una, *R. sinica* Anemone, delicate rose; the new weeping rugosa alba, for which there should be many openings, and which alone received a gold medal on the opening day of the conference. Other good things were *Lady Battersea*, *Leuchster*, the new *Tea Rambler*, said to be obtained from a seedling *Tea* and *Crimson Rambler*, together with many more all beautiful in their way.

As was naturally expected the Roses were neither so fine nor so numerous as would have been the case with more congenial weather preceding the show. Notwithstanding, there were many good and showy flowers, and most of the classes had competitors for the prizes.

#### AMATEURS.

For twenty-four single blooms, distinct, A. Hill Gray, Esq.,

MESSRS. HUGH LOW AND CO.'S GROUP AT THE HOLLAND PARK SHOW.

Bath, was awarded the silver cup, no other competitor appearing on the scene.

For twelve single blooms the first prize went to the Rev. F. R. Burnside, Rochford, Essex, the only exhibitor.

For six single blooms there were some half dozen entries; the first prize lot coming from T. B. Gabriel, Esq., Woking; the second prize went to R. W. Bowyer, Esq., Hertford.

For six single blooms of any one variety Messrs. F. Cant and Co. took the gold medal for the new *Lady Roberts*.

#### OPEN CLASSES.

For forty-eight blooms, distinct, class 7, there were two competitors, the first prize going to Messrs. F. Cant and Co., Colchester; Messrs. Prior and Sons were second.

For twenty-four single blooms, class 8, Mr. George Prince was first, Messrs. R. Harkness and Co. were second.

#### TEAS AND NOISETTES.

For eighteen single blooms, class 9, only one competitor arrived, viz., A. Hill Gray, Esq., Bath, and was placed first.

For twelve single blooms, class 10, T. B. Gabriel, Esq., Woking, was first.

For six single blooms, class 17, the second prize was awarded to Mr. R. W. Bowyer.

For six singles of one variety, class 12, A. Hill Gray, Esq., was first, with Marie Van Houtte.

For eighteen single blooms, class 13, Mr. G. Prince was first, having *Mme. Cochet*, *Rubens*, *The Bride*, *Amazon*, *Jean Ducher*, &c.; second, Messrs. Prior and Sons.

For thirty-six bunches garden Roses, class 14, Messrs. Frank Cant and Co. came first; Mr. George Cooling, Bath, took second place.

For eighteen bunches, not less than twelve varieties, class 15, Mr. O. G. Orpen, Colchester, was first.

For nine bunches, not less than three trusses of each, *Rugosa* varieties, class 16, Messrs. Cooling, Bath, were first; Messrs. Paul and Sons, Cheshunt, being second.

For nine bunches, Sweet Briar hybrids, &c., class 18, Messrs. B. R. Cant and Co. were first.

For twelve bunches, single Roses, class 16, Messrs. B. R. Cant were again first; Mr. George Cooling was second.

For nine bunches, *Chinas* and other hybrids, class 20, Mr. F. Cant was first, with Irene, China, and Queen Mab.

For collection of species, class 22, Messrs. Paul and Son, Cheshunt, were first, having *Rosa hemispherica*, *Alberti*, *Iteola*, *ferruginea*, and *multiflora*.

For a bowl or vase of Roses for effect, class 24, O. G. Orpen, Esq., was first; Miss Beatrice Langton was second. There were six competitors.

#### LUNCH TO THE COMMITTEES.

The council of the Royal Horticultural Society have a very sensible annual custom of inviting the various committees to luncheon once a year. An opportunity was taken on the first day of the show for this purpose, and we think the attendance must have been a record one. The chair, in the absence of Sir Trevor Lawrence, Bart., was taken by the treasurer of the society, Mr. J. Gurney Fowler, who referred to the hall and other matters of interest to Fellows. The toast of the committees and the judges was given, and Mr. George Paul responded.

#### THE ROSE CONFERENCE.

This was held in the course of the afternoon, and opened by the Dean of Rochester (Dr. Reynolds Hole), who, in spite of his advanced age, looked in splendid health. Needless to say, the Dean received a hearty welcome. There was a long list of papers to be read, which will be published in the Journal. Mr. Baker, F.R.S., described two new Roses from the South-West United States, one *Rosa stellata* and the other the Californian *R. minutifolia*. The Rev. J. H.

Pemberton read an excellent paper, which we hope to publish, on "Hybrid Teas," and this was followed by Mr. Alex. Dickson, of Newtowndale, upon the same subject, very interesting and important contributions to the literature of Hybrid Teas. Then Mr. Edward Mawley read a paper on "Sensitivity of Cultivated Roses to Changes of Weather." Mr. George Mount spoke of "The Cultivation of Roses Under Glass."

A conference, as far as attending it goes, is not a success in summer. It is not always possible to hear what is said, and only a few of the papers promised were read. Without the Journal such a conference would become a farce, evidence if it were necessary of the great value of the society's publication.

The sad news of the morning was referred to by the Dean, and a vote of sympathy passed to Her Majesty the Queen. It is needless to say the King's illness cast a gloom over the whole proceedings.

#### NEW PLANTS.

A first-class certificate was granted to:—

*Asparagus myriocladius*, a distinct species, in which the dense growth is of an intense dark green. The pseudo-leaves in this kind form themselves into almost rounded masses or groups, particularly in the first formed, or lower, branches. It is possible there may be some greater elongation in the stronger growths that will lead generally to a lighter and more elegant bearing. Shown by Mr. R. Greenfield, jun., Bath Street, Leamington Spa.

The award of merit was given to:—

*Iris Sunshine*, flag Iris, intermediate in colour between *Heroine* and *Aurea*, the falls being of a pale creamy shade, and the standards yellow. From Mr. G. Yeld, Clifton Cottage, York.

*Rhododendron Lady Clementine Walsh*. — A delightful Rhododendron with fine trusses of flowers of a soft rose-pink and white. The variety is very free flowering. Shown by Messrs. John Waterer and Sons, Bagshot.

*Iris orientalis Snow Queen*. — This is the first white-flowered Iris of this section, and as such promises with all the freedom and grace of the species to become a good garden plant. Quite an acquisition. Shown by Messrs. Barr and Sons, Covent Garden, W.C.

*Begonia Masterpiece*, a magnificent crimson self and double Begonia. The flowers are of great size, and the petals well proportioned.

*Begonia Miss Dorothy Hardwick*, a very beautiful flower of soft or delicate pink hue. The handsome proportions of the flowers are quite a feature.

*Begonia Professor Lanciana*, a fine orange salmon kind. Very double and full, and excellent in every way. This fine trio of double Begonias was shown by Messrs. Blackmore and Langdon, Bath.

*Sparaxis Fire King*. — A better name for this kind would perhaps be S. tricolor, for the brilliant blossoms are crimson, black, and gold, a veritable trio of colours, and a remarkable combination in any one plant. Two fine pans of it were well shown by Messrs. Wallace and Co., Colchester.

#### NATIONAL ROSE SOCIETY.

##### OPENED BY THE DEAN OF ROCHESTER

THIS great metropolitan exhibition of the society was held on Wednesday last in the Inner Temple Gardens. The day was pleasantly cool, the flowers remained fresh until the evening, and the effect in the tents of the garden Roses (which were very beautiful) was charming. The Dean of Rochester opened the show, and in doing so said forty-four years had elapsed since he opened the first Rose show, and remarked how great had been the development of the Rose, and the great work that had been accomplished by the

National Rose Society. The Dean was not forgetful of the grand work accomplished by the Rev. H. Denbrae and Mr. E. Mawley.

As we have mentioned elsewhere the exhibition was not so fine as it would have been in a more favourable season, but it was a surprisingly fresh and interesting display. Exhibits that secured a third or even second prize would in a great Rose year have been passed by.

The garden Roses were superb. Messrs. Paul and Sons contributing delightful exhibits. The champion trophy was won by Messrs. Frank Cant, Braiswick Nursery, Colchester, with remarkably fresh flowers, and this exhibit contained the silver medal Hybrid Tea, a bloom of Mildred Grant, with wonderful petals and tender colouring, and the silver medal H. P. Rose, which was Mrs. John Laing.

Mr. O. G. Orpen, West Bergholt, was a successful amateur. His champion trophy Roses contained the three medal blooms. The best Tea was Maman Cochet, Hybrid Tea Bessie Brown, and Hybrid Perpetual Mrs. John Laing.

Mr. George Prince's exhibition Roses in vases suggest possibilities in the future. It was a beautiful exhibit, especially the flowers of Comtesse de Nadaillac. Boxes seemed dreary after these exhibits in vases.

Mrs. H. E. Molonyen's first prize vase (Munstead glass) of the Killarney Rose was quite a feature of the show.

Of new Roses unquestionably the most beautiful was Messrs. Frank Cant and Co.'s Lady Roberts, which has been described on a previous occasion; Souv. de Pierre Notting was also a lovely variety, orange, yellow, and soft rose, from Mr. George Prince.

#### NON-COMPETITIVE EXHIBITS.

Messrs. W. Spooner and Co., Arthur's Bridge Nursery, Woking, showed a very pretty lot of cut Roses, arranged in Bamboo stands and in boxes. The flowers were fresh and of excellent form, though not large. Some of the best of the bunches were Fisher Holmes, Francisca Kruzer, Marie Van Houtte, The Bride, and Mrs. W. J. Grant; and in the boxes Kaiserin Augusta Victoria, White Maman Cochet, and others were good.

Messrs. George Jackman and Son, Woking Nursery, Surrey, exhibited a very bright bank of cut Roses, as well as a number of blooms in boxes. Those in vases were closely bunched, Gypsophila being placed between them, and they included such lovely things as Amy Robsart, L'ideal, Mme. Fauchet, Ma Capucine, Euphrosyne, Penzance Briars, Carmine Pillar, Eugenie Lamesch, &c. There were good blooms of La France, Mrs. W. J. Grant, François Michelon, Maman Cochet, &c., in the boxes.

Messrs. George Bunyard and Co., Maidstone, displayed a group of bunched Roses in vases and boxes. Included were some very pretty Polyantha varieties, Paquerette, Gloire des Polyanthas, Aglaia, Mignonette, &c. The singles comprised Amy Robsart, Mere Merriles, Leuchstern, Macrantha, and Andersonia, and there were numerous other well-known varieties represented.

Messrs. James Veitch and Sons, Limited, Chelsea, showed large bunches of their Rose Queen Alexandra, a very free-flowering variety, the result of a cross between Rosa multiflora simplex and Crimson Rambler. Their beautiful Rose Electra was also well shown.

Messrs. Layton Brothers, Strawberry specialists, Bedford, exhibited a display of fruits of their new Strawberry, The Layton (Royal Sovereign x Sir J. Paxton). This Strawberry is of good size, squarely conical, and of a bright red colour.

The original plant of the Farquhar Rose (the result of a series of crosses between Rosa chinensis and the Crimson Rambler, made by Mr. Jackson Dawson), was shown by Messrs. R. and J. Farquhar and Co., South Market Street, Boston, Mass., U.S.A. The double flowers are of a lovely pink colour, and are borne in dense clusters.

#### OPEN CLASSES. DECORATIVE ROSES.

For nine distinct varieties of Roses suitable for button-holes the first prize was awarded to Mr. John Mattock, New Headington, Oxford, for a charming lot; Mr. Alfred Evans, Marston, Oxford, was second with less refined flowers; and Mr. George Mount, Canterbury, was third.

For twelve distinct varieties of single-flowered Roses Mr. George Prince, Longworth, Berks, won the first prize with an exhibit that included some charming bunches of flowers in many beautiful colours; Messrs. George Cooling and Sons, Bath, were second with hardly so good a selection; and Messrs. Paul and Son, Cheshunt, were third.

In the class for designs or devices to illustrate the decorative value of the Rose (nurserymen and florists) the second prize was given to Messrs. Paul and Son, Cheshunt, whose flowers were arranged in vases of varying sizes, making a pretty though somewhat crowded table; Mr. Geo. Mount, Canterbury, won the third prize with some splendid blooms, though not effectively arranged.

#### AMATEURS. AMATEUR CHAMPION CLASS.

In the class for thirty-six blooms, distinct varieties, E. B. Lindsell, Esq., Beartown, Hitchin, was placed first with a very bright lot of good flowers, of which the best were Ulrich Brunner, S. M. Rodocanachi, Golden Gate, White Lady, Catherine Mermet, and Lady Mary Fitzwilliam; Osmond G. Orpen, Esq., West Bergholt, Colchester, was second, his blooms of the pink shades being very fine, notably Mrs. John Laing, La France, Mrs. W. J. Grant, Marchioness of Downshire, &c. No less than three silver medals were awarded to blooms in this exhibit as being the best in their respective classes. The third prize was given to the Rev. J. H. Pemberton, Havering-atte-Bower, Essex.

For twenty-four blooms, distinct varieties, R. E. Dean, Esq., Firth Dene, Wray Park, Reigate, was first with well-formed flowers, some of the best being La France, La France No. 2, Marquise Litta, and Captain Hayward; Alfred Tate, Esq., Downside, Leatherhead, was second, the best flowers being Captain Hayward (very fine), Bessie Brown, and Maman Cochet.

For a similar exhibit, open to all amateurs (the previous

class is conditional), Osmond G. Orpen, Esq., West Bergholt, Colchester, won the first prize with small, though well-formed blooms, of which Souv. de S. A. Prince, Catherine Mermet, and Mrs. John Laing were splendid. Rev. J. H. Pemberton was second, including some good blooms of Bessie Brown, Mrs. W. J. Grant, Comtesse de Nadaillac, and La France.

For twelve distinct varieties, three blooms of each, E. B. Lindsell, Esq., was first, and the only exhibitor. Miss Haywood, Woodbatch Lodge, Reigate, was first for twelve blooms of any Rose, except Tea or Noisette, with good examples of Mrs. S. Crawford; Rev. J. H. Pemberton was second, showing Bessie Brown.

#### Open only to growers of less than 1,000 plants.

For twenty-four blooms, distinct, E. M. Bethune, Esq., Denme Park, Horsham, was first, with an excellent lot that comprised Mrs. Sharman Crawford, M. S. Rodocanachi, Caroline Testout, Duke of Teck, and White Maman Cochet. F. Wellesley, Esq., Westfield, Woking, was second, Maman Cochet, Muriel Grahame, and Cleopatra being perhaps the best; W. Colin Remaine, Esq., Old Windsor, won the third prize.

For eight distinct varieties, three blooms of each, Edward Mawley, Esq., Berkhamsted, was first, showing some splendid blooms of Mrs. W. J. Grant, La France, and Mrs. E. Mawley; E. M. Bethune, Esq., was second; and R. E. West, Esq., Reigate, third.

The first prize for nine blooms of any Rose, except Tea or Noisette, was won by E. M. Bethune, Esq., with Mrs. Sharman Crawford; W. C. Romaine, Esq., Old Windsor, was second, showing Crown Prince; and R. E. West, Esq., Reigate, third, with La France.

#### Open only to growers of less than 1,000 plants.

F. R. Curtis, Esq., Worpington, Colchester, won the first prize for twelve blooms, distinct varieties, with splendid flowers of Mme. Jules Grolez, La France, Marquise Litta, S. A. Prince, &c.; Thomas B. Gabriel, Esq., Elmstead, Woking, was second with smaller flowers, Mrs. Edward Mawley, Mrs. John Laing, and Caroline Testout being of the best; G. W. Cook, Esq., Wood Glen, Muswell Hill, was third.

Thomas B. Gabriel, Esq., won the first prize for six blooms of any Rose, except Tea or Noisette, with good flowers of La France; G. W. Cook, Esq., was second, showing Bessie Brown; and Rev. R. Powley, Upton Sundamore, Warminster, was third, with Kaiserin Augusta Victoria.

#### Open to growers of less than 500 plants.

R. W. Bowyer, Esq., Hertford, won for nine blooms, distinct varieties, with beautiful specimens; Mrs. L. E. Times, Bedford Road, Hitchin, being a good second; and G. A. Hammond, Esq., third. There were numerous other entries.

For six blooms, distinct, Charles K. Douglas, Esq., Rathmolyon, County Meath, won the first prize with excellent flowers of Bessie Brown, White Maman Cochet, &c.; R. Boswell, Esq., Hitchin, was second; and Ernest R. Smith, Esq., Melford Lodge, Muswell Hill, third.

For six blooms of any Rose, except Tea or Noisette, G. A. Hammond, Esq., Cambrian House, Burgess Hill, was first with very good blooms of Bessie Brown; R. W. Bowyer, Esq., was second with Marquise Litta; and Charles K. Douglas, Esq., third with Bessie Brown, all showing well.

In the division open only to growers of less than 200 plants, Charles Lamplough, Chatteris, Cambs., was first with good blooms in the class for six blooms, distinct; Hayard Williams, Esq., North Finchley, second; and Herbert E. Molyneux, Esq., Brantwood, Balsam, third. There were several other entries.

In an extra class for twelve blooms, distinct, G. A. Hammond, Esq., won the first prize with an excellent lot, the best being Killarney, Mrs. E. Mawley, Caroline Testout, and La France; Mr. George Moules, Hitchin, was second; and Harcourt P. Landon, Esq., Brentwood, third.

For four distinct varieties, three blooms of each, Rev. F. Page Roberts, Halstead Rectory, Sevenoaks, was first, Antoine Rivoire and S. de S. A. Prince being the best; Ernest Wilkins, Esq., Rosedale, Sidcup, was a good second; and Rev. R. Powley, Warminster, a close third. The other entries were quite numerous.

#### EXTRA CLASSES FOR AMATEURS.

The first prize for twelve blooms, distinct, was won by A. Hill Gray, Esq., Newbridge, Bath, with some lovely flowers, Golden Gate, Souv. d'Elise Vardon, Maman Cochet, Medea, and others were excellent; Rev. J. H. Pemberton was second, showing some good flowers also, notably Comtesse de Nadaillac, John Laing, and Bessie Brown; E. M. Bethune, Esq., was third, and also showed good blooms. This class was well contested.

For six blooms, distinct, Charles K. Douglas, Esq., Rathmolyon, was first with very good specimens of Earl of Dufferin, Catherine Mermet, Ulrich Brunner, &c.; Claude Magniac, Esq., Esher, was second with Mrs. Edward Mawley and Marquise Litta splendid; Lewis S. Pawle, Esq., Rowsham, Harrow, was third.

Joseph Wakeley, Esq., Moor Street House, Rainham, was first for six blooms in not less than four varieties, with some well-formed examples; Miss Lillyett, The Copse, Reigate, was a good second; and Mrs. Du Buisson, West Clandon, Guildford, was third.

#### NURSERYMEN.

The champion trophy class of seventy-two distinct varieties brought five competitors into the field, and the coveted award, after great consideration on the part of the judges, fell to Messrs. F. Cant and Co., Colchester, who staged a remarkably fine display for the season. The most noticeable flowers were Mrs. J. Laing (grand), Lady Mary Fitzwilliam, Jr. Audrey, Margaret Dickson, Maréchal Niel, Rev. Allan Charles, Papa Lambert, Mrs. F. Cant, Mme. de Watteville, Ulster, White Lady, Mildred Grant, Victoria Hugo, Ulrich Brunner, S. M. Rodocanachi, Souv. de S. A. Prince, Comte de Paris, Bridesmaid, and Caroline Testout. Messrs. B. R. Cant and Sons, Colchester, were placed second with a beautifully bright and fresh

display, though taken as a whole they were somewhat weaker than the prize-winning blooms. The best varieties noted were Papa Lambert, Mrs. W. J. Grant, Ulrich Brunner, Cleopatra, Ulster, Fisher Holmes, Duchesse de Morny, Mildred Grant, Golden Gate, Dupuy Jamain, Mrs. Cocker, Medea, and Marquise Litta. Messrs. D. Prior and Son, Colchester, were third.

For forty varieties, three blooms each, distinct, in keen competition Messrs. Alex. Dickson and Sons, Limited, Newtonards, came out first. The best varieties were Bessie Brown, Comtesse de Nadaillac, Duchess of Portland, La France, Lady Ashton, Medea, Horace Vernet, White Lady, Mildred Grant, Countess of Caledon, Ulster, Mrs. W. J. Grant, Mrs. E. Mawley, Lady Clarendon, Alice Lindsell, and Lady Mary Fitzwilliam. The second position fell to Messrs. B. R. Cant and Sons, Colchester. Amongst the best varieties were Helen Keller, Mrs. Sharman Crawford, Cleopatra, Caroline Testout, Ulrich Brunner, Mrs. J. Laing, Rev. Allan Cheales, Medea, Mrs. W. J. Grant, and Kaiserin Augusta Victoria; while Messrs. F. Cant and Co., Colchester, were third. There were three competitors.

For forty-eight blooms, distinct, there were five competitors. Unfortunately, Mr. Geo. Prince sustained disqualification. The first prize was ultimately awarded to Mr. Hugh Dickson, Belfast, for an excellent exhibit. His best varieties were Rev. Allan Cheales, Mme. Jules Grolez, Caroline Testout, White Lady, Mrs. W. J. Grant, Marchioness of Downshire, Captain Hayward, Mme. Hoste, Jeannie Dickson, and Ulster. Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, were placed second for a good level display, the most conspicuous kinds being Gladys Harkness, Souvenir d'un Ami, Marie Baumann, Killarney, Maman Cochet, and Marquise Litta. Messrs. R. Harkness and Co., Hitchin, were third.

For twenty-four blooms, distinct, there were five entries, and Mr. J. Mattock, New Headington, Oxford, secured the first prize, the best blooms being White Maman Cochet, Captain Hayward, Catherine Mermet, Muriel Grahame, Medea, and Caroline Testout. Mr. Geo. Mount, Canterbury, was second with typical blooms of Caroline Testout, Mrs. Sharman Crawford, Mrs. W. J. Grant, General Jacqueminot, and Clio. The third position was awarded Mr. Chas. Turner, Slough.

For twenty-four blooms, distinct, there were five entries, and Mr. Geo. Mount, Canterbury, proved the victor with a good level exhibit, the best varieties being Mrs. Sharman Crawford, Bessie Brown, Anna Olivier, Clio, Mrs. J. Laing, Prince Arthur, Ulrich Brunner, and Chas. Lefevre. Mr. Geo. Prince was second with a weaker exhibition, his best varieties being Caroline Testout, General Jacqueminot, Catherine Mermet, Captain Hayward, Mrs. E. Mawley, and Bridesmaid, and Mr. John Mattock, New Headington, was third with typical trusses of Mrs. Edward Mawley, White Maman Cochet, and Muriel Grahame.

For twenty-four Teas and Noisettes, distinct, there were three competitors, but Mr. Geo. Prince had the misfortune to be disqualified after securing a clear win, for staging two blooms of Souvenir d'Elise Vardon. The stand contained grand blooms of Comtesse de Nadaillac, Mme. de Watteville, Maman Cochet, Souvenir de S. A. Prince, Souvenir d'un Ami, and Princess of Wales, the first prize being awarded to Messrs. F. Cant and Co., whose best blooms were Etoile de Lyon. The Bride, Lady Roberts, Cleopatra, Caroline Kuster, and Bridesmaid. Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, were the premier award, the most prominent varieties were White Maman Cochet, Ernest Metz, Comtesse de Nadaillac, Cleopatra, The Bride, Bridesmaid, and Maman Cochet; Mr. J. Mattock, Oxford, followed, with good flowers of white Maman Cochet, Mrs. E. Mawley, Cleopatra, and Bridesmaid. Messrs. D. Prior and Son, Colchester, were second, having good blooms of Maréchal Niel, Souvenir de S. A. Prince, Catherine Mermet, and Souvenir d'un Ami.

For twelve blooms, distinct, there were only three entries, and Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, secured the premier award. The most prominent varieties were White Maman Cochet, Ernest Metz, Comtesse de Nadaillac, Cleopatra, The Bride, Bridesmaid, and Maman Cochet; Mr. J. Mattock, Oxford, followed, with good flowers of white Maman Cochet, Mrs. E. Mawley, Cleopatra, and Bridesmaid. Messrs. D. Prior and Son, Colchester, were second, having good blooms of Maréchal Niel, Souvenir de S. A. Prince, Catherine Mermet, and Souvenir d'un Ami.

For twelve blooms, distinct, there were only three entries, and Mr. J. Mattock, New Headington, Oxford, secured the premier award. The most prominent varieties were White Maman Cochet, Ernest Metz, Comtesse de Nadaillac, Cleopatra, The Bride, Bridesmaid, and Maman Cochet; Mr. J. Mattock, New Headington, was third with typical trusses of Mrs. Edward Mawley, White Maman Cochet, and Muriel Grahame.

The class for sixteen trebles only produced two entries, but both were good. Mr. George Prince gained the first prize with a good level board, the most notable varieties being Souvenir d'un Ami, Medea, Bridesmaid, Maman Cochet, The Bride, Cleopatra, Comtesse de Nadaillac, Mme. de Watteville, Prince Arthur, Ulrich Brunner, and Chas. Lefevre. Mr. George Prince was second failing to Messrs. D. Prior and Son, Colchester, who had typical blooms of The Bride, Maréchal Niel, Rubens, Caroline Kuster, and Souvenir de S. A. Prince.

The vase classes not only appeared popular with the exhibitors, but equally so with the general public, and in the class for twelve varieties of seven blooms each there were six entries, Mr. George Prince being placed in the front rank with a glorious exhibit; the best varieties were The Bride, Comtesse de Nadaillac, Medea, The Bride, Bridesmaid, and Maman Cochet; Mr. J. Mattock, Oxford, followed, with good flowers of white Maman Cochet, Mrs. E. Mawley, Cleopatra, and Bridesmaid. There were four competitors in the class for Garden or Decorative Roses, represented by thirty-six distinct varieties, and although one would expect to find more competitors in this class, no fault could be found with the quality of the exhibits. The first prize was awarded to Messrs. F. Cant and Co., who arranged some fine bunches of Aglaia, Claire Jacquier, Hebe's Lip, Gustave Regis, Mignonette, Rainbow, and Canoës; Messrs. G. Cooling and Sons, Bath, were second with good examples of Dr. Rogers, Papa Gontier, Princesse de Monaco, Shirley Highberd, Irene Watts, and Mme. Pernet Ducher; Mr. J. Mattock was third.

"The Garden," July 5th, 1902.

# THE GARDEN

No. 1599.—VOL. LXII.]

[JULY 12, 1902]

## A NEW WAY OF SHOWING EXHIBITION ROSES.

**A**N exhibition of surprising beauty and general excellence, although many a winning stand of flowers would have taken a different place in a better Rose exhibition year, filled the tents in the Inner Temple Gardens, kindly lent by the Benchers for the day to the National Rose Society. Exhibitions vary little from year to year as far as outward appearances go, but on this occasion one class in particular gained the approval, not merely of the general public, but of the ardent exhibitor, who we have been led to believe steadfastly pursues the same path as his forefathers, and regards any divergence from set rules as a sin against all that the "florist" has held most precious since the days when Rose exhibitions added a new jy to the pleasures of English gardening.

The class we mean was that for twelve varieties of seven blooms each to be shown in vases. There were six entries, and the display formed quite a feature of the show, the winning flowers of Mr. George Prince showing how beautiful the Rose is when so arranged that the delicate shading on the petals and natural pose of the flower are as perfect as on the bush in the garden. All this natural beauty is lost when the flowers are set out with mathematical regularity on a green painted box.

We regard the Rose exhibition as possessing an immense influence for good in furthering a wholesome desire to produce individual flowers of a high degree of excellence, but there is no reason why the National Rose Society, which may be regarded as a leader in such matters, should not develop the vase class now that such a welcome innovation has charmed not merely the visitor but the keen exhibitor, who lingered over the superb flowers in vases and declared that exhibition Rosesshown in this way were more pleasurable than those in the boxes.

The complexion of the English garden is changing for the better, and the maker of show schedules, who is not forgetful of the change, is wise.

## THE HORTICULTURAL HALL APPEAL.

THE following letter has been addressed by Sir Trevor Lawrence, M.P., President of the Royal Horticultural Society, to every Fellow of the Society, and it remains for those who wish for the hall and offices to add their names to the subjoined list. We hope the requisite

sum will be quickly obtained without touching the reserve fund of the society.

"At a special general meeting of the Royal Horticultural Society, held on March 21, and largely attended, it was resolved to adopt a proposal to build, on a site facing Vincent Square, Westminster, a horticultural hall and offices in commemoration of the centenary of the society in 1904.

"The Society has no home—a want of such national importance that, as long ago as 1890, His Majesty the King addressed to the Society the following words: 'I sincerely hope that your labours to obtain a hall may be successful, for I feel sure that it would be of the greatest use and advantage.' Since 1890 the necessity for increased and better accommodation has become more and more obvious. The Drill Hall is badly lighted, and it is frequently impossible to find room for the plants sent, while the valuable work of the committees is carried on under great difficulties and constant interruption. During the afternoon the hall is often so crowded that circulation becomes impossible and so noisy that the lecture is inaudible. The limited office accommodation, which cannot be increased here, is a serious impediment to the proper discharge of secretarial and other work."

"The present position of the society fully justifies the adoption of the proposal. It has now 6,000 Fellows on its roll, and large numbers are continually joining it. The financial position is satisfactory. But even more important is the high credit enjoyed by the society among horticulturists of every class. At home or abroad it is the recognised head of British horticulture, and many of the most distinguished scientific and practical horticulturists in the kingdom serve on its committees and contribute to its Journal.

"The proposed buildings will involve, it is believed, an expenditure of from £25,000 to £30,000, towards which unsolicited promises have been made already of nearly £10,000.

"May I add your name to the letter to be circulated among the Fellows as approving of the proposed hall and offices.

"TREVOR LAWRENCE, President."

## EDITOR'S TABLE.

### ARMERIA ALBA SUPERBA.

Dr. Mules sends us a few flowers of this handsome white Thrift. The stalks are fully 14 inches high, and the flower heads surmounting them are large and pure white.

### CARNATIONS FROM DAWLISH.

Mr. Weguelin sends from his nursery at Dawlish three superb varieties. One is named Mrs. Weguelin; it is a tree variety, with very large, but not coarse flowers, broad in the petal, soft apricot-buff, and sweetly scented. It has one great virtue, the calyx does not split; the colour is quite distinct and very charming. Mr. Weguelin also sends a flower of the parent, Duchess Consuelo, a beautiful pure yellow, with broad, firm petals. Another novelty from Mr. Weguelin is Pretoria; the flower is of immense size, and the broad petals have cut edges, whilst the colour is a self bright crimson.

### FLOWERS FROM REDRUTH.

A delightful boxful of flowers comes from Messrs. V. N. Gauntlett and Co., of Redruth. The following Mock Oranges or Philadelphuses were very beautiful:—

### PHILADELPHUS MANTEAU D'HERMINE.

This is one of the most beautiful hybrids we have seen. It is of quite erect growth, and the stems are lined with pure white semi-double flowers, faintly fragrant, and produced so freely that the shoot is simply a mass of bloom. A bed of it must be very beautiful. The other Philadelphus sent by Messrs. Gauntlett is named Monstera. This is not a pretty name, but given, we presume, because of the large size of the flowers, which were larger than those of P. grandiflorus, very richly scented, and inclined to quite a cup-like shape, whilst they are creamy white. These hybrid Philadelphuses are amongst the most welcome of all flowering shrubs, the two named in particular.

### BUDDELEIA VARIABILIS.

This is one of the most interesting shrubs sent. It is very beautiful with its graceful arching flower clustered shoot and lilac colouring. It is not a shrub for every garden, but where the soil is warm and the position not too exposed it is quite happy.

### SOLANUM CRISPUM.

Several flowering shoots were sent of this Chilian

shrub, the Potato Tree of Chili. It is a plant for southern gardens rather than those in the midland and north, but where it cannot be trusted in the open ground it is sufficiently interesting to plant against a wall. It will grow to a height of 16 feet, and has clusters of purplish flowers, with conspicuous bright yellow stamens.

#### ESCALLONIA EXONIENSIS.

This is a pretty shrub. It has a wealth of fresh green leaves, and clusters of white pink tinted flowers, which simply smothered the whole plant. Besides these Messrs. Gauntlett sent that excellent *Olearia* (*O. macrodonta*), *Colutea melanocalyx*, and *Deutzia crenata* fl. pl.

#### LEMOINE'S PHILADELPHUSES FROM DUBLIN.

Mr. Greenwood Pim sends from Easton Lodge, Monkstown, County Dublin, sprays of some of Lemoine's dwarf Philadelphuses, with this note : "I enclose a few sprays of Lemoine's dwarf Philadelphuses, which I think are most desirable shrubs for a small garden. They do not grow more than 3 feet or 4 feet high, and flower abundantly in July ; in fact, some flowering sprays of one variety are on the ground, and they are clothed to the top. I fear the double one (Boule d'Argent) is too far gone, but I have been waiting to send you, if possible, all the forms I had, including *P. microphyllus*, which I take to be the parent of most of them. I had them two or three years ago from Newry, but I imagine they are to be had in most good nurseries. They are in a sheltered border, but they seem absolutely hardy."

[A very interesting collection of flowering sprays of some of the most beautiful of the dwarf Philadelphuses or Mock Oranges. Boule d'Argent is very double, and one of the best of the whole series. As Mr. Greenwood Pim well says, they are "most desirable shrubs for a small garden." ]

#### SWEET PEAS FROM LINCOLNSHIRE.

Messrs. Gilbert and Son, Anemone Nurseries, Dyke Bourne, Lincolnshire, send a delightful series of Sweet Peas, very finely grown, and good in all ways. The selection was a most interesting one, as the following list will show : Lottie Hutchins, Queen Victoria, Fire King, a new and welcome variety, of a very striking scarlet shade ; Gorgeous, coral-pink, which we consider one of the most beautiful of all Sweet Peas ; Prima Donna, pale pink ; America, Venus, quite a soft pink shade ; Prince of Wales, Hon. F. Bouvierie, Modesty, Royal Rose, Chancellor, Navy Blue, Duke of Westminster, a very beautiful violet shade ; Othello, the lovely mauve-coloured Lady Grisel Hamilton, Black Knight, Sadie Burpee, and Modesty, white, one spray having six exceptionally large flowers.

Messrs. Veitch and Sons send us from their nursery at Coombe Wood, Kingston-on-Hill, flowering shoots of the following shrubs :—

*AZALEA VISCOSA*.—The deliciously sweet scent of this Azalea is very welcome, and the shrub is a good one for English gardens. The deep green leaves show off the whiteness of the flower clusters.

*VIBURNUM DILATATUM* AND *V. MACROCEPHALUM*.—Very handsome with their white flower heads.

*WEIGELA HORTENSIS NIVEA* AND *W. EVA RATHKE*.—The former is the best of the white, while the latter is intense crimson, a deep and telling colour. Weigelas are amongst the most useful of shrubs ; they are vigorous, last long in bloom, and are happy even in quite the suburbs of large towns.

*LONICERA SEMPERVIRENS*.—Messrs. Veitch send a very good form ; it is a Honeysuckle to establish in the garden, for its brightness and pretty tubular flower shape.

*PHILADELPHUSES*.—*P. coronarius erectus* is a good variety, the shoots erect and crowded with pure white flowers. *P. Mont Blanc* also sent is another good form.

*VERONICA NUTKANUS*.—This has pretty white flower clusters.

*CORNUS KOUSSA*.—This was one of the most

interesting shrubs sent. It is described by Professor Sargent as an uncommon species, but not confined to Japan, as it occurs also in Central China. It is a native of the mountainous parts, and is, consequently, much hardier than some other Japanese trees, and certainly harder and more suitable to our English climate than the beautiful Virginian Dogwood *Cornus florida*, with which *C. Kousa* is best compared. The flowers, or rather the involucral scales, are creamy white, and are produced in May and June, and last a long time on the tree. In Japan it grows into a bushy flat-topped tree, 18 feet to 20 feet high, with wide spreading branches.

*CELALPINIA JAPONICA*.—We were glad to be reminded of the beauty of this yellow-flowered Japanese tree.

*HEDYSARUM MULTIFLORUM*.—A Chinese shrub, very beautiful, with its greyish leaves and purple rose flowers.

*MAGNOLIA THOMPSONIANA*.—A variety of *M. glauca*. Its fragrant ivory-white flower and greyish underside of the leaves are very charming. Both flower and leaf are larger than the type.

*ESCALLONIA LANGLEYENSIS*.—A hybrid raised by Messrs. Veitch at Langley, between *E. macrantha* and *E. philippiana* ; it flowers with great freedom, and its rose-colouring is very bright.

Amongst other shrubs sent were the yellow cut-leaved Elder (*Sambucus racemosa serratifolia folius aureus*), *Ptelea trifoliata aurea*, with foliage of a good yellow colour ; the useful *Cytisus nigricans*, the Rose Acacia (*Robinia hispida*), *Kalmia glauca*, and a very sweetly-scented double rose-coloured Peony named Artemise.

## NOTES OF THE WEEK.

### FORTHCOMING EVENTS.

July 15.—National Sweet Pea Society's Show, Royal Aquarium (two days).

July 17.—Halifax and Helensburgh Rose Shows : Maidenhead Horticultural Show.

July 19.—National Rose Society's Northern Show, Manchester.

July 22.—Royal Horticultural Society's Committees meet ; National Carnation and Picotee Show, Drill Hall, Westminster ; Tibshelf Rose Show.

July 23.—Cardiff Horticultural and Rose Show (two days) : Newcastle Horticultural Show (three days).

July 24.—Summer Excursion of the Horticultural Club.

July 30.—Chesterfield Flower Show.

August 4.—Grantham and District Horticultural Show.

August 5.—Royal Horticultural Society's Committees meet, Drill Hall, Westminster ; Leicester Horticultural Show (two days).

August 9.—Crewe Horticultural Exhibition.

**Exhibits at the Temple Rose Show.**—There were several complaints at the recent Rose show because of the impossibility of making one's way round certain of the exhibits. Although these were arranged with a view to their being equally good on every side, ropes prevented visitors getting near them, and consequently many of the best blooms were not seen.

*Genista virgata*.—This pretty upright-growing Broom is beginning to flower (July 1). It is rather long in coming into flower after being transplanted, I understand, and my plant has been here for several years without showing a flower until now. It is, however, one of the shrubs which one could admire even if it never produced a flower, as its elegant silky foliage is appreciated by all who admire the quieter colouring of leafage as well as of flower. The growth is very elegant, and the Broom looks very pleasing all through the summer even without a blossom. Yet one is pleased to see that it has at length reached a flowering stage, and to observe that it is going to give one so many of its pretty yellow flowers, small as these are compared with those of our native Broom. If, as I anticipate, it will always

bloom at this time, it will be welcome as coming in before *Cytisus nigricans*, a Broom far too little known. It is a native of Madeira, and when established will grow to 6 feet high. My bush is about 4 feet in height. It is hardy in warm positions, and I grow it on the top of a sunny rockery protected from the north winds by a low wall and a trellis on top. It has not suffered in the least from the winters of the past four or five years. *Genista virgata*, which is sometimes sold as *Cytisus virgatus*, is a desirable plant for the rock garden, border, or sheltered shrubbery.—S. ARNOTT.

### Notes from a Devon garden.—

Really South Devon seems the only place to live in, to judge by the woeful reports from all over the Kingdom. It is possible you may remember my reporting the seedling of two Bamboos, *Arundinaria Simoni variegata*, last year. Both plants are again flowering. Is not this rather unusual ? The plants are young, only 5 feet high, but they have thrown up their new canes 6 feet high, and the foliage is bright and the variegation very good. The flowering has not in any way diminished their vigour. We have just sown last year's seed. *Hamamelis zuccariniana* does not want to be the only thing not flowering in the Japanese garden. It is perfectly covered with flower buds, though it bloomed most freely in February. I wonder if they will open or wait till next year ? A rather singular case of "suspended animation" has occurred in its neighbour *Daphne Gwenka*. This was planted in September, 1900, but has not shown the slightest sign of life until ten days ago, when it rapidly broke into leaf. Not far away, in the same garden, *Melia japonica* is in flower bud. I fancy that this is not a commonly grown shrub, for it is more shrub than tree. *Romneya Coulteri* must find something in our soil that it likes, for it seems quite at home. A rather large one was moved this April. Last year's shoots were nearly 8 feet high, and, as usual, these were cut down to about 3 feet after flowering. The result is that every old shoot has a lot of laterals with flower buds ; there are thirty-two showing now, yet the shrub is only 4 feet high, instead of nearly 8 feet, a great improvement I think. A beautiful tree in the Japanese Garden is *Rosa wichuriana Jersey Beauty*, budded, or rather grafted, upon a 6 foot stock. The "head" is already weeping, and the effect of the long shoots of polished green, with the dainty cream flowers and yellow buds, is charming. I am going to have more of these tall weeping Roses on the lawn. A lovely little weeping tree near it is *Pyrus Toringo* ; although beautiful in flower, it is perhaps at its best in the autumn, when the small leaves are various shades of red, gold, and russet, and the tiny Apples, each on a fairly long stalk, a golden shower. The fruit is about the size of Sweet Peas. Perhaps my good luck in rooting a broken-out graft, some 18 inches high, of a single Japanese Tree Peony may be a help to some one else, who like myself finds that the rootstock kills the graft. The graft in question had one flower 11½ inches across. I found it broken before it had withered, and plunged it rather deeply in a peat bed. This was a year ago, and I have kept it moist ever since planting. I am going to try some more cuttings. I note the measurement given of *Iris sofarana magnifica*. Surely they are wrong, or the flower is very tiny. *I. susiana* this year was much larger, the standards being 6½ inches long and 6 inches wide, whilst *I. Gatesii* was 14 inches across, the standards being 7 inches long and over 6 inches wide. The flower was open, as large across as a soup plate, I mean the standards were not upright like *sofarana*, but "flopped." It was like a gigantic Orchid. I fancy that it is unusual for Canterbury Bells to become perennial. We have a great many in the walled garden that are over four years old. The largest, a clear pint "cup and saucer," was about 3½ feet high and 3 feet through when it began to flower, a regular bush, with many hundred flowers open at once. Some of the white ones have become very perfect, duplex, a perfect bell inside the outer one, not "cup and saucer." —A. BAYLDON, Dawlish, South Devon.

**The French Northern Chrysanthemum Society.**—Those of our readers who remember this society, whose headquarters are at Lille, may be interested to know that it has been largely reconstituted, and that its former official publication, the *Nord-Horticole*, has now been replaced by a periodical called *Annales de la Société des Chrysanthémistes du Nord de la France*. The second number, January to July, 1902, is just to hand, as is also the schedule of the society's show, to be held in the Palais Rameau, Lille, on November 14 to 18 next.

**Hastings and St. Leonards Summer Flower Show** will take place on Wednesday and Thursday, August 13 and 14 next, this being the first exhibition the society has held, and we hope it will prove successful. The hon. secretary is Mr. H. G. Stevens, Baldslow, St. Leonards-on-Sea. The members' Rose show was held on July 10, when a paper on "Roses" was read by Mr. H. Alcorn.

**A good early Strawberry.**—The variety Leader, sent out a few years since, is a good early Strawberry. We have had it here on the north-east coast of Essex for three seasons, and for size of fruit and excellence of flavour it is much better than Royal Sovereign, and ripens about the same time. Plants crop heavily the first season; it is of compact growth, and should be more popular. Perhaps soil and situation specially favour it here. I should like to know if my experience of it is general.—GEORGE TYLER, *The Lower Gardens, Dorecourt*.

**Iris Gatesii.**—Mr. W. H. Churchill kindly sends a photograph of Iris Gatesii. Our correspondent writes: "The flower was 2½ inches across. There appears to be a good deal of interest in Oncocycloides Irises just now. I have succeeded with eighteen this year, without any of Sir Michael

Foster's 'covering up' or the late Mr. Ewbank's frames (see article, page 408, in THE GARDEN). Would it be of any service to make a list to tell you what I can grow on this soil? If so, I will gladly do so. I do not pretend to be a scientific gardener, I merely spend what spare moments I have in a very busy life in the garden. These Oncocycloides Irises are curiously fascinating and singularly fickle."—[Yes, we shall gladly welcome Mr. Churchill's promised notes.—ED.]

#### American Chrysanthemum Society.

If we remember aright the above-named society was founded about the year 1889. It was largely composed of members of the trade, and its work hitherto has been principally confined to the appointment of local committees in various cities of the union, which met for the purpose of adjudicating upon novelties and awarding certificates. Once, and only once, the society issued a catalogue of varieties, and it is regrettable that the experiment has not been repeated, for we here, in Europe, have very little opportunity of keeping fully posted up in American seedlings. The society has now, for the first time in its existence, decided to hold a show, and a glance at the schedule which is just to hand shows that very ample provision is made for a large and extensive display. In conjunction with the show we believe a convention will be held, at which various matters germane to the popular flower will be discussed. It is intended that the show shall be held jointly with the autumn show of the Chicago Horticultural Society in November next. Chrysanthemums have fifty-one classes allotted to them, the divisions being cut flowers, new varieties, and plants. Most of the classes have two prizes, while here and there some have three. They vary in value from a few shillings to £10. A special class is

framed for varieties of English origin, and a like one is provided for French varieties. The society of American florists offers medals in the classes for seedlings, sports, and undistributed importations. The schedule contains the rules of the two societies and the revised scales of the American Chrysanthemum Society.

#### Heath Lodge, Twickenham.

Amongst residences in this neighbourhood this is one of the oldest and most historical. It was originally the seat of Earl Ferrers, whom records tell us was hanged at Tyburn in 1760 for murdering his steward. Heath Lodge, however, possesses much more pleasant claims to attention in that the present house was inhabited by Isaac Swainson, F.R.S., in 1801. It may be remembered that a genus of evergreen shrubs—Swainsonia—from New Holland was named in compliment to this celebrated botanist. Indeed, it is to him that the grounds—which he laid out as a botanical garden—owe their fine old trees and shrubs. We read of them that they contained as excellent a horticultural collection as any in the kingdom, specimens of some of which are not to be found in Kew Gardens.—*Quo.*

#### Evergreen and flowering shrubs.

—A lecture will be given on this subject by Mr. A. D. Richardson, at Messrs. Pennick and Co.'s, Delgany Nurseries, Greystone, this afternoon (Saturday).

#### Water Lilies and their pale colouring.

—Most of my coloured or tinted Nymphaeas seem unusually pale this year. Such forms as Laydekeri rosea, Marlacea carnea, M. rosea, M. Chromatella, &c., probably from the cold sunless May. Mr. Burbidge noticed the same thing and drew my attention to it. Have other growers a like experience? Ellisii too, though good, is not quite up to the mark.—G. P., *County Dublin*.

#### BRITISH-RAISED ROSES.

## NOTES ON HARDY PLANTS

## NOTES FROM SWAINSWICK.

**H**EUCHERA cylindrica I may have a rarity, but certainly not a prized possession. In fact, without exercising the slightest generosity, I am willing to present *H. cylindrica*—a fine healthy plant—to anyone who cares to ask for it. It came in the Royal Horticultural Society's bonus parcel last year, and is now midway through what it presumably considers its flowering. It is bigger in leaf and stronger in growth than *H. sanguinea* and one or two others I have, and made a vast display of flower-stems and buds. These latter opened in the usual way, but had nothing inside them beyond a sort of pin-speck of colour on the bunch of stamens. As things are—and as I have

very showy, although individually fugitive, like those of all the family, and the plant goes on blooming profusely for a very long time. I have a peculiar affection for *Cistuses* on account of their want of exactness; when nearly all the other plants round are crying for attention, and afford a flabby reproach to the gardener, who has other things to do besides perpetual watering, the *Cistus* is revelling in the heat and sunshine, and always contented. Besides, one so seldom sees the self-coloured ones, that they, at any rate, are pleasing from their uncommonness alone. I should like advice as to the treatment of a seedling.

GERBERA JAMESONI.

It makes very slow progress in a 3-inch pot, although perfectly healthy. Seedlings at 2s. 6d. apiece seem rather too precious to risk out of doors in the four leaf stage, but as there are not many "vermins" in this garden—it consists in great part of wild woodland, and whether for this reason or another the cultivated part is singularly free from slugs—it might do better put out. At present it is in a sunny position under (unheated) glass. What a lovely thing the yellow

TREE LUPINE is, and how persistently it flowers! I had to leave behind a three year old bush which showed no signs of decay and was full of bud in May, but after losing half a dozen cuttings, managed to strike one, which will, I hope, make a good plant. I found that when placed in a propagator all the leaves quickly dropped off the cuttings; the successful one was simply stuck into a small pot of sandy soil and stood under some Ferns growing in a cold house, which shaded it. There has been a great deal of admiration expressed for the comparatively new white Tree Lupine, but I think the yellow one, with its peculiarly soft green, contrasting so prettily with the clear Primrose flowers, much more charming. This is, however, purely a matter of taste.

M. S. WILLIAMS.

The Cottage, Upper  
Swainswick, Bath.

## MEGASEA LIGULATA.

By whatever name the varieties of this broad-leaved Siberian Saxifrage are known, there can be no doubt of the merit of the best forms for the early spring garden. I do not think they are suitable for beds, for spring frosts often destroy the too early spikes of flower, but on banks under trees or in bold groups in vases it is really of most refined beauty, as the accompanying photograph shows. Altogether it is a plant well suited to artistic use, and demands special treatment in consequence. It lends itself remarkably well to all stonework, whether architectural or rustic, and its fine foliage turns to a brilliant red sometimes when the summer has been warm.

E. H. WOODALL.

## PRIMULA STUARTII.

IN his interesting "Notes from Baden-Baden," in THE GARDEN of June 21, Mr. Max Leichtlin

speaks of *Primula Stuartii* wanting moisture and shade in summer, and a dry, sunny position in winter. In my garden I do not find that it objects to remaining in winter in a moist shady position, in fact, that which it occupies in summer, though it has, of course, no artificial watering in the winter. Climatic differences may account for this, but growers of this lovely Primrose in this country may like to know how it does here.

Carsethorn, by Dumfries, N.B. S. ARNOTT.

## THE KITCHEN GARDEN.

## ASPARAGUS BEDS AFTER CUTTING.

**O**PINIONS are divided as to the best time to feed Asparagus, but there can be no doubt that the plants need ample food, both in the way of liquid manure and otherwise, when making a free top growth.

Much also may be done in the way of top-dressing, giving new soil and, what is often neglected, support to the strong growths, as the latter are important factors in building up strong crowns for another season. As regards the season, I mean the date at which cutting should cease, much depends upon the strength of the plants. Some seasons the growths start later than others. In our own case we cut well into July, but at that late period a special bed is required for cutting. There is no doubt that the plants are best if not cut over after midsummer, and, if at all weak, only the strongest grass cut up to that date. I will take

## FEEDING

first and protection afterwards. Top-dressing with new soil is best done when the plant is at rest, though it is only fair to state many plants suffer at this time of year when the roots are near the surface. Our best material this season has been cut from beds where there was ample surface soil, and this point should not be lost sight of.

There is no better stimulating food than liquid manure from stables. The saline qualities of the liquid just suit the plant, and if a system of irrigation can be employed so much the better. It may be asked how often should liquid manure be given. Much depends upon the strength of the liquid; if at all strong it may with advantage be mixed with water and applied copiously once a week. This season I have, for the first time, used some special Asparagus manure made by Messrs. Willis, of Harpenden, and we never had better grass. I am aware, in a measure, our soil is very light. The wet season lasting well into June favoured good growth, and if artificial foods were given, these could be taken down to the roots more readily. For Asparagus dressing from May to August I am sure many could use artificial foods to advantage if ample moisture were given in dry seasons. Such foods as nitrate of soda may be given as soon as the cutting ceases, the nitrate applied at the rate of 2oz. to 3oz. per square yard, and in using strong foods, such as the last-named, it is best to give, say, 2oz. than more and at shorter intervals, than a strong dose at one time. There are some excellent foods for Asparagus. Fish manure and guano are both suitable, but these are best applied in showery weather or well washed in by liberal waterings. Other equally good fertilisers are soot and salt. These two, though simple aids, are excellent during the earlier stages of growth, and in heavy soils salt is more beneficial if used when growth has ceased or is less active.

It is easier to feed plants in robust condition than weakly ones, as the latter need less food; I mean, having weaker roots, are not able to absorb the food given, and the above advice refers to plants that have given a full crop. In the case of weakly plants it does not pay to keep such beds, as new ones would be more satisfactory, and where this plant is lifted and forced it is an easy matter to use up such plants. I have seen it stated that

BROAD-LEAVED SIBERIAN SAXIFRAGE (*MEGASEA LIGULATA*).

never seen it elsewhere I do not know whether this plant is normal, but it is certainly in great vigour—I call it a weed, and an ugly one at that. Possibly its leafage may be nicely coloured later on. One of the prettiest things of the moment here is

*CISTUS FLORENTINUS*.

Until this spring it was planted in a very draughty corner on a bit of rockwork which only got a modicum of sun; even there it did well. Now, having acquired a real garden in place of an oblong plot of builder's rubbish and effete "eligible site," I have transferred it to a bed of strong loam mixed with weed-bonfire residue, and it is flowering madly. I find it grows very fast up to a certain point, but when, at two or three years old, it has made a compact little bush 18 inches or 2 feet high, it appears to devote all its energies to blossoming. The white golden centred flowers are

are known, there can be no doubt of the merit of the best forms for the early spring garden. I do not think they are suitable for beds, for spring frosts often destroy the too early spikes of flower, but on banks under trees or in bold groups in vases it is really of most refined beauty, as the accompanying photograph shows. Altogether it is a plant well suited to artistic use, and demands special treatment in consequence. It lends itself remarkably well to all stonework, whether architectural or rustic, and its fine foliage turns to a brilliant red sometimes when the summer has been warm.

E. H. WOODALL.

beds are weak on account of old age, but this is rarely the case if the plant is well grown, for though a portion of the crown dies, roots also, with healthy plants new and stronger growth should replace the old growth annually. In places here and there there may be blank spaces, and these should be made good in the early spring. I am aware the plants may be safely lifted up to midsummer, but at this late season more after-care is needed in the way of shade and moisture. Doubtless the best time to plant is in April. It is an easy matter in the autumn when cutting the top growth to mark the blank spaces with labels or sticks and make good at the time named; of course a much easier way would be to sow a few seeds, but I do not advise it, as by so doing the beds get crowded, and it is not well to have young and old roots mixed.

I have referred to giving the roots a deeper covering of soil where at all deficient, and even now I would not hesitate to do this. I have found partially decayed cow manure excellent at this season for thin light soils. For young beds a mulch may be given, and spent manure or an old Mushroom bed will be good and prevent the roots getting too dry. In the autumn or winter months shallow beds may with advantage receive a good covering of soil, as unless there is ample top soil there will be short growths of poorer flavour. I must not omit to note the value of protecting the summer growths when made. Winds often play sad havoc with these if at all large, and they must be large to be serviceable. It may be thought unnecessary, but it is very important that the top growth should not be broken till it is nearly ripe. If damaged in a green state crown growth is arrested. Plants given ample room often make growths 5 feet to 6 feet, and with a heavy green top these are soon injured. Where plenty of room is given the plants between the rows a few strands of twine and stakes at intervals form a good protection; with plants in thick beds a few Pea sticks or bushes between the plants here and there will preserve the growths.

G. WYTHES.

#### NOTES FROM SCOTLAND.

##### SUBRUBS.

It is one of the wonders of this odd season that plants generally considered unsuitable for our Scottish climate should have developed their true beauty. For instance, earlier in the year

##### PHYLLANTHUS NEPALENSIS

clothed its green rod-like stems with tufts of pretty yellow flowers, the stems in some cases to a length of 3 feet, and at present it is making growth, the foliage of the most exquisite green and rivalled only by the lovely stems. This is grown in the open. Our latest acquisition to flower is

BENTHAMIA FRAGIFERA (the Strawberry Tree), also quite exposed. There are three specimens altogether of equal age, about thirty years from the seed, but only one has flowered, and that in the most open position and in heavy soil. I do not remember another instance of its pretty and agreeably-scented flowers to have been produced previously so far North, and I believe in the South of England it is mostly grown against a wall. We have, of course, to thank the abnormally warm dry summer of 1901 for the display of flowers this year, and also, perhaps, the age of the tree. To hope for fruit is, I am afraid, too much.

##### BROUSSONETIA KEMPFERI.

This quaint-looking plant is in flower and bud. It flowers in little oval bunches, which, in the bud, are dark brown, and these are dotted thickly all over the plant, one, in fact, in the axil of each leaf, which, too, is brown. When expanded there is really no flower, but each bud produces three or four stamens, each of which is crowned with a yellow anther. The flowers on the tree here are all male, and to judge from the manner the stamens are arranged one would imagine each one is trying to get away as far as possible from its neighbour. When fully expanded

the foliage of the Broussonetia is very beautiful.

VIBURNUM PLICATUM is at present in perfect condition, the flower heads perhaps a little smaller than in a more propitious year, but it is altogether so good a thing that really no one should be without it. It is perfectly hardy here. The same may be said of

CHOISYA TERNATA, a large bush of which in the open has been smothered in bloom. It is a subject that seems much hardier than is generally believed. A stock is so easily got up from cuttings that even in very cold situations it might well be given a trial.

##### STEPHANANDRA FLEXUOSA

is making very strong and long shoots, and at present those of last year's production are dotted with small sprays of white bloom. The foliage reminds one of that of the Gooseberry, and the aspect of the plant as a whole is most pleasing. To induce the pushing of strong shoots the weaker growths should be removed as required. The evils of budding and grafting have been emphasised in the case of several plants lately. André's Broom is now mostly all dead or reduced to Laburnum Stocks, and a nice standard of the lovely *Prunus triloba* fl.-pl. that has been attended to during

several years has this season lost nearly the whole of its head.

##### NANDINA DOMESTICA.

This plant was much damaged by the cold in winter, losing nearly all its old foliage, but I am glad to see new leaves are being formed. It has flowered in former years, and is, I believe, considered not quite hardy in many parts of England.

##### FRUIT PROSPECTS.

It is certain that the present will not be by any means a first-class one for fruit. Blossom was generally very abundant, but the weather everywhere was generally very unsatisfactory, hence here and there one hears sad complaints of probable small crops. Though it was very cold, with snow and cold rains when Apricots and Peaches flowered, these set very favourably, and now the trees are thinned the prospects are generally good. Plums, however, are not so satisfactory, and in some places there appears to be a blank. Pears, a very important wall crop in Scotland, are somewhat erratic. Some varieties have set well, others not at all, and localities show varying prospects. As a rule it will, I think, be safe to say that it will be difficult to provide an uninterrupted supply. In many gardens Strawberries have suffered extremely, and they are very late. Currants, too, are less plentiful than usual; but the most disappointing of all crops is that of the Apple. It is seldom that blossom has been so abundant, but the weather was so cold that it was impossible to secure a set. The result is that only certain varieties that were flowering during the best of the weather have set, and in these instances the

KALANCHOE KEWENSIS, SHOWING ITS PANICLE OF ROSE-PINK FLOWERS.

trees are very thickly cropped and will require thinning.

##### GOGAR PIPPIN APPLE.

Our Apple supply is just about finished, and as there has been much correspondence in THE GARDEN about late varieties for the North, I may perhaps be permitted to recommend a small but splendid late Apple called Gogar Pippin. It is classed as a dessert fruit, and the flesh is of a different quality to the highlyesteemed Northern Greening, but when thinned to a fair crop and left to hang as long into November as possible before storing, it proves one of the best late kitchen Apples, keeping much later than Northern Greening.

R. P. B.

#### NEW AND INTERESTING PLANTS.

##### KALANCHOE KEWENSIS.

By crossing the bright coloured *K. flammula* with a large white-flowered species called *K. Bentii*, a remarkable and decidedly beautiful hybrid has been raised at Kew. *K. flammula* will be remembered as a new species introduced to Kew from Somaliland and flowered for the first time in 1897. The stock afterwards passed into the hands of Messrs. J. Veitch and Sons, who distributed it. In general habit it is not unlike *K. glaucescens*, but the leaves are fleshy, tongue-shaped, crenate, and the flowers are of an intense scarlet colour. *K. Bentii* was introduced to

Kew from South Arabia and flowered in 1900, when it was named by Sir Joseph Hooker to commemorate the services to botany of the late Mr. Theodore Bent, the archaeologist and traveller. The plant that flowered at Kew had an erect unbranched stem 3 feet high, with opposite sub-cylindrical fleshy leaves from 3 inches to 6 inches long, and a panicle of pure white flowers, each  $1\frac{1}{2}$  inches long and nearly 1 inch across. It is remarkable that the result of crossing a white and a scarlet-flowered species should be a hybrid with bright rose-pink flowers, whilst the leaves are more or less pinnatifid. There is a good batch of plants from this cross, and they all show the same leaf characters. On the other hand, the reverse cross, i.e., with *K. Bentii* as the mother parent, the seedlings all have simple sub-cylindrical leaves, and they are barely 6 inches high, whilst the hybrid is fully 4 feet high.

### PRUNING HARDY SHRUBS.

(Continued from Vol. LXI., page 428.)

*PERIPLOCA*.—A climbing genus which should be thinned out in winter, and only shortened back if necessary.

*Philadelphus*.—These should be thinned after flowering, and the old wood cut back to strong young shoots. This is especially important with *P. microphyllus*, *P. coronarius*, and *P. Lemoinei* and its varieties.

*Photinia*.—Require no pruning.

*Pieris*.—Remove seed-pods.

*Potentilla*.—Thin out after flowering and shorten any old wood back to strong young breaks.

*Prunus*.—In a young state all the members of this genus that are grafted or budded are improved by being cut back each spring until they have attained a fair size and shape. More especially is this the case with the Almonds, double-flowered Peaches, and the various flowering Cherries. When older they need only be thinned, and the flowering Plums and Cherries kept spurred in, but not too hard. *Prunus japonica*, *P. nana*, and *P. triloba* should be cut down to strong young breaks after flowering, the resulting wood bearing better flowers than the old wood. If either of these three latter is grown on a wall it should be spurred back hard after blooming.

*Ptelea*.—In a young state these should be kept trimmed to form small trees, and not be allowed to develop into ungainly bushes. When older they require an occasional thinning. *P. trifoliata* var. *aurea*, a golden form which is not grown so much as it deserves to be, should be cut back annually or biennially, the young wood being better coloured and bearing larger leaves than the old.

*Pyrus*.—The wild Pears should be spurred in the same manner as adopted for fruiting Pears, though not quite so hard. The wild Crab Apples, such as *P. baccata*, *P. floribunda*, *P. spectabilis*, &c., should be cut back every spring until they have formed well-balanced heads. Afterwards an annual thinning and a shortening of the longest shoots after flowering is sufficient. The remaining sections of *Pyrus* merely require an occasional thinning. *P. japonica* should be kept spurred in whether growing on a wall or in the open, and in the latter case should not be allowed to become a mass of weakly shoots.

*Rhamnus*.—These should be thinned out if becoming too thick, but as a rule they require very little pruning.

*Rhododendron* (*including Azalea*).—Remove all seed-pods immediately the flowers are over, and any plants that are in a sickly condition

should be cut down at the same time. By doing this a season or two of flower is lost, but it is practically the only means of bringing a weakly plant back to health again.

*Rholotypus*.—Cut away all old wood and encourage the strongest of the young growths.

*Rhus*.—Keep these well thinned out, and destroy all suckers that appear unless wanted for stocks. Gloves should always be worn when handling any of the *Rhus*, as the sap of all is poisonous to a certain extent.

*Ribes*.—All the *Ribes* are improved by being cut down annually while in a young state, but when older a yearly thinning out of the old wood is sufficient.

*Robinia*.—This is a genus that requires very little pruning when the members of it have attained a fair size, an occasional thinning being all that is necessary. In a young state they require well staking, and the longest shoots should be shortened back, as many of them are top-heavy when young.

*Rosa*.—Although the various garden *Roses* come under this heading, yet they are a class apart, and are better dealt with by specialists. The species of *Rosa* do not require any shortening of their shoots, which should always be left at full length; but all of them should have an annual thinning out of the old wood, either cutting it right away or back to a young shoot. Some of the species are very prone to throw up suckers from underground, sometimes to a considerable distance from the plant, and these should always be dug out and got rid of, merely cutting them off only producing two evils in the place of one.

*Rubus*.—This genus includes the Blackberry and Raspberry, and, in a modified form, the treatment accorded to them for fruiting is the best to employ with the ornamental Rubi, that is, all old wood which has flowered should be cut away and young strong canes encouraged; but while in the cultivation of the Raspberry only a few young canes are allowed to grow, in the ornamental species practically every young growth should be utilised. The double-flowered Rubi should have some of the old wood left, as they do not make so much young growth as the single ones do.

*Sintolina*.—This is a dwarf-growing genus, the old flower-heads of which should be cut away as soon as they are past, and any long or straggling growths cut back at the same time.

*Sambucus*.—The Elders require very little pruning as a rule, but the various cut-leaved golden or variegated forms are improved by being cut back annually. This will prevent their flowering, but as good foliage is required the loss of the bloom is a matter of little consequence.

*Skimmia*.—Require no pruning.

*Smilax*.—The hardy species of this genus do not require any pruning if they have room to ramble. If space is restricted, thin out and shorten in autumn.

*Sophora*.—These should be kept thinned when they have attained flowering size; in a young state they should be kept to a single stem and induced to form well-shaped trees.

*Spartium*.—This should be cut back in a small state, but when older it requires no pruning whatever.

*Spiraea*.—Although all the *Spiraeas* will flower on the old wood, the following are better for being cut back in winter to form young flowering shoots, viz., *S. betulifolia*, *S. Danglasi*, *S. Foxii*, *S. japonica*, *S. Margaritae*, *S. salicifolia*, *S. semperflorens*, *S. tomentosa*, and many of their varieties and hybrids. The remaining *Spiraeas* should be kept thinned out, and if any are making strong young breaks from the lower part of the plant they can be cut back to them after flowering.

*Stachyurus*.—This should be thinned out after flowering.

*Staphylea*.—*S. pinnata* should be kept thinned in late summer; *S. colchica* and *S. Colombiana* require very little pruning, but if too tall or unshapely should be cut back immediately after flowering.

*Stuartia*.—Require no pruning.

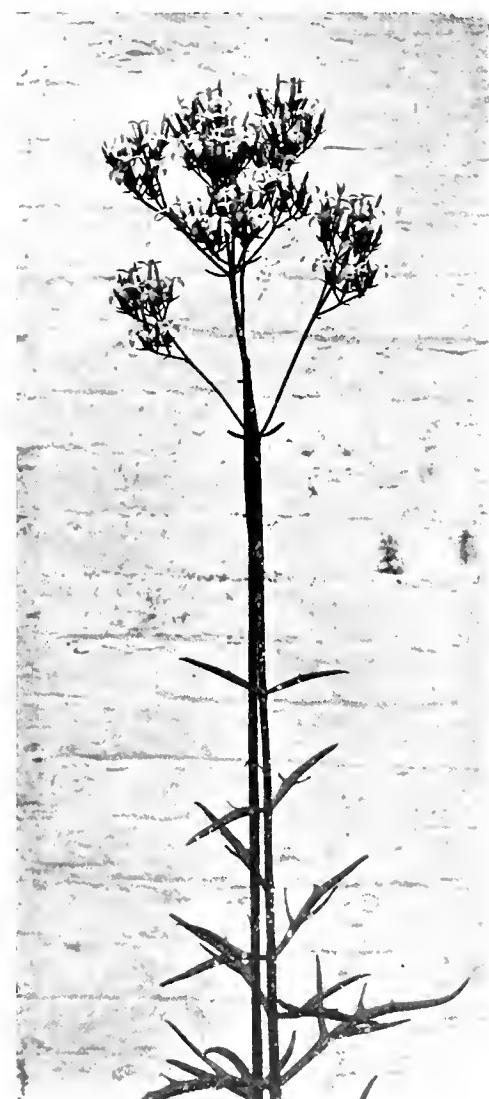

*Styrax*.—Require no pruning.

*Syringa* (*Lilac*).—These should be kept free of suckers, especially the finer named kinds, which are usually worked on stocks of the common *Lilac*. In addition, disbudding may be practised with advantage in the spring, removing the majority of the blind shoots and any flowering or leading shoots that are misplaced or not required. This should be done twice or thrice at intervals of ten days or a fortnight.

*Tamarix*.—Cut back in a young state, but when older they should not be pruned at all.

*Vaccinium*.—The removal of any old or rough wood is sufficient for these.

*Viburnum*.—All the *Viburnums* grow thickly and require an annual thinning.

KALANCHOE KEWENSIS, SHOWING THE UPRIGHT STEM, LEAVES, AND MANNER OF FLOWERING.

BUSH STANDARD TREE OF MAY DUKE CHERRY IN THE ROYAL GARDENS, FROGMORE.

*Vitis*.—The methods practised in growing Vines for fruit suit the ornamental species as well. If space is restricted they should be grown on the spur system, but if there is plenty of room then the extension system may be employed.

*Wistaria*.—These should be kept spurred in, with the exception of the leading shoots, which merely require shortening in early spring, according to the strength of the plant.

*Xanthoceras*.—Require no pruning.

*Zenobia*.—These require no pruning as a rule, but occasionally a hard cutting back will induce healthy growth in place of a weakly one.

*Bagsshot, Surrey.*

J. CLARK.

#### BUSH AND FAN-TRAINED CHERRY TREES.

##### A BUSH CHERRY TREE.

The form of training the Cherry Tree—when planted in the orchard or the open quarter of the garden—most favoured by growers is the standard or half standard, and sometimes as a pyramid, but it is not so frequently seen as a bush. That the Cherry succeeds well trained in this way is apparent from the accompanying illustration of a well-grown bush of May Duke. The bush has many points to recommend it, not the least being the economy of labour in its management. It is pruned with ease, and without the aid of steps or ladders. Its low form is convenient for netting against the depredation of birds, for picking the fruit when ripe, and it is not so exposed to damage by high winds as are trees of higher growth.

##### A FAN-TRAINED CHERRY TREE.

Not the least puzzling of the many puzzles that confront the amateur fruit grower in his early attempts at mastering the art of fruit growing is to find out how to properly train a

fruit tree. In the hope of being some help to any such we give an illustration of a well-trained young Cherry Tree growing on a wall at the Royal Horticultural Society's gardens at Chiswick. It will be noticed how evenly and regularly the flowers are disposed all over the surface of the tree, and that, through timely disbudding, the tree is not over-weighted with bloom, but is furnished with the requisite number to secure a good crop. More flowers would have been useless and even harmful.

W. E.

DESSERT WALL CHERRY IN THE ROYAL HORTICULTURAL SOCIETY'S GARDENS, CHISWICK.

#### MOUNTAIN PRIMULAS.

(Continued from Vol. LXI., page 430.)

##### MARSH-LOVING SPECIES.

A good number of species are found in this section. They grow in peat bogs, in marshy mountain pastures, and by the sides of streams, and comprise the sections *Auriculata*, *Furcatae*, *Minutissimae*, *Nivalis*, *Cordifolia*, and *Proliferae*.

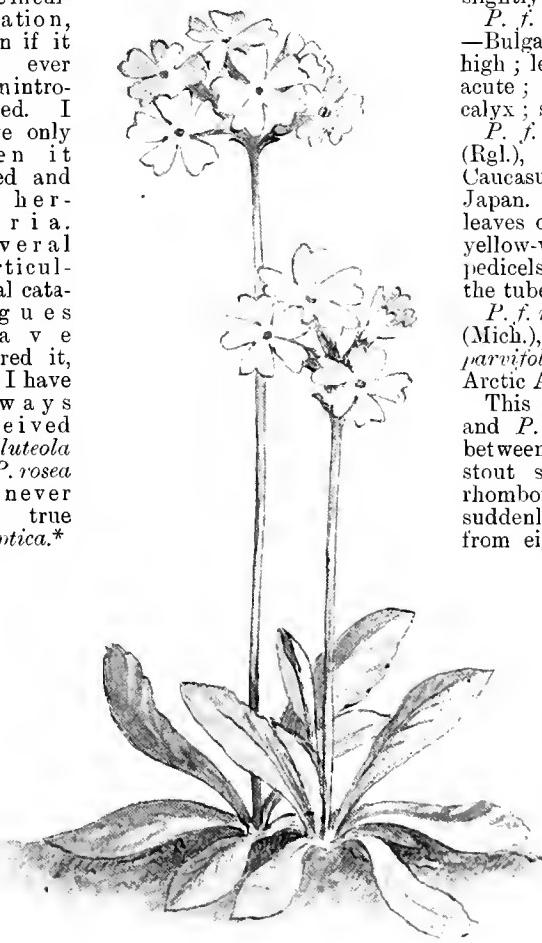

*P. algida* (Adams).—Native of the mountains of the Caucasus, of Turkestan, Persia, and the Songari and Altai ranges. Syns. *P. bungeana* (Mey.), *auriculata* (Led. non Lam.), and *caucasica* (Koch). This plant has some analogy with *P. farinosa*, from which it differs by its large spatulate-obtuse finely-toothed leaves, and by its large corolla of an intense violet colour, and above all by its globular capsule, which is longer than the calyx. Ruprecht has made known two varieties, one *denudata* (Rupr.), with the upper side of the leaf glabrous, and the other *luteo-farinosa* (Rupr.), where it is mealy. Regel has published the varieties *cuspida* with cuspidate denticulate leaves and green calyx, and *colorata* with a deep violet calyx.

*P. altaica* (Lehm.).—A synonym of *P. farinosa* var. *longiscapa*.

*P. auriculata* (Lam.).—From the alpine regions of the Caucasus (6,000 feet to 11,000 feet). Syn. *P. longifolia* (Curt.), *P. pycnorhiza* (Led.), *P. macrophila* (Koch), *P. Tournefortii* (Rupr.), *P. glauca* (Adams). Figured in Curtis's Bot. Mag. t. 392.

Very near the last, with which it is generally confounded in gardens, but distinguished chiefly by the tube of the corolla being much longer than the calyx and by the much shorter and more ovate capsule. Franchet has recorded a variety *polyphylla*, a native of Yunnan, which may be a separate species.

*P. elliptica* (Royle), syn. *P. spathulacea* (Jacquem.).—From the high valleys of Kashmir and the Western Himalayas, between 6,000 feet and 14,000 feet. Leaves small, ovate-orbicular, deeply-toothed, glabrous above and glaucous beneath, narrowing gradually into a more or less winged petiole. Flower stem flexible, 6 inches to 12 inches high; flowers two to three, purplish. It has the habit of *P. rosea*. It is very rare in cultivation, even if it has ever been introduced. I have only seen it dried and in herbaria. Several horticultural catalogues have offered it, but I have always received *P. luteola* or *P. rosea* — never the true *elliptica*.\*

PRIMULA FARINOSA (LIFE SIZE).

*P. farinosa* (L.).—Figured in Reichenbach's "Icones," xvii, t. 51. This well-known plant grows in the mountainous and sub-alpine regions of Europe, of Central and Northern Asia, and of Northern and Arctic America, where it is found in damp, cool meadows. Leaves ovate-obtuse, crenate, white underneath with mealy powder; flower-stem 4 inches to 8 inches high; flowers pale or bright pink, on short pedicels, calyx teeth nearly obtuse and triangular.

\* The Gardeners' Chronicle of April 26, 1884, page 541, contains a very interesting note on some of the Himalayan Primulas which had then not been introduced, and appear not to have reached us even yet. At page 545 there is an excellent illustration, admirably drawn, showing nine Himalayan species, namely, *P. elwesiana*, *gambeliana*, *muscoidea*, *musc.* var. *tenuiloba*, *pusilla*, *soldanettoides*, *sapphirina*, *tenella*, and *uniflora*. They are beautiful species, and it is regrettable that they are not yet to be had — at least, as far as I am aware — in gardens.

† Some years ago we received the seeds of this plant from Kittila in the Lappmarken of Finland; it germinated well and flowered. But we have lost it for some years, and as we have received no answers from our correspondent at Kittila, we have been unable to procure it again. I should be grateful if any reader of THE GARDEN could put me in communication with any forester, or chemist, or any one who could give me information in these distant regions. It cannot be of very frequent occurrence, for Brenner, in his "Floristik Handbook" (the only Flora of this country that I have) does not record it, naming only the rather near type *P. siberica*.

It is not infrequently found with pure white or very pale pink flowers. There are a large number of varieties, of which the following are the most important:—

*P. f. Warei* (Stein).—Leaves regularly dentate-crenate, flowers dark violet.

*P. f. lepida* (Pax), syn. *hornemanniana* (Lehm.), *denudata* (Lcd.).—Under this name it is figured in Reichenbach's "Icones," xvii, t. 51, iii. Leaves of one colour, not mealy, and only slightly toothed.

*P. f. exigua* (Pax), syn. *denudata* (Panc).—Bulgaria. Flowers very small, barely 5 inches high; leaves almost entire, teeth of the calyx acute; tube of the corolla longer than the calyx; seeds yellow, not brown.

*P. f. armena* (Koch) syn. *luteo-farinosa* (Rgl.), *xanthophylla* (Traut).—From the Caucasus, Turkestan, Siberia, Dauria, and Japan. Plant small, 1 inch to 4½ inches high; leaves often finely denticulate, very powdery, yellow-white underneath; flowers on short pedicels, calyx green or purplish, shorter than the tube of the corolla.

*P. f. mistassinica* (Pax) syn. *P. mistassinica* (Mich.), *gigantea* (Lehm.), *borealis* (Duby), *parvifolia* (Duby), *modesta* (Bisset).—From Arctic America and Eastern Siberia.

This plant is midway between *P. farinosa* and *P. stricta*. It is a handsome species between 4 inches and 10 inches high, with a stout strong stem; leaves slightly mealy, rhomboid-elliptical or spatulate, narrowing suddenly into the petiole, with an umbel of from eight to ten flowers; the tube of the corolla is the same length as the calyx, or very slightly longer; flowers rosy, with the lobes deeply indented into a heart-shape.

*P. f. longisepala* (Header), syn. *P. intermedia* (Curt. in Bot. Mag. t. 1219), *erecta* (Lehm.), *davurica* (Lehm.), *altaica* (Lehm.).—The Caucasus, Siberia, and Dauria. A tall plant, sometimes over a foot high; leaves not mealy, obovate-lanceolate. Flowers rose-coloured, carried on very stiff pedicels. Tube of the corolla longer than the calyx.

*P. f. undulata* (Fisch.)—Only differing from the last by its crenate-dentate leaves.

*P. f. magellanica* (Hook. Flor. antarct. Tab. 60), syn. *P. magellanica* (Lehm.), *decipiens* (Duby).—Straits of Magellan. A stout plant with strong, thick stem, about 7 inches high; leaves rhomboid-elliptical, almost acute, crenate-dentate. Flowers white, capitate or on very short pedicels, teeth of the calyx acute, stouter than the tube of the corolla.

The habitat of this plant is one of the most curious in phytogeography. How this northern species has contrived to jump over the whole American continent, to pass the Equator, and to establish itself in the extreme south is a mystery as yet unexplained by science.

*P. f. concinna* (Pax) syn. *P. concinna* (Watt).—From the Himalayas to Sikkim, between 15,000 feet and 16,500 feet. It is nothing but a form of *P. farinosa*, of feeble habit and small size.

*P. finnarchica* (Jacq.) syn. *P. norvegica* (Retz).—From the northern plains of Finland and Scandinavia.†

It is a pretty little plant, pale and delicate, with smooth, roundish, entire leaves; flowers small, a quarter of an inch to five-sixteenths of

an inch in diameter, of a bluish white colour, few in number, and carried on stiff, upright pedicels.

*P. frondosa* (Janka), syn. *P. alpina* (Janka non Ad.).—From the Balkans. A plant near *P. farinosa*, but that cannot be confounded with it because of the leaves being wide and very gradually diminished to the petiole; they are widely spatulate, obtuse and powdery on both sides. The whole plant is stouter and more mealy than *P. farinosa*. It is a handsome plant of easy culture; in the climate of Geneva we find it flowers more freely than *farinosa*. We were able to introduce it into cultivation in Switzerland ten years ago, thanks to the kind assistance of H.R.H. Prince Ferdinand of Bulgaria, who is a great admirer of the mountain flora.

*P. grandis* (Traut.).—From the Western Caucasus, 6,000 feet to 10,000 feet. A handsome species with large, wide leaves, 4 inches

PRIMULA LONGIFLORA (LIFE SIZE).

long by 3 inches wide; flower-stem over a foot long, pedicels over 2 inches; flowers drooping, corolla yellow, cylindrical, with upright lobes. We have grown it for twelve years at Geneva, but it has never bloomed. Messrs. Levier and Sommier, who brought me the seed after their travels in the Caucasus in 1890, told me that when growing in wet soil at the edge of tor-

rents the plant attains a much greater size than the dimensions I have quoted from Boissier.<sup>+</sup> But they did not see it in flower, as they reached its habitat too late. Alboff has told me that he has seen specimens 2 feet high, with leaves  $3\frac{1}{2}$  inches long and  $2\frac{1}{2}$  inches wide. But, while Boissier describes the teeth of the calyx as ovate-acute, Alboff's describes them as triangular. The leaf is characterised by the edge being suddenly contracted into the winged petiole.

I am unable to give a rule for cultivation, for, as I have said, though we can easily grow and increase the plant, we have never yet flowered it; all that I can say is that it likes moisture.

*P. involucrata* (Wall.) syn. *P. obtusifolia*.—From the alpine regions of the Himalayas of Kashmir and Sikkim, between 12,000 feet and 15,000 feet (*Botanical Register*, 1847, t. 31). Height 6 inches to 8 inches. Leaves upright ovate-lanceolate, of a fine green colour, quite glabrous, suddenly contracted to the petiole. Flowers bluish white or opaline: pedicels rather long, allowing the flower to droop a little; involucra membranous and divided at the point where the pedicels spring. It flowers in May, June, and July. Lindley records a variety *Munroi* with scented flowers, with the corolla slightly swelled and with lobes more deeply cut.

*P. japonica* (A. Gray), Japan (Nippon and Jesso).—A well-known plant, 12 inches to 16 inches high, introduced in 1871. Flowers in whorls, one over another; corolla purplish crimson in the type, variously coloured in the garden varieties. Grown by the side of a stream or in damp spongy ground it grows to a large size and has a striking effect.

Franchet has published a variety named *angustidens*, which comes from Southern China.

*P. longiflora* (All.).—Figured in Reichenbach's "Icones," xvii., t. 51 f. iv., v. Alps of Valais, of the Tyrol, of Lombardy, and Transylvania, the Carpathians, Bosnia and Montenegro, between 4,500 feet and 6,000 feet.

A very beautiful species, quite distinct and characteristic. Leaves ovate-elliptical, slightly toothed, lightly powdered on the under surface only, widened to the base. Flower-stem thick, 8 inches to 12 inches high; flowers large, rose-coloured; tube of the corolla much lengthened.

This is one of the alpine *Primulus* which does best in gardens, flowering in April and May.

Brügger found in the Engadine a hybrid of *P. farinosa* and *longiflora*, which he named *P. kraettiana*.

H. CORREVON.

(To be continued.)

## THE FRUIT GARDEN.

### THE CHERRY CROP.

WHEN the severe frosts a month or two ago spread devastation amongst the crops in gardens and orchards, the Kentish growers felt anxious. Till then the prospects had been most fair, the trees bloomed profusely, and the outlook was of the brightest. Then came frost and wet that threatened to destroy the Cherry crop; but, fortunately, things have not turned out so bad as at one time appeared. The sunshine of the last half of June has done wonders for the Cherries, and though there is only half a crop instead of a full one, this is a far better state of affairs than was at one time anticipated, and the prices already obtained for the earliest pickings bid fair to show

a profit at the end of the season for those who can boast of only half a crop.

Like most other things Cherries are this year late. Usually picking is in full swing before June is out, but this year only a few consignments of the earliest varieties were sent to market before July. Though these generally were small and not very good they sold well, and at the time of writing the growers are hopeful that the main crop will do likewise. They have reason for this, not only on account of the scarcity, but when the fruit is thinly dispersed on the trees the cost of picking is much greater, on account of the time it takes to fill a basket and the continual shifting of the long ladders.

It may be that the readers of THE GARDEN are not all acquainted with the ins and outs of the Kentish Cherry industry, attached to which there is a certain amount of speculation. Only a portion of the growers gather and market the fruit themselves, as the Cherries in a large proportion of the orchards are sold on the trees by auction to the highest bidder, who afterwards gathers and markets the fruit, and pockets the profit or stands the loss, as the case may be. It will be readily understood then that considerable judgment is required on the part of the Cherry buyers; but, as a rule, these men know the capacities of the orchards they purchase, and can form a good idea both of the quantity of fruit and its approximate value. Sometimes they get out of their reckoning, however, and last season, when crops were heavy all round and there was a slump in Cherries, many dealers found themselves at the end of the season either quite on the wrong side of the ledger or with only sufficient to cover expenses, and no margin to pay for time, risk, and trouble. A few weeks before picking begins Cherry sales are the general order, and, in spite of half crops, some of the sellers have no reason to complain this year.

The well-known Sittingbourne district is admitted to be the best in Kent this year, and for some of the choice orchards high prices have been obtained. The fruit in some of these fetched as much as £33 per acre on the trees, whereas, in seasons of average crops, £20 per acre would be considered a good price. It will be admitted that £33 is not a bad return from an acre of ground, taking into consideration that the purchaser has to pay all the after expenses of picking and transit. Labour does not appear to be any too plentiful either, and I have heard several complaints of the scarcity of pickers, which may be accounted for to some extent by the fact that the Cherry and the Hay harvest come together, and each demands its supply of labour.

In Cherry-growing Kent a distinct air of activity shows itself when the first red fruits appear amongst the foliage on the trees. Long ladders, broad at the bottom and tapering upwards, are stacked in the orchards, great piles of round sieves appear under the trees, and when the first fruits are ready for market the business begins. A strict watch has to be kept on the fruit all along, for birds like Cherries. Birds are numerous this year, and some old growers take this as a good omen, in one respect, as they contend that both weather and fruit are good when the birds give the most trouble, and these points, of course, have bearing on the price. Birds play the greatest havoc amongst the fruit when the weather is hot and dry. As yet Cherry growers have found no magic of thwarting the birds, and firearms are chiefly resorted to for keeping them at bay. Occasionally one hears the rattle of old-fashioned clappers in the orchards, and bells are sometimes suspended in the trees, but the birds soon get accustomed to the sound. As for scarecrows, they seem to get on intimate terms with them at once, and nothing answers like the gun.

The Cherry tender has to be moving early in the morning, because the birds are feeding before half the world is awake, and through the whole day the man patrols the orchard, shooting more to frighten than to kill, and the bang of gunshots can be heard on every side till the twilight deepens into gloom.

Most of the Kentish Cherries are picked by women and girls, who, with baskets slung over

their backs, mount the long ladders with al the confidence of professional acrobats. At first sight it hardly looks to be the right sort of work for women, and many members of the gentle sex would hardly be induced to undertake such a task; but the Kentish female Cherry pickers are used to it, and the chatter and laughter in an orchard where a number of them are poised up in the trees proves that their nerves do not suffer, while accidents are of rare occurrence. The ladders, which are stout and strong, are fixed by the men, who move them as required, and this operation needs some care, as the ladders are heavy, and if not manipulated properly wholesale damage to the trees would result.

While the women are engaged in picking, the round market sieves are packed beneath the trees or in a marquee erected for the purpose, the paper covering is adjusted, and the receptacles are piled on the light drays, which convey them to the station. Here they are handled again one by one and packed into the vans, then rushed away, some to Covent Garden—the Mecca of all good produce—and some to the great manufacturing centres in the North.

Cherry time is truly an important one in Kent, and in this particular branch home competition is not feared, as the county holds the monopoly in the cultivation of this popular fruit. It is true there is only half a crop this year, but there is the possibility that it will put more money into the pockets of the growers than if every tree and branch were laden. This will ever be the case till the question of dealing with gluts of perishable fruit is solved.

G. H. H.

### PEACH ALEXANDER.

LOOKING through the early Peach house at Castle Hill, Betchingley, on May 8, I noted a fine trained tree of Peach Alexander carrying a good crop of fruit. Some richly-coloured Peaches had already been gathered, and were of excellent character. I enquired of Mr. Barks as to whether he was at all troubled with the bud-dropping so freely ascribed to this variety. He said that no such trouble arose with his tree, and, if it were the nature of the variety to do as is so often said, the result must be due to insufficient watering. His practice is to water the border freely during the winter, and thus keep the roots moist and plump, then when the sap rises there is ample to sustain the buds and none fall. Really he has to thin out his fruits on this tree materially each season. Heat is also applied at the first very gradually, an essential practice with early Peach forcing.

A. D.

### ORCHIDS.

### NOTES FROM THE WOOD-LANDS.

VISITED at no matter what season of the year, the large and varied collection of Orchids owned by Mr. R. H. Measures is certain to contain in bloom one or more Orchids of more than general interest and value. Recently a most beautiful Lælio-Cattleya was seen by the writer—Lælio-Cattleya Wiganiae var. lutescens. The original form was obtained from Lælio-Cattleya gottsiana crossed with Cattleya Mossiae, but the variety lutescens is either a remarkable colour variation or a fresh hybrid of which one of the parents—probably L. C. gottsiana—must have had a strong yellow or buff suffusion in the sepals and petals. In any case the present form gains added beauty and distinction from a pleasing buff-yellow shade apparent in the corresponding segments, which are further flushed on the margins with rose. The labellum is beautifully frilled, palest at the extreme edge, darkest on

<sup>+</sup> "Flora Orientalis," Vol. IV., page 24.

<sup>§</sup> "Prodromus Flora Colchica," page 163.

the central area, these passing from a deep maroon shade to a dark purplish rose.

*Cattleya Harrisoniae var. Nulli secundus*.—For once exception cannot be taken to the varietal name applied here. It is very doubtful if so fine a form will ever be met with again. It is certainly the best of the violacea section yet seen, and is as remarkable for the size and perfect shape of the flowers as for their depth of glossy purple-red colour, heightened by the contrast of the white and creamy white fluted lip. Although introduced so far back as 1836, and frequently imported in quantity since that date, really remarkable varieties of this popular Orchid are seldom seen. Its easy culture, freedom of flowering, and usefulness of the type for cutting make this species largely grown, but though met with in nearly every garden it was not until quite recently that the pure white form was flowered.

*Laelio-Cattleya callistoglossa excelsa*.—This splendid form of callistoglossa was well shown at the Temple show of 1900 by Messrs. F. Sander and Co., who were then accorded a first-class certificate for it. The parents of the type are *Laelia purpurata* and *Cattleya Warscewiczii*, but in the above-named variety that form of Warscewiczii, known as *sanderiana* was the pollen parent. The result may be termed a glorified callistoglossa. The advantage of using the superior pollen parent is evident in the enlarged sepals and petals of tender rose—the petals beautifully waved and crimped—and in the huge lip, the apical portion of which is deep crimson-purple in colour, dashed with velvet-like maroon. The throat is of a soft yellow with a few darker lines, while the side lobes are of lilac-mauve, deepening to rose. It is in every way a most striking hybrid.

*Cypripedium Godefroyae* and its variety *lencocheilum* are largely grown at The Woodlands; in fact, that collection contains what are probably the finest known varieties of *C. Godefroyae*, and though neither of them happened to be in flower on the occasion of my visit, many other grand varieties were well to the front. Whether natural hybrid or species, *C. Godefroyae* is certainly the most polymorphic member of that section of the genus to which it belongs. Forms are here with both yellow and white grounds, and in both are flowers in which the lip is quite free from spotting. The varieties with white ground colour are justly considered the more beautiful, as, however deep and bold, the maroon markings do not show so clearly on the yellow shade as on the white. Their culture is not considered difficult, their main requirement, or, at any rate, the main one extended to them, being exceeding care in watering during the winter months.

Although Orchids are the feature in Mr. Measures' garden, it must not be imagined that other branches of horticulture are neglected. The Carnation houses present a veritable picture at the present time, and many superb new kinds are in flower. One—Carnation Maggie Hodgson—would certainly become largely grown should it ever get into the hands of the trade. Its large shapely flowers are freely produced, and the colour—a dark claret purple—is both novel and beautiful. Many other interesting plants are also in flower, but want of space prevents any mention of them.

ARGUTUS.

## NURSERY GARDENS.

### PLANTS AT THE QUEEN'S ROAD NURSERY, CHELTENHAM.

HAVING lately had an opportunity of calling at this nursery, and remem-hering the many excellent plants displayed at exhibitions from this establishment. I naturally expected a floral treat, and it is almost needless to remark that this wish was amply gratified. A large and freely-flowered collection of that grand old species *Laelia purpurata*, in many fine varieties, possessed of large pseudo-bulbs and dark foliage, was making a gorgeous display. Noticeable were *L. p. Williamii* and *L. p. magnifica*. All

#### THE BEST CATTLEYAS

are likewise grown in great quantities, and of these many grand things have been selected from importations. Some good forms of *C. Mossiae* were observed, together with a magnificent variety of *C. Mendelii*, arranged with many others of this species. *C. Skinneri*, the first of the genus that I

us to know that even here the old type of *C. insignis* is not despised, and that a great quantity of its best forms and the best of its seedlings are grown. With these, growing and flowering in a cool house were some good varieties of *C. Exul* and *C. villosum*. Of kinds in flower that require a warmer temperature, there was a collection of splendid forms of *C. lawrenceanum*, possessed of many large bold flowers. The beautiful *C. Gowerii magnificum*, *C. grande*, *C. grande atratum*, with a magnificent variety of *C. rothschildianum*, the delicate looking *C. niveum*, and many others. All the best

#### MASDEVALLIAS

are largely represented. Many were the kinds in bloom, *M. veitchiana grandiflora*, *M. Lindenii*, and *M. harryana* being most brilliant and effective. Of others, *M. Clunaria*, *M. Roezlii*, *M. bella*, *M. Shuttleworthii*, and a large batch of that pretty little white species *M. tovarensis* were freely flowering.

#### ODONTOGLOSSUMS

fill several houses, two of them being entirely occupied by *O. crispum*, in rude health, possessed

GROUP OF WHITE LELIA ANCEPS IN MESSRS. CYPHER'S NURSERY AT CHELTENHAM.

remember seeing, is still distinct and valued, and was represented by good specimens, *C. S. oculata*, a very bright variety, being one of them. Some plants of that charming *C. schilleriana*, together with a large quantity of *C. citrina*, with remarkably large flowers, were very bright. Mr. Cypher's nursery is especially celebrated for its collection of

#### DENDROBIUMS,

and deservedly so, for this is both large and complete. Of *D. nobile* and varieties alone several houses are filled. Their season of flowering is, however, almost over, but several plants of large flowering distinct dark forms, *D. n. nobilissimus*, as well as the rare and chaste *D. n. virginialis*, the beautiful white flowers of which are most delicately scented, were still in bloom. These late flowering forms of *D. nobile* are greatly valued by Mr. Cypher, both for cutting and other purposes. Amongst other species a large specimen of *D. Farmeri* was densely clothed with its beautiful drooping flower.

#### CYPRIPEDIUMS

are now to be met with almost everywhere, but not always in such rude health as at Cheltenham, nor in such quantity, and it is pleasant to some of

of large pseudo-bulbs and healthy foliage. Many exceedingly fine varieties of this beautiful species were flowering well. Good kinds of *O. Hallii*, *O. bystris*, *O. polyanthum*, *O. andersonianum*, *O. ruckerianum*, &c., were also flowering freely. *Miltonia vexillaria* is grown to perfection in great quantities, and many of the plants were furnished with unusually large spikes of flowers in many shades of colour. It is astonishing how cheaply this grand Orchid can now be purchased as compared with its price soon after it was introduced. It seems but a very short time since I had charge of a small plant of it with one lead, which cost 21 guineas, and if I remember rightly a similar remark might be made about *Masdevallia harryana*.

#### ONCIDIUMS

were another feature, and grand spikes of *O. macranthum*, *O. marshallianum*, *O. Rogersii*, and *O. varicosum* were noted, with a greater number of *O. concolor*. Of *Thunias*, *T. marshalliana* and *veitchiana* were already in flower, as well as a few of *T. winniana*, the best of all dark ones. Some plants, with fine pseudo-bulbs, of *Brassavola*

digbyana were carrying their solitary, beautifully fringed and scented flowers. Some

EPIDENDRUMS AND SOPHRONITIS, with their offspring Epiphronitis Veitchii, were also freely blooming. Their bright flowers are very effective.

In these notes no attempt has been made to give anything like a complete list, to say nothing of describing the beauties of the valuable and choice Orchids this noted nursery contains. I would advise those who have not done so, and are interested in these plants, to visit the Cheltenham establishment, and see for themselves the great quantities of healthy, clean, and in every way splendidly cultivated Orchids. T. COOMBER.

#### FROM THE MOUNTAINS.—I.

A DEEP, narrow valley with high mountain sides, a good way south, a little east of Geneva, and about a third of the same distance north of the Mont Cenis. The valley sides are in places inaccessible, and are, for the most part, where the rock is not sheer, wooded with scrub of Ash and Hornbeam, Hazel and Maple. At the bottom is a rushing torrent fed by the glaciers not far to the south. But in many places the valley widens a little, allowing space for vineyards and pastures. How rich these steep blunt spurs of pasture are with their groves of Walnuts and fruit trees and more open meadow spaces, and how delightful these are with their wealth of flowers and their lovely rippling and tumbling rills! Here is such a one running merrily down its steep descent over big stones and between boulders, with a little cascade at every few feet of its flow and its charming music of rush and ripple and gurgle. It flows on and tips over its little falls with an air of brisk cheerfulness as if it had no apprehension of what awaited it a hundred yards below, where it will be dashed about in the rocky rapids of the roaring torrent. What would one not give for such a little mountain stream in one's garden! What visions it suggests of beautiful rill and bog gardening!

From the stream on both sides rise the steep banks of flowery pasture. However often these alpine pastures may have been described, their beauty is ever fresh and new to see. Here it is scarcely alpine in the usual sense, for the altitude is barely 2,000 feet; the brilliant sheets of tufted vegetation—the region of the Gentians—lie higher. The meadow flowers grow rank and luscious, but such is the wealth of blossom that the whole surface, seen at a little distance, shows clouds and drifts of colour, mostly of pink and rose and purple: strongest purple of the meadow *Salvia*, pale colouring of *Scabious*, rose and pink of the ever-present and always beautiful *Saintfoin*. On the chalk lands at home the colour of *Saintfoin* is a good pink with deeper veining; here the colour is generally fuller, with a good proportion of the bloom of a grand rose colour of the best and liveliest quality, deepening to a strong crimson of rosy scarlet quality in the yet unopened bud. The *Scabious* flowers are very large and mostly of the usual lilac colour, but some are very lilac and some a fine purple, nearly matching the *Salvia*. The *Salvia* is very near our own wild Sage

(*Salvia Verbenaca*), perhaps the same thing, but in these meadows it has the appearance of a much better plant, especially when it takes a densely bloomed, rather bushy form. The colour is so rich and the whole plant so good that one wonders that it has not before now been tamed to garden use. It seeds freely, and one would think that selections from well-chosen wild forms would soon give good garden plants. The good size of the flowers in the whorls and the extreme richness of their colour, fine in itself, and much enhanced by the dark harmonious tinting of the calyx and the deep velvet-purple of the bud, point to a flower that should have a garden future, especially on chalky soils.

Other showy flowers of these rich meadow gardens are Cranesbills, Campanulas, Cow-wheat, Bedstraw, Clovers, Lotus, and Anthyllis. Colchicum is in large green leaf and seed-pod. All these meadow flowers are taller and larger and in more abundant bloom than we ever see at home, only excepting the Ox-eye Daisies, which are smaller than ours. G. J.

#### MISCELLANEOUS.

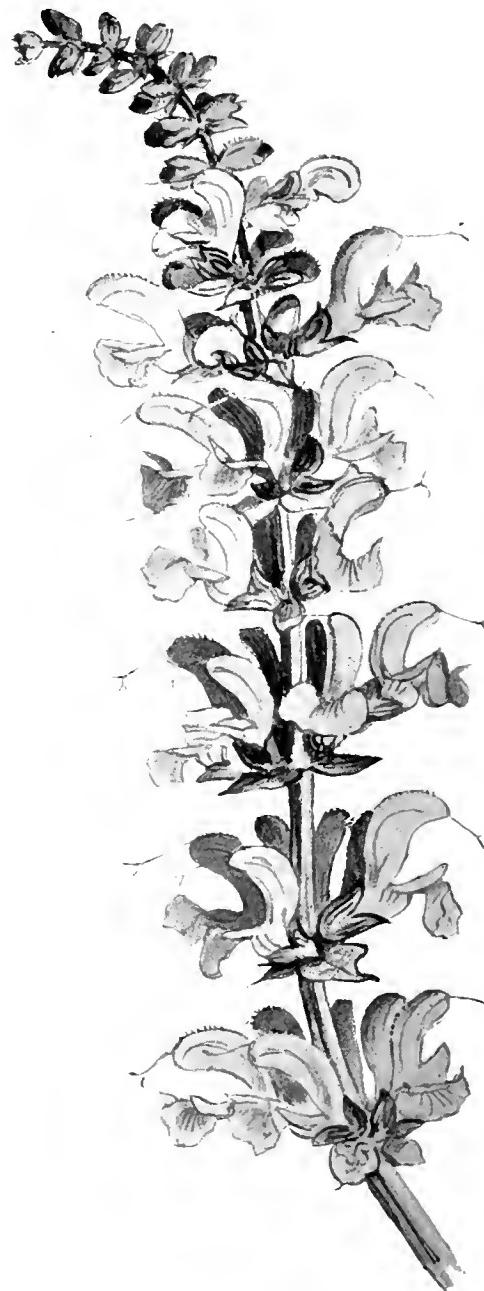

#### NOTES FROM ENGLISH GARDENS.

##### TRENT PARK.

OVERS of Carnations would much appreciate the floral treat afforded the writer during a hurried visit to Trent Park, the home of F. A. Bevan, Esq. At the present time two large houses are completely filled with Malmaison Carnations in flower and bud. The number of varieties seems endless, yet much care has been exercised in their selection, while cultivated skill of the highest has so perfected each plant that not a single poor bloom could be detected. The colour ranges from a soft pink, almost white, flesh shade to deep rose and better size, contour, and substance on the blossoms could not be wished for. All the best varieties known have been collected at Trent Park, and the result is apparent in this splendid collection of Malmaisons.

##### DIPLODENIAS.

Two well-grown and profusely-flowered plants of this handsome genus were just at their best in the stove. The one, *D. Hamabilis*, is well known, but beautiful as its soft rose-crimson blossoms are, they are eclipsed by those of its companion, *D. brearleyana*. It is doubtful if any of the cultivated Dipladenias equal this supposed hybrid in beauty and in the abundance with which the large deep rose-crimson blossoms are produced. Horticulture owes this splendid acquisition to Mr. Simon Brearley, of Halifax, Yorkshire, a working man, not even a gardener, but simply a mill hand who made a hobby of horticulture. One morning the post brought to the late Mr. William Bull, of Chelsea, a box filled with blooms of this magnificent flowering plant, and Mr. Godseff, then manager to Mr. Bull, was at once sent to Halifax to purchase the plant—there was but one. He finally acquired it for 150 guineas, cash on delivery, the free delivery of the plant at Chelsea in good condition being an absolute condition in the bargain. So highly did its raiser value the plant that he would not even accept pounds for cash, but insisted on guineas. The cash so unexpectedly

PART OF A SPIKE OF THE ALPINE MEADOW SAGE.

and easily obtained unfortunately did Brearley but little good, tempting him to extra carousals, and a short time after its acquisition, in one of his escapades, it was said he had the misfortune to break his leg. Among the

##### ORCHIDS

at Trent Park are some really grand specimens of Sobralias. Conspicuous particularly are huge plants of *Sobralia macrantha nana*, Wadey's old variety, the characteristic short growths of which crowned with very large flowers, better than in the type, are admirably set off by the taller growths of such kinds as *S. xantholeuca*, *S. leueoxantha*, &c. Among specimen Orchids at Trent Park claiming attention is a colossal plant of *Celegyne dayana*, larger than the famous plants shown so frequently by Baron Schröder at the Temple shows. The long pendulous spikes bear numerous substantial blooms, straw-yellow, white, and dark chocolate in colour, not gorgeous, but very attractive, their number

and the graceful manner in which they are produced compensating for the absence of brighter tints. The plant is certainly the finest specimen in cultivation, carrying nearly 100 spikes.

There is much that is interesting and worthy of attention at Trent Park. Although he has held the appointment but a short time, Mr. Parr, the able head gardener, has already made great improvements, and as the owner is an enthusiastic lover of gardening — a liberal patron and a good master — in the near future still further advances may be expected.

#### GUNNERSBURY PARK.

A VISIT to Gunnersbury Park, no matter at what season of the year, is never without interest. Just now one of the most charming sights, both from a utilitarian and artistic point of view, is a lean-to house filled with fruiting cherry trees. The uses of the first will commend themselves to every reader, particularly during hot weather, but looking at a house such as this at Gunnersbury, one almost loses sight of the primary cause of their culture in admiration at the charming sight they present. The trees are trained under the roof, and from bottom to top are covered with clean healthy foliage. The branches are laden with ripe fruit in glossy shades of black, yellow, rose-red, cerise and white, contrasting with the luxuriant green foliage : a prettier effect it is difficult to conceive.

#### BEGONIA CORALLINA.

A remarkable plant of this handsome species shows to full advantage, covering the roof of a moderately warm house and bearing hundreds of its brilliant coral-red flowers in drooping panicles. It is a pity greater use is not made of this Begonia. Apart from the size and beauty of the flowers, it is most accommodating as regards temperature, and is very free blooming. If grown in too cool a temperature it is certainly apt to lose its lower leaves quickly, but given a house which falls but little below 60° Fahr., and room to develop its lateral branches, it takes a prominent place among flowering plants and is practically always in bloom.

A hurried inspection of the Orchid houses shows that Mr. Reynolds as thoroughly understands their culture as he does the other branches of gardening.

Odontoglossums, of which a considerable quantity is grown, simply luxuriate. Last year they were potted in Belgian leaf soil, and so satisfied is Mr. Reynolds with the progress they have made that he is extending the use of this material to Lycastes, Cattleyas, &c. Since being potted in the leaf soil, the growth made by the Odontoglossum is twice as good as that made during any previous season, and nearly double the growing room will be required at potting-time (August) this year for the accommodation of these plants.

A.

but it is willing to grow in wilder ways among trees and shrubs where its natural way of making graceful garlands and hanging ropes of bloom show its truest and best uses much better than when it is trained straight along the joints of walls or tied in more stiffly and closely. Even if there are only a few stiff bushes such as Gorse or low Thorns to support and guide it, it gladly covers them just as does the Traveller's Joy (*Clematis Vitalba*) of our chalkland hedges. This also is a climber that, though a native plant and very common in calcareous soils, is worthy of a place in any garden. *Clematis Flammula* is another of the family that should be more often treated in a free way, and grown partly trained through the branches of a Yew or an *Ilex*. The less-known *Clematis graveolens*, with yellow flowers and feathery seeds, and the fine October-blooming *C. paniculata*, make up five members of one family, apart from the large-flowered Clematises, that all lend themselves willingly to this class of pictorial treatment.

One of the most important of our climbing shrubs, the *Wistaria*, makes grand growth in all the south of England. This also can be used to excellent effect trained into some rather thinly-furnished tree such as an old *Acacia*. Its grey snake-like stems and masses of bloom high up in the supporting tree are shown to excellent effect. This is also a fine plant for a pergola. A few plants growing free and rambling full length would, after the first few years, when they are getting hold, cover a pergola from end to end. The piers or posts could also be covered with the same, for though the nature of the plant is to ramble, yet if kept to one stem and closely pruned it readily adapts itself to pillar form and bears a wonderful quantity of bloom.

Among the Grape Vines there is a great variety of ways of use other than the stiff wall-training they generally receive. If they are wanted for fruit they must be pruned, but most outdoor Vines are grown for the beauty

of their foliage. Here is another first-class pergola plant, making dense leafy shade, and growing in a way that is delightfully pictorial. Nothing looks better rambling over old buildings. Now that so many once prosperous farms are farms no longer, and that their dwelling-houses are being converted to the use of another class of occupier, the rough out-buildings, turned into stabling, and adapted for garden sheds, often abut upon the new-made pleasure garden. This is the place where the Vines may be so well planted. If the main stem only is trained or guided it is well to leave the long branches to shift for themselves, for they will ramble and dispose themselves in so pictorial a way that the whole garden is bettered by their rioting grandeur of leaf mass.

*Aristolochia Siphon*, with its twining stems and handsome leaves will, like the *Vine* and the *Virginia Creeper*, answer to all these uses of jungle-like growth among trees and shrubs and free climbing in hedge, over pergola or rough building.

The employment of the climbing and rambling Roses is also now understood for all such uses, and the illustration shows the value of the Dutch Honeysuckle for this purpose.

A rough hedge containing perhaps only a few Thorns and Hollies and stub Oaks, and a filling of wild Brambles, may be made glorious with the free hardy climbers just guided into the bushes and then left to ramble as they will.

#### GARDENING OF THE WEEK.

##### KITCHEN GARDEN.

###### COLEWORTS.

**A**NOTHER good sowing of both Rosette Colewort and London Hardy Green should be made at once. These will stand the winter much better than the early sowings, and give useful supplies during early spring when Cabbage is often very scarce. Take every opportunity of showery weather to plant all kinds of green

DUTCH HONEYSUCKLE ON WALL. (From a photograph by Miss Willmott.)

#### THE USE OF HARDY CLIMBING SHRUBS.

THE best and best known of our good hardy climbing shrubs are by no means neglected, but yet they are not nearly as much or as well used as they might be. Such a fine thing as the easily grown *Clematis montana* will not only cover house and garden walls with its sheets of lovely bloom,

vegetables intended for winter use, and every available piece of vacant ground should be filled. Walcheren and Magnum Bonum Cauliflowers should be planted on a south border, well manured and deeply dug, 2 feet between the rows, and 18 inches from plant to plant. These will give useful little heads generally so much appreciated for the table.

#### TURNIPS.

Three good sowings should be made during the month, consisting of Snowball and Red Globe. Make the ground firm and rake down finely. Thin out those previously sown as soon as they have made the rough leaf; dust over with soot and wood ashes frequently in early morning while the dew is on them, and those that have attained a medium size should be pulled and stored under a north wall in sand or cinder ashes, when they will keep fresh for some time.

#### TOMATOES

planted in the open will continually require thinning and training, exposing the young fruit to the sun and air as much as possible. The plants should be grown on the cordon system, and no manure given till a sufficient crop is swelling.

#### PLANTS UNDER GLASS

should have abundance of air at all stages, especially those setting and ripening their fruits. All carrying heavy crops in pots should be liberally fed both by top-dressing with well-rotted manure and applying patent and farmyard liquid. During hot drying days the stages, paths, &c., should be damped down several times during the day, but endeavour to prevent a stagnant atmosphere, otherwise, should a spell of dull weather set in, disease in the foliage will make its appearance. This will not only cause great check to the plants, but make them very unsightly. The little white fly which often attacks them if allowed to go unchecked will multiply and spread with great rapidity, and does more damage to the growth of the plant than many people imagine. Only by persistently fumigating the house for several nights in succession can it be eradicated. The first one or two doses simply stupefies them, they fall to the ground, and in about twenty-four hours are as lively as ever.

To ensure good strong sturdy plants before late autumn another sowing should at once be made for producing a supply through the winter, as the more robust the plants are when placed in their winter quarters the better will be the results. Sutton's Winter Beauty and Earliest of All are excellent varieties for sowing now, both being very free setters, and the first-named handsome in appearance.

#### WINTER ONIONS.

All the white Tripoli kinds will have finished their growth and should be pulled up and laid in the full sun to ripen. These are never good keepers, especially when left in the ground too long, but many appreciate them on account of their mild flavour. Other autumn-sown varieties, such as Lemoo Rocca and Red Tripoli, may still be fed liberally with both manure and clear water, and in hot weather thorough drenchings overhead during late afternoon will greatly assist large heavy bulbs to develop.

#### PARSLEY.

The earliest batches of this are now growing away freely; the surface soil should be kept constantly stirred, and small dustings of soot applied during showery weather. Make yet another good sowing on deeply tilled ground on a south border.

E. BECKETT.

*Aldenham House Gardens, Elstree, Herts.*

#### ORCHIDS.

##### SOBRALIAS.

THESE form a genus of terrestrial evergreen ornamental Orchids, with reed-like stems, furnished with plaited sheathing leaves. The flowers of many of the species are large, some being 6 inches or more across. The most attractive feature of the flower is the wonderful lip, this sometimes being

3 inches broad. The flowers are produced from the top of the stems and vary in duration, but in the majority of the species as one flower decays another becomes apparent, six or more being produced in succession. Numerous species are included in this genus, the following being among the most beautiful: *S. macrantha*, *S. xantholeuca*, *S. leucantha*, *S. veitchiana*, *S. lucasiana*, *S. wilsoniana*, *S. sanderiana*, *S. virginalis*, and *S. Sanderae*. Most of the species have thick fleshy roots, and being freely produced, the pots should be ample in size, and the compost consist of rough fibrous loam and peat in equal parts, with an addition of coarse sand, or finely broken crocks, or charcoal, incorporated so as to ensure porosity. Drainage must also be ample, as an abundance of water is needed during the growing season, and at no time should they become slightly dry at the root, except when they are resting and during the dull winter months. They should be grown in a shaded position at the cooler part of the Cattleya house.

##### DENDROBIM PHALENOPTIS SCHRODERIANUM.

This beautiful and showy Dendrobium is one of the most useful for exhibition. The flowers are produced, fifteen or more in number, from the apex of the newly-made pseudo-bulb, and are 2½ inches or more across: they vary considerably in colour, some being almost white, others of brilliant hues. As these plants bloom in the autumn months the earlier they produce their flowers the better, especially if grown in smoky centres or near large towns. Being delicate they are unable to withstand smoke and fogs which prevail at that season, and so quickly destroy the buds and blooms. As the young growths advance and the plants become well rooted they should have every encouragement to develop their pseudo-bulbs as early as possible by keeping a high temperature, an abundance of moisture both at the root and in the atmosphere, and spraying the plants overhead twice or three times daily. The young growths should be examined at intervals and the house fumigated should thrip be present. The plants, though lovers of sunlight, should not be exposed to our hot summer sun too long, the thin shading used should be lowered by 8 a.m. and removed by 4 p.m., earlier or later according to the aspect of the house.

##### DENDROBIM DEAREI AND D. REVOLUTUM.

The former is a handsome species, the flowers produced in cluster-like racemes from near the apex of the bulbs; they are pure white with a green centre to the lip. The latter is a very pretty and distinct species, the flowers but little resembling those of a Dendrobium, the sepals and petals are white, the lower sepals being united and forming a sort of spur at back of flower. The lip is yellow with numerous reddish brown lines near the base, three running down the centre of the lip. Both species thrive well in a shady part of the stove or with the warm growing Cypripediums. They have been in bloom for a considerable time, and when the flowers are taken from them and growth again begins they should be repotted if necessary in a compost of equal proportions of peat and sphagnum moss.

##### DENDROBIM SANGUINOLENTUM.

This is a distinct and beautiful evergreen species, producing flowers in clusters from near the tops of the old pseudo-bulbs, which grow from 3 feet to 5 feet high, and continue to bloom for years; the flowers are more than an inch across, the sepals and petals fawn colour, tipped with rich purple, lip of a paler colour tipped with rich purple, having a bright orange blotch in the centre. This grows here freely with the general collection of Dendrobiums but in a more shaded position, it does not require the cool dry rest like many others of the genus, but should be kept in a moderately warm and moist house throughout the year. When growth begins repot if necessary, using equal parts of peat and moss. They frequently produce young plants upon the upper parts of the old bulbs, which should be taken off and potted up in the usual way.

F. W. THURGOOD.

*Roslyn Gardens, Stamford Hill, N.*

#### INDOOR GARDEN.

##### MALMAISON CARNATIONS.

ANY of these plants past their flowering period should be layered; the sooner the layers are rooted the earlier they will flower next season. Plunge the plants in a frame in an open porous compost of loam and leaf-soil, with a free admixture of fine charcoal and coarse silver sand. The growth nearest the base of the stem should be layered, thinning out the weaker growths if not required for stock. Strip the lower leaves away from the plants, and with a sharp knife cut through a joint and peg the layer into the soil at the incision, press the compost firmly round each layer. They must be shaded from bright sunshine, and great care is necessary in applying water to them. Until roots have been freely made keep them free from all insect pests. Border Carnations for pots may be treated in a similar way.

##### TREE CARNATIONS FOR WINTER FLOWERING

that have filled their flowering pots with roots should have a little weak manure and soot water to assist their growth. Great care must be exercised in watering these Carnations at this season, as if the plants get thoroughly dry the roots will suffer. I believe there are more failures from insufficient water than from the reverse. Freely syringe in the morning and again in the evening on bright days, using a little soot in the water, which helps to keep insect pests in check, and will greatly benefit the growth.

##### GLOXINIAS.

The early batches that are going out of flower will require little moisture at the roots and should be gradually ripened off. Later batches coming into flower should be placed in a dry atmosphere and the manure water discontinued. Seedlings for later flowering should be shifted into larger-sized pots as they require it. With liberal treatment they will make a good display in the autumn. Do not syringe the plants overhead, but give a moist atmosphere with a fair amount of shade.

##### POINSETTIAS.

The earliest rooted of these will be making satisfactory progress, and every encouragement should be given to promote a free growth. As the pots become full of roots the plants should be potted up, using a soil of two parts fibrous loam, one of leaf-soil, and the remaining part dried horse manure and sand. Keep the plants near the glass and do not overshade. Another batch of cuttings should be put in. These are most useful for decoration, and may be grown successfully in 3-inch pots if kept liberally supplied with liquid manure when well rooted.

##### EUPHORIA JACQUINELLORA.

When well grown this is useful for house decoration during winter, and every care should be taken to get a stout well-matured growth.

##### CLERODENDRON FALLAX.

This is now making rapid progress, and judicious feeding will have to be resorted to. Keep the plants in a warm moist atmosphere and supply plenty of moisture at the root or they will be liable to the attacks of red spider and thrip, which will soon disfigure the foliage.

JOHN FLEMING.

*Wexham Park Gardens, Slough.*

#### THE FLOWER GARDEN.

INTERESTING and beautiful plants at present much in evidence in the herbaceous border are the

##### CAMPANULAS.

Their form and colour are so much diversified that they can be used freely in any border without fear of monotony. Not the least beautiful and useful of the Campanulas are the different varieties of the Canterbury Bell, though, unfortunately, the period of blooming is very short; if, however, pains are taken to go over the plants when the flowers are past and remove the seed-pods a new flowering season will be secured three or four weeks later. The Canterbury Bell requires treating as a biennial, and should have been sown earlier in the year; but nearly all the perennial ones may be sown now either in boxes or in the open ground.

I prefer sowing in boxes, potting up in autumn, and wintering in frames with the object of flowering the plants the following year.

#### CAMPANULA PYRAMIDALIS

is a splendid perennial for the border. It loves a shady, moist nook, with plenty of good light soil, its tall, fleshy flower stems will then reach 5 feet or 6 feet high. The varieties of *C. persicifolia*, especially *C. p. maxima* (a giant form), *C. p. cornata* *cerulea*, and *C. p. c. alba* are admirable for borders, and are amongst the best and finest of the tall-growing sorts. *C. Platycodon grandiflora* is another splendid plant for the herbaceous border; it likes a light dry soil, as its fleshy roots are liable to decay in wet soils. It grows about 18 inches to 2 feet in height, and bears very large stately blue flowers. Grown in bold clumps

#### C. ROTUNDIFOLIA (the Wild Hare-bell)

is very pretty. It is the best of the small flowering species, though for variety *C. alpina* and *C. pumila* are deserving of cultivation. There is also *C. isophylla*, a very lovely Italian species, which is charming for the rock garden or for a dry wall, or even for the front of a border, if a part is particularly prepared for it by draining and putting light sandy soil for its roots, with some loose stones for it to cover. *C. Van Houttei*, bearing larger showers than almost any species, is very handsome and desirable, and should be in every border, as also should *C. cordata*, *C. petiolata*, *C. glomerata* in sorts, and the light blue *C. elatine*, nor should the pretty *C. nitida* and its varieties be forgotten.

H. A. PETTIGREW.

*Castle Gardens, St. Fagans.*

#### THE FRUIT GARDEN.

##### FIGS.

TREES planted in borders that are now relieved of their first crop of fruit should be thoroughly cleansed, red spider and other insect pests being got rid of. In bad cases it may be found necessary to sponge the foliage. The wood will have become firm during the time the fruit was ripening and in a fit condition to yield a moderate second crop, provided this is considered desirable. To assist the trees to bring this to perfection remove exhausted top-dressings, and replace them with decayed manure, keeping the trees carefully supplied with diluted liquid manure.

Trees growing in pots sufficiently large for ordinary purposes that were forced early, and have furnished a second crop of fruit, should now receive assistance. Remove exhausted surface soil, and replace it by fresh, which should be made firm by ramming, while their drainage, if it is in any way unsatisfactory, must be rectified. Young trees that require a shift into larger pots should be attended to without delay, clean, properly drained pots being used. The compost should be moderately dry, as it is necessary, in order to ensure fruitful growths being made, that it be firm, and it may consist of fibrous loam, enriched with horse manure, wood ashes, and fine mortar rubble. Failing these, use bone-meal fairly liberally for enriching the loam. Encourage free root growth by giving the trees house room until it has taken place, where they can be daily syringed and subsequently hardened. Ultimately arrange them outdoors in an open position upon a firm bed of ashes.

##### GRAPE SCALDING.

Some varieties of Grapes are very liable to injury from this cause, and, although Lady Downe's Seedling is the first to suffer, Alicante, Gros Maroc, and Muscat of Alexandria are not exempt. It usually occurs in inefficiently ventilated structures or from careless ventilation while the berries are passing through their stoning stage, and in some varieties it is impossible to prevent it, unless during that period a slight shade is afforded. We have a closely glazed large paned house that is imperfectly ventilated, and is devoted to Lady Downe's, in which it would be impossible to prevent considerable damage being done if it were not shaded at the time indicated, and the temperature thereby controlled. The way to guard against the evil is to adopt means to prevent moisture condensing on

the berries, and this may be done by keeping up a buoyant night temperature by artificial means, accompanied with slight ventilation. Ventilate early on bright days, increasing it at frequent intervals, so that a sudden rise in the temperature is prevented. Under these conditions the berries and air become uniformly warmed, and moisture settling prevented. Reduce the ventilation in the afternoon gradually, and not too early. In vineyards where the foliage is apt to be scalded similar means should be taken to avoid it.

##### YOUNG VINES IN POTS.

Young Vines that were shafted into their fruiting pots of 12-inch in diameter early last month will now have made considerable root progress, and require close attention to watering, so that the soil at no time becomes sufficiently dry to cause the leaves to flag or in a sodden condition. At this stage of growth assistance with diluted liquid manure given when the soil is moist will be beneficial. Keep the canes trained near the glass, fully exposed to the sun, and free from dust and red spider. This is not a difficult matter in the case of Vines of this description, provided a moist, buoyant atmosphere is given and the necessary syringing is attended to. Stop the leading growth at about 9 feet in length, and the laterals and sub-laterals at one leaf. Ventilate the structure sufficiently to prevent leaf scalding, and leave the ventilators slightly open at night, increasing the ventilation when the canes commence to mature. Keep the atmosphere somewhat dryer, but at no time permit red spider to get a foothold. As soon as the wood is well browned the canes must be placed in the open, with their pots upon a worm-proof bed, in preference against a wall or trellis, with a south aspect, where they should be supplied with sufficient water only to prevent flagging of the foliage.

T. COOMBER.  
*The Hendre Gardens, Monmouth.*

#### THE ROSE GARDEN.

L'INNOCENCE (H. T.).—The value of the Hybrid Tea for pots is now recognised, and they are not seen to better advantage than in a cool greenhouse during April and May. I had not realised how beautiful the above-named Rose is until this year. Outdoors its very thin petals are easily marred by heavy dews and wind, but under glass its beauty is apparent. I am not sure I do not prefer this variety to Kaiserin Augusta Victoria. It expands more freely under cool treatment, and its milky white colour approaches more closely to white. L'Innocence resulted from a cross between a seedling and Caroline Testout, and was raised by M. Pernet Ducher, who is surely entitled to the proud position of being the raiser of the best of our Hybrid Teas. The variety has somewhat the sturdy vigour of Caroline Testout, but without its coarseness, the flowers of L'Innocence being beautiful in form and very pure in colour; its fragrance, however, is very slight.

Rosa sinica Anemone.—The type *R. sinica* rarely succeeds in this country, unless it be in the Southern Counties, but there will be no difficulty in flowering the lovely hybrid named Anemone. The colour of the very large single flowers reminds one of that of *Anemone japonica*. It is very vigorous in growth, with brilliant shiny foliage, different to the type, but sufficiently resembling it to show the relationship, and it is very free flowering. Those who appreciate the charming early-flowering single Roses should look after *R. sinica* Anemone. It will be a grand pillar Rose, or it may well be grown trained over logs in a sunny position. Being a strong grower a root run of good soil should be provided, and such Roses repay one for attention in the way of occasional waterings with liquid manure.

Baldwin (H. T.).—When I saw this Rose some two years ago at Salisbury I thought it very promising. The colour is bright rose, very fresh and pleasing, but not remarkable, the good points of the variety being its wonderful productiveness.

To many this is a great consideration, and if one can cut quantities of Roses of a variety almost good enough for exhibition and at almost any time from June to October then this Rose must be welcome. Our American friends appear to have attached another name to the variety, for I can see no difference between Baldwin and Helen Gould. It will be a good kind for indoors, being so free flowering. The raiser, Hert Lambert, says that Baldwin was raised from Charles Darwin, crossed with Marie Van Houtte. I have often thought that Charles Darwin had a touch of Tea blood in its constitution. I know Mr. Laxton raised a number of kinds by crossing, although he never achieved any marked results. Earl Pembroke, one of Mr. Bennett's seedlings, is another instance in which Tea blood seems to enter largely into the variety, and its very perpetual flowering propensity gives some colour to that conjecture. Certainly I think the more we use these free-flowering kinds for seeding, even though the blossoms may not be quite up to our standard, we shall increase the number of brilliant-flowered perpetual blooming kinds.

Boadicea (T.).—A fine bunch of this beautiful new Tea Rose was seen in the Waltham Cross group at the Temple. The colour is most distinct and attractive, pale peach, delicately shaded with pink and violet, with a perceptible yellow tint at base of petals. The size and shape of the flower will make this Rose a favourite with exhibitors, and I shall be surprised if it does not take a foremost rank among show Teas. But one may say for Boadicea what cannot always be claimed for an exhibition variety, and that is, it is a splendid Rose for garden decoration, its free-flowering qualities, vigorous growth, and sweet violet fragrance all being points that should go to the making of a Rose of this description. Under glass it has quantities of most beautiful buds, and the more heat the Rose receives the more intense and charming is their colour.

Robert Scott (H.T.).—The free-flowering habit of this American novelty will make it valuable to all who force Roses for early cutting. The flower seems to be intermediate between Mrs. Sharman Crawford and Comtesse de Sereny. Its colour is not unusual when a variety with blooms of Hybrid Perpetual size partakes of the free-flowering qualities of the Teas and Hybrid Teas; it is clearly more useful than an ordinary so-called Hybrid Perpetual. It is said to be a cross between Merveille de Lyon and Mrs. W. J. Grant, and resembles the former in some respects, except that of colour, and there is not the hollow centre that is a serious blemish in an otherwise fine Rose.

PHILOMEL.

#### SOCIETIES.

##### RICHMOND HORTICULTURAL SOCIETY.

THE twenty-eighth annual exhibition of the above society, from the floral or general horticultural point of view, can hardly be regarded an unqualified success. At the same time we are bound in common justice to the exhibitors and equally the society to make this statement, that rarely if ever have we seen finer Roses or vegetables than were to be seen in the leading competitions in the Old Deer Park on this occasion. That there was some vacant or unoccupied space we are bound with regret to admit, and we know perhaps of the reason for this, which may not be clear to some of the visitors to the show.

In the exhibits of cut Roses and also the vegetables the shortness of competitors was not a little due to the weather and the lateness of the season; but to the credit of the Richmond society be it stated in view of these facts the gardeners' orphans had not been overlooked; indeed, a special marquee, presided over we believe by Mrs. C. King, the wife of the esteemed honorary secretary, and assisted by many ladies, was set apart expressly with a view of assisting the Gardeners' Royal Benevolent Institution. This tent, replete with fruits, flowers, &c., played a by no means unimportant part in the day's proceedings, and the above institution should certainly benefit thereby, if we may judge by the exertions of Mrs. King, and her little band of willing co-operators.

##### NON-COMPETING GROUPS.

As is usual at Richmond, the non-competing groups were good, as well as large and numerous, the majority being contributed by local nurserymen. Foremost among these was a group of much interest from Mr. John Russell, whose display of hardy shrubs, conifers, and evergreens, was very pleasingly arranged. From a large number of things we selected *Dimorphanthus Manschuricus* fol. argentea marginata, not merely for a most unwieldy title, but for its

picturesque Aralia-like habit of growth. In another tent the same firm set forth a telling array of stoe and green-house plants in such a way that made it clear Mr. Russell is quite as good in the cultivation of tender subjects as in hardy kinds. A silver-gilt medal was awarded.

Mr. W. Thompson, Sheen Nurseries, Richmond, also had a fine group. Silver-gilt medal. Another excellent group of a local nature came from Mr. W. Fromow, Chiswick, whose array of Acers in their many tints made a most agreeable and pleasing study in these plants. Silver medal.

Not the least among the non-competing groups was that of Roses from Messrs. James Veitch and Sons, Limited, Chelsea, and elsewhere. Indeed, it was not merely a fine group, it was a formidable one, revealing to all what could be done with pot Roses. There were upwards of 200 plants, and these largely were contained in 9-inch pots, and being finely flowered made a grand display as a whole, the plants throughout being naturally grown, well flowered, and very encouraging. We do not pretend to mention one-half the varieties shown, but among the more conspicuous were Mrs. J. Laing, Caroline Testout, General Jacqueminot, Jennie Dickson, Victor Hugo, Thos. Mills, La France, Earl Lulfrin, Perle des Jardins, &c. *Gardenia*, a semi-double kind, is very beautiful, the soft yellow buds presently revealing a nearly snow-white flower of good size. The variety is very free and of climbing habit. Silver-gilt medal.

In the forefront of one large tent, Sir F. Wigan, Bart., Clare Lawn, East Sheen (gardener, Mr. W. H. Young), staged a fine lot of Orchids in bloom, among which we noticed many good Cattleyas of the Mossiae and gigas forms, together with other rare hybrids and varieties. Silver-gilt medal.

Messrs. Feed and Sons of Norwood received a silver medal for a group of *Gloxinias* of a capital strain, in which C. Young, a velvet-crimson; Countess of Warwick, pink; Bonne de Neige; Mrs. G. W. Sanday, white; and Mrs. W. Weaver, pink spotted, were of the best. Flowers of a good strain of Legonias were also set up.

Hardy plants found such well-known firms as Messrs. T. S. Ware and Barr and Sons displaying them to advantage, the former bringing large numbers of *Campanulas*, *Delphiniums*, Early *Phloxes*, *Lupinus arboreus*, *Calochorti*, such *Lychnises* as *haageana* and *L. vespertina plena*, some beautiful *Liliums*, and handsome cut specimens of *Romneya Coulteri*, pure white flowers, 6 inches across, being very much admired. Some pretty masses of *alpinus* in pans included *Thymas montana alba* and *T. coccinea*, and the very beautiful *asperula hirta*, dainty and pleasing to a degree. *Begonia Bavaria* is the dwarfest and most free-flowering bedding Begonia we have seen; it is barely 6 inches high, a mass of scarlet-crimson flowers. Silver medal.

Messrs. Barr had in their lot many fine English bellions Irises, Poppies in variety, quite a colony of their showy Peonies and *Delphiniums*, *Potentillas*, *Lychnis haageana*, *Gilia trifoliata*, a fine display of the early *Gladioli* Blushing Bride and Early Moon, several pretty *Heucheras*, the showy *Imula glandulosa*, with intense golden flower heads, and the huge grotesque spathe of *Arum Dracunculus* were among the more striking in a very fine lot of flowering things. Silver medal.

#### COMPETING GROUPS.

Great pressure upon our space precludes the hope of a detailed report, and we therefore take some of the more important features, as e.g., the large Rose class and some others.

The principal Rose class was for forty-eight Roses, distinct, three blooms of each—144 blooms—a large and imposing array for a single exhibitor. The first prize, which this year was easily won by Messrs. F. Cant and Co., Colchester, is the Gunnersbury Park cup, to be held by the winner for one year. There were also prizes in money attached to the three best sets of blooms. There were but two competitors, however, the Messrs. Cant's flowers being of excellent quality throughout. We take the following as among the best blooms: Margaret Dickson, A. K. Williams, Mrs. Cocker, Victor Hugo, Prince Arthur, Marie Baumann, Captain Hayward, Ulster, Gladys Harkness, Marchioness of Downshire, Bessie Brown, Mrs. J. Laing (very fine), Comtesse de Ludre, Vicomtesse Folkestone, Sonv. S. A. Prince, Helen Keller, Rev. Allen Cheales, Mme. A. Chatenay, Fisher Holmes, Zabier Olibo, Mrs. F. Cant, Mrs. Sharman Crawford, &c., a really fine lot, and particularly so for the season. Messrs. D. Prior and Sons, also of Colchester, took the second prize in this important class.

Messrs. F. Cant also took first prize for a dozen blooms of one variety, showing Mrs. J. Laing in superb fashion; indeed, there was no weak or faulty bloom in the lot. Messrs. Prior came second with Marchioness of Downshire.

The premier classes for vegetables and fruit were also of much interest, and not a few were surprised in the special class for vegetables provided by Messrs. Carter and Co. to see Mr. E. Beckett, Lord Aldenham's well-known gardener, in the second place. The first prize was awarded to R. W. Hudson, Esq., Danesfield, Marlow (gardener, Mr. J. Gibson). His collection of nine kinds was as near perfection as possible, and many leading gardeners frankly admitted they had never seen finer produce. Pea Duke of Albany was a magnificent sample, and such perfect bloom on the pods. Lord Aldenham, Elstree (gardener, Mr. E. Beckett), was second with a good selection.

In the collection for twelve kinds of vegetables Lord Aldenham was first, with Colonel Bosworth second.

For six dishes of fruit in the special division G. C. Raphael, Esq., of Englefield Green (gardener, Mr. H. H. Brown), was first, having Royal Sovereign Strawberry, Melon Hero of Lockinge, with Foster Seedling and Black Hamburg Grapes; Hon. Mr. Justice, Oatlands Lodge, Weybridge (James Locke, gardener), being a good second.

For three bunches black Grapes (Madresfield Court) was shown by Earl Onslow (Mr. W. Black, gardener), who was first, with W. E. Wells, Esq., Hounslow, second, with Black Hamburg.

For three bunches white Grapes, the Hon. Mr. Justice

was first with Foster's Seedling, L. G. Baker, Esq., Chertsey, being second.

For a group of plants arranged for effect in a space not to exceed 100 square feet, Mr. H. E. Fordham, of Twickenham, was the only exhibitor, having a capital group.

For a bouquet for the hand, Mr. Wm. Hayward, Kingston, was first: Miss Cole, Feltham, was second.

For six exotic Orchids, Sir Frederick Wigan, East Sheen, was first.

There were many classes for floral and other arrangements in baskets, &c., but in these we saw nothing novel or distinct that would be likely to interest our readers generally.

#### SOUTHAMPTON.

THE annual summer show was held on the 1st and 2nd inst., in the pavilion on the pier, and was a success.

#### PLANTS.

These were numerous and good. For four specimens Mr. T. Hall, gardener to Sir Samuel Montagu, Bart., South Stoneham House, Southampton, was first, staging good *Crotons* and a nicely flowered plant *Ixora Williamsii*. Groups of miscellaneous plants were arranged down the centre on the floor, and very pretty they looked, possessing, as they did, much taste in arrangement.

Mr. E. Wills, The Nurseries, Winchester Road, Shirley, secured the leading award with an exhibit that left little to be desired: Mr. Hall was second.

Messrs. Hooley Bros. had a good exhibit of Orchids in the class set apart for them arranged for effect. *Cattleya Warnerii*, *C. Harrissonii violacea*, with *Odontoglossums* in variety made up an imposing display.

Ferns were shown in quantity. Mr. F. M. Vokes, Birch Lawn, Sholing, won for four specimens with healthy examples; Mr. F. Cozens, Rowhams, was second.

#### ROSES.

The principal class was that for thirty-six distinct varieties. Mr. G. Prince, Longworth, Berks, secured the leading award with medium-sized highly-coloured examples of such varieties as *Horace Vernet*, *Bessie Brown*, *La France*, *Bridesmaid*, *Souvenir d'Elise Vardon*, *Marquise Litta*, Mrs. J. Laing, and *Marchioness Duferin*; Messrs. D. Prior and Sons, Colchester, were second, with Messrs. Rogers and Sons, Bassett Nursery, Southampton, third.

For twelve triplets Mr. Prince was again successful, staging such varieties as *Marie Van Houtte*, *Maman Cochet*, *The Bride*, *Souvenir d'un Ami*, *Comtesse de Nadillac*, *Souvenir de F. A. Prince*, and *Princess of Wales*; Messrs. D. Prior and Sons were again second prize winners.

For twelve Teas there was a strong display of even, good examples, Mr. Prince again securing the leading award—Messrs. E. Mawley, The Bride, Catherine Mermet, and *Maman Cochet* were noteworthy examples; Messrs. Prior second; Messrs. Rogers third.

*Marquis de Litta* won for Mr. G. W. Kent, gardener to Mrs. C. Croft Murray, Perivale, Ryde, J.W., the premier award in the class for six blooms any one dark variety.

Gardeners and amateurs had several classes set apart for them. For eighteen distinct, Mr. Kent was the most successful, winning with fully representative examples of A. K. Williams, *La France*, Helen Keller, and Susannah Marie de Rodocanachi; Mr. W. Nevil, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, was a good second.

Tea or Noisette varieties were well shown by Mr. Neville, Anna Oliver, The Bride, Nipheta, Catherine Mermet, Mrs. E. Mawley, and *Marie Van Houtte* were some of the best in an even stand, Mr. Kent following closely, with Dr. D. Seaton a good third.

Roses arranged in a basket made a pretty feature. Miss Snellgrove, Oxford Road, Southampton, won distinctly with a superior exhibit.

For the best decorated vase or *épergne*, Miss Wadmore, Brook House, Easingstoke, secured the leading award with one of her characteristic displays, which at all times commands attention.

Bridal and ball bouquets were contributed by Mr. F. Ealey, florist, Southampton, and Mr. E. Wills, the prizes going in the order here given.

Hardy border flowers were magnificently displayed. For twelve bunches, distinct, Mr. B. Ladham, The Nurseries, Shirley, Southampton, was easily first with a grand lot. Such plants as the following were well represented: *Dictamnus fraxinella*, *Geum atrosanguineum plenum*, *Betonica superba*, *Iris gigantea*, *Corydalis Eldorado*, *Spiraea auruncus*, *Delphinium Navy Blue*, *Gaillardia maxima*, *Campanula persicifolia gigantea*, *C. p. Porcelain*, *Dianthus abbotsfordiana*, and *Heuchera splendens*; Mr. Hall was second.

Sweet Peas were well staged. For nine bunches distinct Mr. Yokes won with huge blossoms of popular varieties.

Vegetables were contributed in quantity, while the quality left little to be desired. In the class for six varieties, for which Messrs. Toogood gave the prizes, there were five entries. Mr. E. Beckett, gardener to Lord Aldenham, Aldenham House, Elstree, secured the leading award with Godgood's Wonderful Tomato, Southampton Wonder Potato, Walcheren Cauliflower, and White Leviathan Onion; Mr. Davies, gardener to Lord Aberdare, Longwood House, Winchester, a good second; Mr. Bowerman, gardener to Lord Bolton, Hackwood Park, third. In a similar class, in which Messrs. Sutton, seedsmen, Reading, provided the prizes, no less than seven competed, making a fine display.

Mr. Gibson, gardener to R. W. Hudson, Esq., Danesfield, Marlow, was first with exceedingly fine examples for the season of such as Supreme Potato, Magna Bonum Cauliflower, Perfection Tomato, Duke of Albany Pea, New Red Intermediate Carrot, and White Leviathan Onion.

Mr. Beckett followed closely with produce of a high quality. TRADE EXHIBITS.

Mr. Ladham, Shirley, Southampton, arranged an extensive group of herbaceous plants, consisting of at least six dozen bunches of border Pinks, for which he is famous. Such plants also as *Gaillardias*, *Delphiniums*, *Spiraeas*, *Lilies*, *Iris*, and *Peonies* were characteristically displayed.

Messrs. Dobbie and Son, Rothesay, were worthily represented with a huge collection of Sweet Peas, Violas, and Pansies, which added much to the interest of the show.

Messrs. Toogood and Sons, Southampton, had hardy cut flowers in great variety.

Messrs. W. H. Rogers and Son, Southampton, Roses in pots, shrubs, and hardy flowers generally.

Mr. Newton, gardener to W. Garton, Esq., Roselands, Woodston, staged an excellent group of Carnations, *Gloxinias*, *Pelargoniums*, *Crotons*, and Ferns, which made an imposing display.

#### THE NATIONAL ROSE SOCIETY'S SHOW AT EXETER.

ESTABLISHED over seventy years ago, the Devon and Exeter Horticultural Society deserves well of its county and the West of England generally, for during all those years it has strenuously endeavoured to increase the love of flowers and plants by holding periodical exhibitions in the old cathedral city. Of late years the society has, unfortunately, been compelled to struggle against an adverse fate. Time after time the clerk of the weather has selected the day of the exhibition for a continued downpour, and on one occasion its *Chrysanthemum* show clashed with that of Plymouth, to which town the larger prizes offered had the effect of attracting the majority of exhibitors. Under these circumstances it is not surprising that its finances have suffered, but strong hopes were expressed by Sir Edgar Vincent, K.C.M.G., the Member for Exeter and president of the society, at a lunch held on the day of the show, that the visit of the National Rose Society and the unaccustomed fine weather it had brought with it would turn a deficit into a surplus, and enable the society to continue its work of usefulness for many a day to come. At the conclusion of the repast a handsome silver salver was presented to Mr. G. D. Cann, who for a period of fifteen years has ably carried out the onerous duties of hon. secretary.

Owing to the late and cold season the exhibits were not as numerous as they would have been in a more genial summer, but in both the professional and amateur sections splendid blooms were staged that evoked the admiration of the numerous visitors of both sexes that on the 4th inst. thronged the spacious marques, and between whilsts sat under the shade of the great Elms in the beautiful Northernhay Gardens and listened to the strains of the Royal Marine band.

In the premier nurserymen's class Messrs. D. Prior and Sons reversed the Temple and Holland House placings and won the silver cup. The greatest number of prizes was won in the nurserymen's classes by Mr. G. Prince, and in the amateurs' by Mr. A. Hill Gray, both carrying off seven.

#### NURSERYMEN.

Forty-eight blooms, distinct varieties: First, Messrs. D. Prior and Sons, Colchester, with—Front row, Duke of Edinburgh, Ulster, Charles Darwin, Comtesse de Nadillac, Killarney, Mme. Chade, Eugene First, Mayronne, Liberty, Mine, Lacharne, Duke of Wellington, *La France*, Horace Vernet, Cleopatra, Fisher Holmes, and *Maman Cochet*; middle row, Marguerite Bondet, E. Y. Teas, Mrs. W. J. Grant, Mine, Delville, Marchioness of Downshire, Oscar Cordee, Marchioness of Londonderry, Docteur Audry, *Bessie Brown*, Camille Bernardin, Kaiserin Augusta Victoria, Dupuy Janain, Maréchal Niel, A. K. Williams, Marie Verdiere, and Dr. Sewell; back row, Suzanne M. de Rhodocanachi, Mrs. R. G. Sharman Crawford, Mrs. John Laing, Prince Camille de Rohan, *Marquise Litta*, Marie Baumann, Mrs. Cocker, *White Maman Cochet*, Gustave Piganeau, Her Majesty, Ulrich Brunner, Mildred Grant, Comte de Rainbold, Lady Mary Fitzwilliam, Captain Hayward, and Mme. Gabriel Luizet. Second, Messrs. B. R. Cant and Sons, Colchester, whose new seedling, Ben Cant, was very bright. Third, Messrs. F. Cant and Co., Colchester. Fourth, A. Dickson and Sons, Newtownards, County Down, Ireland, whose stand held the premier Hybrid Perpetual Bloom, Marchioness of Downshire.

Twenty-four distinct: First, Mr. G. Prince, Oxford, with—Front row, Captains Hayward, Comtesse de Nadillac, Prince Arthur, Bridesmaid, General Jacqueminot, Mine, G. Luizet, Earl Duferin, and The Bride; middle row, Marchioness of Downshire, Dupuy Janain, *Souvenir de S. A. Prince*, Ulrich Brunner, Muriel Grahame, Suzanne M. de Rhodocanachi, Princess Beatrice, and Marie Baumann; back row, Mildred Grant, *White Maman Cochet*, *Marquise Litta*, *Maman Cochet*, Mrs. J. Laing, *Bessie Brown*, A. K. Williams, and Mrs. R. G. Sharman Crawford. Second, Messrs. Townsend and Sons, Worcester.

Twenty-four distinct varieties, three blooms of each: First, Messrs. D. Prior and Sons, with A. K. Williams, *Bessie Brown*, Caroline Testout, Gustave Piganeau, Marie Baumann, Mrs. Cocker, Kaiserin Augusta Victoria, Captain Hayward, Prince Arthur, Mrs. R. G. Sharman Crawford, Mrs. W. J. Grant, Crown Prince, Duke of Edinburgh, Mme. G. Luizet, *La France*, Helen Keller, Fisher Holmes, Mrs. John Laing, Mine, Lacharne, Horace Vernet, Duke of Wellington, Lady Mary Fitzwilliam, Marchioness of Downshire, and Ulrich Brunner. Second, Messrs. B. R. Cant and Sons. Third, Messrs. F. Cant and Co. Extra prize, Messrs. A. Dickson and Sons.

Twelve blooms, any Rose, except Tea or Noisette: First Messrs. Townsend, with *Bessie Brown*. Second, Messrs. D. Prior and Son, with the same Rose. Third, Mr. G. Prince. With Mrs. R. G. Sharman Crawford.

#### TEA AND NOISETTE SECTION.

Twenty-four blooms, distinct varieties: First, Mr. G. Prince, with—Front row, Muriel Grahame, *La Boule d'Or*, Mine, de Watteville, E. V. Hernando, Cleopatra, Jean Ducher, Innocente Pirola, and Princess Beatrice; middle row, Comtesse de Nadillac, Catherine Mermet, Medea, Ernest Metz, Princess of Wales, *Souvenir d'Ami*, Etoile de Lyon, and Mme. Cusin; back row, *Maman Cochet*, *premier Tea* in nurseries' classes; The Bride, Bridesmaid, Rubens, Mrs. E. Mawley, *White Maman Cochet*, Elsa de Turenne, and *Souvenir d'Elise Vardon*. Second, Messrs. F. Cant and Co. Third, Messrs. D. Prior and Son.

# THE GARDEN

No. 1600.—VOL. LXII.]

[JULY 19, 1902.

## FAILURE OF LILIES.

**W**E have received many complaints of the failure of Lilies in general, not the white Madonna Lily only, but of kinds that seldom fail to flower abundantly in their appointed season. The subject is of general interest at the present moment, and therefore it will be well to find out the cause of the wholesale failure of colonies that have been undisturbed for many years.

A cold, wet spring, with intervals of strong sunshine, and severe frosts in early summer, have been responsible for many Lilies failing this season. *Lilium Hansoni* and *L. Henryi*—two good garden Lilies that seldom fail to flower well in most situations—have lost their buds and much of their fresh leafage in cold situations and moist valleys. Happily, experience has proved that injury to these plants is only temporary, and the bulbs, if old-established, appear none the worse for this check to their growth. Lilies of the Martagon type, especially the beautiful Martagon album, have also suffered severely, but the injury to these is local. Newly-planted bulbs of *L. Brownii*, *L. Humboldtii*, and *L. longiflorum* in variety, all of which are difficult to tide safely through a cold, wet spring, have in many cases failed to grow; water settling in the bases of the bulb scales and freezing there has fractured the tissues, and successive heavy rains have completed the wreck of the bulbs, which in ordinary seasons would have made some effort to grow or have produced plenty of bulbils from the scale-bases instead of rotting completely. Mishaps such as these, though fortunately rare, emphasise the need of protective covering during winter. The bulbs are made up of brittle, closely-fitting scales, without any protective tunic, and are particularly susceptible to injury from frost or wet, especially when quite dormant and newly planted. The Tulip, Hyacinth, Colchicum, and Camassia have sealed conical bulbs which throw off unnecessary moisture.

Lilies in a growing state are less liable to injury below ground, as the stem roots (where present) search among the scales for moisture, and maintain a more genial condition. Newly-planted bulbs of most Lilies are best wintered under a protective layer of litter, Fir branches, or similar material, whilst Fir boughs, inserted in the ground so as to cover the growing points of Lilies in late spring, will do much to

ward off sharp frosts, such as those we have lately experienced.

The *Lilium candidum* disease (*Botrytis sp.*) is always most virulent in a cold spring, attacking not only *L. candidum* but *L. excelsum* as well. It gives the greatest trouble a few days after a severe frost when the wet flaccid leaves offer the best conditions for spore germination. The only method of combating this disease is to spray the plants heavily several times during early growth with sulphate of potassium half an ounce to the gallon of cold water. This mixture speedily kills the fungus and the spores also, and if the surface of the soil is sprayed there would be less fear of a recurrence of the attack. The bulbs would not require lifting, as sufficient potassium would penetrate to them by way of the stem and by soaking through the soil. The old-established bulbs have a better chance of resisting disease the following year than they would if they were lifted for a dressing.

No matter what measures are taken to keep stocks free from disease we shall never succeed in stamping out the white Lily disease until some restraint is put upon our wholesale merchants, who still persist in importing French *L. candidum* bulbs, the majority of which are reeking with disease, though they do not show it until they start into growth. Scarcely 5 per cent, we are told, of these bulbs survive the third year of planting. In every case it would be a good precaution to dip the bulbs for a few minutes in the preparation of potassium before planting. Flowers of sulphur is another good remedy to apply to the bulbs, but it must be used carefully as it completely sterilises soil with which it comes in contact.

A peculiar disorder affecting *L. auratum*, popularly known as "sunstroke," is probably due to climatic or cultural conditions. Plants, apparently healthy and thriving, suddenly cease growth, the growing point keels over, the tiny immature buds turn brown and drop off, followed by the leaves. Then the stem becomes flaccid, withers, and dies down to the ground level. The bulbs when lifted show no trace of disease, being firm, plump, and healthy, and the roots in most cases clean and vigorous. Numbers of bulbs have been submitted to us showing the same characteristics, nearly all were newly planted that year, and they invariably went wrong during a period of great heat or when the weather suddenly changed. From the reports of correspondents and our own observations it was possible to gather that only those plants

in full sunshine, and planted late in the season, were affected in this way, hence we feel disposed to think that they received a check due to absence of moisture in the soil or to the heat destroying the root hairs nearest the surface. The stem roots are produced just below the surface, and are exposed to fluctuations both of heat and of moisture. It must not be forgotten that *L. auratum* is not a plant of the plains but a native of cool hillsides covered with shrubby growth, where its roots would be protected by other vegetation, and some such conditions must be afforded it under cultivation. Other Lilies, such as *Brownii*, *odorum*, *Kramerii*, &c., which have only modified leaves on the lower part of their stems, succeed best amongst dwarf growing plants as a root screen. They derive their main support from stem roots, and these must have a moist, cool and congenial root-run such as would be found beneath a close tangle of scrub. If it is not possible to plant *L. auratum* and allied species with protective plants about them, then such steps as are possible must be taken to ward off heat and retain moisture in the soil. A mulch of soil and manure may do much good, but there is nothing to approach a screen of protective plants that would help in the winter also by withdrawing moisture from the scale-bases, where it is least wanted. We feel we must attribute "sunstroke" to the practice of growing a shade-loving plant in open sunshine, exposed to hot, dry winds. Only those plants that produce abundant stem roots suffer in this way, and these are generally found wild in scrub. Plants like *L. Martagon*, *colchicum*, *Hansoni*, &c., grow wild in exposed situations; they produce very few stem roots, and never suffer from "sunstroke." They are benefited by a sun-screen about their roots, but they can do without it. We believe the cultivator of the future will give greater attention to this matter than has hitherto been the case.

## THE HORTICULTURAL CLUB.

UNDoubtedly one of the most interesting and at the same time useful reunions in the horticultural interest which this club can record took place at the Windsor Hotel, on Tuesday, the 8th inst., on the occasion of the monthly dinner. About thirty members and guests were present. Mr. Harry Veitch took the chair, and the chief guest of the club was Mr. H. M. Arderne, now on a visit here from Cape Colony, where he is the happy possessor of what, by the descriptions and photographs, appears to be a veritable paradise for flower and tree lovers. This lovely and interesting domain, however, in 1840 was rough bush land, but with contour

and possibilities in the landscape line, enhanced to an enormous degree by the immediate vicinity of Table Mountain itself, which inspired Mr. Arderne's father in the first place to improve it, and himself in the second to bring it to its present state of perfection. As Mr. Arderne's paper, which gives the names of most of the striking trees and plants appearing in the photographs, some of which were panoramic, will appear in full in the Journal of the Royal Horticultural Society, we may here, despite the attractiveness of this part of the entertainment, yield to the exigencies of space and touch rather upon the economical points raised by the paper and discussed subsequent to its reading. Mr. Arderne, although the guest of the evening, was not the only one. Professor Henslow, also just returned from the Cape after a four months sojourn, was another, and our Canadian Colonies were hospitably entertained in the person of Mr. McKinnon, who represented Official Agriculture in that country. These gentlemen took a prominent part in the discussion, as also did the Rev. W. Wilks, Mr. Elwes, F.R.S., Mr. Garcia, and Mr. George Monro, each representing different but very practical phases of general horticultural experience. Professor Henslow called attention to the peculiar adaptation of Cape plants to stand the drought to which they were usually exposed, and following an enquiry by Mr. Elwes, referred particularly to the spread of imported plants, to the singular case of *Oxalis cernua*, a plant not known to seed at all, multiplying only by root bulblets, and yet two or three bulbs planted in Malta in 1804 have succeeded in invading the entire Mediterranean region. Mr. Elwes stated that in many parts of Chili our English trees have obtained such a foothold as to give a most misleading appearance as regards locality to the landscape, and Mr. Arderne confirmed this as happening to some extent at the Cape. The most practical part of the general discussion was aroused by a remark of Mr. Wilkes, anent the comparative unfitness of the William Pear to stand long journeys unimpaired, and the greater adaptability for this purpose of the Winter Nelsi and other winter kinds. This lead to a general consideration of the foreign fruit question, with special reference to the opening now presented by the establishment of peace at the Cape, for improving the methods of fruit culture in that extremely favourable climate, and thus adding another great British Colonial source of fruit supply to the world. So far it would seem that, with some few exceptions cited by Mr. Arderne, the fine arts of fruit culture, such as the thinning out of Grapes and careful selection, were practically ignored to the great detriment of the ultimate results, while given the more careful culture it was abundantly manifest by the description given that splendid crops could be obtained, much of which would be exportable if the various kinds were selected on the lines suggested by Mr. Wilkes, viz., suitability, not merely to the British demand, but also for transport without deterioration. As a side issue, the Canadian trade was discussed, and also that of California, to which fruit producing domains the question of suitable kinds, especially Apples, there being apparently too blind an adherence to precedent in the formation of new orchards. The entire discussion was so replete with sound practical suggestions that it would be highly desirable that the pith of it should appear as an addendum in the Society's Journal, to the valuable paper which evoked it. In any case fresh evidence is afforded that the Horticultural Club is not merely a social horticultural centre, but is also of great practical service in bringing good men together.

#### EDITOR'S TABLE.

##### GREEN PEAS FROM DERBYSHIRE.

I have enclosed a few pods of Drummond's Primus Pea, of which I have a splendid crop in this very cold part of Derbyshire. Early Peas in this district are generally very poor. These Peas were sown in December, 1901, and have grown 6 feet to 7 feet high. Drummond's Primus ought to be more often grown than it is. I think there

is no other Pea to compare with it for quantity and quality; it is also very hardy and early.—E. CLEMENTS, *The Gardens, Brookhill Hall, by Altrington.*

[Mr. Clements sends some excellent pods of Peas, and we can well believe this to be a valuable variety in this cold district.]

##### DIANTHUS DELTOIDES.

This charming native Pink has been sent to us by "H. R." Chiswick, who writes: "This little pink is growing freely in my rock garden at Chiswick, which, as you are doubtless aware, is a suburb of London. Its bright pink flowers are very pretty. It is a good plant for a wall."

#### NOTES OF THE WEEK.

##### FORTHCOMING EVENTS.

July 19.—National Rose Society's Northern Show, Manchester.

July 22.—Royal Horticultural Society's Committees meet; National Carnation and Picotee Show, both at Drill Hall, Westminster.

July 23.—Cardiff and County Horticultural Show (two days); Newcastle Exhibition (three days).

August 4.—Grantham and District Horticultural Show.

August 5.—Royal Horticultural Society's Committees meet, Drill Hall, Westminster; Leicester Flower Show (two days).

August 7.—Midland Carnation Show, Birmingham (two days).

August 9.—Manchester Carnation Show; Crewe Horticultural Exhibition.

August 12.—Clay Cross Flower Show.

August 13.—Salisbury Horticultural Show.

August 14.—Taunton Dean, Rock Ferry, and Sheffield Horticultural Shows.

**Midland Carnation and Picotee Show.**—We are authorised to state that this exhibition will be held at Birmingham on Thursday and Friday, August 7 and 8.

**National Dahlia Society.**—A meeting of the committee of the above society will be held, by kind permission of the Horticultural Club, in the Club Room at the Hotel Windsor, Victoria Street, S.W., on Tuesday next, at 4 p.m. Business: Election of Judges; Advertising Exhibition; other business.—J. F. HUDSON, Hon. Secretary.

**Royal Horticultural Society.**—The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday next in the Drill Hall, Buckingham Gate, Westminster, 1–6 p.m. At this meeting plants—other than for certificate—can only be shown in very small groups, and only then by rearrangement with the superintendent. A lecture on "The Botanic Gardens and Flora of Malta," illustrated by limelight, will be given by the Rev. Professor George Henslow, M.A., V.M.H., at three o'clock. At a general meeting of the above, held on Tuesday, the 8th inst., seventy-four new Fellows were elected, amongst them being Viscountess Strathallan, Lady Fermoy, Lady Savile, Lady Clementi-Smith, Sir Cecil Clementi-Smith, K.C.M.G., Colonel Carruthers, and the Hon. Cecil Campbell, making a total of 826 elected since the beginning of the present year.

**National Chrysanthemum Society.**—The annual outing and picnic of this society will take place on Wednesday next, when, by kind permission of Sir Weetman Pearson, Bart., M.P., the gardens and grounds at Paddockhurst, Worth, Sussex, will be visited. The company will be conveyed to the Three Bridges Station by the London, Brighton, and South Coast Railway. Trains leave Victoria at 10.40 a.m., Add'son Road (change at Clapham Junction) 10.15 a.m., London Bridge 10.5 a.m. Members and friends are, however, requested to meet at Victoria, if possible. The train leaves Three Bridges at 8.30 p.m. Application for tickets, which are 10s. each, should be made to Mr. Richard Dean, Ranelagh Road, Ealing, W., at once.

**Some really distinct and good new Zonale Pelargonia.**—Amongst a

THE MAIDEN PINK (*DIANTHUS DELTOIDES*).  
(Natural size.)

large and so well filled with flowers as to make it a most desirable variety. *Fraicheur*: This is quite the most beautiful double-flowered variety with a distinctly marked Picotee edge that I have yet seen. It is a distinct improvement on that fine old French double, *Mme. Alcide Bruneau*, which remained so long without any rival. The new comer, however, is much more delicate in colouring, and with well-formed and most evenly-margined pips. *Olive Schreiner* is also a very fine Picotee, edged double with larger and more double flowers, but it is not so delicately beautiful as *Fraicheur*.—W. E. GUMBLETON, *Ballygore, Queenstown, Ireland*.

**Ealing Horticultural Society's show at Gunnersbury Park.**—It would be difficult to select a better and more suitable spot for a flower show than Gunnersbury Park, the charming suburban retreat of the Messrs. de Rothschild, so full of arboricultural and horticultural interest. Since the above society held its previous summer show here many improvements have been made, not the least of which being the removal of the wall dividing the grounds of Gunnersbury House from Gunnersbury Park, thus giving a greater extent of beauty and interest to both places. With a truly kindly characteristic forethought and practical way of showing his well-known interest in gardening charities, and well worthy of being imitated in many private gardens, Mr. Leopold de Rothschild threw open the delightful Japanese garden at Gunnersbury House for inspection by visitors to the show, the proceeds derived from the admission charge being devoted to those splendid charities the Gardeners' Orphan Fund and the Gardeners' Royal Benevolent Institution. The elements were decidedly unpropitious on July 9; it is to be feared, therefore, that Mr. Leopold de Rothschild's excellent idea did not meet with the success it so richly deserved, and that the society itself did not secure that financial harvest it looked forward to reaping.—*Quo.*

number of new varieties of these most free blooming and ornamental greenhouse plants that have bloomed with me this spring, the following four varieties seem to me to be especially worthy of commendation for distinctness and beauty of colouring, being real improvements on any that I have yet seen:—R. A. de Lasaux is a most beautiful combination of colours in the way of that fine variety *Melenic*, but with deeper ground colour and larger and purer white eye, the petals also being well rounded, and the form of the pip flat and good; quite a lovely variety. Gustave Girardin (Gerbeaux): The most brilliantly-coloured of all the so-called French bicolors, and though the individual pips are somewhat thin in quality and lacking in substance, the truss is so

**Gerbera Jamesoni.**—The following note about this beautiful plant is interesting:—"My son sent me some roots of Barberton Daisies (*Gerbera Jamesoni*) from Barberton, near Transvaal, on May 7. They were potted here on June 2. Some are in bloom now. I think it may interest you and your readers to see a sketch of one. The flowers vary in colour from rich red to pale coral-pink. The pistils of the central florets are black in some and yellow in others. The leaves are a rich dark green. I have four different colours in bloom now.—EDITH D. L. THORNYCROFT, *Thornycroft Hall, Sildington, Crewe*.—[A very charming sketch of a plant that does well in warm soils.—E.D.]

**Agricultural Association of Hungary.**—This society will hold an exhibition in the town of Pozsony from September 7 to 14, at which displays of horticultural produce and implements will be features of interest. This district has the reputation of being the most highly cultivated as well as one of the most beautiful parts of Hungary.

**Great Hyacinth and Tulip competition for 1903.**—The Royal Bulb-growing Society of Haarlem have offered, and the Royal Horticultural Society have accepted, a grand prize for Hyacinths and another for Tulips, to be competed for at the Drill Hall on or about March 24, 1903, as follows: 120 Hyacinths in pots (single spikes) in forty varieties, not more than three pots of any one variety, open, first prize, £7; second prize, £5; third prize, £3. 100 pots of Tulips in fifty varieties, three plants of the same variety in each pot, and not more than two pots of any one variety, open, first prize, £4; second prize, £3; third prize, £2.

**Royal Horticultural Society's Scholarships.**—Sir Trevor Lawrence, Bart., President of the Society and Master of the Worshipful Company of Gardeners, very kindly offered a scholarship of £25 a year for two years, to be awarded after the examination of the Royal Horticultural Society in 1894, to the student who should pass highest, if he were willing to accept the conditions attaching thereto. The main outline of these conditions is that the holder must be of the male sex, and between the ages of eighteen and twenty-two years, and that he will study gardening for one year at least at the Royal Horticultural Society's Gardens at Chiswick. Scholarships have been offered by various gentlemen every year since then, and that for 1901 was given by Henry Wood, Esq., and will be continued in 1902 by F. G. Ivey, Esq., both gentlemen being members of the Court of the Worshipful Company.

**Examination in horticulture.**—The annual examination in the principles and practice of horticulture was held by the Royal Horticultural Society on April 23 last, when 229 papers were sent in. Three hundred marks were allotted as a maximum, and all candidates who obtained 200 marks and upwards were placed in the first class. The total number was ninety-seven, or about 42.3 per cent. The highest number of marks, 285, was awarded to Miss W. M. Buttenshaw, of the Horticultural College, Swanley, Kent. Those who secured 150 and less than 200 marks were placed in the second class. The number was ninety-eight, or about 42.7 per cent. Those who obtained 100 marks and upwards were ranked in the third class. The number was twenty-eight, or about 12 per cent. Six candidates obtaining less than 100 marks were not placed. A slight increase in the number of entries has occurred, 225 being that of 1901; but still it falls considerably short of that in 1900, viz., 236. In the "principles" there were no serious mistakes, but merely varying degrees of knowledge upon the matter treated of in the replies. The answers as a whole were well expressed, showing considerable care in preparation. In the horticultural practice department the candidates kept well to the questions they had to deal with, except in the one relating to landscape gardening; on this subject there is considerable room for improvement. The examiners were the Rev. George Henslow and Mr. James Douglas.

**Potentilla pulcherrima.**—From a good source I have obtained under this name a pretty Cinquefoil at present in bloom, after standing the

winter in the open. According to the "Index Kewensis," its correct name is *P. hippiana*, but on referring to Britton and Brown's "Illustrated Flora of the Northern United States and Canada," I find no reference to the name of *P. pulcherrima*, and the plant there figured as *P. hippiana*, with the synonym of *P. leucophylla*, does not quite correspond to my plants, though there is certainly a considerable resemblance in the description. Although we have a good number of single *Potentillas* with yellow flowers in cultivation, one may find a space for this with advantage, as its bright yellow flowers, so freely produced on a plant of erect, but not weedy habit, make it attractive in the border, where such things are welcomed. *P. pulcherrima*, as I have it here, grows to about a foot in height, and produces a number of small bright yellow flowers about half an inch across in loose terminal cymes. The leaves are quite white beneath. In North America it favours dry soil. As it has a widely extended habitat it possibly varies considerably in appearance according to the different localities in which it grows.—S. ARNOTT, *Carsethorpe, N.B.*

**Chrysanthemums at Woodford.**—This eastern part of London is well known as a great Chrysanthemum centre, the large, handsome, exhibition blooms emanating from the two collections herein referred to usually achieving much success. The collection at The Monkhams this year is represented by several hundreds of well-grown plants, Mr. A. F. Hills being quite an enthusiast, and in consequence heartily supporting the efforts of Mr. R. Kenyon, his able grower. The latter appears to be taking infinite care, no doubt with the object in view of securing some of the leading prizes in November next. One was impressed with the care taken to ensure the development of the second crown buds or other buds at a date best suited to the respective sorts, and for this reason Mr. Kenyon has freely adopted the now recognised system of stopping and timing his plants. Those of Edwin Molyneux were looking remarkably well, as were some grand plants of Mrs. Barklay. The last named, as well as many others, were developing their first crown buds, and this should give the second crowns at the right time. Miss Nellie Pockett, Le Grand Dragon, Kimberley, and that antipodean wonder, J. R. Upton, were noticeable. Calvat's '99, Godfrey's Pride, and May Vallis were each well represented. Quite a lot of the Mme. Carnot family were in evidence, and this year smaller pots than usual are being used. Of the newer sorts calling for special notice the following may be mentioned: Masterpiece, Mrs. G. Mileham, Godfrey's King, Sensation, Bessie Godfrey, W. R. Church, Phyllis, Charles Longley, Ethel Fitzroy, C. J. Mee, Ben Wells, Lily Mountford, and Mme. Von André. A batch of healthy-looking plants of Viviand Morel and its sports were given a cooler position than most others, and they certainly seemed to appreciate that consideration. About a mile away from the first-named garden is the establishment of Mr. R. C. Pulling, at Monkhams Nursery, Woodford. Mr. Pulling grows some thousands of plants for trade purposes, and at least a thousand for exhibition uses. His exhibition plants are superb. Quite a lot of Julia Scaramanza are grown for the December shows, and these were splendidly represented. Australia and Mme. Herrewege (white sport from the latter) were in fine form, and there was ample evidence of the buds coming about right. Plants of General Hutton were making good wood, and those of Scottish Chief were promising. The latter is a refined flower, unfortunately seldom seen. A batch of Lily Mountford was represented by pretty dwarf plants, and there is a feeling this variety will equal expectations originally entertained of it. The family of plants, of which Mrs. C. Harman Payne was the original, are all doing well, Mr. Louis Remy, Mr. A. Barrett, and Mrs. G. W. Palmer being the more noteworthy. The plants of Mrs. Barklay have probably never been seen in better form, the growth being luxuriant, strong, and well ripened. The richly-coloured Duchess of Sutherland has a rather straggling habit of growth, but it was doing well. Of the "Carnot"

family there was a grand lot of well-ripened plants, which augurs well for future display. Other good sorts were W. R. Church, Godfrey's Pride, Miss Evelyn Douglas, Kimberley, Sensation, Bessie Godfrey, and H. E. Haymao.—D. B. CRANE.

**Crystal Palace Fruit Show.**—The Royal Horticultural Society's ninth great annual show of British-grown fruit will be held at the Crystal Palace on September 18, 19, and 20. For schedule of prizes including special ones for bottled and preserved fruits and full particulars, apply to the secretary, R. H. S., 117, Victoria Street, S.W.

**National Carnation and Picotee Society.**—The above society will hold their annual show on Tuesday next in the Drill Hall, Buckingham Gate, Westminster, at 1—6 p.m.

**Japan Irises.**—There is a remarkably fine lot of these superb Irises growing close to the edge of a long lake in Clarendon Park, near Guildford, the residence of the Earl of Onslow, who is a warm admirer of these beautiful Japanese flowers. A narrow footpath runs along on the north side of the lake, and the Irises are between that and the water, and close, so that ample moisture is supplied them. In such semi-aquatic positions they seem to luxuriate, growing and flowering splendidly. All the best-named varieties seem to be present, and in a more remote spot are large numbers of seedlings flowering in drills as sown, but these seem to be chiefly reproductions of the parents. On the sloping side above the path German and tuberous Irises grow abundantly and Alstroemerias and Day Lilies luxuriate. Such a collection of the Japanese varieties is rarely seen in any private garden.—A. D.

**Peas at Chiswick.**—There is a big trial of sixty-five varieties of Peas in the Royal Horticultural Society's gardens at Chiswick this season, and members of the fruit and vegetable committee met there on the 11th inst. to examine them. Some of the varieties are old; some are new. Oddly enough, an award was made to but one really new variety, viz., Western Express, 5 feet in height, and somewhat of the Gradus type, sent by Messrs. R. Veitch and Sons, Exeter. This had an award of merit. Similar awards were made to Messrs. Sutton and Sons' Dwarf Harbinger, very early, and well suited for pots, boxes, or warm borders; Little Marvel, 20 inches, a great cropper, and early; and Early Giant, 4 feet, a fine early Pea of the Duke of Albany type. First-class certificates were given to Messrs. James Carter and Co.'s Daisy, a dwarf Pea of noted excellence; and to Messrs. Webb and Sons, Wordsley, 3-feet Pea Senator, a splendid cropper, and early. The seed of this variety was sent by Mr. A. Dean, Kingston-on-Thames, who regards it as one of the very best Peas in cultivation.

**Aesculus indica.**—With the Californian Horse Chestnut, *E. californica*, and the dwarf species, *E. parviflora*, from the Southern United States, the above species forms a small summer-flowering group, the flowers appearing long after the others are over. The Indian Horse Chestnut—which is the popular name for the species under notice—is a native of the Western Himalaya, and forms a medium-sized tree. The leaves are quite distinct from those of the common Horse Chestnut; they consist of seven leaflets, the two, and sometimes the three, lower ones being considerably smaller than the others. The leaflets are well apart at the base, and have stalks from a quarter of an inch to half an inch long. The whole leaf is glabrous, and the margins of the leaflets are regularly serrated with minute teeth. At Kew flowers have been borne recently. The first opened during the last week in June, and the inflorescences were at their best during the first and second weeks in July. They are rather smaller in size than those of the common Horse Chestnut, but otherwise very similar. When they first open the upper petals are blotched with yellow, the yellow turning to a reddish colour with age. At Kew the species proves more tender than most varieties, spring frosts often damaging the young shoots. For gardens where severe frosts are not experienced in late spring, this tree would be an excellent subject to plant, as it flowers at a time when very few other trees are in bloom.—W. DALLMORE.

**Notes from North-East Scotland.**

—*Ramondias* are just going over in the rock garden, and *Liberia formosa* is beginning to open its clean white flowers. The *Heleniums* are a blaze of colour, with shades seen only among some of the Tea Roses; the double ones I do not care for. *Silene alpestris* is very charming, and should be grown in every alpine garden, however small; it is always neat and tidy. Another good plant is *Linaria hepaticafolia*, which runs about over the stones and smothers itself with its little mauve-lilac flowers. The following *Sedums* are in flower: *kamtschaticum*, *glaucum*, and *lydium*, the latter, except for the flowers, looking like tufts of bright green Moss. Of Lilies, *rubellum*, *monadelphum*, and *Martagon album* are flowering well, while *giganteum* is throwing up some splendid spikes. Among shrubs *Hedysarum multijugum* is just beginning to open its reddish flowers, and the plants are covered with buds. The Snowdrop Tree (*Halesia tetrapeta*) is passing over, and *Spartium junceum* is showing its first spikes. *Spiraea Van Houttei* is a sheet of white, and the Austrian and Penzance Briars are very bright and full of bloom. Some of the Bamboos are now growing at the rate of 6 inches or 7 inches a day.—N. B.

**THE PLANTING OF VINES.**

(Continued from page 2.)

BEFORE going into details as to how planting should be done, it will be advisable to first consider what we ought to plant. When a viney is replanted with young Vines, when those used have usually made one season's growth that is to say, they consist of a long rod or cane furnished with leaves or buds only according to the season of the year. These young Vines are raised from buds very early in the year, and are made to grow as quickly and vigorously as possible throughout the following summer, and in the autumn are ready for sale. If, however, one wishes to make sure of having extra strong canes, that one knows will go ahead when planted, it is advisable to procure what are known as "cut-backs." This name is given to young Vines that have been grown exactly as the others during the first season, but instead of being offered for sale they are kept through the winter, then cut back to within two buds of their bases; the stronger of the shoots emanating from these buds when the Vines are again started is selected to form the cane for the next season, the other bud being rubbed off. The following autumn, or perhaps before, these are sold as "cut-backs," really Vines two years old instead of one year old, as are the majority of planting Vines. The difference in price is not very great, and by obtaining "cut-backs" there is often a better start made, and this means a great deal, although, of course, there is no reason why one year old Vines should not do equally well, provided they are carefully treated and not hurried along at all. For the first few years after planting young Vines require the coolest of treatment, anything in the way of forcing should be altogether avoided or the Vines may perhaps be crippled. Opinions differ as to the most suitable season for planting Vines, but they may be planted at various times with quite equal chances of success. We usually prefer, when it is possible, to plant them in late summer or early autumn before growth is quite completed, for they then have an opportunity of becoming established before the winter months, and are in the best possible condition for starting away freely in the spring time, and making the best use of the long season of growth before them. If proper precautions and reasonable care are taken young Vines may be planted at almost any season of the year; but still, for the reasons given, we consider the early autumn or late summer to be the most suitable if this can be managed. We have, however, planted them in midsummer on several occasions. Great care is then required in planting, for the plants being in full leaf and growth will naturally much more quickly receive a check than if the roots were not so active.

At any time during the summer they may be planted, providing care is taken not to leave them

in the cool or cold air any longer than is necessary, for they will, of course, have been grown in a warm house. It is not wise to plant young Vines in the dead of winter, for then their roots are less active than at any other part of the year, the soil of the border would be cold, and the plants could not possibly make any progress at all until the advent of brighter and milder weather. Probably by that time many of the most valuable roots, the young fibrous ones, finding themselves amidst such uncongenial surroundings, would to some extent perish. Such naturally would greatly affect the Vines making a vigorous start in early spring, with the result that they would probably still be growing when the wood should be ripening. Upon such wood good buds could not possibly be produced, and a permanent weakening of the Vines might therefore be brought about.

That planting, which while admitting of the least check to the progress of the Vine, and yet allows of its becoming so established before the winter that it may make a good beginning in spring, seems to me to be the most rational method to adopt, and that plan undoubtedly is the one above recommended. After having practised it also for many years, it can unhesitatingly be said that it has a great many advantages over any other. Having then decided upon late summer or early autumn planting, we will now consider the best way to proceed with this important operation. Supposing the border to have been made a week or more, since when it will have settled down considerably, the first thing is to determine how many Vines are to be planted in the house and how far apart they are to be planted. Before doing this there are several points to take into consideration, namely, whether the Vines are, as soon as established, to be forced for early crops, or whether they are simply to provide late summer Grapes. If the former is the case, then naturally the canes might be planted more closely together than under the latter circumstances, for the shoots and leaves made by the early forced Vines would not be so vigorous, and therefore would not require so much room as those produced by plants assisted rather than forced in their development. Different varieties also vary greatly in habit and vigour, such, for instance, as Diamond Jubilee, Gros Moroc, and Alicante should have more space between them than would be necessary for such as Lady Downe's Seedling, West's St. Peters, Golden Hamburgh, or Madresfield Court.

**THE FRUIT GARDEN.****FRUIT THINNING.**

**I** FEAR in many parts of the country, at least in the southern portion, there is less need to thin hardy fruits this season than has been the case for many years. In our own case we have fewer Pears and Apples than we have had for many years. On the other hand, trees here and there (but very few indeed) will well repay thinning, and one often passes young healthy bush Apple and Pear trees that have not a single fruit. Such varieties as need thinning should now receive attention. Our best cropper among Apples is Lane's Prince Albert, and this never fails us. Frogmore Prolific is very good. Several of Calvilles and Sandringham are bearing splendid crops. As regards Pears the crop is more even, but a very thin one, and a Plum tree here and there needs thinning; but, fortunately, in other parts of the country I have seen some heavy crops of Victoria, Monarch, and late varieties. I am greatly in favour of lightening the crops of late Peaches even now, as the fruits left finish up so much better, and as far as my experience goes small fruits of any kind are not worth growing or storing, and by early thinning the trees have a better chance of finishing the crop. It is an easy matter to go over the trees here and there occasionally; it is far better to do this than remove a great many fruits at one time, as by doing the work piecemeal it can be seen which fruits are

likely to take the lead. These, if well placed, are best retained. I recently noticed in the northern part of the country there is a heavy Apple crop. As the trees were in bloom about a month later than ours they escaped the severe weather we experienced in May, and here thinning will be more beneficial. Even such fruits as Strawberries will repay by timely removal of surplus fruit. Gooseberries may be made use of in a green state, and by their removal the young trees especially greatly benefit, as these trees often mature too many fruits, and there is a great drain on the roots. For some seasons our best Gooseberries have been obtained from cordon trees grown under wire netting, and if heavy crops are left to mature such trees will fail to make good leaders; the latter should be encouraged as much as possible. Raspberry canes suffered so badly that the plants will produce very poor crops this season, but the autumn fruiters will be good if the canes are thinned to allow others to grow freely.

G. WYTHES.

**CHERRIES AT HOLLAND HOUSE.**

THE interesting collection of Cherries (in all twenty-four dishes) enabled many interested in their gardens as amateurs, as well as those engaged in the trade, to institute comparisons. The exhibit would have been much more instructive had the Cherries been placed into the several sections in which they are grouped in Messrs. George Bunyard and Co.'s comprehensive catalogue. This I will endeavour to do, so that the colour of the fruit may be indicated. When the displays in the large tent in which the collection of Cherries from Maidstone was placed were roped off, which was done as soon as the contents of the tent had been judged, it became practically impossible to read the names of the different varieties without difficulty, and that is a valid reason for giving the names of the leading sorts.

Of the Bigarreau Cherries, with their large and either white or amber-tinted fruit, the well-known Frogmore Early Bigarreau was seen in fine character. It is a luscious fruit, and ripens on a warm wall early in June. Early Amber is perhaps one of the very earliest to ripen, and the quality being good, as well as possessing a desirable habit of growth, it is a great favourite in the East Kent market gardens. Elton Heart, which is also early, is an excellent orchard variety to yield a first crop, and it does well in a heavy soil; fruit large and bright. Governor Wood is well known as a fine Cherry, the fruit large, but to have it at its best should be grown against a wall. It does well as a pot plant, but when cultivated as an orchard standard is apt to gum if in a position exposed to the action of frost. Kirkland's Mammoth was in fine character, the fruit large, handsome, and firm. It should have wall culture.

The Black Heart and Bigarreau Cherries were generally represented by very fine fruits. Early Lyons, as it was named at Holland Park, but probably more properly Bigarreau Jaboulay, was represented by fine fruit, and grown in a Cherry house or on a wall it is superb. It is also a hardy variety for orchard standards. Bigarreau de Schreken is also a very early variety, the fruit large, richly flavoured, and of fine colour. Bigarreau Noir de Schmidt produces fruit of a rich blackish red colour, and is a good early variety. Its best position is on a wall. Black Cluster (or Caroone) is recommended as a prolific orchard market variety, fruiting with freedom in clusters, the fruit small, deep black in colour, and travels well. The old Black Ifeart was in fine character, one of the earliest to get into the markets, and a reliable orchard tree. Early Rivers' was superb, its large black fruit most tempting, very handsome and richly flavoured, one of the best for forcing or a Cherry house, and also for a wall. Mr. George Bunyard states that "as an orchard tree it requires close pruning for three or four years and then forms a grand tree." No one will be surprised to learn the fruit fetches a high price in the market. Knight's Early Black is a very early Cherry, well flavoured, and one of the freest bearers. Roundwell Black Heart is a large and fine looking East Kent Cherry, ripening in mid-season.

Of the May Duke Cherries Archduke produces fine fruit, is a good bearer, and excellent flavour. Belle d'Orleans is a very early Gean type, the fruit tinted pink, well adapted for wall or Cherry house, good bearer, and sweet flavoured. Belle de St. Trone is also very early and a useful sort. Guigne d'Annonay is a very early new black fruited Gean, free bearer, richly flavoured, and extra fine. The old May Duke is one of the best orchard varieties for an early crop; it is the English Cherry of the Parisians. Ramon Oliva produces large black fruit. It is a mid-season variety, the fruit very large, sweet, and firm.

R. DEAN.

### BRUNFELSIA CALYCINA.

BRUNFELSIA CALYCINA (*confertiflora*) does very well in Hong Kong, as may be seen from the illustration sent. The specimen is growing

These two species are just in their prime, and never more effective than when planted in this manner. *Rosa setigera* (the Prairie Rose) blooms in clusters, the buds of which open one after the other. They are a bright pink when they first unclose, but the hot sun fades them to a much lighter shade, giving a variegated aspect to the clusters, which show at the same time blossoms of clear bright rose, those of a lighter hue, and some that are almost colourless.

The white *Microphylla* Rose is also now at its best, and very charming with its glossy, dark green, healthy looking foliage and its fragrant waxy white blossoms, opening all summer long. There always seems to be something bride-like about the *Microphylla* Rose, suggesting wedding bells.

Of the ornamental shrubs and small trees that we plant in our gardens fully two-thirds bloom in spring or early summer. At present only a few kinds are in flower, and most of these have white blossoms. I have just returned from a ramble around the shrubberies. Only one species out of a collection of several hundreds bears yellow blossoms at this time of the year, and that is the double-flowering Japan Corchorus. It is too early for Hypericums, and all the Coluteas, Caraganas, Laburnums, and Forsythias are past their flowering season. But the Japan Corchorus is with us always in flower, from April until late in the autumn, making it one of the most valuable shrubs we possess.

In a collection of Spiraea numbering thirty-two species, we find some bloom throughout the summer, but May is the month when most Spiraeas are at their best. The species and varieties of Spiraea now flowering at Rose Brake are *Spiraea lindleyana*, *S. sorbifolia*, and *S. callosa* var. *alba*; also the well-known variety with bright rose-coloured flowers called Anthony Waterer.

*Spiraea lindleyana* has Mountain Ash-like foliage, very much resembling that of *Spiraea sorbifolia*, which with me is harder and much more robust in habit of growth. Both species are in flower.

The blossoms of *Spiraea lindleyana* are a purer white than those of *S. sorbifolia*. *S. lindleyana* is best planted in moist earth, such as the margins of brooks or ponds. When well grown it is a beautiful and graceful tropical-looking plant. Here it is very apt to die down to the ground in severe winters, but our most intense cold weather fails to kill it outright. We are trying several varieties of *Spiraea callosa*. One sent to us under the name *superba* is a fine large shrub, differing from the type by the superior size and deeper colour of the flower-truss. This may be described as a rich light crimson. *Ceanothus americanus*, which is our one representative of its family, is now in flower. It is a small shrub, with ovate leaves 1 inch to 1½ inches in length, and dense panicles of small white flowers, and is chiefly valuable because it blooms at this time. It is pretty for the margin of shrubberies.

*Itea virginica* is an interesting little plant, now flowering in company of the *Ceanothus*. It belongs to the Saxifrage family, and is the only species in the United States. In favourable situations this

shrub grows 10 feet in height. The light green leaves are oval and from 1 inch to 2 inches in length. The white blossoms are in terminal racemes with linear petals. It is a pretty and rather showy plant when in bloom.

*Callicarpa purpurea* has many little pink blossoms in axillary cymes, which, while they are not individually showy, are very pretty in the mass. Later, when the beautiful violet-blue berries take the place of these little flowers, the shrub will be strikingly ornamental.

Privets and Elders are in flower, but are too well known to English readers to need a description.

Yuccas are making a grand display, but I scarcely know whether it is proper to describe them under the head of shrubs. But the showiest of all the flowering plants now in bloom at Rose Brake are the Catalpas and the Oak-leaved Hydrangeas. The Catalpa is a native of the Gulf States, but is perfectly hardy in the Virginias. It belongs to the family of the Bignoniacæ. In its native haunts it forms a tree 50 feet in height, but in this neighbourhood it is seldom more than half so tall. This tree is largely used in the public grounds of Washington. At Chevy Chase Lake many of them are planted along the margin of the water. When they are in bloom it is worth taking a long journey to see them, so showy are the large panicles of bloom. The campanulate flowers are about 1½ inches in length, and are white, streaked and mottled with purple and gold. The kinds that are most planted are *Catalpa bignonioides*, *C. Kämpferi*, which is a Japanese species, and *Tea's* hybrid *Catalpa*.

The Oak Hydrangea is a most noble shrub, often 15 feet or even 20 feet in height, with branches feathering to the ground, and great leaves from 6 inches to 1 foot in length. Sometimes on the lower limbs, the grand panicles of bloom rest on the grass of the lawn. These feathery panicles, from 6 inches to 9 inches in length, are creamy white when they first open, but change gradually to pink and then to a dull red.

The latest Magnolia to flower at Rose Brake is *Magnolia glauca*, which is quite hardy, and is found in a wild state as far north as Boston. This is a pretty little Magnolia now in bloom. It has lustrous foliage, unharmed apparently by any insect, and beautiful creamy white blossoms, very fragrant, but not very freely produced.

This is a list of all the shrubs now in bloom at Rose Brake, as it is still too early for Hypericums and the various kinds of Hibiscus.

DANSKE DANDRIDGE.

Shepherdstown, Jefferson Co., West Va., U.S.A.

### FLOTSAM AND JETSAM.

THE Fair, a large department store in Chicago, has made a new departure in attractions for visitors by providing a real playground for children inside its vast building. Pillars form the corners, covered with bark and long branches intertwining overhead, while underneath is a real lawn, a real sand pile, with wheelbarrows and shovels and gravel paths. Swings and hammocks are provided, and the whole surrounded by a picket fence. The sods will be replaced frequently, as soon as worn down. Attendants are provided, and it will be a veritable paradise to weary little ones dragged along by their mammas who go shopping.

An unfortunate florist's assistant in New York is answerable for \$10,000 of damage done to a magnificent residence last week. The family were from home. The conservatory is immediately above the ballroom, and the man in question had daily to water the many fine plants. On this occasion he forgot to turn off the hose when he left, and the water flooded the room, leaking through into the ballroom. The alarm was given by the water reaching the electric wires and grounding the circuit, which caused a buzzing in the electric company's alarms. The ballroom was highly ornamented in white and gold fancy designs, while the ceiling, which is more than 20 feet high, was beautifully frosted.

A comical item comes from one of the colonies, where a resident found the duty on cricket

BRUNFELSIA CALYCINA IN HONG KONG BOTANIC GARDENS.

(From a photograph by Mr. Tutcher, Assistant Curator).

in a rather shady corner of the garden, and flowers freely every year during March.

W. J. TUTCHER.

Botanic Gardens, Hong Kong.

### AMERICAN NOTES.

#### A FEW LATE-FLOWERING SHRUBS

IT is late in June; the "sweet o' the year" is over, for have not the Roses faded? Only some of the ramblers and trailers, such as the *wichuriana* type, and Hybrids, and a few belated blossoms here and there on the Hybrid Perpetuals mark the close of the great Rose carnival of June. In a sunny space opposite Cedar Ledge the Prairie Roses, each plant a graceful fountain of bloom, rise from a carpet of *R. wichuriana*, which is starrng the ground with numberless pure white blossoms.

paraphernalia oppressive till he hit on the plan of importing them as "agricultural implements." This being rather demurred to on arrival, he demonstrated their utility in that capacity by making a hole in the ground for a plant with the round end of a oat and shovelling in the dirt with the paddle end. It succeeded.

Chicago.

C. MACQUARIE.

### IRIS HISTRIOIDES.

THIS is one of the most charming of the spring-flowering Irises. It has a stronger constitution than any of the reticulata forms, and, generally speaking, proves of easy culture. The flowers are large, the falls mottled with white and rich lilac both on the claw and on the broad, rounded blade. It is a native of Eastern Anatolia, and flowers in early March.

It should have the same treatment as Iris reticulata. A coloured plate of this Iris was given in THE GARDEN, October 22, 1892, vol. xlvi. It was exhibited by Messrs. Laing and Sons before the Royal Horticultural Society on February 9, 1892, and then received an award of merit. T.

### RECENT PLANT PORTRAITS.

THE number of the *Botanical Magazine* for July contains portraits of *Begonia angularis*, a native of Brazil, also known under the synonyms of *B. crenulata*, *B. zebrina*, *B. hastata*, and *Pritzelia zebrina*. This is one of the fibrous-rooted varieties producing large loose panicles of pure white flowers and with handsome dark green foliage of angular form veined with white.

*Muscaris latifolium*, native of Asia Minor, also known as *Bellevalia monophylla* and *B. muscarioides*, a very broad-leaved variety with large spikes of rather dull purple flowers.

*Impatiens cuspida var. arthritica*, a native of the Nilgiri Mountains. This is also known as *I. latifolia* and *I. flaccida* var. *arthritica*. It is of only botanical interest, with curiously swollen joints and small white flowers shaded or flushed with rosy purple.

*Cynorkis villosa*, native of Madagascar. This is a pretty little terrestrial Orchid, with handsome foliage and spikes, rosy purple and white flowers.

*Byblis gigantea*, native of Western Australia, also known as *B. lindleyana*. This is the most beautiful Sundew I have ever seen, with bright rose-coloured flowers resembling those of an Oxalis.

The July number of *Revue de l'Horticulture Belge* contains portraits of:

*Begonia Perle de Lorraine*, one of the fibrous-rooted varieties, with small pink and white flowers produced in great abundance.

*Deutzia corymbiflora*, one of the many forms of beautiful new Deutzias of recent introduction, but the colour as here shown is not true to Nature, as I know it, being shaded with purplish rose, whereas I believe the flower to be pure white. The plant here figured is more like Lemoine's *D. gracilis carminea*.

The first part of the *Revue Horticole* for July has a portrait of:

*Erica mimosa verticillata major*.—This is a Heath with relatively large bells of a curious shade of reddish orange.

The second and third numbers of the seventeenth volume of *Lindenia*, which appear together, contain portraits of the following eight Orchids:

*Odontoglossum sceptro-crispum*, a fine variety with pale yellow ground colouring, distinct brown blotch marking, and a pure white lip with a fringed edge.

*Cypripedium lathamianum var. imperiale*, a fine

variety, with a pure white dorsal sepal clearly veined with rosy purple.

*Cattleya gigas var. menieriiana*, an extremely beautiful variety with large flowers and a deeply fringed lip.

*Cypripedium tectorum var. Alexandru*, a fine Orchid with large pure white dorsal sepal.

*Lulio-Cattleya var. Dachsenii*, a most beautiful and highly coloured variety with fine broad purple lip edged with white.

*Cymbidium zaleskianum*, a fine large flowered variety with distinctly marked showy flowers.

*Oncidium Forbesii var. atratum*, a fine large flowered variety with brown and yellow colouring.

*Odontoglossum crispum var. memoria Bulli*.—This is an exceedingly beautiful and most distinctly and evenly marked variety, with a pure white ground with large blotches of a clear shade of reddish brown.

IRIS HISTRIOIDES.

(From a drawing by Miss Agnes Barr.)

The last bi-monthly portfolio of the *Dictionnaire Iconographique des Orchidées* has portraits of the following thirteen Orchids:

*Cypripedium rhodopsis*.—*C. germinianum* and *Eucharis var. fournieranum*; both in their way ornamental varieties.

*Lulio-Cattleya Mme. Marguerite Fournier*.—An exceedingly beautiful variety with deeply fringed lip.

*L.-C. Doris* var. *Marquis de Colbert*.—A very beautiful variety.

*L.-C. Gladiolus*.—A comparatively dull and insignificant variety.

*Lulia harpophylla* and *L. prastans var. aurea*.—The former extremely well known, the latter extremely pretty.

*Odontoglossum tripudians*.—A not very ornamental variety.

*Phalaenopsis leucorrhoda*.—Somewhat resembling *P. schilleriana*.

*Galeandra Beyrichii*.—A variety with green flowers, with a white lip.

*Rhynchostylis retusa*.—A dense pendulous raceme of small white flowers with rosy lip.

*Sophro-Cattleya Nydia*.—A much enlarged Sophronitis.

W. E. GUMBLETON.

### ALPINE FLOWERS AT HOME.

BESIDES the weedy plants found on meadows below the Untersberg, near Salzburg, are, of course, a number of highly interesting perennials, the more noteworthy being the always interesting *Arnica montana*, owing to its well-known medical properties, showy golden yellow flowers, and hairy foliage; *Astrantia major*, a large flowering form of *Arabis alpina*; *Anemone ranunculoides*, with pretty white Lily-like flower; *Anemone ranunculoides*, with pale yellow flowers, and *Hepatica triloba cerulea*, but not as fine as the Central German variety, nor like the Pyrenean form; the pretty shrub *Andromeda polifolia* and *Actaea spicata*, usually not left out of any collection on account of its ornamental foliage, flowers, and berries. Of the charming Gentians, the large flowering *G. acaulis*, with its handsome deep blue flowers, is seen wherever the long grass permits its growth. In very low places, boggy or wet the whole year, grow an abundance of pretty and interesting plants. The showy *Gentiana Pneumonanthe* with its tufts of wiry stems and long pale blue flowers; several kinds of Cotton-grass, the dwarf *Eriophorum alpinum*, ascending to heights of 6,000 feet; *E. angustifolium*, *E. latifolium*, *E. triquetrum*, and *E. vaginatum*. Some of these are also British plants belonging to the most interesting of the large order Gramineæ; of the interesting Sundews or *Drosera*, the greater number of North European kinds are here represented—*Drosera intermedia*, *D. longifolia*, *D. rotundifolia*, and *D. obovata*. I believe the latter is a little known plant.

Of Primulas the only ones in evidence are *P. farinosa*, a fine tall-growing dark rosy red flowering form, *P. officinalis*, and *P. elatior*. *Spiraea Aruncus*, a well-known plant growing here in company with the bog *Spiraeas*, *S. Filipendula* and *S. Ulmaria*, ascends to heights of 5,000 feet. The stagnant ponds are full of such plants as the pretty *Veronica Beccabunga*, *Potamogeton lucens*, *P. nutans*, *P. perfoliatus*, and others, and round the margin one sees the showy Grass of *Parnassus*, *Parnassia palustris* with its large erect white flowers.

As soon as we leave the more or less wet meadows and reach higher ground, gradually ascending, we follow at first the road, quitting it afterwards for a path on the north side of the mountain.

The flora in open woods of tall Pines, Birch (*Betula alba*), *Acers*, such as *A. platanoides* and *A. Pseudo-platanus*, the Beech (*Fagus sylvatica*), the common Ash (*Fraxinus excelsior*), the underwood mostly of *Daphne Mezereum*, *Andromeda polifolia*, the pretty *Clematis* climber *Atragene alpina*, and *Clematis montana*, *Berberis vulgaris*, *Sambucus nigra*, and the charming coral-red berried *S. racemosa*, *Cornus sanguinea*, *Corylus* (Hazel Nut), the Heath (*Erica carnea*), both the red and white flowering forms flowering here during the early spring, while higher up often not before September, *Euonymus europaeus* and *E. latifolius*; *Pyrus* *Aria*, often in good sized trees; *Sorbus* (the Mountain Ash), *Staphylea pinnata*, *Vaccinium Myrtillus*, *V. Oxycoleus*, *V. uliginosum*, *V. Vitis-Ideas*, *Viburnums*, both *V. Opulus* and *V. Lantana*. The common Oak is usually more a shrub than a tree, but excep-

tionally fine were groups of *Pinus Cembra* and *P. Picea*.

Of perennials in these sub-alpine regions are some interesting ones, as the common Christmas Rose, *Hepatica triloba*, and *Leucojum vernum* (the Snowflake), very common, especially where the soil is good and not too dry. In places among shrubs and tall-growing grasses, grow *Lilium Martagon* and *L. bulbiferum*, both fine deep-coloured forms. Very plentiful also is the common Lily of the Valley, and the allied small *Majanthemum bifolium*, *Pyrola rotundifolia*, *P. uniflora*, and *P. secunda*, pretty evergreen low-growing plants, with bell-shaped, white, rosy tinted flowers, grow usually in deep, shady, and damp spots. *Corydalis cava* and the rare white flowering form (*alba*), and the tall, very graceful, willowy *Epilobium angustifolium* grow almost everywhere in sun or shade. *Gentiana asclepiadea* grow here from 2½ feet to 3 feet in height. Unfortunately, it is more or less difficult to cultivate unless established plants are procurable. The showy *Cephalanthera rubra*, growing often over 2 feet in height, with large magenta-purple flowers, is next to the common Lady's Slipper (*Cypripedium Calceolus*), the finest Orchid in these regions. Less common seems to be *C. ensifolia*, a very easily cultivated plant, and *C. pallens* has, like *C. rubra*, large flowers, but whitish in colour. *Cypripedium Calceolus*, once very common, is more or less rare, owing, no doubt, to travellers tearing up the plants when in bloom. There are fewer rare Ferns than might be expected. Of Mosses one can see *Lycopodium clavatum* and the neat little *L. helvetica*, and *Asarum europaeum*. All are well adapted for all positions, either damp or dry, on the mountains or in the plains. As we ascend higher the trees, which are giants, grow dwarfer and dwarfer until they disappear altogether.

G. REUTHE.

### PYRUS SINAICA.

THIS is one of the few species of *Pyrus* worth growing for its leaves alone, for throughout spring and summer the silvery appearance of the foliage makes it a conspicuous object in the garden. It is a native of Asia Minor, and is stated to grow to a height of 20 feet, a height which it seldom attains under cultivation. As a rule it makes a small, bushy-headed tree of stunted appearance, the branches being short jointed and arranged closely together. The leaves are small, the blades being about 2 inches long and half an inch wide. When young they, together with the young wood, are covered with a silvery tomentum; this with age disappears, but a greyish hue is still retained. The flowers are borne in small, dense heads in April, and are white in colour. It belongs to the section of the genus which is characterised by pear-shaped fruits, the fruits being small, green and hard. Another white-leaved *Pyrus* of very distinct appearance is *P. salicifolia* from the Levant. W. DALLMORE.

### TREES AND SHRUBS FOR ENGLISH GARDENS.

#### THE HARDY HEATHS.

(Continued from Vol. LXI., page 432.)

**E**RICA CILIARIS.—Although in gardens that are afflicted with the smoke and fogs of London this Heath may not always be satisfactory, in the purer air of the surrounding counties it is a most charming shrub. In some of the old Oak-bearing country in Sussex, for instance, it succeeds to perfection. It is a native of Britain, but is, I believe, confined to Cornwall and Dorset in England, and to Galway in

Ireland. It has long, slender, prostrate stems, from which spring erect flower-bearing branches. The flowers are borne in a long raceme, are of a rich rosy purple, and the largest individually of all the species of native Heaths. The leaves are borne in threes nearly always, and, like all the younger parts of the plant, are covered with hairs and pubescence. It flowers from July onwards.

*E. mawiana*.—This appears to be a fine variety of *E. ciliaris*, larger in its leaves and flowers, even richer in colour, and of sturdier habit. It was discovered in Portugal some thirty years or so ago by Mr. George Maw, but does not seem to have spread in cultivation so much as it deserves. It was obtained for the Kew collection from Messrs Cunningham and Fraser of Edinburgh three or four years ago, and certainly promises to be a better grower there than *E. ciliaris*. The flowers are rich crimson and produced in large racemes.

*E. Watsoni* is supposed to be a natural hybrid between *E. ciliaris* and *E. Tetralix*, and was first discovered near Truro by Mr. H. C. Watson. It has rosy crimson flowers produced in a flatter raceme than that of *E. ciliaris*. In this character, as in its leaves, &c., it is intermediate between its parents.

*E. Tetralix* (the cross-leaved Heath).—This beautiful Heath is met with on most of the moors and mountain sides throughout the British Isles, being, perhaps, the most widely spread of all the true Ericas in this country. It is commonly known as the cross-leaved Heath, because of the arrangement of its leaves, which are in whorls of four. It is not very different in general appearance to *E. ciliaris*, being similarly downy and hairy on its young stems, leaves, &c. It differs, however, in the arrangement of the flowers, which are in a terminal umbel. *E. ciliaris* has its leaves usually in threes at each node, and of course its distribution in Britain is much more restricted than that of *E. Tetralix*. There are other minor points of difference that need not be referred to here. The cross-leaved Heath grows 1 foot to 1½ feet high, and its flowers are a bright rose. There is a white flowered variety (*alba*), and another very markedly pubescent one (*mollis*).

*E. Mackaii* (Mackay's Heath).—Very nearly allied to the cross-leaved Heath, this is, by some authorities, looked upon as merely a variety of it. It was first found in Galway in Ireland, between Roundstone Bay and Clifden. It has since proved to be a native also of Spain. It makes a charming garden

PYRUS SINAICA IN FLOWER.

plant, flowering from July to September. The leaves have the same right-angled arrangement as those of *E. Tetralix*, but the flower is shorter, broader, and of a paler rose.

*E. vagans* (Cornish Heath).—This species is one of the most useful of dwarf evergreens. It is a vigorous grower, especially when planted in good soil. I think, however, it flowers better and has more of the typical Heath character when grown in somewhat poor, sandy soil. I know, at any rate, it succeeds well in such a soil. In England it is almost or quite confined to Cornwall, but it occurs also in Ireland and south-west Europe. It is especially valuable in the garden because it flowers late. Commencing in July it keeps on till October. Its blossoms are crowded in racemes 4 inches to 6 inches long, and they are of a pinkish purple colour. The plants may be kept neater and more compact by removing the flowering portion of the shoots before growth recommences the following spring. Left to themselves, especially in soil that is at all rich, the plants are apt to become straggling and unkempt.

*E. multiflora*.—This belongs to the same type of Heath as *E. vagans*, the Cornish Heath, but differs in its much more compact habit and its shorter racemes of flowers. Although not so vigorous and showy it may still be preferred for some situations. It is a neater plant, and its lower branches have not the same tendency to become sprawling and ungainly as *E. vagans*. In other respects it is very like that species, the leaves being similar in shape and arrangement, and the flowers a

paler purple. The raceme, however, is only 2 inches or so long. *Erica multiflora* is not found in Britain, but is a native of the country to the north of the Mediterranean Sea from France to Greece.

#### HARDY BAMBOOS.

BEING shrubby grasses, Bamboos belong to a type of vegetation essentially tropical in character. The family has no representative in the native flora of Britain, or, indeed, in that of Europe. It is to their forming so new and distinct a feature in our gardens that much of their rapidly-acquired popularity is due. Fifteen or twenty years ago many of the best of the sorts now largely cultivated were unknown in this country. But apart from their novelty, they have other qualities that commend them. No evergreens capable of withstanding our winters exceed these shrubby grasses in beauty and grace of form, in luxuriance of leafage, or in their bright fresh tints in winter time. Very few, indeed, equal them.

Between forty and fifty sorts of Bamboos are now in cultivation but owing to the similarity there is between several of them, and the tenderness and inferior qualities of others, not more than about twenty need be grown. They belong to three genera, viz., room to allow of their free and graceful development. This can only be accomplished where the outer stems have a chance to bend outwards. All Bamboos should be transplanted in late spring. Winter and early spring are the worst times for disturbing the roots. Use to those forming new plantations: *Phyllostachys Henonis*, *P. viridi-glaucescens*, *P. flexuosa*, *P. nigra*, *P. boryana*, *P. sulphurea*, *P. Marliacea*, *P. ruscifolia*, *P. Castillonis*, *Arundinaria nitida*, *A. japonica*, *A. auricoma*, *A. fastuosa*, *A. Simoni*, *A. Fortunei*, *A. anceps*, *A. Hindsii* var. *graminea*, *Bambusa palmata*, *B. tessellata*, and *B. marmorea*.

It must be observed that Bamboos are somewhat particular in regard to position. They need, almost more than any other class of evergreens do, shelter from north and east. When planted in positions fully exposed to winds from those quarters they always remain stunted and unsatisfactory, and for several months in the early part of the year their foliage is usually brown and withered. A merely low temperature they do not mind so much. It is one of the commonplaces in horticultural practice that evergreens will stand many more degrees of frost in a still atmosphere than in a moving one, but few of them emphasise its truth so strongly as do

Bamboos. The remarks, therefore, that have previously been made as to the necessity of a shelter belt on the north and east for the tenderer evergreens apply with especial force to these plants.

The second important requirement is a rich, moist, open soil. Bamboos are gross feeders, and their full beauty can only be seen when they are in vigorous, even luxuriant health. An unhealthy Bamboo is not even passable—it is an eyesore. Many of the species spread rapidly by means of underground stems, and for this reason they ought never to be planted promiscuously. Each plant, or, if they are grouped, each species, should stand well apart. Some sorts, like *Phyllostachys viridi-glaucescens* and *P. Henonis*, need abundant

space, and the same applies to all Bamboos. The remarks, therefore, that have previously been made as to the necessity of a shelter belt on the north and east for the tenderer evergreens apply with especial force to these plants.

W. J. BEAN.

(To be continued.)

#### ODONTOGLOSSUM CRISPUM ARDENTISSIMUM.

ONE of the most striking of the many new Orchids exhibited at the Temple show of the Royal Horticultural Society was that represented in the accompanying illustration. It

was sent by M. C. Vuylsteke, Ghent, and received a first-class certificate. As may be seen, the flowers are of good form, and the sepals and petals are heavily and regularly blotched with claret-red. It is undoubtedly one of the best varieties of *Odontoglossum crispum* that continental growers have recently sent over to our exhibitions.

Many beautiful forms of *O. crispum* have been shown this year at the meetings of the Royal Horticultural Society, and interest in such beautiful pro-

ducts as *ardentissimum* is undoubtedly increasing. The blotches are very large and rich in colour. The illustration does not represent the flowers life size, but slightly smaller.

*ODONTOGLOSSUM CRISPUM ARDENTISSIMUM.*

(Shown by M. C. Vuylsteke, Ghent, at the Royal Horticultural Society's Temple Show. It then obtained a first-class certificate.)

#### BRITISH HOMES AND GARDENS.

##### COTELHELE.

THE slow tide of the river Tamar, which divides the southern portions of the counties of Devon and Cornwall, is, with its tree clad heights and vistas of winding waters, bountifully dowered with natural beauty, but although Nature has, without doubt, been the chief factor in investing this lovely region of the "west country" with its all-pervading spirit of peace and restfulness, the hand of man has done much in adding human interest to Nature's entrancing picture in raising here and there along the Tamar's sides noble residences, about which old-world legends cluster thickly. As one ascends the river from Devonport and follows its tortuous course between the wooded hills, the grey towers and terraces of castellated Pentillie, looking downward from their heights over the

Where Bamboo groves are desired—and such groves are amongst the most beautiful of all the features possible in English gardens—a secluded dell or wooded ravine is the ideal spot for them. Briefly, what I wish to impress

tree-tops upon a circling river-reach, meet the eye. Passing upward by Halton Quay from Pentillie Castle, the narrowing river reflects the dense, hanging woods of Cotehele, one of the most interesting of the many historical homesteads of the west. The property of the Earl of Mount Edgecumbe, it is a well-preserved example of the old fortified dwelling of 400 years ago, portions of the main building and the entrance gateway being of considerably greater antiquity. Among the many legends connected with Cotehele, perhaps the most thrilling has for its hero a certain Richard Edgecumbe, who, being suspected of disloyalty, was pursued to Cotehele by the emissaries of "Crookback," and so closely hunted that he took refuge in the woods overhanging the Tamar. Being followed to this retreat he, in endeavouring to escape, dislodged a rock, which fell with a resounding splash into the water, followed by his hat, torn from his head by a branch. His pursuers, close at his heels, were quickly on the spot, and, seeing his hat in the river, concluded that the noise they had heard was his body falling into the Tamar, and that he was drowned. They therupon abandoned the chase and Richard fled to Brittany, to return, however, and fight at Bosworth Field, where he was knighted by Henry. On the site of his miraculous escape Sir Richard erected a votive chapel, on a tablet within which is carved the account of his deliverance from capture.

The old, many-gabled, Ivy-covered house is most picturesque, and as one gazes at it one becomes conscious that every stone is eloquent of an eventful past. Its effect is heightened by the four stone terraces with their central flights of low, lichen-stained steps, flanked by rough buttresses crowned with artistically-fashioned earthenware flower-baskets. The gardens are filled for the most part with old-fashioned flowers in keeping with the antiquity of the house. In the best gardens of Cornwall, bedding plants, much to the satisfaction of the lovers of natural as against artificial methods, have little place, and this is particularly the case at Cotehele. Eleven years ago the trees on this estate suffered severely from the disastrous blizzard of March 11, in company with those in the neighbouring properties of Pentillie, Maristow, Mount Edgecumbe, and others, but Nature is such a rapid repairer that no one who did not know Cotehele before the blizzard would imagine that it had lost hundreds of its finest timber trees. If in any one special point the gardens of the south-west compare favourably with those in more northern districts it is in the matter of flowering shrubs, many tender subjects flourishing that refuse to grow except under glass shelter elsewhere. With many of these Cotehele is well supplied, but it is perhaps for its beds of simple flowers, its Cabbage Roses, Pinks, Carnations, Rockets, old Paeonies, and such like blossoms of a bygone day that its gardens are chiefly interesting. Rhododendrons grow admirably, and looking in the springtide from the summer house across the pond to where the swelling hills recede into the blue

distance, the Rhododendrons on the further side of the water, masses of flower, form a fitting frame to the picture. A large fruit-growing industry is carried on around Cotehele, the earliest outdoor Strawberries of the year in the London market coming from the steep hillsides. The punnets are made by the village children in the winter time, and the peasant communities are enabled to add materially to the comfort of their lives by the production of their early Strawberries.

S. W. F.

#### THE UNHEATED GREENHOUSE.

##### XII.—AUTUMN PERENNIALS UNDER GLASS.

It is easy enough to have plenty of bright flowers under glass in late autumn when an average temperature of 50° to 60° Fahrenheit can be

maintained, but when there is no heating apparatus, or merely a portable one, which is strongly to be recommended in certain cases, plants must be chosen warily. Chrysanthemums, no doubt, are the mainstay of all gardeners for conservatory decoration at this season, and are as available, being hardy perennials, for unheated as for heated houses. No one would wish to be without such old, but fine, stand-by varieties as Mme. Desgranges and its bright-coloured sports, Source d'Or, Mlle. Lacroix, Bouquet Fait, Cullingfordii, and others, not forgetting some of the delightful single forms, grown naturally as free flowering bushes. For our special purpose, early and mid-season varieties are more to be recommended than late ones. It is true that nothing else can quite take the place of Chrysanthemums in greenhouse decoration. They are so universally grown, however, and it is so easy to get information on all points with regard to them, that it will be more profitable to enquire

IN THE GARDEN AT COTEHELE, CORNWALL.

what other flowering plants are attainable from Michaelmas to the end of the year.

Naturally we think first of the few late-blooming perennials which, though quite hardy, are likely, out of doors, to have their flowers either crippled or wholly destroyed by early frosts. One such, often grown in pots on this account for the greenhouse, is *Stokesia cyanea*, a fine composite, with blue Thistle-like flowers. There are two varieties—a fact which has only recently been made known—and as one of these is summer flowering care should be taken to get the right sort for late work. *Aster grandiflorus*, the latest of the Michaelmas Daisies, is sometimes treated in the same way, as it seldom perfects its large blue flowers in the open border. *Senecio pulcher* is a good late-blooming Groundsel, with red-purple flowers, which may be put into the same list. It is interesting to grow it from inch-long root-cuttings in early autumn, like *Senecio*, thus securing fresh plants every year, and the best effect is made when several plants occupy a broad deep pan to form a clump. The colour of the flowers, unfortunately, is one that contrasts badly with most others, which is a drawback. A very good low-growing plant belonging to the same genus, *Senecio Kämpferi*, may be mentioned here, though it is somewhat more tender. It has broad handsome foliage, splashed with white and a touch of pink, and is worth growing both for its leaves and flowers. It bears a loose cluster of large yellow Daisy-like flowers, and is more often seen in Belgium and elsewhere on the continent as a window-plant than with us. This is not to be confused with *Farfugium grande*, with round yellow spots on its green Coltsfoot-like leaves, which is, perhaps, a greater favourite with English folk than it need be.

*Chrysanthemum serotinum*, better known amongst herbaceous perennials as *Pyrethrum uliginosum*, rears its great height and holds up its flowers high above our heads in the autumn garden, unless the precaution is taken of heading down the plants in early June. These tops may be put in as cuttings and make excellent little pot plants, proving very useful in the greenhouse during October and November. The new Japanese species of Winter Cherry (*Physalis Franchetii*) is striking and handsome for late autumn when grown with several stems and hung with its vivid orange-scarlet capsules. It is much finer in every way than the old P. Alkekengi. The first frost makes the leaves drop out of doors, but with the protection of glass we get foliage with the brilliant lanterns, which is a great gain. Another hardy

Japanese perennial—*Tricyrtis hirta*—which is strictly speaking, a miniature Lily, with a short, creeping root-stock, makes an admirable late cold greenhouse plant. Its pretty mauve-white flowers, spotted with lilac or purple, are very Orchid-like in their effect, and are borne pretty freely.

Carnations of the self-coloured Grenadin type, which are chiefly white and scarlet of various shades, are invaluable for autumn flowering. If the object is to ensure really good flowers it is a good plan in the first instance to raise a batch of seedlings from reliable seed of the best strain, which should be allowed to flower the first season in the open ground. Many variations will occur amongst them, and a strict selection of the finest must be made for future stock. Any tendency to throw up flower stems in the spring must be kept in check, and layers should be laid early in the season, before midsummer if possible. When thoroughly rooted, which will be in about six or eight weeks from the time of layering, they should be transferred to 5-inch pots, and it must be borne in mind that Carnations, of all plants, like very firm potting to ensure good flowering. If all goes well flower stems will soon begin to appear, and a cold frame will be sufficient to bring them on until they are ready for the greenhouse.

For hanging baskets or pans raised to a position near the eye, a creeping Himalayan perennial, familiarly known as the Shamrock Pea (*Parochetus communis*), which flowers naturally in October and November, is extremely pretty, both in its twin Pea flowers of pale stone-blue and its large trifoliate leaves. It is also more satisfactory to flower under glass than out of doors, even on the most sheltered rockery. For the same purpose two Italian Bell-flowers (*Campanula fragilis* and *C. isophylla alba*) are invaluable, the latter being the more easy of the two to grow into a fine specimen. A little early pinching back of the shoots will help to retard their flowers till late autumn, when they are very welcome. Though these are both natives of sunny Italy, they prefer partial shade when under glass. A fine new blue variety, *C. isophylla Mayi*, named after its raiser, has recently been introduced.

So far, mostly quite hardy plants have been under consideration, but there are a good many half-hardy perennials which may be used, with a little careful preparation beforehand, for the autumn greenhouse. Two or three dwarf species—not varieties—of Dahlia, for example, come in very well to fill up a gap at this late season.

*D. gracilis*, a slender growing Mexican plant, with bright scarlet single flowers and finely cut leaves, is good and showy, only care must be taken to secure the true species, and not some coarse growing seedling masquerading under the name. *D. glabrata* (syn. *D. Merckii*) has smaller lilac or white flowers, but produced very freely; while the Black Dahlia, so called (which is not really a Dahlia at all, but *Cosmos diversifolius*), makes a good foil with its dark brown velvety petals. These can be raised from seed, and answer best if they are grown in pots plunged out of doors during the summer, and all the strength thrown into the growth by the removal of all buds until the plants are wanted to flower. *Arctotis arborescens*, a very beautiful, but rather tender, perennial, often used for summer bedding, comes under this class. It is somewhat bushy in habit, and likes plenty of room, but it is well worth taking any pains to get its large creamy-white flowers in autumn. These are tinged with pink on the under side of the petals, and the fine grey-green foliage sets them off to great advantage. How true it is that no greenery goes better with any flower than its own leaves. Another species, *A. aureola*, has glowing orange flowers, which it produces till quite the end of the year out of doors in the Isles of Scilly, and would probably answer as well as the larger-growing *A. arborescens*. Alas! they have one fault, they close in dull weather.

Paris Daisies, both white and yellow, grown from spring-struck cuttings, make delightful autumn plants when plunged out of doors during the summer, and the points of the shoots carefully pinched out to make them bushy. There is something so innately cheery about them that, common as they are, they may not be left out of our year-end programme. Several of the hardier Salviyas, treated in the same way, make fine and useful plants. They are so quick growing as a rule that, after the cutting stage is passed, they require several shifts during the season, until finally they reach a 9-inch pot, in which size they should flower well. Severe pinching is also necessary to make them compact, but in any case they take up more room than most plants. For a strictly cold greenhouse it is better to be content with such species as *S. Pitcheri* (syn. *S. azurea grandiflora*), *S. coccinea superba*, *S. Greggii*, crimson, *S. bifans*, purple with spotted lip, and *S. patens*, well known with deep blue flowers, of which there is also a white form, rather than the more tender species. In a good season, however, and with the temporary help, on occasion, of a heat radiator, *S. splendens*, with its brilliant scarlet spikes, *S. cacaifolia*, deep blue, *S. gesneræfolia*, and *S. rutilans*, but with Pine-apple scented foliage, may be successfully grown, though they need a genial temperature of at least 50° to develop their flowers satisfactorily. The cultural treatment of both hardier and more tender species during the summer is identical.

The subject of retarding flowering plants by refrigeration, which is coming so much into vogue, can hardly be passed over without some reference here. It will be quite possible in the near future, if it be not so already, to procure many different kinds—perennials (such as *Astilbe japonica*, better known as *Spiraea*), bulbs, represented by several species of Lily, and even hardy deciduous shrubs, like *Azalea mollis*—ready prepared to flower in the autumn greenhouse. These will, probably, require special care in the way of very gentle forcing to bring them to perfection after the severe ordeal to which they have been subjected. But the amateur who loves his plants, and desires to know more of the unstinted variety which the garden of the world offers to the seeker, may do better than to hark back to spring when so great a wealth of autumn flower is within his reach. There is more show of reason for helping autumn and spring to clasp hands over the sleeping form of winter,

## CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

### EUCALYPTUS GUNNII.

[To THE EDITOR OF "THE GARDEN."]

SIR,—As many of your readers are interested in this species which appears to be grown in all parts of England and Scotland and to prove perfectly hardy everywhere, a few particulars as to its range and variation in its native country will no doubt be acceptable.

Mr. J. H. Maiden, Curator of the Botanic Gardens, Sydney, has kindly sent me a copy of a paper upon the species, from which I glean the following facts.

It ranges through Tasmania, the original type being from the cold mountain districts, but it also occurs on the lowlands.

In Victoria it is found on the summits of the higher mountains; and in New South Wales on many of the mountains up to 5,000 feet or 6,000 feet above the sea-level; but in both colonies varieties are found in the lowlands. It is also found in the eastern part of South Australia, but not in West Australia, as has been erroneously stated owing to a mistake of one of the older writers.

Mr. Maiden thinks that this species is the most protean of all the Eucalypti, and he gives a list of twenty varieties of it which have been described by various botanists as distinct species. Hardly any of its characters are constant. In stature, colour and surface-texture of the bark, shape and colour of the leaves, shape of the fruit and of the operculum, and form of the inflorescence, it varies greatly, but there are always intermediate forms connecting one variety with another indicating that all are the varying forms of a single species.

Still more extraordinary is the very wide range in stature of the various forms in different localities. In the mountains it occurs generally as a shrub or small tree, reaching to about 40 feet in sheltered positions, while in the lowlands it often attains to a large and sometimes a gigantic size. One of the forms of the variety, *E. stuartiana*, is said to be near 100 feet high in the south-eastern ranges of Australia, where it is called "White Gum," but another writer calls this same variety a "Red Gum," and says that it attains "an enormous size in Victoria, perhaps only surpassed by the *Eucalyptus amygdalina* and the Karri of West Australia." But the following account by Rev. T. J. Ewing, in the Proc. of the Royal Society of Van Dieman's Land, 1851, is both precise and extraordinary. Speaking of the "Swamp Gum" of Tasmania, he says:—"One about 40 yards from the biggest was 60 feet in circumference at 4 feet from the ground, and at 130 feet must have been fully 40 feet round; it was without buttresses and went up in one solid massive column without the least symptoms of decay. . . . The largest we measured was, at 3 feet from the ground, 102 feet in circumference, and at the ground 130 feet. We had no means of estimating its height, so dense was the neighbouring forest, above which however it towered in majestic grandeur." On this Mr. Maiden remarks:—"The above magnificent trees were in the vicinity of the North-West Bay River, and if correctly described as Swamp Gum are probably *E. Gunnii* var. *acerula*."

That any variety of *E. Gunnii*, always considered to be one of the smaller species, should

be also one of the largest, and not only so but one of the most gigantic trees in the world, equaling the finest specimens of the Californian *Sequoia gigantea*, seems very remarkable, but the same variety occurring on the coast of New South Wales is described as being "one of the largest trees of these parts," which renders it quite possible that the enormous Tasmanian specimens are truly identified as forms of the same species.

The local names by which the varieties of *E. Gunnii* are known are even more numerous and more puzzling than those of the botanists. "Red Gum," "White Gum," "Black Gum," "Swamp Gum," "Blue Gum," "Hickory," "Apple," "Cabbage Gum," "Yellow Gum," "Ribbony Gum," "Spotted Gum," and "Candle Bark" are some of these, and are a good indication of the uselessness of such names, which only tend to confusion and error.

Mr. Maiden's paper is evidently written only for botanists, and especially for Australian botanists; hence it is very technical, and many details which would be of great interest to English cultivators are only incidentally mentioned. Two points may be here referred to. Some of the forms are said to produce "manna," and the following is quoted as to an exhibit in the Paris Exhibition of 1855 by Mrs. John (afterwards Lady) Hay, as being "manna" from a tree believed to be *E. Gunnii* var. *rubida*. "It is found in considerable quantities in many tracts, generally rather upland, scattered under the trees from which it exudes." But nothing is told us of the nature of this substance, whether it is edible or is used in any way by Europeans.

In Tasmania trees of the type first described by Sir Joseph Hooker are called "cider trees," and to one specimen collected by Mr. Gunn is appended the note—"A tree yielding rich cider." But again we are not told how this cider is made, or whether it is really used as a beverage by residents in Tasmania. It would be very interesting to obtain seed of these "manna" and "cider" yielding trees from the greatest elevations at which they grow; and if they have any of the hardy character of the varieties usually grown in this country it would give an additional charm to the cultivation of *Eucalyptus Gunnii*.

Parkstone.

ALFRED R. WALLACE.

### THE OTAHEITE ORANGE.

[To THE EDITOR OF "THE GARDEN."]

SIR,—You gave a fine illustration of this Orange, on page 130, vol. ix., of THE GARDEN, which attracted my attention at the time. That drawing of Miss West's represented the fruit, leaves, and twigs accurately. I now send you a photograph of a plant in full fruit, which has been greatly admired in my window.

It is so seldom that we find the variety illustrated that I trust you will find the print suitable for reproduction. This plant is six or seven years old, and was received from a Pennsylvania florist by mail when very small. Its present size can be judged

THE OTAHEITE ORANGE AS A POT PLANT.  
(From a photograph sent by Mr. H. Hendricks, of Kingston, N.Y.)

by the 8-inch pot. Two years ago it matured four fine specimens. It has now thirteen Oranges, as will be seen, all of which are perfect and fully ripe. They set late last autumn after a shower of blossoms, and have been growing through the winter. The colour of the fruit is a dark, rich orange, which was assumed even before the fruit was half grown. This, in contrast with the large dark green leaves, makes a very pretty shrub indeed. This being the season for new growth, some of the older leaves have dropped off, the heavy crop of fruit having doubtless retarded the growth somewhat. Soon the fresh pink buds will appear again, and anon the charming white, fragrant blossoms with the wealth of new leaves and young shoots, which, once started, grow with astonishing rapidity.

I really know of nothing more beautiful or desirable in the way of a small ornamental shrub for the window, garden, or house, than this little Otaheite Orange. A large part of the year it is in fragrant bloom, and the flowers are fully as large and sweet as those produced by the standard varieties of the Citrus family. The fruit never drops when fully formed and healthy, but will hang on all through the year, if desired, for it has the habit of the Citrus family in general in retaining the fruit even until all the juices are absorbed by the tree and the rind can be squeezed together like a sponge, as though Nature said, "Well, if they don't want this luscious fruit I'll return its juices to the tree, where it may be worked over into new leaves, growth, and fruit." For Nature is an economist; nothing is ever lost in her domain. I must, however, differ with your correspondent in regard to the flavour of this little Orange. He says it is not good to eat, and that it is grown "only to be looked at." Now, speaking from my own experience, I must say it is very sweet and good when fully ripe, juicy, and pleasant, without a trace of bitterness or astringency. The pulp parts very readily from the skin, it has few or no seeds, and in most respects it is very much like the Mandarin type of Orange as it grows in our State of Florida. A little kid glove gem, and an ornamental shrub of charming value, it succeeds well in the house with ordinary care, the scale insect being its only enemy, and that is easily controlled.

The precise origin of this Orange seems somewhat obscure. I have been unable to get information on this point, and would be very glad if some reader of THE GARDEN would tell us where, how, and when it was first produced, or why it is called Otaheite. It is comparatively new in this country, I think, and

not very extensively grown even now. It seems to have been brought into France as early as 1815, but I cannot find where it came from, nor who brought it there. Its dwarf habit and comparative freedom from thorns has led to its use to some extent as a stock upon which to work standard table sorts for ornamental and indoor purposes.

As to the size of the fruit shown in this picture, I might say that the largest specimen measures 2½ inches in diameter and the smallest about 1½ inches. In the larger specimens the skin is very rough.

Kingston, N.Y.

H. HENDRICKS.

## GARDENING OF THE WEEK.

### INDOOR GARDEN.

#### CROTONS.

**A**S these root and get pot-bound they should be potted on, using a porous compost of three parts fibry loam, one part leaf-soil, with a liberal addition of charcoal and coarse silver sand. Give thoroughly efficient drainage, as a sour soil is fatal. The soil must be firmly rammed into the pots and the plants placed in a warm and moist atmosphere in order to produce the rich colour in the leaves, which is the chief attraction. They require to be kept close to the glass and receive no shade whatever. Large specimen plants not required for growing on may be used for the cold conservatory. They are amongst the finest things that can be used among Palms and flowering plants, and will stand a long time in a cool house in summer. The Croton is a plant with a strong constitution, and will survive where harder ones fail. Here we grow them in a mixed flower bed out of doors. With many similar plants it is a question of constitution rather than temperature.

#### DRACENAS.

Similar treatment is also necessary in every detail. The potting compost should be three parts fibry peat to one of loam. Every care should be taken to produce good plants, as they will make fine ornamental subjects during the winter, and are serviceable at that season for rooms or for the dinner table.

#### MIGNONETTE

for autumn flowering should be sown in 4½-inch or 6-inch pots. A light, rich, open compost should be used. Sow about a dozen seeds in each pot and place in a cold frame until the seeds germinate, after which keep them as hardy as possible and afford plenty of light. Thin early to five in a pot. Several strains are recommended. Miles Spiral and Machet are good varieties. Statice profusa and allied varieties that have done flowering should be repotted in a mixture of rich fibry loam, leaf-soil, and sand, and kept in a warm, humid temperature until growth recommences. These plants, although almost perpetual bloomers, are often much neglected and seldom have proper attention given to them; they should be general favourites, and if care is taken in watering there will be little difficulty in their cultivation.

#### CHINESE PRIMULAS AND CINERARIAS.

These should have plenty of air, and on very hot days damp the shading material with cold water. The plants should have plenty of room between them. They enjoy moist surroundings, and do better if the ashes are kept well damped. It will be well now to leave the lights off the frames at night, as the dew moistens the foliage. Frames facing north are especially suitable for Cinerarias.

#### CALLAS.

Previous instructions having been followed these plants will be sufficiently dried off to be repotted. Use a fairly rich soil, good, sound, fibry loam, and a liberal quantity of dried cow manure, though decayed horse manure will form a good substitute. The plants should be potted firmly and watered with care until growth is perceptible. Give weak

manure water at frequent intervals as soon as the pots are filled with roots. This will obviate the necessity of using large unsightly pots.

JOHN FLEMING.

Wexham Park Gardens, Slough.

### THE FLOWER GARDEN.

ALTHOUGH good strains of the ordinary hybrid Pentstemon are so popular in our flower gardens, and in the autumn months are so conducive to the beauty of the herbaceous borders, comparatively few of the highly ornamental

#### PENTSTEMON SPECIES

are cultivated, which is surprising when one considers the beauty of some of them. One particularly, *P. pubescens*, no garden should be without, for wherever it is seen growing it is sure to elicit admiration. It may be grown in the border or in the rock garden. Somewhat similar in appearance to *P. barbatus*, but much larger and of better habit, *P. pubescens* has numerous stems from which spring rosy scarlet and yellow flowers in profusion. Its free and easy habit of growth necessitates no staking. Seed sown now will produce good flowering plants next summer, though plants established three or four years are the most effective. The seed may either be sown in boxes and stood in a cold frame or in outdoor border. I practice the former, and when the seedlings are strong enough prick them out into a well-prepared border, where they remain over the winter, and in the spring are ready for their permanent quarters.

#### PENTSTEMON SPECIOSUS

is another very handsome kind, growing 4 feet to 5 feet in height, with clusters of blue flowers with a reddish tinge. It is best treated as a biennial. Another kind, somewhat like this, is *P. grandiflorus*, but it has larger flowers of a lovely pink, and at the present time is at its best. It, too, should be treated as a biennial. *P. murrayanus* is a pink flowering one, and with me has grown to the height of 6 feet or 7 feet. Not only are the flowers particularly handsome, but its foliage and habit of growth are attractive. I saw it a little earlier than this in boxes, and when the seedlings are large enough pot them up and winter them in frames. In the spring they are planted out into a warm sunny border, where they make a grand show in the summer. *P. jeffreyanus* belongs to the blue flowering section, and is beautiful during a long period in the summer months. It is hardy, but still is best treated as a biennial. *P. procerus* is another blue flowering one, and being dwarf, with a creeping habit, is splendid for the border or the rock garden. Its complete hardiness makes it a desirable plant for every flower garden, and its earliness of flowering, in comparison to the other Pentstemons, is also one of its recommendations.

HUGH A. PETTIGREW.

Castle Gardens, St. Fagans.

### THE KITCHEN GARDEN.

#### MULCHING.

THE great value of thoroughly mulching between growing crops during the past spell of hot scorching weather has been fully demonstrated, and one may easily see the beneficial effect it has had where it has been well practised. I would strongly advise all who have not done so to lose no time in doing this, especially to late crops of Peas, Beans, Cauliflowers, Brussels Sprouts, and the like. Nothing is better for the purpose than long stable litter, but failing this old hot-bed manure, leaf-soil, or even short grass may be used. It will not only materially save labour in watering, but it also does much to conserve the moisture, keep the roots cool, and the growth will be more vigorous and healthy. Waterings, both at the roots and overhead, are best given during late afternoon and evening; give thorough drenchings, as small dribs are of little use. Peas in all stages of their growth should have copious supplies of manure water, either the drainings from the farmyard or house sewage, and to obtain extra fine pods for exhibition the growth should be stopped after about

the fourth flower is open, and the pods thinned to a reasonable number, selecting the most shapely, which should be looped up and held in position with broad pieces of bast. Syringe freely with tepid water just as the sun is leaving them, and any pools which are quite full and are wanted in a few days' time should be carefully cut, the ends placed in water and stored in a cool place, where they will keep quite fresh.

#### LEAKS.

The blanching of these for exhibition must be carefully and systematically carried out. Endeavour to get the desired length as soon as possible, and when 12 inches or 13 inches is attained the paper collar should be removed, when they will, if kept well supplied with moisture at the roots, quickly begin to swell. Good Leeks should be of proper proportions, which means that specimens 13 inches in length should be as thick as one's wrist. The plants should be well earthed up, using poor soil, or the roots will, instead of descending, come to the surface. It is a capital plan to fix 2-inch drain pipes to convey water direct to the roots, also damp the tops over every evening in hot weather.

Green fly and black fly are very troublesome in many districts this season, especially among Carrots, Marrows, and Celery, but they may be easily eradicated by syringing the foliage with soft soap and water in the evening and wash off the following morning.

#### BEETROOT.

The earliest sown globe shape varieties, which are extremely useful for salads, should not be allowed to remain in the ground after they have made medium-sized bulbs or they will become stringy and of little value. Lift and store in sand or ashes under a north wall, where they will last in good condition for many weeks. The later sown long-rooted kinds should be thinned, and the surface soil kept constantly stirred with the Dutch hoe. During showery weather apply small doses of artificial manure and soot in equal proportions.

#### POTATOES.

Many of the early varieties will now have completed their growth, and should be lifted and stored, choosing a fine day for the purpose. Unless Winter Greens have been planted between them the ground can be utilised for other crops, such as Spinach, Turnips, Lettuce, and Endive. Ridge Cucumbers should have their growths thinned and regulated, and thoroughly syringed with insecticide to rid them of all insect pests. Keep the roots well supplied with water, and when in full bearing manure water ought to be given.

#### CAPSICUM AND CHILLIES

may now be arranged in the open, in a sheltered sunny position, and stimulants given freely, when a good crop of fruit is assured.

E. BECKETT.

Aldenham House Gardens, Eustree, Herts.

### THE FRUIT GARDEN.

#### STRAWBERRIES.

THE plantations of these should be examined when the crops of fruit are gathered, and the condemned ones, such as have been upon the ground two years, or those that were planted for the purpose of yielding only one crop of large fruit, should be cleared off the ground, which may then be prepared for Broccoli or some other vegetable. Plantations that are intended to remain for another year must on no account be neglected, as the quality of the next season's crops depends greatly upon the way they are now managed, which should be with getting strong crowns. Consequently, first remove their netting protectors, and clear them of weeds, exhausted foliage, and runners. See also that the plants do not suffer from want of water, and give necessary nourishment in the form of liberal applications of liquid manure or other suitable stimulants. The plantations of late varieties, especially if planted upon north borders, together with such perpetual bearers as St. Antoine de Padoue and St. Joseph, will together carry on a supply of fruit for a long time, provided they have been mulched and are properly watered. This is all the more necessary in light soils.

## PEACHES AND NECTARINES.

The demand for water at the roots of these trees greatly depends upon the character of the soil they are growing in, and it should be supplied accordingly. In cases, however, where the soil is naturally light and porous it is easy to err in not giving sufficient to meet the requirements of the trees, and both they and the crops suffer in consequence. Mulching with short litter also will be useful. Growth is now active, and requires close attention to keep it secured to the walls, and the stopping or entire removal of unduly gross shoots, so that the balance of strength is maintained, must not be overlooked. Avoid crowding, and if the young growths were not adequately disbudded do not hesitate to remove the superfluous ones. If aphis is present spray the trees with Quassia Extract, and in the evening after bright days thoroughly wash the trees with the garden engine. Mildew is a virulent enemy to the Peach, and makes rapid progress if not checked, therefore should it appear at once first lightly spray the trees, and then thoroughly dust them with flowers of sulphur, and subsequently wash it off when the vitality of the fungi is destroyed.

## GRAFTED STOCKS.

Newly grafted stocks should be carefully examined, and if the scions are making satisfactory progress gradually remove the shoots that have started beneath the scions. If the situation is windy see that robust scions are properly secured, so that they are not injured by being blown out of position. As soon as the union is formed, the ties should be entirely removed or slackened as is found desirable.

## BUDDING.

This may be begun as soon as the wood is about half ripe, and damp weather is most favourable for the operation, although if the stocks are clean, young, and healthy, and good buds are selected success is almost certain, provided the operator is

an expert. The process is so simple that it is needless to fill space here by describing it. It may, however, be remarked that under ordinary circumstances it is best to leave this in the hands of nursery specialists, from whom the very best trees can be procured at quite reasonable prices.

## BLACK CURRANTS.

Once the fruit is gathered the bushes should be pruned by cutting out old exhausted branches and thinning the young shoots by shortening the weakest, leaving the strongest, which produce the finest fruit, to form the bushes. Keep the plantations free of weeds and well supplied with water if necessary, using liquid manure if it is available.

T. COOMBER.

## THE KITCHEN GARDEN.

## CUCUMBER BRITISH KING

**C**OMPARATIVELY seldom is it that a new Cucumber is honoured by the fruit and vegetable committee of the Royal Horticultural Society with an award of merit, but the variety named British King, which was shown by Mr. S. Mortimer, Farnham, at the Temple show, and of which we now give an illustration, was fortunate enough to be thus recognised. Mr. Mortimer is inseparably associated with the culture of Cucumbers, Melons, and Tomatoes, and he has raised many good things amongst them. To his list of new varieties must now be added Cucumber British King. Mr. Mortimer obtained this as the result of a cross between Sensation and

Famous, each of which has also been certified. It is a large and handsome Cucumber of a deep green colour with black spines, and is undoubtedly destined to become a favourite variety.

## SUMMER TURNIPS.

WITH variable weather such as heat and drought it is often difficult to have a good supply of summer Turnips. In our case we largely rely upon north borders or land partially shaded by fruit trees for our early autumn supply, but much depends upon locality and situation. In the north it is not so difficult to get late summer Turnips as in the south. Many shifts may be adopted to get a crop. I once sowed a few seeds on a bed that had been dressed with salt, and here we were never troubled with the fly, so that, though I do not advise using salt after sowing, I have done so previously and saved a crop. It is also well to sow in land not recently dug, or previous to sowing the seed to well tread the

soil if the latter is at all light or sandy. I would much prefer land that had been prepared in winter than that newly dug. Another point is to sow thinly and avoid severe thinning, also to sow varieties that will stand a long time, such as the Golden Globe, Red Globe, Criterion, or the Matchless. The plants delight in being cool at night, so that any watering is best done late in the day. The land for this crop should, if possible, be on the level, so that water given may be retained longer.

A. C. N.

## MISCELLANEOUS.

## PLANTS SUITABLE FOR THE ROCKERY.

**R**OCKERY formation may be adapted to a variety of requirements both outdoors and under glass. Outside rockeries may be constructed of various sorts of stone so as to suit the culture of hardy plants of various kinds. We may note first hardy Ferns and Lycopods. These may all be expected to thrive well in the crevices of a rockwork formation, if the requirements of shade, soil, and ordinary care in cultivation are attended to. In small suburban and other gardens there is often ground that cannot be utilised for the growth of either vegetables or flowers; in fact, the ground would not be suitable for the development of such crops, whilst a collection of hardy Ferns, with the background filled up with dwarf-growing hardy evergreen shrubs, would not only add a new feature of interest but make a hitherto neglected spot a thing of beauty.

I will give a selection of a few of the hardy Ferns as I proceed. Ferns are not very particular as to the soil, providing it is not too retentive and does not contain too much lime; but, if otherwise, the cultivator should have a better class of soil at his disposal, such as a good meadow loam, peat soil, leaf-mould, burnt earth, and sand. Care should also be taken that the peat is well drained, because if the crowns and roots get wet in the winter there is a great danger of decay taking place. It must not be stagnant. The main secret of success in Fern growing is to keep the plants well supplied with water during dry weather. Hard water should not be used for sprinkling the foliage of Ferns during the summer, because it used too much the fronds will become coated with a deposit of lime. Use soft water therefore in all cases if practicable. The hardy Ferns I should recommend for small rockeries would comprise the following:—

*Nephrodium Filix-mas*, *Osmunda regalis*, *Polystichum angulare* and its varieties, *Polystichum aculeatum*, and the stronger forms of the common Polypodium. Those best suited for a small rockery formation are *Polyodium Dryopteris*, *P. Phegopteris*, *Polyodium vulgare*, *Asplenium Trichomanes*, and a few of the *Scolopendriums*. Any kind of rough sandstone formation will be suitable for the culture of these.

There is another class of plants that I would specially mention as being adapted for the outside rockery, and these are the alpine and dwarf growing varieties of hardy herbaceous plants. I would recommend the following plants as specially adapted for this work: *Silene* (dwarf varieties), *Delphinium sinense* and *grandiflorum*, *Dianthus barbatus*, *Dielytra spectabilis*, *Eryngium alpinum*, *Gypsophila paniculata*, *Lychnis Viscaria splendens*, *Phlox decussata* in varieties, *Vinca minor* and *V. major*, *Achillea* in variety, *Auriculas* (alpine varieties), *Anchusa italicica*, *Arabis albida* and *albida variegata*, *alpine Aster*, *Anemone purpurea*, *Epimedium macranthum*, *Veronica Traversii*, *Genista radiata*, *Helianthemums* in varieties, *Rock Cistus*, *Hypericum Potentillas*, *Tradescantia virginica*, *Thymes*, &c. The above comprise a great variety of flowers, foliage, and growth, and will also furnish a continuous supply of bloom till late in the autumn. We must not, however, forget the *Aquilegias* and the taller-

CUCUMBER BRITISH KING.

(Shown by Mr. Mortimer at the Temple Show and given an award of merit.)

growing varieties of Phlox, which would prove very effective for the background.

In reference to the cultivation of half-hardy and tender Ferns, which I have not as yet mentioned, these plants would require an inside rockery for their culture. The stone specially adapted for growing to perfection the choicer greenhouse Ferns and those requiring stove heat should be the best porous tufa rock. When a place has been specially selected for their cultivation it is essential that the structure should be well heated. A moist heat is necessary for the successful culture of these beautiful plants. The hot water piping should be fixed so as to pass underneath the rockwork. The compost in which the plants are placed should be a mixture of Jadoo fibre, leaf-mould, and sand put into the interstices of the tufa. Keep a moist heat by syringing at intervals the heated pipes. By this means a luxuriant growth will be promoted and the health of the plants maintained. The tufa blocks would require to be carefully placed and cemented together, and the entire arrangement of the plants to be put in should be entrusted to the care of a competent man. As a good illustration of a greenhouse rock fernery I would mention those at Osmaston Manor, near Ashbourne, and Snelston Hall, not far away. The two places represent two distinct styles of rock formation, both alike beautiful in their character, the rock formation at Osmaston being chiefly tufa stones, whilst at Snelston one sees a combination of the natural sandstone rock with the grey limestone.

A. GODWIN.

### BIG TREES OF CALIFORNIA.

THE interesting article on the big trees of California, which appeared in THE GARDEN some months ago, leads me to some further observations concerning these most remarkable forests, and more especially that most wonderful of all, situated in the Big Basin of Santa Cruz, which is not spoken of in the article referred to. When we stop to think of these cyclopean specimens of vegetation that must have taken root long before the birth of Christ and grown old while the end of the world was still the eastern shore of the Atlantic Ocean, and that to-day they are the only living objects that have been preserved to us from those remote ages, we may well bow our heads in reverent awe and stand speechless in silent admiration. Well may we marvel at the vandals among our human brotherhood whose petty souls are dominated alone by the mercenary spirit of gain, and who stand ready and eager to destroy and despoil these hoary sentinels of 2,000 years.

Much has been said of the big trees of Calaveras and Mariposa, and those wonderful groves are visited by tourists in increasing numbers annually. But this great Sequoia forest in the Big Basin of Santa Cruz has remained almost unknown because of its comparative inaccessibility, and yet it is now found to be more marvellous, more wonderful to science, and more beautiful than anything of its kind in the world. Scientists tell us that the only vegetation which escaped destruction during the glacial period on this western continent was this narrow strip of redwood trees, scarcely twenty miles wide, extending from Monterey County on the south upward to the line of the State of Oregon, a distance of some 400 miles. Here stand these hoary monarchs of the forest primeval, members of the genus known as *Sequoia*, the term being the name of the Cherokee tribe, ascribed to the inventor of their alphabet. There are two species—*Sequoia gigantea*, of the north and Sierra Nevada Mountains, and *Sequoia sempervirens*, evergreen, of Santa Cruz County and the Coast Range. Both are coniferous. The redwood is valued for lumber, although most of the colour fades away when exposed to air and light.

This remarkable virgin forest in the Santa Cruz Mountains lies about twenty miles north of Santa Cruz, and contains over 14,000 acres. This Big Basin is a great rough oval rift in the summits of the range, about eight miles long and four miles wide. It is very difficult to reach, and has been seen only by a few lumber men and a still smaller

number of intrepid scientists and explorers. Careful data from such writers show that there are many trees that measure over 100 feet in circumference and 400 feet in height. There are many groves where the trees average 20 feet in diameter and 250 feet in height. Lying in the zone of maximum rainfall, which averages about 60 inches in the year, and the soil of the valley being very rich and deep, the fallen leaves and vegetable debris of age adding to the fertilising properties, these immense trees are said to surpass anything of the kind in the world in quality of texture as well as in size and age. President B. J. Wheeler, of the University of California, says that in no other place in the world can such studies in forestry be made, and, together with President D. S. Jordan, of Stanford University, he has asked that a school of forestry be established, with this Big Basin as its centre. Half the distance, and by far the most formidable half, is still without any road.

The growing demand for redwood timber has almost denuded a large part of the original forest in the vicinity of Monterey. But so far this great tract in Big Basin has been spared because of its protected situation. For a time the ruthless "mills" were headed that way, but fortunately a protracted struggle on behalf of the honour of the State and the cause of common decency succeeded in keeping them back, and the grand old monarchs of the vegetable kingdom are safe from vandal hands—for the time, at least. Money has been appropriated by the State for the purchase of this entire forest tract, and efforts are being made to convert it into a State park, and thus preserve the remarkable forest for future generations.

Concerning the practicability of converting the big trees of Calaveras Grove into lumber, it is said the cost of felling alone would be almost prohibitive. It would take five men twenty-two days to bore enough holes through any one of these 30-foot trees to bring it down. Then it would have to be cut into 40-feet lengths, each of which would still weigh about 600 tons, and no machinery has yet been built to handle such ponderous masses in the forest. No saw could work on such a section, even were it possible to haul it to the mill. Splitting with dynamite would shatter the log and spoil it for lumber. Have not we got lumber enough without sacrificing these hoary giants? And shall we not respect the edicts of Nature in placing an embargo upon these cherished patriarchs of her household? How can we permit the destruction of these oldest living witnesses of so much of the world's career, who have been so marvellously preserved to us by Nature?

KINGSTON, N.Y.

H. HENDRICKS.

### SOCIETIES.

#### CROYDON HORTICULTURAL SOCIETY.

THE annual exhibition of the above society was held in the grounds of Brickwood House on Wednesday, July 3, thus conflicting with the metropolitan show of the National Rose Society and the gathering in the Old Deer Park at Richmond. The fact that there were three such important fixtures on the same day was demonstrated in the lack of competition in the open classes for Roses, but apart from that the general exhibition was practically equal to the high average of merit that we look for in such an excellent gardening centre. The arrangements at Croydon, in the hands of Mr. Roffey and a few energetic members of the committee, are invariably good. Non-competitive exhibits, including a superb group from Mr. W. P. Bound, gardener to J. Colman, Esq., Gatton Park, Reigate, and from such well known nurserymen as Messrs. J. R. Box, J. Laing and Sons, W. Cutbush and Son, and J. Cheal and Sons, added materially to the beauty and interest of the exhibition.

The several open Rose classes did not afford any particular interest, as Messrs. G. and W. H. Burch, Peterborough, were the only exhibitors and were awarded first prizes in each class. They showed in the various stands good blooms of Maman Cochet, La France, Duke of Wellington, Medea, Viscountess Folkestone, Mrs. W. J. Graut, Margaret Dickson, and Ulrich Brunner. The principal class for amateurs was for thirty-six single trusses, distinct, and Mrs. Haywood, Woodhatch Lodge, Reigate (gardener, Mr. C. J. Salter), was a splendid first. This is the third occasion upon which Mr. Salter has proved victorious in this class, and, as usual, he had a weighty stand of well-arranged blooms, Xavier Olibo, Duke of Wellington, Prince Arthur, Maman Cochet, and Margaret Dickson being conspicuously good. This exhibitor was first for twelve blooms of one variety, with handsome examples of Margaret Dickson. Mr. E. M.

Bethune, Denne Park, Horsham, secured several prizes, including the first for eighteen Teas and Noisettes. Smaller Rose classes were numerous, and while they did not bring the same uniform excellence of quality as the larger ones there was generally a little stronger competition. Mrs. Lascelles, Sydenham Road; Miss Thrale, Shirley; Messrs. T. B. Crisp, Chichester Road; A. E. Mason, Vincent Road; G. B. A. Schofield, Sutton; F. S. Rich, Chichester Road; F. W. Amsden, Chichester Road; and W. J. Dart, Thornton Heath, were successful exhibitors.

Table decorations were good in the winning exhibit, arranged by Mssrs. W. H. Still, Addington, but in the others crowding was the order of the day. Mr. E. H. Coles, Burtonwood, Caterham (gardener, Mr. C. Lane), had some splendidly furnished table plants. Greenhouse and hardy cut flowers in bunches were grandly shown by several gardeners. Mr. C. J. Salter won with twenty-four bunches of tender flowers, and Mr. G. Lewry, gardener to Mrs. Blade, Dupras Hill Terrace, for a similar number of hardy flowers. Alderman Barrow (gardener, Mr. W. Collins), had a splendid table of Gloxinias, and Mr. F. W. Amsden (gardener, Mr. J. Knapp), nine well grown tuberous rooted Begonias. Mr. G. Lewry and Mr. F. Chappell Whytelake (gardener, Mr. C. Walton), sent grandly grown Ferns, and the latter had some splendid Fuchsias. Mr. A. C. Blogg, Brighton Road, and Mr. W. G. Child, Frant Road, had interesting Cactaceous plants, and were both first prize winners. Mr. G. Lewry sent the best Caladiums. In the fruit section the classes were not numerous. Mr. E. M. Bethune, Denne Park, Horsham (gardener, Mr. H. Harris), and Mr. W. Lintott, The Gardens, Marden Park, were first and second respectively for black Grapes, the order being reversed for white ones. Mr. W. Collins had the best Strawberries, and Mr. C. J. Salter the best Melon. Vegetables did not present anything of very striking merit.

#### NORFOLK AND NORWICH HORTICULTURAL SOCIETY.

ANNUAL SUMMER SHOW.

OWING to the early date this show was arranged for the Rose blooms were behind the usual standard seen at these gatherings. There were, of course, some good blooms, especially when we consider that the Rev. A. Foster-Mellar was a large exhibitor. The medal of the National Rose Society for the best Tea was secured by the Rev. A. L. Fellowes for a fine specimen of that charming variety Muriel Graham, whilst that for the best Hybrid Perpetual went to Miss Penrice, Witton House, for a fine bloom of La France. One of the finest features at this show for several years has been the exhibits of herbaceous flowers and also flowering shrubs. This section has taken a firm hold in the district, backed up by such noted private growers as Dr. Beverley of Brundall, F. W. Harmer, Esq., of Cringleford, and Mr. O. Corder, of Brundall, not forgetting the names of many others. This year the cream of the class was without a doubt the entry of forty-eight bunches, hardy flowers, distinct, staged by Mr. G. Davison, gardener to Captain Petre, Westwick House, Norwich. The same exhibitor was first for twelve bunches of flowering shrubs, and also received an award of merit for a grand new seedling Montbretia with very large golden yellow blooms named Davisonii. Mr. F. Pitch, gardener to G. F. Buxton, Esq., Dunstool, had a good collection of hardy flowers, first in the class for twenty-four bunches, distinct.

Fruit and vegetables were a fairly good class, Mr. W. Allan, gardener to Lord Sutherland, showing some of his famed Strawberries named Lady Sutherland, of the type of Waterloo, but of a distinct Pine flavour.

Trade exhibits comprised a grand display of pot plants nicely arranged and cut blooms by Messrs. Daniels Bros., Limited; Hobbies, Limited, had a charming bank of Sweet Peas, including a new variety which received an award of merit, named White Wings, also a nice array of pot plants and miscellaneous cut flowers; Messrs. Cutbush had some of their best Carnations; Paul and Son choice Peonies and herbaceous flowers; both the Messrs. Cant sent Roses. The attendance showed a great falling off.

#### ROYAL HORTICULTURAL SOCIETY.

ORCHID COMMITTEE.

PRESIDENT: H. Little, Esq. (in the chair), Messrs. J. O'Brien, J. Coleman, F. W. Ashton, W. H. White, W. H. Young, E. Hill, G. F. Moore, H. J. Pitt, James Douglas, H. M. Pollett, de C. Crawshay, J. Wilson Potter, J. Gurney Fowler, and W. A. Bilney. The work of this committee was light, as will be seen from the number of exhibitors and awards.

Messrs. Hugh Low and Co., Enfield, staged a charming display of Orchids, chiefly Cattleyas and Lælias. In the former were noted C. Mossiae Wageneri, C. M. alba The Queen, gaskelliana, and granulosa; Lælias epicasta, digbyana, and elegans were also noteworthy, as was also a Lælia hybrid (cinnabarinaria × arnoldiana). Silver Banksian medal.

Messrs. Sander and Sons, St. Albans, staged a few choice plants, which included Platycchinis filiformis, Zyngonia polyeana var. superba, a cross between Anguisaria lepida and Zygoepatulum Gautieri; Lælio-Cattleya Martinetti, from Cattleya Mossiae × L. tenebrosa; and Brassia-Cattleya conspicua, from C. Leopoldii × B. glauca.

Messrs. B. S. Williams and Son, Upper Holloway, staged a few Cypridiums and a good plant of Lælio-Cattleya Edouard André; the former included good plants of C. superbiens, C. cenanthurum, C. harrisiae superbum, and C. Curtisii.

Messrs. James Veitch and Sons, Limited, Chelsea, staged two good plants of Cattleya Warscewiczii Countess of Derby and Lælio-Cattleya C. G. Roebeling albida, a cross between L. purpurata alba and C. gaskelliana.

Messrs. W. Bull and Sons, Chelsea, staged an excellent variety of Cattleya Mendehi named Souvenir de William Bull.

From Mr. White, gardener to Sir Trevor Lawrence, Bait, came a well flowered plant of Cirrhaea purpurea.

Mr. Chapman, gardener to Captain Holiford, Westonbirt

Tetbury, sent a fine plant of *Laelio-Cattleya* Earl Grey; a distinct variety with a deep purple lip.

Mr. E. Hill, gardener to Lord Rothschild, Tring Park, staged plants of *Cattleya gaskelliana alba* and *Lelia cinnabarinaria* in good form.

*Cirrhea viridi-purpurea*, from Sir Trevor Lawrence, Bart., was given a botanical certificate.

#### FRUIT AND VEGETABLE COMMITTEE.

Present: H. Balderson, Esq. (in the chair), and Messrs. J. H. Veitch, II. Esling, S. Mortimer, Alex. Dean, Geo. Kelf, T. Coomber, F. L. Lane, J. Smith, Geo. Wythes, A. H. Pearson, and the Rev. W. Wilks. Practically speaking there was little before this committee, which is rather surprising at this season.

Messrs. G. Bunyard and Co., Maidstone, staged a collection of Cherries in pots, and about thirty varieties of picked fruit arranged on plates. The trees, though small, were well crooked, and comprised Noir de Schmidt, Napoleon Bigarreau, Windsor, Bigarreau Damson, and Monstreux de Mezel; the dishes included Knight's Early Black, Noir de Schmidt, Nouvelle Royale, Waterloo, St. Margaret's, and Florence, Silver Knightian medal.

Strawberries were exhibited by Messrs. Laxton Bros., Bedford; the exhibits included boxes of The Laxton in capital condition, also the new late variety Trafalgar.

Mr. G. Kelf, gardener to Miss Adamson, South Villa, Regent's Park, sent some grand clumps of Mushrooms as they were lifted from the beds, and for which he was awarded a cultural commendation.

Mr. Thos. Coomber, gardener to Lord Llangattock, Hendre Gardens, Monmouth, staged fifteen splendid Queen Pines; the fruits were large, ripe, and in perfect condition, a very fine exhibit. Hogg medal.

The Horticultural College, Swanley, sent an exhibit of Carter's Endive-leaved Lettuce.

#### FLORAL COMMITTEE.

Present: W. Marshall, Esq. (chairman), Messrs. C. T. Drury, H. B. May, James Walker, J. Jennings, J. W. Barr, G. Reuthe, C. R. Fielder, W. Howe, C. Dixon, H. J. Cutbush, G. A. Nix, J. Fraser, W. P. Thomson, Charles E. Shea, E. H. Jenkins, C. Blick, and J. H. Pitt.

Probably for the first time in the history of the Sweet Pea a gold medal was awarded to what was regarded as the finest arrangement of these flowers ever brought together upon one occasion. The collection was all the more noteworthy as coming from an amateur—Percy Waterer, Esq., Fawkham, Kent. There were upwards of 5,000 sprays of these flowers set up, taste and good quality marking the arrangement throughout. The varieties, too, were numerous. We give just a few of the best: Navy Blue, Black Knight, Fire King, Gaiety (a striped kind), Mars (red), Miss Willmott, Salopian, Countess Cadogan, Mrs. Eckford (yellow), New Countess, Gorgeous (an old, yet good kind), America (one of the best striped kinds), Blanche Burpee (white), Othello (dark), Lady Grisel Hamilton, Captain of the Blues, Lady Ormsby Gore (pale primrose), &c. The vases were set on a white cloth, over which was strewn some pale green muslin. This, with a background of dark velvetine, gave a good finish to as fine and fresh a lot as we have yet seen staged.

Lord Rothschild, Tring (gardener, Mr. E. Hill), had a splendid group of that fine yellow Carnation Cecilia. There were some 150 plants shown, each crowned with a flower about 5 inches across. The group was very fine, and attracted a good deal of attention from quite a numerous company. The flowers were all the more notable as the plants were only about ten months old. Silver-gilt Flora medal.

G. Fergusson, Esq., Weybridge, had a large group of showy Delphiniums in variety, for which a bronze Banksian medal was awarded.

Messrs. Hugh Low and Co., Enfield, had a group of mixed things, in which Roses of the Rambler type mingled with such New Holland plants as *Phenomena prolixa* Barnesi, *Dracophyllum gracile*, and such things. In front of these some finely expanded flowers in shallow trays of the newer Water Lilies were much admired. Silver Banksian medal.

Messrs. T. S. Ware, Limited, Feltham, brought a large and varied group of hardy flowers. There were Delphiniums, Gaillardias, Erigerons, Eryngiums, Phloxes, Gallegas, and such showy things, interspersed with small alpines and many interesting plants. Silver Banksian medal.

Mr. A. Wade, Colchester, set up a group of hardy things in which the English Irises were largely in evidence. Sweet Peas, with Calochorti, Gaillardias, several Campanulas of the Peach-leaved section, *Lilium pardalinum*, and *Chelone barbata* were also shown, together with Larkspurs and other showy flowers.

Mr. B. S. Williams, Holloway, again showed English Irises, together with Alstroemerias, early Gladioli, &c.

Hugh Aldersey, Esq., Aldersey Hall, Cheshire, had a small collection of Sweet Peas in variety.

Messrs. Wallace and Co., Colchester, had a group of showy things in which a large batch of *Lilium thunbergianum* Orange Queen formed a feature. There were also good batches of Calochorti, the rich golden of Iris juncea, and the hybrid day Lily *Heremocallis luteola*, which is a cross between *H. aurantiaca* major and *H. Thunbergii*.

Messrs. Wm. Bull and Sons, Chelsea, had a small group of Dracenas, such as *D. Victoria* and *D. goldieana* being most conspicuous. *Ficus stipulata variegata*, a small-leaved kind, was also shown in pyramid form.

From Messrs. Wm. Cutbush and Sons, Highgate, came a capital lot of Malmaison and other Carnations. Of the former we noted Mrs. Trelawny, red; Nautilus, blush; Princess of Wales, pink; and the fine crimson Maggie Hodgson. Other kinds in capital form and quantity were Cecilia, yellow, the crimson Uriah Pike, and the very pure white Much the Miller. Silver Banksian medal.

Mr. H. B. May, Edmonton, staged a capital lot, mostly double Pelargoniums in groups, each group or kind being well separated by ferns and the like that constituted the

general groundwork. The more worthy kinds shown were Lady Ilchester, double pink; Lord Ilchester, cerise-red; Blanche, double white; Perfection, scarlet; Lord Kitchener, double crimson-scarlet, &c. Silver Banksian medal.

In view of the lecture on trees and shrubs by Lord Annesley, the large collection of cut trees and shrubs, shown by Messrs. Paul and Son, Old Nurseries, Cheshunt, was of two-fold interest. The collection by itself, indeed, was a remarkable one, and included much valuable material in this especial branch of horticulture or arboriculture. Some of the rarer things were Buddleia globosa in flower, *Abutilon vitifolium* with pale blue saucer-shape blossoms, *Caragana jubata*, *Larix Kampferi*, the variegated *Dimorphothecus*, *Tamarix odessana* and *T. germanica*, *Elaeagnus argentea*, with *Viburnums*, *Weigelas*, *Robinias*, *Catalpa*, *Philadelphus*, *Aceris*, *Ericas*, and many more, forming a most interesting study in these plants. Silver-gilt Banksian medal.

Messrs. Veitch and Sons, Limited, Chelsea, showed some Rambler Roses, the result of crossing a multiflora simplex variety with the Crimson Rambler. Rito is a pink, wonderfully free; Edna, blush pink; Queen Alexandra, a semi-double pink, and all are free and showy. *Lonicera sempervirens*, *Hedysarum multifidum*, with *Cornus Koussae* were also shown by the firm.

A good group of pink Malmaison Carnations in a cut state and in pots was shown by Lady Nina Balfour, Kelso (Mr. Wood, gardener), the plants evidently grown with great freedom, and were quite free from the disease that in some districts plays such havoc with these handsome flowers. A silver Flora medal was awarded.

Messrs. Kelway and Sons, Langport, brought one of their characteristic displays of Delphiniums. Dorothy Kelway, azure blue, with metallic tinge; Captain P. Scott, dark blue; Coronation, purplish blue; Britannia, dark blue; Dorothy Daniel, semi-double purple and blue with white eye, extra large pip; and Queen Alexandra, glistening azure blue, very large flowers, were of the best. A large array of Gaillardias was also staged. Silver-gilt Banksian medal.

Messrs. B. R. Cant and Co., Colchester, had a few select Roses, in which we noted Liberty in splendid colour; Killarney, pink; the giant flowers of Ben Cant, a veritable "Big Ben" among bedding Roses of the H.P. class; Maharajah, semi-double crimson; Mrs. B. R. Cant, a seedling Tea Rose, delightfully sweet. These, with the superb white Frau Karl Drusckhi, which gained an award of merit, made quite a display.

Mr. M. Prichard, Christchurch, again showed excellent hardy flowers. Iris Kampferi, Funkias, *Tropaeolum Leichtlinii*, *Alstroemeria aurantiaca*, *Potentilla*, Wm. Rollison, Delphinium Bella Donna, and *Peonia albatross* were among the best things generally. Then quite alone was a corner of Bell Flowers, of which at least some dozen or more good kinds were seen, mostly of the taller border sorts. Silver Banksian medal.

From Beckenham, Mr. J. Surman brought a big display of Petunias in pots, single kinds, well grown and well shown also. There were many varieties and perhaps nearly a couple of hundred fine plants. Silver-gilt Banksian medal.

Mr. Amos Perry, Winchmore Hill, again showed hardy plants finely and in great variety. Heucheras of sorts, a splendid lot of Calochorti, *Lychinis haageana*, the noble *Ostrowskia magnifica*, Iris juncea, Delphinium Zafil, Allium azureum with globular heads of blue, Iris Black Prince apparently a late flag Iris, *Geranium sanguineum album*, *Campanula* G. F. Wilson, and many more fine and good things. Silver-gilt Banksian medal.

Single and semi-double Begonias in great variety, size, and brilliancy were from Messrs. Cannell and Sons, Swanley. Silver Banksian medal.

Another fine lot of hardy things came from Messrs. Barr and Sons, Covent Garden, who, in addition to large numbers of the more showy flowers, Delphiniums, Sweet Peas, Gaillardias, Sea Hollys in variety, Campanulas, Pinks, &c., showed quite an array of the early Gladilus such as Blushing Bride, Crimson Queen, Little Lady, *Carnimata elegans*, &c., also Ixias and Irises. Iris anrea, I. juncea, and I. Monnierii, formed a trio of yellow Iris not easy to surpass in July. Silver Banksian medal.

Mr. J. Russell, Richmond, had a group of stove plants in which Alcasias, Dracanas, Crotons, Palms, *Aralias*, *Acalypha hispida*, *Araucaria Cooki*, and such things took a leading part, and with bolder plants in the background were margined with *Caladium argyrites*, &c. Silver Flora medal.

#### CERTIFIED PLANTS.

The following received awards of merit:—

*Asternomeria Mrs. Salter*.—A dark red form of the Aurantiaca group, with enormous heads of some three dozen flowers. A very showy kind. Exhibited by J. H. Salter, Esq., Witham.

*Delphinium Kitty Woodall*.—A semi-double kind, with large violet-blue flowers, arranged on a handsome spike. From Messrs. Kelway and Sons, Langport.

*Dracena His Majesty*.—A well-coloured member of the D. terminalis (*Cordyline*) group. The richly-coloured leaves are closely arranged, giving a compact habit, broad arching, and of a character well fitting it to general decorative work. Shown by Mr. H. B. May, Edmonton.

*Polyodium irides raino-crystatum*.—This striking plant is 2 feet high, and from a tapering base the fronds rise and spread out in a varied, cristate fashion at the termini. Shown by Messrs. Wm. Bull and Son, Chelsea.

*Carnation Countess Carrington*.—A fine border kind of a pale pink shade, and strongly fragrant. The flowers are of good size and well maintained within the calyx. From Martin Smith, Esq., Hayes, Kent (gardener, Mr. Blick).

*Rose Frau Karl Drusckhi* (H.P.).—A sweet-scented variety of large size and almost pure white. The variety evidently possesses great vigour and freedom. Shown by Messrs. E. R. Cant and Co., Colchester.

*Lobelia coronopifolia*.—This beautiful species appears to have been introduced from the Cape as long ago as 1752. The gentian blue flowers are large and showy, and borne on

slender peduncles. The lance-shaped leaves have a toothed-like termination, hence the specific name. This very attractive species was shown by Mr. J. T. Bennett-Poe, Cheshunt.

#### NATIONAL SWEET PEA SOCIETY.

The second exhibition of this society was held on Tuesday and Wednesday last, in the Royal Aquarium, Westminster, and was generally considered to be most satisfactory. The flowers on the whole were small, but many good blooms appear to have been spoilt by the storm last week. At the luncheon given to the committee and judges, Mr. George Gordon presided, and in the course of his remarks referred to the opposition the society had had to encounter, but said they were, notwithstanding, determined to persevere in the improvement of the Sweet Pea by upholding the society and its exhibitions. The name of Mr. Richard Dean was coupled with the toast of the society, and Mr. Dean suitably replied. Mr. S. B. Dicks proposed "The Judges and Exhibitors," and Mr. John Wright and Mr. Simpson replied. The proceedings closed with the toast of "The Chairman," given by Mr. William Cuthbertson.

#### OPEN CLASSES.

For thirty-six bunches of Sweet Peas, distinct (prizes given by Messrs. Hurst and Son), Mr. W. Simpson, gardener to R. C. Foster, Esq., J.P., The Grange, Sutton, won the first prize with an excellent display. The flowers were not crowded at all, and they included the leading varieties. Miss Willmott, Senator, Prince of Wales, Safety, Prima Donna, Dorothy Tenant, Gorgeons, and Lady Hamilton were of the best. Messrs. Jones and Sons, Shrewsbury, won the second prize with some very good flowers; Mr. Leonard Brown, Brentwood, Essex, was third, and Messrs. F. Smith and Co., Woodbridge, fourth.

For twenty-four bunches (prizes given by Messrs. Cooper, Taber and Co., Limited, Southwark Street), Messrs. Isaac House and Son, Westbury-on-Trym, were first with a very good stand, Gypsophila being interspersed. Of the best were Lady Grisel Hamilton, Black Knight, Salopian, Grace Greenwood, and New Countess; Messrs. Jones and Son, Shrewsbury, were a good second, and Mr. Leonard Brown, Brentwood, third.

Messrs. Jones and Sons were first for twelve bunches, showing some excellent flowers, of which Purity, a new white seedling, was the best; Messrs. Isaac House and Son were second; and Mr. Charles W. Breadmore, High Street, Winchester, third.

#### TRADE EXCLUDED.

For thirty-six bunches (prizes given by Messrs. Webb and Sons) Mr. J. Clark, Wislow Hall Gardens, was first with a good exhibit of bright and fresh flowers, Gorgeons, Mars, Black Knight, and Monarch were of the best; Mr. F. Ackland, Hopford House Gardens, Frome, was second, showing well also; Mr. C. Osman, Sutton, Surrey, was third; and Mr. Thomas Leith, Basingstoke, fourth.

For twenty-four bunches of Sweet Peas (prizes given by Mr. Eckford), Rev. L. Knight-Smith was first, showing some very good flowers of the best varieties; Mr. F. J. Clark, Wislow Hall Gardens, Leicester, was a good second; Mr. Tom Stanton, Sion Hill Place, Bath, third; and Mr. J. G. Ward, Brentwood, fourth.

Mr. Silas Cole won for twelve bunches (prizes given by Mr. Robert Sydenham), with remarkably good flowers of Emily Eckford, Hon. Mrs. Kenyon, Countess Spencer, Sadie Burpee, and others; Mr. G. Hughes, Kingston, was second, and showed well also; Mr. Aubrey F. Woottte, Epsom, was third; and Mr. J. G. Ward fourth. There were numerous other entries, making this one of the best classes in the show.

For six bunches (prizes given by Hobbies, Limited, Dereham), Mr. Silas Cole was first with good flowers; Rev. L. Knight-Smith second; and Mr. H. A. Needs, Horsell, third. All three showed good blooms.

For nine bunches (prizes given by Messrs. Jones) Mr. H. A. Needs was first with fine flowers of good sorts; Mr. Ernest Beck, Hoddesdon, was second; and Mr. Silas Cole third.

#### FLORAL DECORATIONS IN SWEET PEAS.

For a decoration of Sweet Peas for the dinner table (trade excluded) Mr. H. A. Needs was first, using yellow and pink Sweet Peas, Smilax trailing upon a white cloth and a pink muslin centre; Mrs. F. H. Barnes, Horncastle, Essex, was second; and Mr. D. B. Crane, Woodview Terrace, Archway Road, Highgate N., was a good third. In a similar class (open to all) Mr. D. B. Crane was first with Sweet Peas in shades of pink and grasses prettily used; Messrs. Jones, of Shrewsbury, were second, using pale blue and a few buff Sweet Peas; Miss Adelaide Harwood, Colchester, was third.

Messrs. Jones and Son, Shrewsbury, won for an epergne of Sweet Peas; Miss Cole, Feltham, being second, and Mrs. Noth third.

Messrs. Jones were first for a basket of Sweet Peas, Miss Cole second, and Mr. Hayward, Kingston, third.

#### OPEN.

Two bunches of white Sweet Peas: First, Rev. Knight-Smith with Sadie Burpee.

Two bunches of scarlet or crimson: First, Mr. Charles W. Breadmore with Mars.

Two bunches of yellow or buff: First, Messrs. Isaac House and Son, Westbury-on-Trym, Bristol, with Hon. Mrs. Kenyon.

Two bunches of pink: First, Miss Cole, showing Prima Donna.

Two bunches of rose: First, Messrs. Isaac House with Lord Rosebery.

Two bunches of mauve: First, Mr. Isaac House, showing New Countess.

Two bunches of blue: First, Mrs. Noy, Brentford, with Navy Blue.

#### NON-COMPETITIVE EXHIBITS.

Messrs. Dobbie and Co., Rothesay, N.B., were awarded a large gold medal for a remarkably fine display of Sweet

Peas in splendid variety. They were pleasingly arranged in Bamboo stands, in glasses, both tall and short, and interspersed was suitable greenery. A very attractive exhibit.

Mr. H. J. Jones, Lewisham, displayed an excellent lot of Sweet Peas also. An effective background of Bamboos and grasses prettily arranged between the flowers added much to the general effect. Gold medal.

Hobbies, Limited, Dersham, had a splendid exhibit of Sweet Peas, including many beautiful sorts, which were tastefully displayed. Gold medal.

Messrs. Jones and Sons, florists, Shrewsbury, also obtained a gold medal for a very fine display of the flower of the day in some of the best varieties. The flowers were of good quality, and the Palms, Ferns, and other greenery made the exhibit very effective.

Hobbies, Limited, displayed a collection of cut Roses in considerable variety, for which they were awarded a gold medal.

Messrs. Isaac House and Son, Westbury-on-Trym, Bristol, were given a silver medal for an attractive group of miscellaneous hardy flowers.

Messrs. George Stark and Son, Ryburgh, exhibited a good display of Sweet Peas. Silver medal.

Messrs. G. W. King and Co., Coggeshall, also showed Sweet Peas in variety. Silver medal.

Messrs. John Peel and Son, West Norwood, S.W., were awarded a silver medal for a very attractive display of Sweet Peas and hardy flowers.

*Pelargonium Fire Dragon* was shown by Mr. E. S. Towell, Hampton Hill.

#### CERTIFICATE VARIETIES.

The following varieties were shown by Messrs. Robbie and Co., Rothesay, and each obtained a first-class certificate: *Britannia* (crimson and white), *Jessie Cuthbertson* (white, splashed with pale crimson), and *White Queen* (pure white).

#### THORNTON HEATH.

THE southern suburbs of the Metropolis provide many admirable exhibitions of gardening produce, and amongst the latest recruits is Thornton Heath, whose second show was held on the 9th inst. under regrettably unpropitious climatic conditions. Taking into consideration the age of the society, it speaks well for the management that it was able to bring together such a considerable array of meritorious produce, and it is pleasant to hope that this may be an augury of even better and greater things in the future.

Though grown within a comparatively limited radius, Roses were beautifully shown in several classes. For twenty-four distinct, Mrs. West, Grange Road, Sutton, was first; Mrs. W. H. Lascelles, Sydenham Road, Croydon, second; and Mr. G. V. Schofield, Sutton, third, but neither showed strong sets. For four trebles, C. B. Crisp, Esq., Croydon (gardener, Mr. J. Heading), was first with Jeanne Dickson, Ethel Brimner, Margaret Dickson, and Her Majesty; Miss Thrale, Shirley, was second. Mr. Keppe H. Gifford, Sutton, was first for six distinct, with Francois Michelon, Suzanne Marie Rodocanachi, Mrs. J. Laing, Horace Vernet, Her Majesty, and Comtesse de Lndre; Mr. H. E. Molyneux, Balham, was a dangerously close second with smaller blooms of refined character. Mrs. West won, for six Teas, with Innocente Pirola, Maman Cochet, The Bride, Mrs. Edward Mawley, White Manan Cochet, and Bridesmaid. For six, one variety, Mr. Gifford was first, Mrs. Lascelles second, and Mrs. West third, each with Mrs. J. Laing; it was a very easy win for Mr. Gifford. In local Rose classes, Messrs. Holmes Davis, W. J. Dart, A. E. Mason, and E. T. Baker were successful.

Sweet Peas were beautifully shown by Mr. C. Osman, Sutton, who won the open class for twenty-four bunches; Mr. F. W. Amesden, Croydon (gardener, Mr. J. Knapp), was a good second; Mr. J. Heading third. Mr. G. Davidson, London Road, won Mr. Sydenham's first prize for nine distinct. Mr. Eckford's prizes for twelve were won by Mr. H. Dart, Woodville Road, and Mr. R. Ballfield, Brigstock Road, both of whom showed well. Eleven tables were arranged by ladies, of whom Miss May Dart was first with pink Sweet Peas; the centre piece was slightly heavy at the top, and the base was not nicely finished, but the general effect was good. Miss Ethel Burrough was second with Iceland Poppies effectively displayed, and Miss West third. This was a splendid class. Mr. W. J. Dart won in the class for gentlemen with a bold arrangement of Improved Shirley Poppies; Mr. Cooke, jun., was second with white and light and dark purple Sweet Peas, somewhat heavily placed, but very beautiful. Mr. J. P. Bewshier was third.

The classes for hardy flowers, plants in pots, bouquets, sprays, hardy fruits and vegetables were well contested, and much excellent produce was staged. Mr. H. Eckford, Wem, had a beautiful collection of Sweet Peas, not for competition.

**Exhibition of Roses at Regent's Park.**—In the beautiful gardens of the Royal Botanic Society, Messrs. William Paul and Son, of Waltham Cross, from July 16 to 20, arranged a delightful exhibition of Roses, the extent and variety of which speak volumes for the resources of this firm. The Roses were both growing and cut, and were arranged in a natural and graceful manner. The pot plants comprised all the leading Hybrid Perpetuals, together with many of the best Hybrid Teas. Pillars of Crimson Rambler and Leuchtstern were very bright, and from the roof hanging baskets were suspended full of lovely trailing Roses, such as Jersey Beauty, Pink Roamer, and

Ruby Queen. A pretty feature, and one we should like to see more generally adopted at Rose shows, was made by the neat green baskets filled with some two dozen flower sprays, each basket containing one variety and displayed just as cut from the plant, surrounded by all the buds that are so characteristic of many of our modern decorative Roses. We have not space to enumerate all the varieties to be found in this unique exhibit, but we noted many of the firm's own special raising. Foremost among these was Corona, a grand flower of the Hybrid Tea section. Morning Glow is a Rose of an almost indescribable colour of bronzy yellow, and Chameleon is one of the pretty ever-blooming Roses. Other novelties exhibited in baskets were the brilliant Corallina, which well maintains its reputation; Queen Mab, and a new hybrid Polyantha, Floribunda by name, a most prodigious bloomer. Baskets full of climbing Belle Siebrecht were grand, and so were Clio, Tennyson, White Lady, Pride of Waltham, Duchess of Bedford (scarlet), Ella Gordon (a fine crimson), Star of Waltham (a splendid full Rose, very double, and most handsome foliage), and the fragrant Aurora. Baskets of the leading Tea-scented kinds showed how suitable they are for exhibiting in this way, and particularly striking were Georges Schwartz, certainly the best yellow hedger yet raised; Souvenir de William Robinson, of a most uncommon colouring; Mme. Antoine Mari, a pretty novelty; and Mrs. Edward Mawley. The China or Monthly Roses were much in evidence, and the Polyantha Roses were not forgotten in this most representative exhibit. We noted fine lots of Eugene Lamesch, Leonie Lamesch, Petite Constante, Perle des Rouges, Gloire des Polyanthas, Perle d'Or, and others. A splendid new rambler Rose was shown named Waltham Rambler. It is a great advance on Rose of the Leuchtstern type. Old-fashioned Roses were represented by Persian Yellow, Common and White Provence, Moss Roses of sorts, Mme. Hardy, York and Lancaster; and we also noted the quaintly pretty crested Moss and the curious green Rose viridiflora. When we say that numerous bunches and sprays were interspersed, and altogether some 6,000 or 8,000 flowers were placed in view, some idea may be formed as to the extent and beauty of this Rose exhibition, and Messrs. William Paul and Son are to be congratulated, especially in such a trying season.

**South Shields Chrysanthemum Society.**—This famous Chrysanthemum society, an advertisement about which appears this week, has come to life again, and we hope, to begin a successful career. The president is Mr. Jas. Readhead, J.P., and the hon. secretary, Mr. Bernard Cowan, and the assistant, Mr. Thos. A. Binks. The prize list is a most liberal one, the first prize in the classes for thirty-six Japanese and thirty incurved flowers being £6. The president offers a Coronation silver cup value 15 guineas.

**The Midland Carnation and Picotee Society.**—At a committee meeting held recently it was decided to postpone the exhibition on account of the lateness of the season to Thursday and Friday, August 7 and 8, instead of July 30 and 31, as originally named.—HERBERT SMITH, Hon. Sec. The show takes place in the Birmingham Botanic Gardens.

## ANSWERS TO CORRESPONDENTS.

**Names of plants.**—*E. W. I.*—Your Iris flowers were in a withered condition on arrival. They appear, however, to be—1, unrecognisable; 2, Iris sibirica variety lactea; 3, Iris sibirica variety (near lactea); 4, Iris sibirica variety atropurpurea; 5, Iris squalens variety. Your soil is probably too retentive of moisture for the majority of Irises. You would do well to trench the ground deeply and dig in a quantity of grit and cinders. The plants should not be left too long in one position without replanting. It would be a good plan to get some good local gardener to examine your plants and beds. It is difficult to advise on these subjects when the exact conditions are unknown.—*J. R. D.*—Your plant is *P. pilosum* var., and

differs from that species in the absence of the white marking on the base of the petals. There is also a slight difference in the foliage which, in the true plant, is of more pale green. You will not be far wrong in calling it *P. pilosum* var.

**Mulching herbaceous border** (ROSEMARY).—Certainly the mowings of a lawn, spread over the soil of a herbaceous border, form a useful mulch, and there is no need to dry it before placing it on the soil, as it withers up rapidly. But if these mowings be used the lawn should be frequently mown to prevent Daisies or grasses producing seed. The fewer weeds or coarse grass in the lawn the less danger is there of weed production through seed agency. Grass dies rapidly, and whilst brown is less noticeable as a mulch than cocoa-fibre refuse. The brown material you refer to is no doubt peat moss litter, which helps to retain moisture in the soil, but is far more useful when it has been employed to bed horses in stables, as then it is full of plant nutriment. Any of these things with other manure will benefit the soil if dug in the following winter.

**Orchis maculata** (N. B.).—The flower is *Orchis maculata*, one of the most cherished of native orchises.

**Hollyhocks from seed** (CHALSTON).—If you want to have a fine show of Hollyhocks next year by all means get seed and sow it at once. There should be no difficulty, now that the soil is so moist, in getting the seed to germinate freely, and

if sown thinly in shallow drills, 12 inches apart, you should have plenty of strong plants to lift and put out where you want them to bloom in September. They would thus become strong and flower finely the following year. If you fear to sow the seed out in the open, then sow thinly in shallow boxes or pans, or in a frame, or under a hand-light. In such a case, when the plants are 3 inches in height they had better be lifted and dibbled out into some good ground, 9 inches apart, where they can remain till the autumn, then be lifted with good balls of soil attached to each, and planted where to bloom. When seed is sown late or in warmth early in the spring very often many plants fail to bloom the following year.

#### QUESTIONS.

**A plant naturalisation society.**—Would you be so kind as to inform me if there is any society or company called the Botanic Naturalisation Society for introducing seeds and plants to every part of the world?—B. N. S. [We have never heard of this society, but perhaps some reader of THE GARDEN can give the address.—ED.]

**Wall gardens in summer.**—Will you please tell me what plants I can have to make my walls bright and interesting during the summer months? They are bright in spring, but at this time are most unsatisfactory. I want masses of colour, and will spare no expense to get it. There must be many things I can get from seed to give colour in June, July, August, and September. I feel sure there are many readers of THE GARDEN who can help me over this difficulty. My garden is near the River Thames, but on rising ground.—H. E.

#### TRADE NOTE.

##### RUSTIC SUMMER HOUSES.

MESSRS. PREEDY AND CO., Kelross Road, Highbury, N., manufacturers of portable rustic summer houses, arbours, bungalows, garden seats, &c., send us their illustrated list, which contains several exceedingly attractive designs in the above garden furniture, and these are all built of the very best forest hard woods. The designs are artistic, and the articles before leaving Messrs. Preedy's works are well finished and varnished. This is an important matter, for nothing is more annoying than to find that one's garden furniture quickly suffers from the effects of the weather, yet this will happen unless the wood is first well seasoned and prepared. Messrs. Preedy also make a specialty of rustic bridges. The summer houses are built in sections, and need simply to be screwed together to fix, although experienced workmen are sent to erect them if necessary. Messrs. Preedy will be pleased to send an illustrated list upon application.

# THE GARDEN

No. 1601.—VOL. LXII.]

[JULY 26, 1902.

## INDUSTRIAL GARDEN CITIES OF THE FUTURE.

**A**MONGST the many serious social problems of the day not the least serious, perhaps, is one which ought, for reasons both ethical and physical, to come home to every thoughtful dweller in a country house and garden. The constant drifting away of the able-bodied rural population to London and to the larger towns arouses, on the one hand, grave misgivings, while the sad cry is just as constantly wafted back to the country, of the squalor and misery and crime inseparable from the over-crowding of congested cities and the consequent gradual deterioration of the race.

The problem of getting the people back to the land is, confessedly, a hard one, and not easily to be understood in all its bearings, much less solved, without large expenditure, not of money merely, but of labour and anxious thought, and probably not without some false demonstrations and futile attempts at solution as well. The attention of the readers of **THE GARDEN** was directed some two years since to a scheme put forward by the Garden City Association, whereby it was proposed so to combine the opposing attractions of town and country as to create and gather into the common focus of a rural city a counter influence strong enough to overbalance the advantages presented separately by town life or country life, whilst it sought to correct and mitigate the evils inherent in either one or the other. It is a satisfaction to learn that the sprouting germ of the idea is taking strong root and gives promise of healthy growth and fruitfulness. We are, at the same time, assured by the names of able and sober-minded men of all shades of religious and political opinion which appear on the list of vice-presidents of the association that the youthful but vigorous organism is regarded, in influential quarters, with hopefulness and some degree of faith in its future useful development. The scheme, Utopian as it may seem at first sight, claims to be based on sound financial principles, and a small book, entitled "Garden Cities of To-morrow," a second edition of which has recently been published, enters fully into the projects of the association and will repay candid and careful study. We may not, perhaps, agree with all the arguments of the author, temperate in essence though they be. Knowledge of human nature may forbid us to look for perfect harmony or for

unalloyed material prosperity in any given area, even under the most ideal conditions, and many may shrink from the sacrifice, which such propositions, adequately carried out, must inevitably entail, in the long run, on that part of the community which seldom comes, even remotely, into touch with the submerged tenth or the stratum of society immediately above it. Fain would most of us let conscience sleep and, so long as misery is not in actual evidence, allow things to remain as they are in a world which has treated us individually with so much kindness. Nevertheless, it may not be. As Ruskin once wrote: "There is no wealth but life. Life, including all its powers of love, of joy, of admiration. That country is the richest which nourishes the greatest number of noble and happy human beings; that man is richest who, having perfected the functions of his own life to the utmost, has also the widest helpful influence both personal and by means of his possessions over the lives of others." (Unto this last, page 156.) Can it be possible for us, then, to forget the thousands existing in our midst, who are neither noble nor happy, owing, in great measure, to the unutterable evils engendered by the grime, the narrow limits, and the stifling air of the over-packed tenements in the city streets, which represents to them the best elements of all that they can call "home?"

The ring of the hammer, the clank of machinery, all the busy sounds, in fact, of human industry, are apt to affect the over-strung nerves of the age, and so, in order that we may shut out the bustle and hum of workaday life which encroaches upon us unceasingly, we, who belong to the leisured classes, fence about our homes with fair garden plots, larger or smaller as circumstances dictate. These, year by year, as taste and experience grow, bid fair to become more and still more idyllic, and who would say that we do wrong to enjoy them to the full. But for this very reason, surely, it behoves us to lend, as we are able, a helpful hand to any reasonable scheme for bettering the condition of those whose lines are not cast in the same pleasant places, that we may bear our part in bringing a share of the peace and refreshment of our own beautiful surroundings into the weary and unbeautiful lives of so vast a proportion of the citizens of this great empire of our love and pride.

We may, at any rate, venture to hope that a scheme, "having its origin in the thoughtful study of many minds and the patient effort

of many earnest souls, each bringing some element of value," will, when it is perfected, work for the ultimate welfare not of one class only but of all estates in the realm. Therefore, while wishing it well ourselves, we think it not unseasonable to commend the subject in good time to the serious consideration of the gardening public in general, and of landscape gardeners in particular, for if the "Garden Cities of To-morrow" are to be ideal in natural beauty as well as healthful and self-sustaining through trades and manufactures the opposing forces thus brought together will require to be firmly held in leash by very strong and skilful hands.

## TENDER SHRUBS AND TREES IN THE SOUTH-WEST.

THE possibilities that exist of the successful open-air culture of tender subjects in the south-west are but little dreamt of by the majority of English flower lovers. They doubtless read with interest the accounts in the Horticultural Press of Australian, Chilian, and Californian flowering trees and shrubs growing in their native habitats, and very possibly feel a desire to visit these climes in order that they may verify with their own eyes the truth of their readings. As a matter of fact, however, a lengthy sea voyage is by no means indispensable in order to view certain of these exotics flourishing in the open air, for a few hours' journey by rail will bring the passenger to a land where many of these denizens of other climes may be seen enjoying robust health under English skies.

The following list of tender shrubs and trees growing in the gardens of the south-west cannot claim to be an exhaustive one, since it contains only such as I have personally noticed in good health during my rambles along the southern coast line of Cornwall and Devon, and, where no lengthened inspection is possible, it is obvious that certain species and varieties must be overlooked. Incomplete, however, as it doubtless is, it should give an idea of the climatic advantages enjoyed by the district in question.

On consulting my note-book I find that many of the subjects mentioned were growing in Tresco Abbey Gardens, Isles of Scilly, but most of these I also found in mainland gardens as well. Where I have met with any at Tresco only I have noted the fact, but these may also be present on the mainland unknown to me.

The soil of the Scillies, which is composed apparently of peat and disintegrated granite, and is almost identical with much of that around Penzance, is admirably adapted for hard-wooded Australian, New Zealand, and Chilian shrubs and trees, and almost all the species and genera enumerated would be best suited by a compost in which peat or leaf-mould and granite sand formed the chief proportion, although it must be allowed that some alluded to have been found to succeed equally well in sandy loam. Porosity in the soil is indispensable, for in this district, where the winter rains are often exceptionally heavy, unless the water percolates rapidly through the ground,

stagnant moisture collects around the roots, a condition which is absolutely fatal to success. The advantages of the Cornish granite sand are gradually being appreciated. I was told the other day by an acquaintance that since he had imported it by the truck-load to his Sussex garden, he was able to grow many things successfully that he had before failed with.

I have arranged the following list in alphabetical order:

*Abrilia floribunda*.—Mexico. A beautiful evergreen shrub, bearing clusters of drooping pink flowers about 3 inches in length. Requires a sunny and sheltered site. Finest specimen 6 feet. Several gardens.

*Abutilon reuterianum*.—Rio Grande. A handsome evergreen species, generally grown against a wall. It throws up long slender arching shoots from 6 feet to 8 feet in length, studded with pendulous, bell-shaped flowers with crimson sepals, yellow petals, and dark brown stamens, which are very striking, and often remains in bloom for six months. Common.

*Abutilon vitifolium*.—Chili. A most ornamental evergreen shrub of which there are two forms, one bearing lavender flowers, the other white. In exceptional cases it attains a height of 20 feet, and when covered with its large blossoms, which are about 3 inches in diameter and feathered to the ground with foliage, it presents a lovely picture. Large specimens form pyramids of bloom, and in some gardens numbers of these are to be found. Wall protection unnecessary.

*Acacias*.—Australia. In Cornish and South Devon gardens many species are to be met with in robust health. *A. atlinis*, very generally confounded with *A. dealbata*, is the most common. In many cases *A. atlinis* is grown as *A. dealbata*. The leaves of the former are green, while those of the latter are bluish, and its flowers are less bright in colour. A group of *A. atlinis*, about 35 feet in height, was a wonderful sight at Tregothnan at the end of March, being simply covered with golden blossom, which was thrown into high relief by a background of Ilexes. *A. verticillata* is another handsome species, flowering later in the spring. It is a very rapid grower, reaching a height of 15 feet in a few years, generally growing in the form of a broad based cone, with its lower branches but a foot or so from the ground. When in flower it is so covered with its pale yellow blossoms that no foliage is discernible. *A. armata* may be seen as a bush 7 feet high and as much in diameter. *A. orata*: This I have only seen as a bush some 3 feet high, very pretty when bearing its circular, golden flower-balls. *A. longifolia*: Another handsome tree with leaves something like those of an Oleander, and bright yellow flowers. *A. melanoxylon*: A fine tree. The specimen at Treseco is about 50 feet in height, and there are good examples on the mainland. Pale yellow flowers produced in profusion. Other species I have met with are *A. riceana*, *A. lophantha*, *A. calamifolia*, *A. tinifolia*, *A. latifolia*, and *A. platyptera*, the latter against a wall.

*Adenandra fragrans*.—Cape of Good of Hope. A small evergreen shrub, bearing fragrant rose-coloured flowers. Tregothnan.

*Anopterus glandulosus*.—Tasmania. A vigorous evergreen shrub with dark, shining green leaves, bearing long, erect, terminal racemes of white cup-shaped flowers, resembling the blossoms of Clethra arborea, but larger. Tregothnan.

*Aralia quinquefolia*.—Garden seedling. A striking plant with dark green, large-sized leaves divided into five sections. Height at present 5 feet.

Tregothnan. S W. FITZHERBERT.

(To be continued.)

glorified Eucalyptus, and the tree grows to a fair size. (The Chilian species is hardy at Harrow Weald.) The yellow-flowered *Agave* (*Agave Morrisii*) was just coming into bloom. Each spike rises in solitary grandeur to a height of certainly 15 feet. It is attractive to the humming birds, for on one spike, of which only the lower flowers were open, we counted twenty of these lovely creatures. It would be an endless task to name and describe all the splendid trees and shrubs one remembers having seen, and I will therefore say nothing further on the subject, but will just add a few words as to the various fruits, and close with a slight account of the two important botanical gardens of Jamaica. Seeing that our visit to the islands was made in the winter, and that the best fruits do not ripen until summer (even the Mango was not then by any means in perfection) it would perhaps hardly be fair to say that the fruits of the islands would only appeal to the palates of the curious, for we discarded one and all in favour of the Jamaica Orange—the best being one with a very thin skin, which, when the fruit is in perfection, remains of a green colour, almost as green as the skin of a ripe Lime.

From recent correspondence in the *Times* I gather that the fruiters of this country persistently boycott the Jamaica Orange, and, as a mere matter of business, this is not to be wondered at, for if the Jamaica Orange once became well known here the public would insist upon having it, to the ruin of thousands of people at present employed in the Orange trade.

The supply of these Oranges in Jamaica alone could soon be made inexhaustible, and some idea of price can be gathered from the fact that when driving in Trinidad we asked a coloured man for a few Oranges and he swarmed up the tree at his "front door" with a bag, and came down with about three dozen absolutely perfect Oranges, for which he was well satisfied with a threepenny bit. These Oranges carry very well, and arrive here in excellent condition. We all know of the trade that is being established in Bananas by a large and enterprising firm of shipowners, and it was interesting to see how the cultivation of the Banana was spreading in Jamaica.

The plant is easily enough grown, and the natives just cut the bunches when ready and leave them by the roadside until the collecting carts from the various villages pass by, when they are carried to Kingston or in some cases to Port Antonio on the opposite side of the island for the American markets. At first it was difficult to realise that the limit of production was one bunch of fruit to one shoot, and that after the fruit was gathered the grand growth from which it was taken was cut down (in three distinct operations at intervals of a few weeks in order to avoid excessive bleeding), and then, instead of the one shoot, come up three to five strong suckers which, in the incredibly short space of about nine months, will have their single bunches ready for gathering.

There is one variety of Banana that is far away better than the best obtainable in England. It is called the "Fig Banana," a very thin-skinned and delicately-flavoured form of small size; and at the other end of the scale is the Plantain, which is in appearance apparently exactly like the Banana, but the fruit is large and coarse, and requires cooking before it can be eaten. Of the other fruits there is little to say; we tried several—Green Cocoanut was cool and refreshing; Sapodilla has a sharp and pleasant taste—it has to be kept like a Medlar, which it is not unlike in

flavour, while in appearance it resembles a rotten Apple; the Star Apple is considered rather a delicacy; the acidity of the Tamarind is known to all; Sour Sop (*Anona muricata*) and Sweet Sop (*Anona squamosa*) are both largely used, but the former only by Europeans. It is in appearance somewhat like very large Custard Apples, but the flesh was simply cotton wool saturated with delicious acid juice; the latter is only eaten by Creoles and natives, being much too sickly for European taste; the Grape-fruit is worth eating, a very refreshing fruit on a hot day—it looks like a large pale-coloured Orange, and is very juicy.

Beyond the fruits named I do not remember any that call for special notice. The two public gardens in Jamaica, which every visitor ought to see, whether specially interested in flowers or not, are the Hope Garden and the Castleton Garden, both under the management of Mr. Fawcett, the director of Public Gardens and Plantations. The Hope Gardens are within four or five miles of Kingston, and the few hours which alone we could spare out of our too short visit of four days to Jamaica might have been spread into days without seeing all that there was of interest there.

Mr. Fawcett's house is pleasantly situated in about the centre of the gardens, having for a view a well-kept and large lawn—the rarest of things on these islands—studded with specimen Palms of various kinds and other well-grown trees of fine foliage, including the Traveller's Tree (*Urania speciosa*), so called because the leaves when cut yield an abundant and refreshing juice. At the back of the gardens rise hills of 4,000 feet in height, the house itself is covered with creepers, the verandah by a handsome Bignonia, and the railings which separate Mr. Fawcett's private grounds from the public gardens are draped with a lovely trailing plant well named Coralilla (*Antigonon leptopus*), a plant which was blooming profusely in all the islands. Over the gateway was hanging a bluish clustered twiner (*Petrea volubilis*), contrasting most beautifully with the rose-coloured flowers of the Coralilla.

Our walk through the gardens with Mr. Fawcett was an education and pleasure which it would be hard to equal. We strolled along a well-shaded avenue where every tree was covered with Orchids, either growing naturally and well established upon the bark or suspended in baskets, and came out upon two grand shrubs of Bougainvillea, just a mass of bloom. After passing Tree Ferns and an immense variety of other Ferns, and noticing the many Aroids which there covered the tree trunks, we came again into the full sun to be met with a glaring scarlet blaze from a good breadth of double Poinsettia, a plant which Mr. Fawcett was anxious to know the history of, and of which he was much surprised to hear that, so far as we knew, it had lost favour in this country. Perhaps some of your readers will kindly send a note to THE GARDEN on the subject. Amongst the flowers that Mr. Fawcett named for us was the glorious blue trailer (*Clitoria Ternatea*), which was well figured in the coloured plate of your journal some years ago. In the nursery gardens there were some 70,000 plants, such as Cocoa, Nutmeg, Clove, Vanilla, Cinnamon, Coffee, Orange, Rubber, &c., chiefly in many varieties, and on an average some 40,000 of these are annually distributed throughout the island, to the great benefit of the growers, both small and large. The gardens are comparatively new, but when looking at the grand

## PLANTS AND FLOWERS IN THE WEST INDIAN ISLANDS.

(Continued from Vol. LXI, page 392.)

A SPECIES of Eugenia (I think the one from which Allspice is obtained) has flowers like

trees and Palms it is hard to realise that this is so.

The Castleton Gardens are much older, having been started some forty years ago; they are about nineteen miles from Kingston, and every yard of the drive is of interest. As the gardens have a rainfall of 12 inches, as against 50 inches at Hope, and are somewhat sheltered from both morning and evening sun, the place is a sort of vapour bath, which the vegetation, if not the visitor, enjoys.

At the entrance stand two noble Palms, with a drapery of *Thunbergia Harrisii* in full bloom, and close by was a large tree of *Jacaranda filicifolia* covered with blue flowers, while at one's feet *Phaius grandifolius* showed numerous spikes of flowers. Further on we came to the Water Lily tank, where *Victoria regia* had opened its first flower of this season, while by its side was the Water Hyacinth (*Pontederia azurea*), which was figured in THE GARDEN a good many years ago. We were shown very many things of great interest and beauty by Mr. Thompson, the superintendent, but the greatest treat of all, and one which alone was worth crossing the ocean to see, was a magnificent tree of *Amherstia nobilis* in full bloom. I cannot better close my paper than by quoting what is said about this in that rightly prosaic, but valuable book of reference, "Nicholson's Dictionary of Gardening": "Amherstia nobilis is a stove evergreen tree of unsurpassed magnificence and brilliancy. The flowers are, unfortunately, somewhat ephemeral, lasting but a few days in perfection, during which period however no object in the whole range of the vegetable kingdom presents a more striking aspect than this tree."

ANDREW KINGSMILL.

## ORCHIDS.

### ORCHIDS AT THE WOODLANDS.

#### CATTLEYA MARRIOTTIANA.

CERTAINLY as seen at the Woodlands this forms a decided acquisition to the Cattleya house. It was originally raised in the gardens of Sir William Marriott, Bart., of Down House, Blandford, from *Cattleya Eldorado* crossed with *C. Warscewiczii* (*gigas*) and well combines the characters of the two parents. The seed parent is chiefly distinguished by the rich purple-magenta colour of the labellum and its deep orange-yellow throat. Both features are reproduced to advantage in the hybrid, and are the more conspicuous from the greater size obtained from the pollen parent. The sepals and petals are soft rose, much the same shape as those of *C. Warscewiczii*, but carried more erect. Four of the handsome flowers were carried on the spike, and their great substance, the stoutness of the pedicels, and the glossy green of the leaves speak highly for the culture and point favourably to the use of Belgian leaf-mould, in which substance the plant is growing. The improvement in the plant since this material has been used is most marked, growth, &c., being much superior to any previously obtained.

#### LÉLIO-CATTLEYA CANHAMIANA

was first named and described by Professor Reichenbach in 1885. The parents had not been recorded, but were correctly ascribed to *Laelia purpurata* and *Cattleya Mossiae*. More recent hybrids between the two species mentioned have fully proved the truth of Reichenbach's

hypothesis. Naturally, however, considering the wide variation exhibited by both the parent species the majority of the later raised "Canhamianas" differ more or less from the form first raised. Usually the divergence is seen merely in the colour, but a variety flowering with Mr. R. H. Measures shows great superiority both in colour and size, the sepals and petals are clear rose, the petals slightly darkened on the tips and centres; the whole front area of the lip is a vivid crimson-purple, abruptly terminating at the apex of the throat, which is deep ochre-yellow, with dark radiating veins. So far a varietal name has not been given, but next year, when with additional strength, the plant may reasonably be expected to perfect its beauty, it should have a distinguishing name.

#### CATTLEYA MAXIMA × LÉLIA PRÆSTANS.

A most interesting hybrid between the above parents was also in flower. It has not yet reached its maximum development, and for that reason will not yet receive a name, but is already most promising in appearance. It may be compared to *Lælio-Cattleya Clive*, derived from *Lælia præstans*, crossed with *Cattleya aurea*. Whether or not it will equal in size that fine hybrid remains to be seen. At present the flowers are of medium size, but far darker in colour than would have been anticipated from the parents; in fact, the colour inclines strongly towards that of the *Lælia* parent, though the distinct venation of *Cattleya maxima* is well marked, extending far into the throat on a soft yellow ground, a quite different shade to the old gold colour seen in *L.-C. Clive*.

ARGUTUS.

## ROSES FOR ENGLISH GARDENS.\*

THIS new addition to the *Country Life* Library is one of the most welcome of the series, and that the book will meet a great want no one who has watched the remarkable development of garden Roses during the past few years will deny. As the preface points out "One of the surest signs of the great and ever-growing interest in gardening is to be seen in the remarkable improvement in the kinds of flowers that are now to be had. New

\* "Roses for English Gardens." By Miss Gertrude Jekyll and Mr. E. Mawley. *Country Life* Library. Price 12s. 6d. Geo. Newnes, Limited, 7-12, Southampton Street, Covent Garden, London.

ROSE THALIA (WHITE RAMBLER).  
(Reproduced from "Roses for English Gardens")

plants are being constantly introduced; good old plants, of late forgotten, are again brought forward, and a lively and wholesome competitive industry has increased among growers in the improvement of garden flowers. In no class of plant is this more apparent than among Roses. The increasing desire to deck our gardens pictorially has been met by a truly surprising and successful series of efforts on the part of raisers, so that now, in addition to the older classes of Roses that have been available for the last forty years, namely, the Hybrid Perpetuals and Teas, there are already in great variety quantities of beautiful new Roses of mixed parentage for every possible use and purpose. The time having come when there is a distinct need for a book that should not only show how Roses may best be grown, but how they may be most beautifully used, and that will also help the amateur to acquire some idea of their nature and relationships, the present volume, with its large amount of illustrations, is offered in the hope that it will fit usefully into a space as yet unfilled in garden literature."

Miss Jekyll also mentions in her preface that "In order that the book may be a complete Rose manual, I have had the pleasure of working in concert with Mr. Edward Mawley, who, in the second part, gives the result of his long experience as a practical rosarian." There are nearly two hundred illustrations, showing beautiful ways of planting Roses, three of which we reproduce, those representing the exhibition box, filled and unfilled, being with Mr. Mawley's part. It is a

charming book, with useful lists of garden Roses for planting on pergolas, against pillars, and in beds, and information on all phases of garden Roses. Mr. Mawley's part is full of practical hints about Roses for exhibition and under glass. The book is artistically printed and in all ways a publication worthy of the interesting library of which it forms one of the volumes.

### THE BOG GARDEN.

As a pond should naturally occupy the lowest level in the rock garden, so should the bog bed have the next lowest position. Though we may have picturesque rock gardens without either a pond or bog bed, it cannot be denied that both form a very desirable addition. The bog bed will enable us to enliven the scene with a number of charming plants, which, though not strictly of an aquatic nature, love, nevertheless, an abundance of moisture, such as many Cypripediums, Primulas, Dodecatheons, Pinguiculas, the Bavarian Gentian, &c. In small rock gardens containing neither pond nor streamlet, owing perhaps, to scarcity of water, it may often be the case that the comparatively small quantity of water required for a bog bed is easily obtained. Sometimes even a bog bed might be made, without introducing any water artificially, by utilising only the natural surface drainage of the surrounding land, but as this naturally would be fluctuating, an additional soaking would be required at least occasionally. In many cases the low part of the ground where the bog bed should be might be in itself of a swampy nature, and if so, very little labour will be required to turn such a spot into a picturesque bog garden.

Though the term "bog bed" might be suggestive of a formal bed, there should really be no visible hard-and-fast outline in the rock garden, and the bog bed should be amalgamated with its surroundings in such a way as to make it absolutely impossible to discern its real shape or extent. It is not at all neces-

sary that there should be only one bog bed in a rock garden, but we might have a number of them, and in different positions regarding light. Many of the moisture-loving plants prefer a sunny position, while others delight in shady nooks, and the requirements of the plants to be grown must therefore be our first consideration.

### EDITOR'S TABLE.

#### SEEDLING PINKS.

You were kind enough last year to give me some words of encouragement in my work of raising seedling Pinks. I now venture to send you for your table and opinion blooms of three seedlings which have just come into flower. Those numbered 1 and 2 are from the same capsule, and both pollen and seed parents are single-flowered varieties, the result of several years selection and cross-fertilisation. No. 3 is a hybrid, the produce of a single-flowered rose-coloured Pink, fertilised with pollen from a crimson Sweet William. All three are very floriferous and remarkably vigorous.—SIDNEY HALLAM, *Broomsgrove Road, Shiffield.*

(We are very glad to know that any words of ours have encouraged you to persevere in a most interesting and welcome work, that of improving our garden Pinks. The flowers you send are most promising. No. 1 in particular, a good crimson fringed Pink, reminding one of the beautiful old white fringed Pink, but self bright crimson in colour, and very sweetly scented. No. 3 is a sweet and pretty crimson single. We hope you will keep on with this good work and get other colours. Remember our previous words. The great want is a good flower of the old black and white class. Good types of this probably still exist, most likely in Scotch gardens. We should be very glad to hear of it in any good form. It should be fairly double, though not crowded, and have a very dark chocolate-black blotch at the base of the petal—the darker the better. The petal is rather solid and not much jagged, and it has a delicious scent. If any nurseryman would get up a really good form of this we can assure him that it

would be appreciated. Not only is it much wanted in our gardens, but "there is money in it" for a successful raiser or finder.)

#### ALSTREMERIA MRS. SALTER.

Mr. J. H. Salter, Witham, Essex, sends flowers of this beautiful Alstroemeria, which was given an award of merit at the meeting of the Royal Horticultural Society on July 8. It is a very showy form of the Aurantiaca group, with immense umbels of flowers, each umbel with eleven flower stems, each bearing three blooms of a brilliant carmine-rose colour, the two centre flrets intense yellow, with a few purplish stripes. Its colouring is both brilliant and unusual. We should much like to know its parentage.

#### INTERESTING SHRUBS AND FLOWERS FROM SCOTLAND.

Mr. R. P. Brotherton sends from Tynningham, N.B., the beautiful *Carpenteria californica*, *Benthamia fragifera*, superb spikes of the deep purple-lilac Madeira Orchis (*O. foliosa*), the greyish leaved *Olearia macrodonta*, and *Colutea cruenta*, also remarkably fine fronds of the Bird's-foot Maidenhair Fern (*Adiantum pedatum*). All these were from the open garden, the *Benthamia* having flowered exceptionally well. We usually regard this tree as one only for quite southern gardens.

#### SUB-TROPICAL TREES FOR TERRACES AND STEPS.

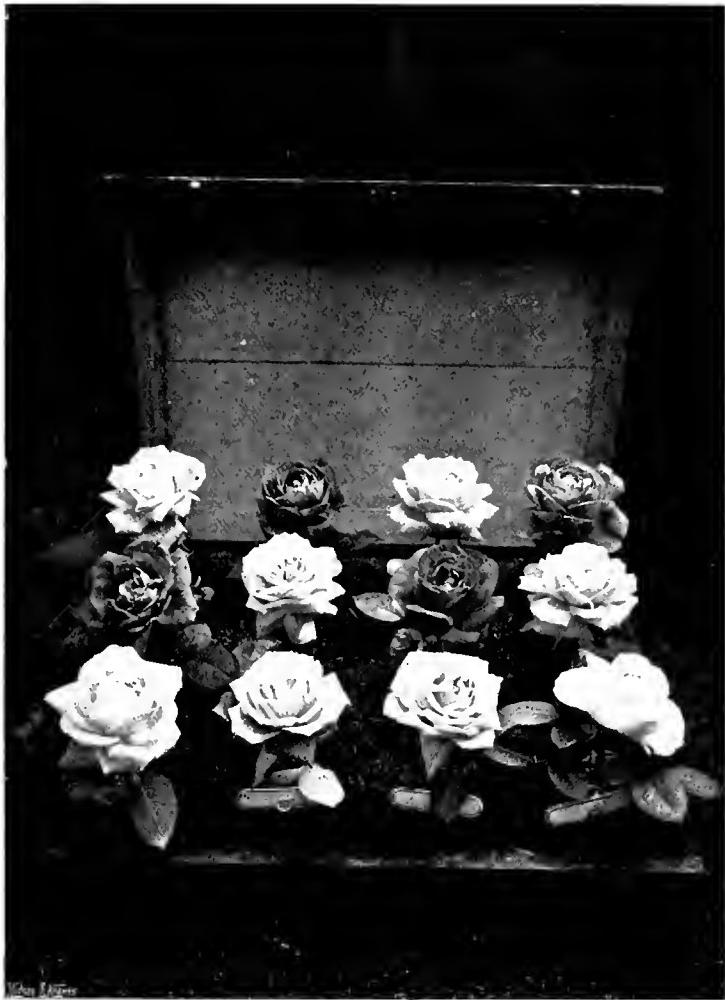

THOSE who have watched the growth of an Orange tree for several years will have observed how very slow such growth is. As a result it is practically impossible to ornament a terrace with these trees in boxes, as is done in the Tuilleries Gardens, at the Luxembourg, and at Versailles, if one does not possess specimens at least a century old. Neither do Pomegranates, Eugenias, and Myrtles, which are at times used with, or substituted for, Orange trees, more readily attain good proportions. Moreover, all these are becoming rare plants; of a former epoch they are now considered rather as curiosities, and it is as such that those found in the State Orangeries are regarded. In private gardens for some time past the Common Laurel, or Laurel of Apollo, has been substituted for them. Belgian horticulturists are past-masters in the art of forming standards and pyramids of this evergreen.

The Laurel of Apollo, as everyone knows, is infinitely more hardy, and grows much more rapidly than an Orange tree. However, I have known people refuse at first to use it on account of its sombre foliage and the souvenirs of cookery it invokes. But these disagreeable impressions are easily overcome. They are forgotten in time in the interest inspired by the proved hardiness of the Laurel; the ease of its culture; its practical immunity from disease; and the comparatively small price at which good specimens can be procured.

For similar decorative purposes we should place on the same level, if not before this tree, *Trachycarpus excelsus*, cultivated under the name of *Chamaerops excelsa*. No other Palm possesses so many excellent qualities, hardiness, rapid growth, decorative appearance, and easy culture. I put on one side the unique aspect of the tree, which gives a picturesque and exotic appearance to terraces and steps quite foreign to the above-mentioned trees, and which I had an opportunity of observing at Beauregard, where M. Welkes, the head gardener, has a number of strong specimens of *Chamaerops excelsa* arranged in front of the château. For rapidity of development, *Chamaerops excelsa* yields to no other species; its growth is

ROSE MRS. JOHN LAING (H.P.), ROSY PINK.  
(Reproduced from "Roses for English Gardens.")

EXHIBITION BOX WITH BLOOMS ARRANGED.  
(Reproduced from "Roses for English Gardens.")

quicker than the Orange, Pomegranate, or even the Laurel.

A specimen cultivated in the orangery at Versailles, grown from seed, and sown by the head gardener, my predecessor, in 1860 or 1861, now measures 19 feet high, and the head has a diameter of 8 feet 4 inches. Now, in order to find an Orange tree of such dimensions, one must look amongst specimens at least 150 or 200 years old. I will not dwell upon the safety with which *Chamaerops excelsa* may be wintered in an orangery. It is enough to say that of all evergreen plants that are so wintered, it without doubt best withstands the low temperature and dull light.

It is so much more appropriate to call attention to this vigorous and interesting Palm, as at the present time it is easy to procure strong specimens at reasonable prices from our horticulturists in the south of France, who have veritable nurseries of it in the open air.—GEORGE BELLAIR, in the *Revue Horticole*.

## NOTES OF THE WEEK.

### FORTHCOMING EVENTS.

August 4.—Grantham and District Horticultural Show, Ramsey.

August 5.—Royal Horticultural Society's Committees meet, Drill Hall, Westminster; Leicester Flower Show (two days).

August 7.—Midland Carnation Show, Birmingham (two days).

August 9.—Manchester Carnation Show; Crewe Horticultural Exhibition.

August 12.—Clay Cross Flower Show.

August 13.—Salisbury Horticultural Show.

August 14.—Taunton Dean, Rock Ferry, and Sheffield Horticultural Shows.

August 19.—Royal Horticultural Society's meeting, Drill Hall, Westminster.

August 20.—Shrewsbury floral fete.

### *Verbascum longifolium var. pannosum.*

For several weeks past this plant has been one of the most striking objects in the herbaceous collection at Kew. It is upwards of 7 feet in height, and of imposing appearance. The lower 2 feet consist of a dense rosette of handsome leaves, the largest of which are between 2 feet and 3 feet long, and 6 inches wide, the smaller and upper ones being scarcely one-third the size of the lower ones. The inflorescence rises from the centre of the leaves, and forms a huge, upright, branched raceme not over 5 feet in length. On the lower portion of the flower stem about a score of branches are borne, some of which are nearly 3 feet long. The flowers are borne so abundantly as to almost hide the stem, which, together with the leaves, is covered with a dense whitish

tomentum. The individual flowers are yellow, and larger than those of most Verbascaums, the largest being rather more than 2 inches across. It would make a good wild garden plant. Most Verbascaums naturalise readily, and this variety being more showy than the majority would be the best to use.

**Pear tree in full bloom.**—Mr. C. R. S. Cadell, Fox Hill Lodge, Upper Norwood, writes: "In the orchard on Fox Hill there is a Pear tree in full bloom." It is not unusual for both Pear and Apple trees to bear a few flowers in autumn, but it is seldom that there is a large display.

**A peculiar grafted Laburnum.**—In passing through the beautiful rock and water garden at the Birmingham Botanical Gardens a few days ago my attention was drawn to the peculiar appearance of a certain Laburnum tree. The peculiarity consisted in a number of tufty foreign growths appearing on many of its branches, looking at a distance not unlike bunches of Mistletoe. On enquiring of Mr. Latham (the well-known and courteous curator) the reason for this peculiar growth he related the following particulars, which I think may interest some of your readers. The tree was planted as a young sapling about thirty years ago. Soon after planting, as a matter of experiment, a *Cytisus purpureus* was grafted on to the stem. This graft succeeded fairly well for a year or two, but afterwards the stock proved too strong for the branch and it died completely away. In course of time the young tree formed other branches and grew away vigorously, and the fact of the failure of the graft was lost sight of until a few years afterwards, when it was discovered that on many of the branches appeared small growths of *Cytisus purpureus*. These growths have remained ever since, have now attained a good size, and still

retain the true characteristic of *C. purpurea*. They flower freely every year—a little earlier than the Laburnum. This may not be an exceptional experience, but I think it is sufficiently rare to make a note of, and a comment on the same from some of your scientific correspondents could not fail to be interesting and instructive.—OWEN THOMAS.

**Notes from Italy.**—Every subscriber to THE GARDEN must feel grateful for the articles in the numbers for July 5 and 12, entitled "British-raised Roses," in which many new kinds are indexed in a way that saves much time, trouble, and eyesight—those valuable things that to many contributors seem of small value, judging by the vagueness of their lists of plants or bulbs. In the first number a list of some fine Tulips, mostly seen in Holland, is given; notwithstanding that no clue is afforded as to whether these are double or single, late or early, I took the trouble to hunt up the names in the catalogues of two well-known Dutch growers, but could only find our Harlequin, which appears to be a blotted Murillo. Living out of England, and having scant opportunities of seeing novelties in the gardening line, I am always glad to make a note of such as correspondents of THE GARDEN mention, and it is a pity when such notes are rendered useless from the want of a little precision. Will "H. P.," who, in the same number refers to the wonderful show that Messrs. Osborn, of Fulham, used to make with their hardy Azaleas, give the names of some of those older varieties now so generally discarded in favour of the more tender tints of the mollis. For many years my English home was close to Osborn's nurseries, and I have the most vivid recollection of the quite dazzling effect produced by their beds of crimson and orange and flame-coloured American Azaleas. When the sun shone on these the effect was almost blinding. I particularly want to know the catalogue name of what is known in England as the "Old Yellow," a very sweet-scented striking Honeysuckle kind of flower, much stronger in growth than the modern tender tints. One can hardly expect a foreign nurseryman to know the plant under that designation.—TUSCAN.

**Strawberry The Laxton.**—I have been asked as to the character of this new Strawberry so far as may be known this season. I think some members of the gardening Press have been to Bedford to see it, but it has not been noticed so far as I have seen. The only holders of the variety being the Messrs. Laxton, it is only from them that knowledge can come. The firm sent up to the Drill Hall, at the meeting on the 8th inst., several boxes of The Laxton fruit, and also of their new Trafalgar. When tasted The Laxton was found to be of the most delicious description, flesh firm, sweet and richly flavoured, having the shape of Royal Sovereign and colour of Sir Joseph Paxton. Its merits evoked the warmest praise. Trafalgar might be said to resemble a fine Sir Charles Napier. Messrs. Laxton stated that in their exposed grounds the May frosts killed all the first bloom on The Laxton, a misfortune unhappily common to other varieties all over the kingdom. It is hoped that when sent out The Laxton will prove to be ahead even of Royal Sovereign.—A. D.

**The Potato crop.**—Growers of Potatoes will do well to closely watch their Potato breadths now, as the fungus spot has shown itself in some localities in a very marked way quite early. The best check to its spreading, of a natural character, no doubt, is plenty of heat, as that to some extent renders the fungoid spores unfertile. If, however, we get frequent thunderstorms and showers, or a return to cold nights and rain, then we may find the disease spreading rapidly. It is useless to evoke the aid of spraying with Bordeaux Mixture once the disease has fastened on the leafage. The sulphate of copper solution will kill the minute spores on the leaf surface, but not after they have penetrated into the leafage or stems. Sprays should commence at once; and be repeated some two to three weeks later if they are to be efficacious. We have suffered little relatively from the disease for several years, but there can be no doubt that the uneven growth seen this season is materially due to latent disease in the seed tubers.—A. D.

**Glut in Strawberries.**—A few weeks ago, when we had a succession of rain, hail, and frost, it was generally anticipated that this would be a bad fruit year, and that there would be a great scarcity of Strawberries. The altered climatic conditions, however, suddenly changed the whole outlook, and the season now promises to be memorable for the large crops of the "king of fruits." The London markets have been completely glutted this week by the heavy consignments of this luscious fruit, and the result has been that no higher price than 1s. 6d. a peck is obtainable. On Monday, in Mr. E. Vinson's fields, no less than 3,000 pecks of Strawberries were picked, being a record gathering on his farm, and before breakfast on Tuesday morning 1,200 peck baskets had been filled by the pickers. On Monday, at Bexley railway station, thirteen truck loads of the fruit were despatched to London, and every day the roads between the Swanley district and London

to thin the shoots occasionally, as by this means light and air are admitted to the branches.—W. DALLMORE.

**The Winter Heliotrope (*Petasites fragrans*).** This is one of our true winter-blossoming flowers, blooming in January or February on sunny banks. It is a native plant, and should be very cautiously admitted to the garden proper, as it is one of those free-rooting weeds that are almost impossible to eradicate when once established. It soon forms thick mats of fleshy roots, every joint of which, if broken off and left in the ground, will form a plant. But on the outskirts of the garden, or anywhere where its persistent rooting is not likely to be an annoyance, it should be grown for the sake of its sweet-scented flowers. The photograph from which the reproduction has been made was sent by Mr. Peake, of Norwich, who is doing such good work in practical horticulture among the boys of the Crooke's Place School.

course ripen after having been fertilised, the styles are two or three in number and proceed from the apex of the ovary : it is these styles or horns that have to receive the pollen in the form of a fine dust, obtained from the anthers of another flower. The anthers are small oval bodies, supported by slender stems termed filaments, and the two together form the stamens.

The stamens have to be hunted for amongst the petals of the flower selected to fertilise the parent plant. They are eight, ten, or more in number. The pollen is found in the form of a fine dust lying on the anthers, that is, when it is in a proper condition for transmission.

The best time to hybridise is about the middle of the day, when the sun is high and everything is dry, for if the pollen is not perfectly free and powdery it is not in a proper condition for the purpose : the tips of the styles also should be well curled and the flower in its fullest development of bloom. The styles at that period, in suitable weather, will be found covered with a delicate down ; on these the fertilising powder is laid with (as I said before) a finely-pointed dry camel's hair brush. If the operation has been successful the flower will collapse in a very short time and gradually shrivel up ; should it be found to be in the same fresh and bright condition next day it is a proof that the bloom has not been inoculated, and the operation must be done again. A really microscopic quantity of the pollen only is necessary for the purpose.

When the flower has been successfully hybridised it must be left on the plant until it is quite dead and dry. It is a good plan to pull out the petals when dry to promote the swelling of the seed-pod and to admit air thereto. This should be done without damage to the styles. When the seed is ripe the pod will assume a brown colour. It should then be removed and laid on a sheet of paper to dry thoroughly, when the seeds can be extracted, stored, and labelled.

By the way, when hybridising it is as well to attach a small label, giving the name of the variety with which the parent plant has been fertilised, and care should be taken to retain this label when the pod is gathered, and, later on, when the seed is sown.

I would impress upon the would-be hybridiser that the start should be made with some definite object in view, as indiscriminate crossing of different plants is not likely to result in anything but failure. For this reason it is as well to have some contrivance of gauze over the ventilating windows or to envelope any special bloom in a small bag of this material to prevent bees that may visit the blooms from promiscuously inoculating them, as it is indeed aggravating just before a large Carnation exhibition, for instance, to find one's best blooms collapse owing to the indiscriminate researches of these insects.

It is a good plan also when a self-coloured Carnation is the object in view to cross the variety with a self-coloured Carnation or a fancy with a fancy, and so on through the several sections into which Carnations are divided. It may interest some of your readers to hear the result of some of my experiences.

Having a large number of plants in pots of the now well-known yellow self Carnation called Duchess Consuelo, a variety of tree Carnation raised at Blenheim that grows to a great height and develops an immense bloom, I decided to make certain experimental crosses, with a view of obtaining other colours, but at the same time retaining if possible the peculiar growth of this large tree variety.

I selected this therefore as the parent plant,

THE WINTER HELIOTROPE (*PETASITES FRAGRANS*).  
From a photograph sent by Mr. Peake, of Crooke's Place School, Norwich.)

have been crowded night and day with vehicles, including motor waggons, bearing their freights of Strawberries for the Metropolis. —*Swanley Chronicle.*

**Lonicera flavescens.**—This is a bushy Honeysuckle from British Columbia of considerable interest. It forms a shapely bush 4 feet or more high, clothed with dark green oval leaves with ciliated margins, glabrous above, but smothered with fine soft hairs on the under surface. The flowering period ranges over a considerable time, the flowers being borne from the axils of the leaves on the current year's shoots; the flowers are yellowish and enclosed in crimson bracts, which are persistent until after the fruit is ripe. The fruit is the size of a large Pea, quite black when ripe. On single shoot unopen buds, expanded flowers, and ripe fruits are to be found. As in the case of the majority of the Honeysuckles, no special cultural directions are required, as it grows vigorously in any good garden soil. It is advisable

## THE FLOWER GARDEN.

### HYBRIDISING CARNATIONS.

**C**ARNATION cultivation is a most delightful hobby. Everybody that has a love for flowers holds these beautiful sweet-scented blooms in high esteem. They are well adapted for cultivation out of doors, but perhaps more real gratification can be obtained by the amateur by growing them in pots ; indeed, in no other way can perfect blooms be obtained and the more delicate sorts induced to produce well-formed and well-marked flowers of the largest size.

Some growers are content to purchase varieties that are offered by specialists or selections they may take a fancy to from what they see at Carnation exhibitions, and then grow them to the best of their ability, but if the amateur has taken the "Carnation fever" badly he will not long be content to proceed on these lines only, but will wish to create for himself new varieties, by the system of hybridisation and the production of seedlings.

This is a worthy ambition, but not one easy of attainment, as the standard of perfection is now very high and is becoming more so every year. Still, a well-directed attempt cannot fail to be productive of great pleasure, and, although many of the seedlings grown may not be of any particular merit, the grower will have the satisfaction of watching the plants develop their buds and flowers : the result, at any rate, will be good for cutting, although perhaps not reaching the state of perfection hoped for or any great advance on existing varieties.

Hybridising Carnations can be carried on perfectly well in the open border, but is better and more certain with pot plants under glass. The principle is precisely the same, whether it be in or out of doors, but the climatic conditions in a cold conservatory are more under control, for even here, in the lovely county of Devon, the seed on plants in the open border will sometimes not ripen, owing to want of sun or too much rain at a critical period, and this valuable crop becomes a dismal failure.

To hybridise Carnations the pollen of one variety must be conveyed from the anthers of one flower to the stigma of another ; this is best effected by the aid of a small dry camel's hair brush. I will try to explain clearly the different parts of the Carnation so that the amateur may easily carry out the operation himself. They consist of the pistil, the ovary, and the styles ; the ovary is the lower part that contains the embryo seeds which in due

and raised a number of seedlings, about a dozen of which may be considered good. It would occupy too much of your valuable space to describe the colours and peculiarities of all of them, although exceedingly interesting.

These two varieties are perfectly distinct in colour and habit of growth amongst tree Carnations. One is a large scarlet self of a rich blood-red colour, the blooms being at least 4 inches across, and the height of the plant is about 5 feet 6 inches from the top of the pot, after being severely disbudded. It has forty blooms nearly all out at once, and the effect as a decorative plant for the conservatory is most gorgeous. This variety I named Pretoria.

The other is a very lovely novelty of similar growth and height as the foregoing. It is of pure orange colour, the same as that of the well-known border Carnation called Mrs. Reynolds Hole, a colour which as yet has not been found amongst winter-flowering Carnations, Malmaisons or trees. The shape of the flower is excellent, and the calyx sound and perfect in shape. It never bursts, and the shape of the petal is good. The bloom is almost as large as that of Pretoria, but its colour and the peculiar habit of the plant denote a decided advance in this section, and repay me in the pleasure of looking at it alone a hundred times for any time and trouble I have taken in its creation. This novelty I have named Mrs. Weguelin, and I hope I may be successful in producing plants next year for distribution amongst my numerous friends and correspondents.

*Dawlish, Devon.* H. W. WEGUELIN.  
[Mr. Weguelin kindly sent some flowers of the varieties Mrs. Weguelin, a very beautiful buff colour; Duchess Consuelo, pure yellow; and Pretoria, bright crimson.

THE HARE-BELL (*CAMPANULA ROTUNDIFOLIA*), SHOWING ITS BEAUTY ON THE ROCK GARDEN.

#### ALPINE CAMPANULAS.

THESE belong perhaps to the most attractive and useful of rock plants, flowering invariably at a time when early alpines are past and flowering plants on the rockwork are anything but plentiful, the English climate, when the plants are well grown, being rather favourable to the development of this class. They flower almost, as far as the perennial Campanulas are concerned, the whole summer through. With the exception of a few of the high alpine species, which demand special treatment, all grow in a good loamy soil mixed with coarse gritty sand in a half-shady position either on the north-west or west side of the rock garden, fairly moist during the summer months. As they do not root very deeply it is advisable to mulch with a mixture of loam and sand or leaf-mould and loam annually during the early part of the season, as this will promote a greater abundance of flowers of richer colouring.

*C. Allionii*.—A charming little plant with creeping rootstock and recumbent stems, about 3 inches to 5 inches high; the flowers are large and reddish violet, a rare plant in English gardens, though one of the most distinct of alpines. It belongs to the small number of species succeeding best in a fairly sunny position in gravelly or stony soil. I have found it more than once growing on moraines on the Alps of Pedemont in high altitudes and also in the valleys. It is of rather slow growth, and sometimes a little difficult to manage. A similar species is *C. morettiana* and found in the same part of the Alps. It grows at an altitude of about 5,000 feet, invariably in the most inaccessible part in fissures of steep rocky walls; at least I have never seen it anywhere else, and the collecting of it is somewhat hazardous and difficult, and seems to be almost impossible unless one could blast the rocks without injury to the plants to get well-rooted specimens. Consequently, only now and then a small number can be collected, of which only a few survive the rough treatment. Well-established specimens, if planted on the western side of the rockwork between stones, succeed, and are very showy; it is one of the most desirable alpines. The plant is small, forming neat little bushes of ovate-cordate foliage somewhat tomentose. The very pretty flowers are of medium size, bright lilac, and even the smallest plant, if healthy, is covered with flowers.

*C. Raineri*.—In the Eastern Alps and the slopes of the Italian Alps. Although very local, this lovely plant is often seen in various shades of colouring, from deep blue to pale lilac, and lately a pure white form has occurred, and with me this white form, judging by the growth and leaves, is nothing more than a form of the not even nearly allied *C. carpatica alba*. *C. Raineri* grows only a few inches in height, has sturdy stems, thick tomentose leaves, and large, erect flowers. It is blooming here splendidly at the present time, both on the rock garden, border, and in pots. There is also a form in gardens introduced by a Lower Austrian collector quite different to *C. Raineri*; it has greener foliage and less shiny flowers; this I call *C. Pseudo-Raineri*, probably a natural hybrid between *C. turbinata* and *C. Raineri*. Although this form, which I saw first in the garden of the late Mr. Leonard of Guildford under the name of *C. Raineri*, is well worth growing, still I feel sure all who saw the two kinds together would prefer the true old *C. Raineri* for beauty and distinctness.

*C. gorganica*.—A pretty old garden plant, succeeding equally well in the border and in pots. I have specimens here which were planted as small-rooted cuttings only about eighteen months ago, being now pyramidal-shaped specimens 1 foot across at the base, and though of creeping or trailing habit, 9 inches in height, with small, heart-shaped leaves, smooth and deep green, turning purplish; the innumerable flowers are small, erect, light purplish blue, with whitish centre. It is very free. Another form with larger silvery grey leaves (*C. gorganica hirsuta*), with lilac-coloured flowers, is quite as pretty, but not quite so hardy.

*C. gorganica alba*, with small pale lilac or whitish flowers, is another form of *C. gorganica*, flowering at the present time everywhere in the garden. The *C. gorganica* forms are natives of the Carpathians.

*C. pumila*.—A small plant with oval, light green leaves and nodding deep rich purple-blue flowers. It prefers shady, fairly moist positions, and comes from Eastern Alps and Carpathians. Easily grown in our gardens.

*C. pusilla* (synonymous with *C. pumila*) and *C. cuspitosa*.—A common but pretty alpine plentiful in the sub-alpine region of Switzerland and Tyrol, and found in shady, fairly moist positions.

#### NOTES ON HARDY PLANTS

##### CAMPANULA ROTUNDIFOLIA.

THE interesting procession of illustrations that have appeared in THE GARDEN portraying the charms of dwarf Bell-flowers makes one desirous of noting the beauty of this native Bluebell as a rock garden plant. The fact of it being a wildling may give this flower a lower place in the estimation of those who only care to have real alpines on their rockeries. Although flowers are generally supposed to appear at their very best as regards grouping, &c., when with their natural surroundings, there are exceptions, and this plant is one. On mead and moor the blue flowers blend rather than form a good contrast in colour with the green grass. On a rockery the flowers are well displayed against the darkly stained rocks.

Of course *Campanula rotundifolia* grows rapidly in the ordinary border, but there it is liable to run out of bounds. Given good soil and a sunny position the strength of the plant is much improved. The stems are too slender to support the numerous blossoms, thus the rocks form a clean rest for the profusion of flowers that open week by week. In such a position they are better seen and appreciated. Several of the varieties of this wildling are excellent, but a clump of the true Bluebell should have a place too. D. S. FISH.

Royal Botanic Gardens, Edinburgh.

Very close and erect in growth, and 2 inches to 4 inches high; the lanceolate or ovate leaves are light green on thin wiry stems, with nodding small pale blue flowers. Still better is the pure white form, which is even more free flowering than the type. Of this there are two forms, one disappearing almost entirely during the winter, while the other and better one is evergreen, keeping, even during the winter, the ground carpeted with bright green foliage.

*C. G. F. Wilson.* — A garden form (*C. pulla* × *C. turbinata*) with much larger flowers than *C. pulla* and deep purple; it is a really good plant, also the sport with yellow foliage.

*C. muralis* (synonymous with *C. portenschlagiana*), of close growth, not over 2 inches to 3 inches in height, deep-green cordate leaves, and small purplish flowers. A quick-growing, free-flowering plant, on which account it is now much used for bedding out. Lower Alps. A finer, slight, tall-growing form with larger, deeper coloured flowers, though not quite as free-growing or flowering as *C. muralis var. bararica* of Bavarian Alps.

*C. tommasiniana.* — A pretty species growing about 9 inches to 1 foot in height, with branched, erect, wiry stems, linear or lanceolate light or silvery green leaves, and long, light blue, or lilac bell-shaped flowers. Dolomites. It is sometimes given as a synonym of *C. waldsteiniana*, but they are quite distinct. This plant grows only 1 inch to 2 inches in height, with silvery grey, roundish, or lanceolate leaves, and small, pale blue nodding flowers appearing at the present time. A neat, very pretty plant of Dalmatia or Istria.

*C. Zygii.* — One of the most beautiful of this class; unfortunately also one of the most difficult to keep after the second year. It forms small, dwarf, very neat bushes, about 1 inch to 2 inches in height, with ovate or obovate leaves, light or bright glabrous green. The flowers are small, usually in threes, fringed or hairy inside, light blue, somewhat contracted. Very rare, and only local on the Dolomites.

*C. cuneata* (of the Mont Cenis). — A very dwarf, slow growing species, having small spatulate foliage and dark blue funnel-shaped flowers, with deeply cut lobes. It should be grown in peaty soil or leaf-mould in pots or in fissures on the rockwork. Not of perennial habit, being biennial, is the quaint

*C. thrysoides.* — The leaves are linear, hairy, light green, forming a rosette, out of which the stout stem issues, attaining a height from 1 foot to 3 feet. The flowers are large and greenish yellow: the plant is common on the Alps, and easily grown and raised from seeds. Also biennials are *C. alpina* and *C. barbata*, both with large hairy bells of deep blue or purplish blue flowers; they succeed well under the same treatment as the former.

Ashford, Middlesex.

G. REUTHE.

### LILY NOTES.

TAKING the Lilliums as a whole they promise to be unusually good this year. The early ones, *L. elegans* vars., were a failure, for they flowered in June, when alternations of pouring rain and tropical sun ruined them — they were either drowned or burnt. *L. croceum* and *L. candidum* have both suffered from the same cause, for their flower buds were well advanced during this queer month and a good many bulbs of *L. croceum* rotted. My poor white Lillies have had a bad time of it lately. A glorious row of them lived in sweet company on the south border of the rosary, a young Cypress hedge making a perfect background. But, alas! these Cyprus grew like young giants last year, smothering the tall white Lillies. It was decided to shift them to two new groups of evergreen shrubs just formed in a couple of 30 feet

RHODODENDRON PURITY IN AN IRISH GARDEN.

beds in an open spot. *Choisya ternata* and *Cistus ladaniferus*. "Man proposes —" February with its frost and snow, March with easterly gales and utter rainlessness, prevented this, and April was well advanced before they could be moved, about 200, to each bed. Unfortunately, the flower stems were over a foot high, and the wretched weather following did them a great deal of harm; still, about 100 are flowering, small heads of small flowers and short stems, none over 4 feet high, but comforting, as showing they will be much better next season. *L. longiflorum* is looking splendid. The foliage is as sound as under glass, though of much greater substance. Groups have greatly increased: where there were, say, six bulbs planted last year or the year before, there are from nine to a dozen flower heads. I have about 500 of them in the Japanese garden. *L. auratum* is, if anything, even stronger, whilst *L. speciosum* is rampant. Last season they were not so strong as usual, but now (mid-July) the tallest are over 6 feet high. In an Azalea bed about thirty bulbs were planted nearly four years ago. I tried to count the flower stems lately, but got muddled: there are between 150 and 200, with an average of fifteen flower buds to a stem. *L. Henryi* is nearly 7 feet high (a great disadvantage); the strongest one has twenty-five buds. *L. Kramerii* is in much better flower than last year. It is a lovely Lily. The tallest is 3 feet 10 inches high, and the week before they opened were just over 6 inches long. The open flower is quite as large, and the exact shape of an average flower of *L. auratum*, one of its supposed parents; indeed, a white one that is amongst these pink ones is like *L. auratum* virginale without the gold bands. *L. Brownii* is also in flower. These have not made the growth of the others, but perhaps their position has something to do with this. They were sun-baked last year and again this spring. None of them have more than one flower (the normal number), but they are unusually large and richly coloured. They have made satisfactory increase, several having flowering young bulbs and others with two to four, with stems 1 foot high. *L. Kramerii* increases rapidly, and the young bulbs flower

the second season after showing above ground. There are half a dozen not more than 1 foot high, with opening buds 3 inches to 4 inches long. I say "showing above ground," for I am sure that many Lilliums do most of their growth without any leafage. *L. Henryi* has seedlings, but no bulb increase.

The bulb of *L. auratum* seems to continue growing in size, throwing up several flower stems, but not making any offsets till a time comes when the parent bulb "breaks up," a bulblet being formed under each scale. Few or any of these grow, the rotting of the old scale, in our moist winters, being the cause, involving them in the decay; but, if noticed in time, if these seed-like bulblets are planted in a trench of sandy peat they form good flowering bulbs in about three years, and are far stronger than imported ones. The same thing applies to *L. longiflorum*. When one of these "break up" the dozens of little ones should be planted as advised, a cheap and very satisfactory way to stock a garden with good Lilliums. One word of advice to beginners in Liliaceae growing: Always purchase *small* but sound, heavy bulbs, not "gigantic bulbs." There is little or no fear of these "breaking up."

Dartish, South Devon.

A. BAYLDON.

### THE PLANTING OF VINES.

(Continued from page 46.)

FOR comparatively weak-growing varieties such as those named, and for vines hard forced for early supplies of fruit, a distance of 3 feet is sufficient, while the stronger-growing ones and those allowed to start almost naturally should be at least 4 feet apart. Having measured out the positions for each vine, place a small stick where the cane should be planted; then around each of the sticks, taking each one as the centre, make a hole 3 feet in diameter and sufficiently deep that when the vine is placed therein it is about 3 inches or 4 inches below the surface. The vines will, of course, have been grown in pots, and care should be taken when turning them out to damage the

roots as little as possible. It will probably be found that when the Vine is taken from the pot that the roots are quite matted together; to plant the Vine with the roots in this condition would be extremely foolish. They should be disentangled so far as can be done without injury to the roots, that they may be properly spread out at planting and so be placed in contact with new soil at once. If the roots are allowed to remain matted together, as they to some extent inevitably must be when confined within a pot, the probability is that instead of emitting new fibres into the new food all around them, they will not do so, simply because they have not the opportunity. I believe this has much to do with the failure of newly-planted Vines not making a satisfactory start, which, unless the roots are assisted by being placed in a proper and suitable position, they are never likely to.

With the roots thus spread out, the necessity for having the holes made 3 feet wide will now be apparent. Remove the crocks from the base and a little of the soil from the top of the mass of roots, and endeavour to loosen as many of the small roots all around as can be conveniently done. Then place the plant carefully in the hole prepared for it. An important point has not been stated. Make sure that the mass of soil and roots is thoroughly well watered before being taken from the pot. If this is not attended to the results may be very disappointing; indeed, when in the pot the Vine roots and the soil around them can be made properly and thoroughly wet through to the base, but with the plant removed from the pot it is different. There is nothing to prevent the soil from escaping down the sides of the ball of soil, as this mass is technically called, and that is exactly what it does, and when planted in the ground it is also difficult to water it properly once it has become dry, for the water, instead of percolating through the hard and dry mass (as it can be made to do when the plant is in a pot, even if the latter has to be placed in a tank of water), trickles away into the new and more easily permeable soil around.

Always make sure, therefore, that the plant is not in the least in want of water when planted. Providing it is in a properly moist condition, it is not difficult to keep it so afterwards, for water applied will easily go through the ball of soil if this is moist. Even though the latter is buried, it is surprising how quickly it will become dry, so that attention is necessary on this point, for if allowed to suffer from want of water the Vine must be materially checked. With the plant in position, carefully spread out the lowest roots and cover them over with fairly fine soil, drawing this towards the extremities of the roots with the hand. The roots that are above the bottom layer should be held back until the latter are completely covered with soil and this is made firm. Then proceed to lay out the other roots in as natural a manner as possible, and cover them with soil in the same way. They should be slightly sloping away from the plant rather than quite level. Be sure that each layer of roots is carefully placed and covered with soil made firm before the layer above is spread out. Having thus treated the roots all around the Vine, so far as they reach, fill up the remaining space, and also make this firm, leaving the surface somewhat higher than the surrounding border, for the disturbed soil will sink a little.

The prepared border soil that was removed to make the necessary holes will, of course, have been used for the purpose of planting. It is most important that the soil should be made firm as the work of planting proceeds, for Vines planted in a loose border never do well. They are then incapable of making proper root-action, and a

firm border has the effect of encouraging this. It is well to give a mild watering after the planting is finished, so as to settle the soil as much as possible. It should have been mentioned that the stems of the Vines must on no account be placed nearer to the hot-water pipes than 18 inches: unless there is this distance between the two there is a danger of the bark suffering from the heat emitted from the pipes. It is a good plan to place a piece of board behind each Vine to protect the stem from this dry heat when planted too near, and thus avoid any possible danger of harm in that direction. A. P. H.

(To be continued.)

## TREES AND SHRUBS.

### RHODODENDRONS IN A DONEGAL GARDEN.

I ENCLOSE some photographs of Rhododendrons which I took here in June. It may interest some of your readers to see what can be grown in the North of Ireland, the Donegal Highlands.

Rhododendrons, and, indeed, most plants that flourish in Cornwall, we find do well here. The blooms this year of all varieties have been exceptionally fine.

The following Himalayan Rhododendrons bloomed to perfection here this season out of doors:

<i>R. niveum</i>	<i>R. nilghiricum</i>
<i>R. Falconeri</i>	<i>R. arboreum album</i>
<i>R. fulgens</i>	<i>R. " roseum</i>
<i>R. Thomsoni</i>	<i>R. nobleanum</i>
<i>R. campylocarpum</i>	<i>R. Edgeworthii</i>
<i>R. cinnabarinum</i>	<i>R. Gibsoni</i>
<i>R. Keysii</i>	<i>R. glaucum</i>
<i>R. ciliatum</i>	<i>R. barbatum</i>

Of hybrids the following were particularly good: Manglesii (120 blooms), Coombe Royal, and Luscombei, also all the best of the hybrids known as the Waterer class, of which there is a fine collection, some being exceptionally large plants.

CALYPSO.

HARDY HYBRID RHODODENDRONS. HARDY, evergreen, hybrid Rhododendrons can be divided into several groups, according to parentage. Of these groups by far the most common is that which has originated through the crossing and intercrossing of the Himalayan arboreum with the American species *catawbiense*, the Caucasian species *caucasicum*, and the European and Asiatic *ponticum*. The members of this group are well known by the many handsome hybrids distributed by the firms of Waterer, Noble, Paul, and other well-known growers. Work among these species has been in progress for upwards of half a century, and a high degree of excellence has been attained. The habit of the plants, size of flowers and leaves, colouring, &c., differ according to the predominance of one species over another. Thus, where arboreum asserts itself most strongly, we find rich red flowers and leaves with a silvery under-surface. Where *catawbiense* is most in evidence the leaves are large and handsome, deep green, and softer to the touch than arboreum, while the trusses are often of immense size, the flowers prettily spotted, and the plants of exceptionally good habit. For very cold districts the *catawbiense* hybrids are the best, being harder than the others. The flowers of many of the earliest of the *catawbiense* hybrids are lilac or purple in colour. The influence of *caucasicum* is most in evidence in the rose-white and heavily-spotted varieties, while it also gives a share of its sturdy habit to its progeny. *R. ponticum* shares with *catawbiense* the honour of pro-

A RHODODENDRON GROUP IN AN IRISH (DONEGAL) GARDEN.

ducing many of the best lilacs and purples, but through so much intercrossing it is difficult to trace the influence of any particular species in many of the newer hybrids. In this group raisers are fastidious with regard to the shape of the inflorescence, the correct thing being a conical truss of symmetrical outline, the flowers being on short stalks and held firmly in the truss. In the Rhododendron dell at Kew a great many of these hybrids are to be seen, and in a number of the older ones it is not difficult to trace the influence of the various species mentioned. Some of those which show a considerable amount of catawbiense blood are *album elegans*, white with yellow spots; *delicatissimum*, blush; *everestianum*, lilac with darker spots; *fastuosum* fl.-pl., double lilac; and *purpureum elegans* and *purpureum splendens*, with purple dark spotted flowers. *R. arboreum* blood is very marked in the early flowering bright red *nobleanum*, the rich red *russelli-*

in evidence, we find a few very good things. *R. Thomsoni* itself is hardy at Kew, but flowers early, the flowers often being damaged by frost. It grows from 6 feet to 10 feet high, has broadly ovate leaves and loose trusses of six or eight blood red waxy-textured flowers. By crossing this with the fragrant Chinese species *Fortunei*, Mr. Lusecombe raised an exceptionally fine plant, which is named *Luscombei*. At Kew there are several specimens which flower superbly every year. It is nearly thirty years since the cross was made, so that plants have now attained their full size. The largest plant at Kew is nearly 8 feet high and 8 feet through. The flowers, which are borne in loose trusses in April, are rich rosy red, tubular, 3 inches across the mouth, and thick in texture: altogether it is an admirable plant.

Another hybrid which originated from a similar cross is called *Francis Thiselton-Dyer*.

largely in Cornwall. It is grown in a cold house at Kew, but may prove hardy, as a small plant has withstood last winter's cold outside without injury.

*R. Harrisii* is the result of crossing *Thomsoni* with *arboreum*. It is a red-flowered hybrid of considerable merit, flowering freely in a small state. It is cultivated at Kew, but has not yet attained any great size. It appears to be perfectly hardy here.

#### GRIFFITHIANUM GROUP.

The group in which the Himalayan species *griffithianum* is most marked is made up of a number of large-flowered hybrids, which vary considerably in size and colour of the flowers. The species itself is represented in some gardens by large bushes; it was introduced about fifty years ago, and grows upwards of 10 feet in height, has large, oblong, bright green leaves, sometimes 9 inches or 10 inches long, and large, pure white flowers—sometimes tinged on the outer side with pink—4 inches or more across, and borne in loose trusses of four to eight flowers each. It is, without doubt, one of the most beautiful of all Rhododendrons, but is, unfortunately, not hardy enough to stand out of doors at Kew. By crossing this with hardier species and varieties, however, a race has appeared which includes many varieties that are perfectly hardy and of sterling worth.

Of the group the following are conspicuous among others, and most of them are to be seen growing at Kew:

*Kewense*.—This was raised at Kew in 1874 through crossing—it is said—*griffithianum* with *Hookeri*. It did not flower until fourteen years later, but since that time it has flowered with exceptional freedom annually. It makes a large bush 6 feet or 8 feet high, of wide-spreading habit. The leaves resemble those of *griffithianum* to a great extent, and the flowers in shape and size are very similar. In colour they are a delicate rose, changing to white with age. One advantage is that the flowers are very fragrant. In addition to the true *Kewense*, a form is in cultivation with red flowers. As the flowers of this hybrid commence to expand a pretty effect is produced by the large bright red bracts.

*R. Mangelsii* is another very fine hybrid, exceptionally free flowering and deservedly popular. It was sent

Messrs. Veitch nearly twenty years ago, but does not appear to have become well known until several years later. It was raised by crossing *R. griffithianum* with the *catawbiense* hybrid “*album elegans*.” Although the leaves are smaller, the plant resembles its Himalayan parent to a very great extent when not in flower, but when in flower the influence of the American blood is easily detected. The flowers are large and white, the upper petal being spotted with red or reddish brown. A peculiarity of the inflorescence is the long truss, which is much longer than most varieties, but no wider. There are several forms which might all be placed under this one name, as the flowers only differ slightly in size or density of spots.

*R. Pink Pearl*.—This is without doubt one of the finest Rhododendrons ever raised, and one which, although sent out but a few years ago, is now in a large number of gardens.

RHODODENDRONS IN IRELAND (DONEGAL).

anum and *russelianum superbum*, the white, dark spotted *Baron Osy*, the blush, or almost white, *Blanche superb*, and many others, whilst *R. ponticum* is in evidence in a large number of hybrids.

In addition to this group there are others which, though not so universally grown, are quite as beautiful, and need but to be better known to be appreciated. For a number of years other species, besides those worked on to produce the last-named group, have been taken in hand in several places, notably at Tremough, by Mr. Gill, by Messrs. Waterer, and Veitch, and Paul, at Kew, and in other places, and many fine hybrids are the result. Of these groups representatives are to be found in the Rhododendron dell at Kew.

#### THE R. THOMSONI GROUP.

Commencing with the group in which the Himalayan species *R. Thomsoni* is very much

in evidence, it has large, deep rose flowers, with a darker mark at the base of the tube. In habit it is very similar to *Luscombei*.

A variety raised by Mr. Waterer, called *Ascot Brilliant*, is much admired at Kew every year. In the habit of the plant, size of calyx, texture of flowers and loose truss, *Thomsoni* is very much in evidence. It is of dwarf, bushy habit, flowers with remarkable freedom, and of a particularly rich scarlet in colour. It is a plant worthy a place in any collection.

*R. Shilsoni*.—This is a large-growing hybrid raised by Mr. Shilsoni, through crossing *Thomsoni* and *barbatum*, the flowers of both being similar in colour. The hybrid combines the good qualities of both. In stature it resembles *barbatum*, in foliage *Thomsoni* is most in evidence, whilst the truss is compact as in *barbatum*, with the larger, more fleshy flowers of the other parent. It is an exceptionally fine Rhododendron, and is cultivated

The leaves and size of flowers point strongly to griffithianum influence. The truss is very large, well formed, and the flowers a delicate shade of pink. The individual flowers are often from 4 inches to 5 inches across. It is perfectly hardy, and has been exhibited many times of late, a fine group of it being exhibited by the raiser, Mr. J. Waterer, of Bagshot, at this year's Temple show. Another new variety of considerable promise, introduced by the raisers of Pink Pearl, is *Mrs. E. C. Stirling*. From the foliage griffithianum seems to have had some share in its parentage. The flowers are large and peculiar in shape, the petals being wide apart and much narrower than in Pink Pearl. The truss is of good size and the flowers rosy lilac in colour.

Besides these there are many other griffithianum hybrids, new ones continually appearing. One of the newer ones is *Beauty of Tremough*, a variety raised by Mr. Gill by crossing with *Thomsonii*. In habit it is very like griffithianum, the flowers being intermediate in shape between the two species, and pink in colour. At Kew it is grown indoors, young plants which were placed outside last year were considerably damaged in the winter. Griffithianum has long been a favourite parent with Mr. Mangles, and he possesses a large number of beautiful hybrids, a few of which are Liza Stillman, Dulcie—

Daffan, *Manglesii* var. *delicatum*, *Daphne Daffan*, Mrs. Mallard, and various others.

#### FORTUNEI GROUP.

Mr. George Paul, of Cheshunt, has been the principal worker with this group, whilst several

distinct by reason of each having seven petals. The progeny are of good habit, flower with great freedom throughout May and early June, are for the most part fragrant, and often have flowers with six petals. A peculiarity of the group is that the stamens are often imperfect. Throughout the group there is not a very great range of colour, pink and deep rose predominating, a few being red. Many of the varieties are prettily spotted or blotched with red or chocolate. The group is not at all well known, which is a great pity, as it contains many first-rate things. An objection has been raised to these hybrids on account of the trusses being rather loose, but this is not at all a defect, as the plants make first-rate shapely bushes and flower profusely every year. There are very few named varieties. At Kew two very pretty ones were named a few years ago *Mrs. Thiselton-Dyer* and *George Thiselton-Dyer* respectively. They flower profusely, the flowers being very deep rose, blotched at the base with dark brownish marks. The principal difference between the two is that the former is paler than the latter.

An interesting hybrid raised at Kew by crossing Fortunei with the variety Meteor has flowered well for the last four years. The cross was made in 1893, and the plants flowered when but a few inches high. Several plants have now attained a height of 2½ feet, and are well branched. The flowers are borne in May and are in compact rounded trusses. They are a delicate shade of pink in colour and fragrant. The great peculiarity of the hybrid is that no plant has perfect stamens, in some the stamens being full size but barren, in others reduced to mere specks, while in others again they are absent. To increase these Fortunei hybrids stocks of Fortunei are preferable to ponticum.

(To be continued.)

THE CALIFORNIAN POPPY

(*ROMNEYA COULTERI*).

(From a drawing by

H. G. Moon.)

#### AN ARTIST'S NOTE-BOOK.

##### ROMNEYA COULTERI.

I HAVE been unusually successful with this beautiful Bush Poppy for several seasons past. My plants are fully 6 feet high, and are freely bearing their delicate fragrant flowers. The *Romneya* with me in Berkshire is quite hardy. The soil here is warm and of a sandy nature, and appears perfectly to suit this handsome Californian Poppy. Well-developed plants when bearing a good number of flowers are very beautiful and always admired. Those

pretty varieties have been raised at Kew. It is a Chinese plant, and when not in flower bears a great likeness to griffithianum. The flowers, however, are quite distinct; they average nearly 3 inches across, are white, deeply suffused with pink, very fragrant, and

whose gardens are so situated as to cause misgivings as to the hardiness of *Romneya Coulteri* should plant it against a wall facing south, when, unless conditions are very unfavourable, it will almost certainly prove satisfactory.

H. A. P.

## USES OF BRITISH PLANTS.

### IV.—RESEDACEAE.

(Continued from page 376, Vol. LXI.)

**WELD** or *Dyer's Weed* (*Reseda Luteola*), common in waste places, is a plant 2 feet to 3 feet high, with a long spike of greenish yellow flowers. It has long been employed as a yellow and green dye-plant for colouring cotton and woollen fabrics. The water-colour called "Dutch pink" is also made from this plant. It has been preferred to other dyes for giving a lively green lemon-yellow to silk and for paper staining.

### VIOLACEAE.

*Violet* (*Viola odorata*).—Besides their value for their perfume, the petals of the Violet are used in a medicinal syrup for children, though the numerous virtues attributed to the Violet by the mediaeval doctors were imaginary. The underground stem is, however, strongly emetic, and resembles ipecacuanha, being employed to adulterate this drug. It is said that the syrup forms a principal ingredient in the oriental sherbet, and that it is eulogised in the Koran, which states that it possesses the same degree of superiority over other flowers that the prophet had above men.

*Heartsease* (*Viola tricolor*) is of no medicinal value, but was supposed to be a good cordial, hence the present name. Turner (sixteenth century) says: "It is cold and moist under the mild influence of Venus." Culpeper (seventeenth century) declares: "The herb is Saturnine, being cold, viscous, and slimy." So doctors disagreed then just as they sometimes do now!

### CARYOPHYLLACEAE.

*Pinks* and *Carnations* (*Dianthus*, sp.).—Two naturalised species, doubtless long introduced from the Continent, are the sources of these garden favourites, viz., *Pink* (*D. plumarius*) and *Carnation* (*D. Caryophyllus*). The enormous size now attained was foreshadowed in Gerard's day (1597); for he figured "the great double Carnation" 3 inches in diameter. It was called the Clove Gillyflower, from its scent.

*Soapwort* (*Saponaria officinalis*).—This plant is not uncommon near villages, being sometimes double, with pink or white flowers, flowering in August. The leaves, &c., when boiled and macerated in water become saponaceous, and were formerly used as soap. It was used medicinally, but has no certain virtues.

*Bladder Campion* (*Silene Cucubalus*), a common plant in waste places, having smooth foliage and white petals in an inflated calyx, hence its name. The young shoots are said to resemble green Peas in flavour and supply an excellent vegetable. It is recorded that "in 1685, the crops of Minorca being nearly destroyed by locusts, this plant afforded support to many of the inhabitants."

*Chickweed* (*Stellaria media*).—Though despised as human food and only given to cage birds, this resembles Spinach, and might be used when vegetables are scarce, as it can generally be found all the year round.

### HYPERICACEAE.

*St. John's Wort* (*Hypericum perforatum*), a common plant with opposite entire leaves and clusters of yellow flowers. It was formerly regarded as a plant which could ward off disasters caused by evil spirits if it be gathered on the Eve of St. John's Day (Midsummer Eve). It was customary to hang it up over doors for this purpose, and was therefore called *Fuga de monum* in the Middle Ages. It was also used as an astringent application to wounds, being one of the ingredients of "Save," mentioned by Chaucer as being used by the knights after being wounded.

The buds will give good red and yellow dyes, and if they are steeped in oil of turpentine will furnish a red varnish.

*Tutsan* (*H. Androsaeum*), so called from the French "tout-sain" or "all-heal." Like the preceding, it was regarded as a vulnerary from its astringent properties.

### MALVACEAE.

*Mallow* (*Malva sylvestris*).—This and other species are characterised by having much mucilage, and consequently have been used as emollients. The flat fruits called "cheeses" by country children are often eaten by them, as no species of the Malvaceæ is harmful. Several members of the family yield excellent fibres, the Musk Mallow (*M. moschata*) being one of the best for the purpose.

*Marsch Mallow* (*Althaea officinalis*) is a local plant found in marshy meadows, &c., near the sea, having a thick root, rose-coloured flowers, and downy leaves. Its root, which abounds in mucilage, has long been used as an emollient, and forms an ingredient in "pate de guimauve" and Pontefract lozenges. As a syrup it is excellent for bronchial affections, while decoctions of the leaves are good for fomentations. A South European species (*M. parviflora*) is cultivated as a pot herb, as at Cairo.

*Tree Mallow* (*Lavatera arborea*) is found on maritime rocks, growing from 3 feet to 6 feet or more in height and bearing purple flowers. It is often grown in gardens by the seaside.

GEORGE HENSLOW.

## MISCELLANEOUS.

### HARDY GRAPE VINES.

**V**INES, in nine cases out of ten, are not well grown out of doors. Far too much wood is left on the plants to get good bunches, and a good portion of the weaker shoots should be removed when in the bud state or as soon as it can be seen which are the strongest shoots. Only recently I saw some Vines that had been pruned by a so-called gardener—a jobber—and every shoot was close cut in. Later on these were a forest of useless wood and no fruit. With hardy Vines there must be ample thinning, and the cultivator should endeavour yearly to get the fruit on the best wood, and expose and ripen the shoots thoroughly for another season's fruiting. It is necessary to go over the Vines frequently at the early stages of growth, removing any surplus shoots and stopping those bearing bunches at one or two leaves on fruits beyond the bunch, training in those not stopped to the wall at equal distances apart. Avoid overcrowding. Each shoot should have ample room, and as these main leaders make growth at the joints lower down the shoots, these new small shoots should be pinched to the first leaf or joint, and later on rub off or stop growths that are made, thus encouraging the shoots to grow as strongly as possible without impoverishing them by supporting small shoots at their base.

I have frequently heard it said, "Oh, the bunches will not ripen," the season being blamed, whereas often the cultivation is at fault. The leaves should not be allowed to cover the bunches, but this will not be so if disbudding and stopping are properly attended to. Another point often overlooked is thinning. Even with outdoor grapes it is necessary to thin both berry and bunches; the latter should be reduced, only leaving the strongest and best placed.

It often happens that the Vines receive very little feeding, and if the roots have a free root-run they do not suffer much; but in a small border feeding is necessary, and when we see what liberal quantities of food are given to Vines grown for show and the small crop carried, it is evident that to get good berries food is a necessity. Hardy Vines would be much better if fed in the summer months. At times they are planted so that it is impossible to mulch over the roots with decayed manure; the last-named should be employed wherever possible. Failing this a good supply of

liquid manure will do much good, also any quick-acting fertilisers may be given, such as Thomson's Vine manure. This, if well watered in, will do much good. It will be found that Vines left to chance and much crowded often suffer badly from mildew, and the pest frequently attacks plants that are much crowded. I am aware that even well-managed Vines are not exempt, but as soon as ever the mildew is seen means should be taken to arrest its progress. Flowers of sulphur is one of the best remedies, either in a dry state or as a liquid, if used when first observed, by dusting a little dry sulphur over the affected part; it will not spread if used in a liquid state. The sulphur should be dissolved in tepid water. There are some excellent prepared insecticides for this pest, such as Bentley's Mildew Specific. It is not often that open-air Vines get attacked by other pests. If red spider should appear, weak tobacco water or Gishurst will clear the foliage.

I have not referred to varieties: the best white is undoubtedly the Royal Muscadine, an early white Grape, a free grower, having a fine constitution and berries of a rich sweet flavour. This variety is often grown under the name of White Sweetwater. A good black is the Black Cluster, also the Black July—a good black Sweetwater, valuable for its earliness. There are others well worth growing if more variety is needed. The new Reine Olga is a splendid outdoor variety, and should be planted where space allows.

G. WYNES.

## FRUITS.

CERTAINLY one of the most curious results of evolution in the plant world has been the production of almost innumerable edible fruits of the utmost diversity. Primarily it would seem that a plant had quite fulfilled its, so to speak, maternal duties when it had fashioned a fertilised seed and provided this seed with sufficient material to give it a fair start in life, and the large majority of plants are satisfied with this, producing seeds pure and simple and unaccompanied by any tempting associations of flesh and flavour. Even in these cases, however—our wealth of cereals to wit—man has managed to fatten up these mere seeds by selection until they rank so high among the "fruits of the earth" as to form the "staff of life"—our daily bread. The fruits, however, which we have in mind are of quite a different category. The plants which bear them are not content with the mere provision of a seed. A seed to secure the spread and continuance of its race must, in some way, become scattered abroad. To simply drop prone at the parental feet or roots is to court failure in the struggle for existence by being handicapped from the outset by competition with its progenitor, to mutual disadvantage. Some plants, therefore, bear winged seeds, to be wafted afar by the breeze; others burst their pods so violently as to widely scatter their contents by a sort of explosion; others are armed with hooks, by which they cling to the coats of animals, or even man himself, and so get transported to unlimited distances, and, in fact, to describe Nature's contrivances in this direction would form a book in itself. It must, however, have been an extra slim plant that conceived the idea of basting its seed with a luscious coating over an indigestible husk, and so tempting the animal world to swallow it with a probability of eventual survival, or, as in the case of the Cherry, Plum, and stone fruit generally, tempting the birds of the air to peck and scatter, while in the case of the Bramble tribe, with tiny, hard seeds dotted over the delicate fruits, dissemination is doubtless effected, both by swallowing and by dropping the remains of partly devoured fruits at a distance. The Nut family presents curiously converse cases. The Walnut and Chestnut, for instance, while building up a fleshy envelope to the fruit on parallel lines to the Peach, endow this with external thorns and internal acridity of flavour, designed to prevent them from being eaten, the explanation of which difference lies in adaptation on different evolutionary lines. The hard or better-shelled Nut tribe has armed

itself, speaking generally, against the squirrel tribe, precisely as in the tropics we find the armour-plated Cocoa and Brazil Nuts evolved in the struggle with the monkey's teeth. With the sweet and fleshy fruits, however, man has ample reason to bless the "happy thought," the "slim" idea which led to their adoption, for when he came in as at once a selective and protective factor the plants speedily expressed their gratitude for his careful tending by increasing the volume of the luscious reward, or, what is very much to the point, those who did not were speedily eliminated. As a marked example of what he has done in this line, we may quote the hard and tough-fleshed wild Almond as an example of the repellent tribe which has undoubtedly been transformed bit by bit into the opposite extreme of the attractive, the Peach and Nectarine, and in fact we have only to contrast most wild fruits with the highly-developed cultivated ones to find differences nearly as great. A very curious fact in this connexion is, as we see in some Grapes, Oranges, Bananas, &c., that the plants have responded so generously to continued selection of the "bait" portion of their economy that they have clean forgotten the primary reason of its existence, viz., the precious and all-important seed. Even where it is not forgotten, in other cases the seed is, as a rule, utterly incapable of reproducing the parent form, and is essentially a wastrel, the reproductive vigour of the plant having been exhausted or depleted by the abnormal growth of the attractive pulp, a curious perversion of Nature's provisions by man's intervention.

## THE ROSE GARDEN.

### HYBRID BRIAR ROSE UNA.

**O**f the many early-flowering garden Roses that hybridists have given us, the above variety must be regarded as one of the best. The handsome tawny-yellow, Tea-like buds expand into fine large blossoms of quite 4 inches diameter, bearing two rows of petals of a lovely creamy white shade of colour. The flowers are produced in clusters of from three to six, and appear all along the growths if these latter are left to their own devices. The huge bed of Una at Kew, some 70 feet in circumference, contained but fifteen plants, and yet very little of the ground was visible. Some of the long shoots were crawling quite along the ground and studded with beautiful flowers, presenting a most unique appearance.

The growth of the Rose is Briar-like in its robustness, but exhibits its hybrid nature in the reddish foliage, wood, and prickles. Una would be a delightful Rose to mingle with the Penzance Briars or Carmine Pillar, but I think hedges of this kind will be in most request. A raised bank of good loam, planted on its summit with Una and just left to run wild, would make an ideal Rose hedge. There is no form in which such Roses are better displayed than in arched growths, and, of course, one makes this possible by planting on raised banks.

P.

### SUMMER PLANTING OF OWN-ROOT ROSES.

At the time of writing we are having a downpour of rain which has made the land unsuitable for

ROSE UNA IN FLOWER IN THE ROYAL GARDENS, KEW.  
(The photograph represents a bed 70 feet in circumference, and only fifteen plants.)

planting, but as soon as possible own-root Roses should be planted, as they will quickly take hold of the soil now that it has become warm. Plants struck in March are now in 5-inch pots and are in splendid condition for planting out. They will make grand little specimens by the autumn if the work is not delayed. A liberal amount of grit should be incorporated with the soil when planting. If one desires to establish a collection of own-root plants it is much better to begin now than to wait until autumn, as by so doing delicate kinds are more easily procurable, and they also become hardened to our climate.

Do not plant deeply, but it is important the soil be well and deeply worked. Own-root Roses do not crave for rich food; in fact, it is very detrimental to their well-being at first, but having such fine roots the soil must be porous and free from lumpiness. Considerable patience is required in dealing with own-root plants. In the first place they are smaller than budded or grafted ones, and one should not weaken them by permitting them to flower the first year. I believe in a rigid plan of pinching off all flower buds the first year, and moreover, the branches, where crowded, should be carefully tied out; in fact, everything possible should be done to assist these little plants to develop into sturdy bushes.

P.

planting of Roses of this description in woods for cover, and also in the wild garden, is growing in popularity. At one time it was the common pink form that was used, but there is no reason why varieties producing better flowers should not be so used, especially if raised from layers or cuttings, so that wild suckers are not troublesome.

PHILOMEL.

## BOOKS.

### The Primrose and Darwinism.\*

This title is scarcely appropriate, as "Darwinism" is always understood to mean Darwin's theory of the origin of species by means of natural selection. Here it is Darwin's methods of experimenting on the fertilisation of flowers. It is an unsparring indictment of those methods, as given in his book, "Cross and Self-fertilisation of Plants." As a consequence we find their results, according to the author, to be often fallacious. It was long ago shown that Darwin's conditions, so far as they concerned the supposed absolute benefit resulting from crossing, were not altogether trustworthy; first, in that he neglected to examine or experiment with small-flowered plants, which are habitually self-fertilised in nature, such as Shepherd's Purse, Chickweed, Knot-grass, &c.; but he also failed to see that his own experiments only proved that the artificial crossing was but a temporary stimulus, and that when some plants were crossed for a few generations, and others of the same kind were regularly self-fertilised, though the former appeared to be benefited at first, the latter gradually gained the ascendancy and beat them in the long run. Hence, if we regard a healthy life, wide dispersion, and the production of many good seeds as the "seeds" of plant-life, there is no denying the obvious fact that self-fertilising insignificant-looking weeds, such as Groundsel, Black Solanum, and the others mentioned are pretty well cosmopolitan. The author takes up an additional line and argues that by growing his experimental plants under a close-meshed net, Darwin thereby greatly reduced the influence of the sun's rays upon the maturation of the pollen, he deprived the flowers of dew by

"The Primrose and Darwinism." By a Field Naturalist, M.A., Camb. Grant Richards, London. 1902.

A BEAUTIFUL NEW RUGOSA ROSE.  
The maiden's blush colour among Roses is always acceptable. There is a delightful freshness about the tint that appeals to all. M. Guillot introduced last year a very good addition to the Rugosas under the name of Mercedes, and from all appearances the variety is quite distinct. It is a very beautiful Rose, with flowers of a soft rosy pink colour on a white ground. They are fairly large and of fine shape. It is to be hoped we shall have more of these bright colours. Hitherto this section has been wanting in freshness of colour, there being too many washy pinks. The richly coloured variety *Atropurpurea* I like very much. It is certainly a most distinct kind, probably the forerunner of even darker hues. I quite expect that the Rugosa Roses will be considerably improved in the near future now that hybridisers are turning their attention to the group, and all lovers of this hardy race will welcome them. The

arresting radiation, and prevented the wind from reaching the flowers. He takes the dimorphic Primrose as the subject of his main contention and wherein to base his discourse, and it cannot be denied that he makes out a good case against some of Darwin's conclusions, though it must be borne in mind that the author has not proved *experimentally* the value of the three agencies to which he refers. They are, therefore, though plausible, *a priori* assumptions. When, therefore, Darwin charges a plant with "sterility," because it bore no seed under the net, the author maintains that it is no proof that the plant would be sterile, growing naturally wild, and that in many cases the sterility was actually caused by the net. His words are: "Minimise the sun, the dew, the wind, and other atmospheric agencies in such a way as practised in these experiments and not all the insects in the world would have caused sound and full fertility." He criticises Darwin's terms "legitimate" and "illegitimate" unions among Primroses, saying: "Surely when Nature herself unites stamens and stigma in the same corolla, that is Nature's 'legitimate union,'" the obvious retort is that though such is the case in Orchids the pollen cannot reach the stigma without insect agency; and that, too, of some other flower, as the bee quits it as soon as the pollinia are abstracted. But he appears to lose sight of the fact that when self-fertilisation is the normal process in a flower the anthers are placed in actual contact with the stigma, as may be seen in Shepherd's Purse, small-flowered Epilobiums, Knot-grass, and all cleistogamous flower-buds, so that when these organs are wide apart or strongly dichogamous, then the *a priori* inference is of an opposite kind. The author, in his way, sometimes seems to be as positive as Darwin himself. That Darwin was strongly impressed with the notion that crossing was of vast importance is obvious, coupled with a corresponding depreciation of self-fertilisation, and no one can read his book without seeing this bias at every turn. The difficulty seems to be to hold the balance evenly. Our own impression is that as soon as stamens and pistil were formed in the same flower, in the course of evolution, self-fertilisation was from that time the primeval method, but that by the coming of insects it was, so to say, upset. The stimulation induced on protoplasm resulted in the innumerable differentiations we now see in the structure of flowers; among these are the stamens maturing before the stigma (protandry), the development of corollas and other coloured organs, the production of honey, irregularity as issuing out of regularity, &c. But all these things have occurred, not for any special benefit to the plant, but because they could not help it. The protoplasm builds up structures in response to external impulses, and the results may be magnificent flowers (as those so "made" by florists), but it is done at the loss of fertility, as florists only too well know, and as may be seen in Orchids. Nature seems sometimes, as it were, to protest against it: as in the frequent homostyly seen in Primroses, noticed by the author, and we may add in the presence of cleistogamy against the barren but perfect flowers of Violets, &c. The author discusses so many more matters than space will allow us to refer to; but it must be added that he appears to have spared no pains in observing for himself the habits of the plants mentioned in his book, which Darwin experimented upon under the nets, and often with very different results. The very fact that insects do not play so frequent a part in crossing such flowers as the Primrose, Daffodil, and many others, as Darwin seemed to think absolutely necessary, is obvious to any keen observer in early spring. Similarly with Red Clover Darwin's well known and amusing but hypothetical correlations between Clover, humble-bees, field mice, cats, and—someone suggested—elderly ladies, has long since been proved to be merely fictions, as the Red Clover gave plenty of seed in the Colonies before the humble-bees were ever imported. It is rather a pity this book was not published in the seventh decade of the last century, instead of appearing nearly thirty years after the date of Darwin's book, viz., 1876. However, it is always desirable

to strive after the truth in anything, and if the author seems to be a little too eager at times to substitute self-fertilisation in opposition to Darwin's view of crossing, his book will do good if it shows any enthusiastic Darwinian that that great observer did not always say the last word.

## GARDENING OF THE WEEK.

### INDOOR GARDEN.

#### FERNS.

**M**ANY species are now growing freely, calling for a general overhauling of the stock of plants. Many of the stronger growing varieties will benefit if repotted now, so that they can get established while growth is active. Adiantum cuneatum and similar varieties that have been used for house decoration may be cut over and repotted. These will form useful plants during the winter months. A suitable compost for most Ferns is one consisting of three parts turf-loam, the small particles shaken out, and one part leaf-soil, with a liberal admixture of coarse silver sand and crushed charcoal. The plants should be potted firmly and the soil well drained. Syringe the sides of the pots and maintain a warm moist atmosphere. Water with care until the plants begin to grow, when they should be given abundance of moisture at the roots.

#### HYDRANGEAS.

In order to raise a stock of plants for next year's flowering cuttings should be taken with a heel of the strong shoots which have not flowered. Insert singly in small pots filled with light sandy soil, and place on a half-spent hot-bed, where they will soon root.

#### ACHIMENES

that are passing out of flower and showing signs of decay should be gradually dried off. Later batches coming into flower should be given cooler treatment, but not a too dry atmosphere or spider and thrip will be troublesome. The latest batches must be grown on in a light and moist position near the glass to encourage a sturdy growth. Stake and tie the young shoots, the tallest in the centre, and let the others slope outwardly. Give manure water occasionally.

#### GESNERAS.

The earliest of these are now flowering and should be given a cooler atmosphere. Later batches should be grown on, and given similar treatment as recommended for Achimenes.

#### SHOW AND FANCY PELARGONIUMS.

As the plants pass out of flower cut them close down. Until the buds begin to push little water must be given, except slight sprinklings with the syringe. Cuttings should still be put in small pots in light sandy loam and placed in a cold frame.

JOHN FLEMING,  
*Werham Park Gardens, Slough.*

### THE FRUIT GARDEN.

#### VINES.

The Black Hamburgh and other early Vines that have furnished a supply of fruit should, when this is gathered, if the wood is not properly matured, be treated with a view to satisfactorily accomplishing that end and thus secure a good prospect for next year. Their vigour must therefore be maintained by the borders, which, for early Vines at least, are best placed inside the house, being sufficiently supplied with water and liquid manure, or, previous to watering, a dressing of a suitable artificial compound should be given, at the same time remulch, if it is necessary, with short litter. If the Vines are affected with red spider spray daily with insecticide until all traces of it have disappeared, and subsequently keep the foliage clean by syringing and the sublateral growths moderately restricted, so that the principal buds are encouraged to develop fully. Keep the structure ventilated so that a buoyant atmosphere is con-

stantly upheld until the wood is properly matured; the house should then be fully opened, and the foliage of the Vines kept clean by being occasionally syringed, the object being to thoroughly mature the wood, which cannot, however, be satisfactorily done unless the foliage is kept healthy, and decays naturally.

#### LATE VINERIES.

The intensely hot weather that lately suddenly succeeded a spell of cold necessitated much care being taken to prevent injury from scalding of the berries and foliage of Vines. We took timely precaution to prevent this by devoting extra care to ventilation, affording artificial warmth at night and by slightly shading the houses containing Lady Downe's Seedling, Museat of Alexandria, &c., that are more or less prone to have berries scalded during the stoning period. This mode of treatment prevents condensation of moisture upon the berries, which readily takes place, and works much mischief if a sudden rise in the temperature from solar influence occurs while the berries are cold. The ventilation should be increased early and frequently on bright days, but avoid checking the growth of the Vines by admitting cold air too freely at once. Regularly stop sublaterals, so that the fruit-bearing wood is not crowded or the fruit unduly shaded, although more freedom of growth, in order to encourage free root action, may be allowed at the top of the rods.

#### MILDEW.

Should this attack the Vines its progress should be at once stopped by the aid of sulphur, for if neglected it quickly works disastrous results. For Vines carrying fruit sulphur is best employed by first heating the hot-water pipes, damping them with a wet cloth, and then dusting with flowers of sulphur before the house is closed for the day. Highly increasing the fire-heat after the house is closed will cause fumes to arise which will effectually destroy the fungus. This disease is usually caused by maintaining a low temperature, accompanied with too much atmospheric moisture.

T. COOMBER.

*Th. Hendre Gardens, Monmouth.*

### THE KITCHEN GARDEN.

#### WINTER GREENS.

If for want of room or from any other cause the planting of the various kinds of Broccoli, Savoys, and Borecole has been delayed, no time should be lost in getting them out into their permanent quarters, and give every assistance by watering and mulching to induce them to grow away freely. Savoys are often most useful when planted late; indeed, the earlier ones are of little use in large establishments as they are generally preferred during mid-winter and early spring, when unquestionably the flavour is much better; but, unlike the earlier plantings, the ground should be well manured and deeply dunged, and the surface soil kept constantly stirred with the hoe. Vacant plots of ground, such as those which have been occupied with early Cauliflowers, should be cleared of the old leaves and stems, and the roots should not be dug in but taken away and burnt. The ground should receive a good dressing of farm-yard manure and be bastard trenched. Apply a good coating of burnt refuse taken from the smother heap and soot and fresh lime to the surface. This is a capital place for sowing Winter Spinach and Tripoli Onions next month. Winter Spinach is often a very precarious crop in many parts of the country, and to ensure success several sowings should be made at various times onward till October, and in different parts of the garden, as it is a vegetable much in request in most gardens. New Zealand Spinach should be kept well supplied with water during dry weather when the quality will be much improved.

#### ENDIVE.

To ensure a good supply make small sowings every ten days or so, and plant out on good ground when ready. The earlier crops must not suffer for want of water or it will be of little use at this season. Begin to blanch it when about half grown, either by tying it up like Lettuce or by

placing flower-pots over it. The latter is a simple and very good plan, but it must be examined occasionally to see that it is not damping.

#### LETTUCE.

Make frequent sowings of both Cabbage and Cos varieties. Hicks' hardy white is a capital kind to sow now and onwards. Plant out, when ready, on a south or west border on rich, deeply dug ground.

#### CHICORY AND DANDELION.

The later sowings should be thinned and the ground kept constantly hoed, as good strong plants should be ensured before winter.

#### RADISHES.

Make a small sowing every ten days or a fortnight of French Breakfast on ground of a fine tilth, and keep well watered to promote a quick growth. Net the seed securely against birds.

#### VEGETABLE MARROWS.

These should now be bearing abundantly, and to ensure a late crop the fruit should be kept cut as soon as large enough, and the plants well supplied with water both at the roots and overhead. Should any signs of mildew appear dust thoroughly with sulphur, and in case of black fly syringe with strong soft soap and water.

#### ONIONS.

Those being grown to produce large bulbs should be kept well drenched with water during dry weather and syringed overhead in the early evening. This will greatly assist their development. Those which were planted to produce seed must have the heads carefully supported and exposed to the sun as much as possible. Mulch between them with long litter, and keep well watered both with clear water and farm-yard liquid, as the better the seed so much better will be the plants the following season.

E. BECKETT.

*Aldenham House Gardens, Elstree.*

#### ORCHIDS.

##### MILTONIA ROEZLII.

AMONG our warm-growing Orchids *M. Roezlii* is one of the most useful; the flowers are large and flat, white, with a purple blotch on each petal, the variety album being pure white except for the yellow shading at the base of the lip. Many of the plants begin to grow at this season, and should therefore be repotted if they require more rooting space, fibrous peat and sphagnum moss in equal proportions being a suitable compost. The drainage must be ample, as the plants need abundance of water when growing, and at no time should they become more than slightly dry at the root. Previous to repotting sponge the plants and carefully examine them for thrip. Should any be present they should be dipped in some insecticide and sprayed overhead twice a day throughout the summer months and be grown in a moist and shady stove.

##### MILTONIA VEXILLARIA

should be grown by all lovers of Orchids. Like *Miltonia Roezlii*, it is a handsome and showy species, the flowers large, flat, and very variable, usually lilac-rose, deepening to dark rose, lip very large, usually darker than other parts of the flower. There are many fine varieties. The majority of the plants have begun growing, and should have attention in the way of cleaning, repotting, &c. Use for compost equal proportions of peat and moss, and Fern roots picked from the peat as substitute for crocks. The plants should be kept slightly on the dry side until the roots have taken to the fresh material and the growths further advanced. These are best grown in the cool intermediate house where plenty of fresh air is admitted.

##### MILTONIOPSIS BLEUANA (SYN. MILTONIA BLEUANA).

This is a handsome hybrid, the result of crossing *M. vexillaria* with *M. Roezlii*. The variety *Nobilior* is perhaps the most beautiful; the flowers are very large, of the purest white, petals rose-purple at the base, with a large reddish brown blotch on the lip, the base of the lip being chrome-yellow. This hybrid thrives best with *M. Roezlii*, and should have treatment identical with that species.

##### CYRTOCHILUM MACULATUM (SYN. ONCIDIUM MACULATUM).

This, though not a showy Orchid, is worth growing, and should be in every collection, though seldom seen exhibited. It has stout pseudo-bulbs, 3 inches to 4 inches high, leaves 7 inches or more long, flower scapes 1 foot to 2 feet high, sometimes branching, bearing many flowers in spring, which are about 2 inches across: the sepals and petals are yellowish green, heavily blotched with chestnut-brown, lip whitish, passing into yellow on the apical half. It should be grown in the cool intermediate house, with the *Anguloas*, *Cymbidiums*, *Miltonia vexillaria*, &c.; it is again

lip lemon-yellow spotted with red-brown. This also has a period of rest, and during that time should be kept somewhat drier at the root, otherwise it should be grown with and have the same treatment as the *Crispum* section of *Odontoglossums*.

*Roslyn Gardens, Stamford Hill, N.*

## THE FRUIT GARDEN.

### NECTARINE LORD NAPIER

In late years we have had several valuable additions to the early varieties of Nectarines—good forcing ones especially—but the old variety that we herewith illustrate—Lord Napier—is still

a favourite, and is perhaps as largely grown as any early Nectarine. For its cropping powers and quality of fruit it is hard to beat. The value of such grand sorts as Cardinal

FRUITS OF NECTARINE LORD NAPIER PACKED FOR MARKET.

beginning to grow, and should be repotted if necessary in the usual compost, peat and sphagnum moss.

##### ODONTOGLOSSUM LÆVE.

This is a strong-growing cool house Orchid, having large pseudo-bulbs and branching spikes 2 feet to 3 feet long; the flowers are fragrant, 2 inches or more across, the sepals and petals dark brown, tipped and barred with greenish yellow; lip pale lilac-purple, white at the apex. The variety *Reichenheimii* has yellowish green sepals and petals, barred with purplish brown; lip variable in colour, usually light purple. These plants have a decided period of rest, and during that time should have sufficient water only to keep the bulbs plump. Repotting should take place when growth begins. Use as compost peat, moss, and leaf soil in equal proportions, and Fern roots in place of crocks.

##### ODONTOGLOSSUM PARDINUM

is a very pretty and distinct Odontoglossum, having erect branched flower spikes 2 feet or more high. The flowers are fragrant, about 2 inches across, sepals lemon-yellow, petals and

and Rivers' Early are not minimised by such a statement, but those who grow fruit for table from June to September will not fail to agree that the older variety is still one of the most valuable fruits we have. Nectarine Lord Napier was one of the earlier introductions of Mr. Rivers. Packed as is shown in the accompanying illustration, with a piece of cotton wool around them, these fruits will travel long distances to market without the least injury.

T.

### FRUIT GROWING IN CEYLON.

Uva has long been known for its fruit, and it has undoubtedly a future as a fruit-producing country which will sooner or later receive increased attention from planters. We lately received a box of delicious Uva Peaches, sent to us by a prominent planter, which were excellent in flavour and of good size and appearance. But an examination of the rates the Ceylon Government demands on small parcels of fruit, &c., makes it apparent that, until a very considerable alteration in these is brought

about, the extension of *petit culture* will not develop on the Uva side. We have enquired the cost of sending 19lb. of fruit, eggs, and vegetables from Haputale to the Fort Station, and find the charge is R. 1.90; but fruit and eggs can be sent at half parcels rate if an agreement is made with the general manager. Compare these rates with the encouragement given to vegetable and fruit growers on the Great Eastern Railway by the price, four-pence per 20lb., of fruit and garden produce, charged from any station on its line to London, and we are not at all sure that this does not include also the return of empties free. The result of this forward policy of this railway is that it has attracted a large number of market gardeners, small farmers, and others who have embarked on this pleasant mode of earning a livelihood, and this class in the summer supplement their incomes by the letting of rooms to Londoners and others, and thus the railway is additionally recouped for its public spirit by the largely increased flow of excursionists and travellers over its line. There is an increasing demand in the capital of Ceylon for fruit and garden produce; and we feel assured that, were the price for rail transit of parcels of such culture brought down to a popular rate, the extension of fruit cultivation and market gardens would expand to the benefit of the growers, the house-holders of Colombo, and the large number of vessels calling here.—*Times of Ceylon.*

## NOTES FROM SCOTLAND.

### ROUND EDINBURGH.

MESSRS. R. B. LAIRD AND SONS, LIMITED, Pink Hill, Edinburgh, cultivate a most charming biennial called

### CHERONIA INFERA.

The habit of the plant is rather straggling, the shoots being slender, though thickly arranged, but most profusely flowered, the blooms being a pleasing shade of rosy pink, and specimens exhibited in the Music Hall on the 16th attracted considerable attention on account of their general effectiveness. I believe this is the first time it has been produced in Scotland, though it has been cultivated round London for some time.

### PRINCES STREET GARDENS.

After the spring display of Tulips the beds are somewhat sombre in their summer dress, but they are already, despite the backward nature of the season, becoming daily more attractive. In the West Gardens an effective bit of carpet bedding adjoins the stairs at Pope's statue, and the long border alongside the railway is quite gay in yellow and blue. The superintendent has had to prepare plans for the grounds of a new hospital, which will require some £5,000 to carry out successfully.

### MR. RICHARDSON.

This gentleman has now retired from the position of head gardener in the Royal Botanic Gardens, his successor being Mr. Harrow, previously the clever manager of the glass department. Mr. Richardson's health has been rather unsatisfactory for some months, and he contemplates a tour among the Swedish forests as a means of regaining his usual vigour. At the same time he will study methods of forestry. Mr. Richardson's many friends are at present joining together to bestow upon him some tangible mark of their appreciation of his services to forestry and horticulture.

### METHVEN'S JUNE BROCCOLI.

This remarkably fine late Broccoli, lasting this season into July, has proved one of the hardiest, as well as one of the latest, varieties. In many Scottish gardens the winter destroyed all the Broccolis, and in the few cases where they survived the above has been prominent, occasionally being the only variety left unscathed. Methven's June was distributed for the first time some years ago by Messrs. Thos. Methven and Sons, the well-known Edinburgh seedsmen. Mention may be made, too, of an April variety, also raised near Edinburgh, which is in many respects the best of that season. I refer to Gordon's Niddrie-

Protecting, raised many years ago by the late James Gordon. The head is pure white, deeply conical in form, and a variety that finds a place in all gardens where the best sorts of vegetables are cultivated.

### THE SCHOOL OF GARDENING FOR WOMEN.

I was very pleased to hear that this new venture at Inveresk, near Edinburgh, has, since its commencement in January, been fairly successful, not a few ladies from the West End attending the lectures, in addition to the ordinary pupils, who may contemplate some form of gardening as a means of gaining a livelihood. One of the features has been a course of lectures on bouquet making by a skilled bouquettist from the city. "The School" exhibited some examples of its horticultural skill at the show held in the Music Hall lately, and were awarded a medal.

### A FLOWER SHOW.

A very pleasant meeting of garden lovers of all classes took place in the Music Hall, Edinburgh, on the 16th inst., on the occasion of a flower show held under the joint auspices of the Royal Caledonian and the Scottish Horticultural Association. There were grand Roses from Mr. Dickson, Belfast, who secured a gold medal and two certificates, and from Messrs. Croll, Dundee (silver medal). Sweet Peas in variety came from Mrs. Wanchope's garden (silver medal), and from Mr. Eckford, Wem. A grand collection of cut herbaceous flowers from Messrs. Cunningham, Fraser and Co., Comely Bank (gold medal); Gaiardias from Messrs. Kelway and Sons, Langport; Carnations and Peonies, the former remarkably fine, from Messrs. Laing and Mather, Kelso; Carnations chiefly from Mr. Kild (Lord Elphinstone's gardener), Carberry Towers (gold medal); and from Mr. Campbell, Blantyre (silver medal), mostly choice named seedlings. An altogether attractive collection of vases of cut flowers beautifully arranged and bouquets from Messrs. Todd and Co. also received a gold medal. Immense single Begonias from Messrs. Storrie and Storrie, Dundee, attracted great attention; a cultural certificate and a silver medal marking the high opinion of the adjudicator. Very little fruit was shown, a few Strawberries, Figs, Grapes, and Pine-apples mostly. Water Lilies, Gloxinias, Peonies, Roses, &c., were shown by other exhibitors. The one drawback to the success of the show was the small attendance of the general public. Messrs. Loney and P. Murray Thomson, joint secretaries, deserve all praise for the success of the show, the first of its kind, but let us hope by no means the last.

R. B.

## SOCIETIES.

### HARROW HORTICULTURAL SOCIETY.

The annual meeting of the above society took place on Tuesday, July 8, in the delightful grounds of Kenmet House, the residence of J. Charles, Esq. The weather was all that could be desired. The chief attraction was the Roses, in which many of the leading growers entered into competition, both tradesmen and amateurs.

In the principal class for thirty-six distinct, Messrs. B. R. Cant and Sons, of Colchester, were placed first, many of their blooms being very fine. The buck row contained Her Majesty, Ulrich Brunner, Mrs. J. Laing, Marie Baumann, Mildred Grant, Gustave Piganeau, S. M. Rodocanachi, Marchioness of Londonderry, Lady Marie Fitzwilliam, Caroline Testont, A. K. Williams, and Marchioness of Dufferin. Middle row : Le Havre, Papa Lambert, Comtesse de Lude, Mme. de Ramey, Prince Arthur, Bessie Brown, Tom Wood, Innocente Pirola, Dr. Andry, Mariel Graham, Duke of Wellington, and Merveille de Lyon. Front row : Helen Keller, Dr. Sewell, Mme. Hoste, Jean Loupert, Frau Karl Drnchi, Marchioness of Devonshire, Mme. G. Luizet, Xavier Olibo, Ulster, Reynolds Hole, Mrs. Cochet, and Dupuy Janain.

The second prize was given to Messrs. D. Prior and Sons, which must have run the first prize set uncomfortably close, their blooms being very fresh, large, even, and well formed; the third prize going to Messrs. Paul and Sons with good flowers, out of which was selected the best bloom in the show, a very fine specimen of Bessie Brown.

For twelve Teas, Mr. George Prince, of Oxford, was a good first, staging fine blooms; Messrs. Prior second, and Messrs. B. R. Cant and Sons third.

For twelve bunches of garden Roses, distinct, Messrs. Paul and Son were a splendid first, staging them in their well-known style, the varieties being Lady Battersea, Marquise de Salisbury, W. A. Richardson, L'Innocence, Dawn,

Camoens, Gustave Regis, Mme. Ravary, and Triomphe de Pernet père; Messrs. F. Cant and Co., Colchester, second.

For twenty-four distinct, amateur (open), the competition was good and keen. Miss Beatrice Langton, Hendon, led with magnificent blooms, splendidly staged; Mr. E. Mawley, Berkhamsted, second; and Mrs. Adcock third.

For twelve Teas and Noisettes, Mr. E. Mawley was a good first, his blooms being fresh but not over large; Mr. H. C. Turner, Edgware, second.

The class for twelve distinct was certainly one of the best contested in the show, no less than nine good boxes being staged. Lewis S. Paule, Esq., South Hill Avenue, Harrow, was a splendid first with grand flowers, being staged as well as any in the exhibition, and the flowers were of a very high standard, which were made up as follows: Marchioness of Downshire, Kaiserin Augusta Victoria, Her Majesty, Mrs. S. Crawford, Duke of Fife, Mrs. G. Laing (grand), The Bride, Marquise Litta, Tennyson, and S. M. Rodocanachi; Mr. G. R. Carter second, and Mr. Charles third.

There were several other smaller classes, most of which were well contested, Mr. Williams, of Harrow (the energetic secretary), staging well in these classes. The show was made up of miscellaneous plants, cut flowers, fruit, and vegetables for the best group. Mr. W. Smith, gardener to S. Gardner, Esq., was easily first with a pleasing arrangement; Mr. J. Fuller, gardener to J. N. Stuart, Esq., was second.

There was an extensive show of hardy cut flowers, which made quite a display in themselves. To the principal class Mr. H. E. Hargreaves was a good first, putting up splendid bunches.

Sweet Peas were excellent, and many of them pleasingly arranged. For twelve bunches Mr. G. Gardner was a good first, and for six bunches the competition was equally keen. Mr. A. K. Carlyon was well ahead with a very bright selection.

The ladies' tent attracted a good deal of attention, and it was certainly worthy of any society, the competition being most spirited. The first prize for a dinner table decoration was well won by Miss Hawkins with a very light and pleasing arrangement of Sweet Peas and Gypsophila, Miss A. Horley being second.

For an epigene Miss Langton was worthily first with a choice arrangement of Tea Roses; Mrs. L. S. Paule second, and Miss Ella Brown third.

There were several miscellaneous collections of plants shown by the trade, the most noteworthy being that of Messrs. W. Cutbush and Sons, Highgate, which was composed of splendid Carnations, Roses, and Sweet Peas charmingly arranged. Mr. J. Lyon, Park Nursery, Stanmore, staged a large and representative collection of hardy flowers, also Messrs. G. and A. Clark, Dover, and Messrs. Paul and Sons, Cheshunt.

### UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

The usual monthly committee meeting of this society was held on Monday evening, July 7, at the Caledonian Hotel, Adelphi Terrace, W.C. Mr. C. H. Curtis presided. After the minutes of the last meeting were read and signed, four new members were elected. The death of a member was reported, and the amount standing to his credit in the ledger was granted to his nominee. A request for assistance from the convalescent fund was granted to a member who has been ill for a long time. Four members were reported on the sick fund.

### WINDSOR AND ETON ROSE AND HORTICULTURAL SOCIETY.

The annual exhibition of this society was held in Eton on Wednesday, July 9, and although the display of flowers was excellent, the attendance was a poor one. There were many fine displays of hardy flowers from the leading nurseries, these in themselves making quite a show. The late Queen's cup went once more to Ireland, Messrs. Alex. Dickson winning it the second time. The same cup has also been won twice by Messrs. B. R. Cant, of Colchester, and there will be a keen contest next year between these growers to secure final possession of this much-coveted trophy.

The amateurs' classes were well filled. Here again, Mr. Colin Romaine carried off the Windsor challenge cup for another year; if he wins it next year he will keep possession of it altogether. For the best display of cut Roses, the Dowager Duchess of Sutherland's challenge cup went to Mrs. Irving, of Pelling Place, Old Windsor. The National Rose Society's silver medal for the best Rose to the show was awarded to Messrs. Dickson for a Mildred Grant. It was the best Rose this year, and it was also the best Rose two years ago.

### OPEN CLASSES.

Forty-eight distinct Roses, single trusses : The Queen's cup, value ten guineas, presented by her late Majesty Queen Victoria—First, Messrs. A. Dickson and Sons, Royal Irish Nurseries, Newtownards, County Down; second, Messrs. B. R. Cant and Sons, Colchester; third, Mr. R. Barkess; fourth, Mr. D. Prior.

Eighteen Teas or Noisettes, distinct, single trusses : First, Mr. D. Prior; second, Messrs. B. R. Cant and Sons; third, Mr. Frank Cant.

Twelve distinct Roses, three trusses of each : First, Messrs. A. Dickson and Sons; second, Messrs. B. R. Cant and Sons; third, Mr. D. Prior.

Twelve single trusses of any Hybrid Perpetual or Hybrid Tea : First, Mr. Prior; second, Messrs. A. Dickson and Sons, and the silver medal of the National Rose Society for the best Rose in the show (Mildred Grant); third, Mr. Charles Turner, Royal Nurseries, Slough.

Twelve single trusses of any Tea or Noisette : First, Mr. Prior; second, Messrs. B. R. Cant and Sons; third, Messrs. A. Dickson and Sons.

Eighteen bunches of garden Roses, distinct varieties : First,

less than three trusses to the bunch : First, Mr. Charles Turner.

## AMATEURS.

Thirteen distinct single trusses : First, Mrs. Haywood, Wood Hatch, Reigate (gardener, Mr. C. J. Salter); second, Mr. Colin Romaine, The Priory, Old Windsor (gardener, Mr. J. Guttridge).

Six single trusses of one kind : First, Mr. Francis Wellesley, jun., Westfield, near Woking (gardener, Mr. J. Gilbert); second, Mr. T. B. Gabriel, Woking; third, Mr. R. Foley Hobbs, Thornehill, Worcester.

Twelve Teas or Noisettes, single trusses, not less than eight varieties : First, Mr. A. Munt, Hedgerley, Slough; second, Mr. F. Wellesley; third, Mr. T. B. Gabriel.

## LOCAL CLASSES.

Eighteen distinct single trusses : The Windsor cup—First, Mr. Colin Romaine; second, Mr. J. B. Fortescue, Dromore, Maidenhead; third, Mrs. Irving.

Twelve distinct trusses : First, Mr. A. Munt; second, Mr. C. Norman Lacey, Westfield, Datchet; third, Mrs. Risvan Hollings.

Messrs. Sutton and Sons, J. Carter and Co., Titt and Sons, and H. Eckford, presented special prizes. At the luncheon Mr. J. F. Hoddinott presided, and was supported by Sir Albert Rollit, M.P., Mr. Colin Romaine, and others.

## EAST ANGLIAN HORTICULTURAL CLUB

At the July meeting of this club a large number of members assembled to hear an interesting paper by Mr. T. B. Field, of Ashwelthorpe, upon the subject of "Old-fashioned Roses." Mr. Field was a friend of the late Mr. Ewbank, and with him fostered a love for types of Roses which seem to be fast disappearing. The essay was listened to with much pleasure, the essayist mentioning the treatment of these Roses, and also the difficulty in obtaining true plants of some species. Those touched upon included Rosa sulphurea, The Provence and its accidental sport the Moss, the Damask Austrian Briar, Musk Rose, Banksian, Japanese Rosa microphylla, Scotch Rose, York and Lancaster striped, and others. Mr. Field, to further demonstrate his paper, had a large assortment of blooms and growths of many of the types mentioned; these were inspected closely by the members. A capital discussion followed, in which Mr. Geo. Daniels, Mr. F. Fitch, and Mr. E. Peake took part. A hearty vote of thanks was accorded Mr. Field for his interesting paper.

A noteworthy feature was a grand display of herbaceous flowers from the well-known collection of Westwick House, staged by Mr. Geo. Davison, among them being a couple of grand home hybridised Delphiniums of sterling merit. One named Westwick Blue is undoubtedly the best of its colour (a deep shade) yet introduced, and has a magnificent spike; the other, Mauve Perfection, as its name implies, is a grand acquisition in this shade. The floral committee without much hesitation granted certificates to both. Campanula Morheimi, a large flowered semi-double white, has been crossed with a single blue and a fine semi-double blue equal in size to the white has resulted. Again, our common hedgerow Harebell found scope for Mr. Davison's skill, and he exhibited spikes of Campanula rotundifolia over 18 inches in length, carrying upwards of a dozen blooms. Of Rudbeckias he had several shades of pink and red, massive blooms, home hybridised. Mr. Davison is to be congratulated on his success, and hopes are expressed that more may be heard of his novelties. The exhibition tables were packed with flowers, fruits, and vegetables, Roses especially being a strong feature. The premier award for these was secured by Mr. R. Balls, gardener to Miss Penrice, Witton House. Mr. C. H. Hines had the best all-round collection of vegetables.

## WOODBRIDGE HORTICULTURAL SOCIETY.

THE exhibition held annually by the above society is eagerly anticipated by East Anglians, as it is invariably excellent. This year's show in the Abbey grounds on the 10th inst. was well up to the average of its predecessors, both for quantity and quality of the exhibits. The schedule caters for all classes of gardeners, and included about 170 classes, in the vast majority of which there was competition. The show was well arranged by Mr. John Andrews and the committee, but it would much enhance the interest if the full addresses of the exhibitors were placed upon the class cards, instead of simply the names of the employer and the gardener as at present.

This is the time of the Rose, and the Queen of flowers unquestionably made the finest feature at Woodbridge, and the principal portion of this report will, therefore, be devoted thereto. The principal class was for thirty-six single trusses, distinct, a twenty-five guinea silver cup going with the premier award, which was well won by Messrs. P. R. Cant and Sons, Colchester. The best blooms were Mrs. Jas. Cocker, Frau Karl Druschki, Lady Mary Fitzwilliam, Ulster, Suzanne Marie Rodocanachi, Papa Lambert, Mrs. J. Laing, Mrs. W. J. Grant, White Maman Cochet, A. K. Williams, Duchesse de Morny, Comtesse de Ludre, Dupuy Janain, Bridesmaid, Xavier Olibo, Le Havre, Charles Lefebvre, Caroline Testout, and Ulrich Brunner. The second position was assigned to Messrs. D. Prior and Sons, Colchester, whose best varieties were Bridesmaid, Kaiserin Augusta Victoria, Maman Cochet, Victor Hugo, Souvenir de S. A. Prince, Killarney, Sybil, and Mrs. E. Mawley. Messrs. F. Cant and Co., Brayswick Nursery, Colchester, were third.

In the class for twenty-four distinct, Messrs. F. Cant and Co. were ahead with a handsome stand, in which the most conspicuous varieties were Helen Keller, The Bride, Suzanne Marie Rodocanachi, Mrs. J. Laing, A. K. Williams, Mildred Grant, Oscar Cordell, Mrs. W. J. Grant, and Fisher Holmes. In Messrs. D. Prior and Son's second prize stand we observed Marchioness of Dufferin, Charles Darwin, Mme. Cousin, Her Majesty, Maman Cochet, and Marie Baumann. Messrs.

E. R. Cant and Sons were first for twelve distinct with a fine stand comprising Frau Karl Druschki, Fisher Holmes, Bessie Brown, A. K. Williams, Alfred Colomb, Mrs. J. Laing, Marie Baumann, Suzanne Marie Rodocanachi, Gustave Piganeau, Francois Michelon, Helen Keller, and Dupuy Janain. Messrs. D. Prior and Son were second, and Messrs. F. Cant and Co. third. For eighteen bunches of garden Roses, Messrs. F. Cant and Co. were awarded the premier prize. The best varieties were Mme. Abel Chatenay, Rainbow, Laurette Messimy, and Mme. Julie Grolez.

The chief class in the open amateurs' section was for twenty-four distinct, and Mr. Osmond G. Orpen, West Beigholt, Colchester, was first. His best varieties were The Bride, Captain Hayward, Souvenir d'Elise Vardon, Comtesse de Nadaillac, Mrs. J. Laing, White Maman Cochet, Ulrich Brunner, Bessie Brown, Countess of Caledon, Helen Keller, Her Majesty, Mme. Cousin, and A. K. Williams. The Rev. A. Foster Melliar, Sproughton Rectory, Ipswich, was second, and had in good condition Catherine Mermet, Maman Cochet, Muriel Grahame, Bridesmaid, White Lady, Mrs. E. Mawley, Bessie Brown, and Mrs. A. G. Sharman Crawford. The last-named grower won with twelve distinct, having Chas. Lefebvre, Maman Cochet, Francois Michelon, Mrs. J. Laing, Ulrich Brunner, Mrs. E. Mawley, Dr. Audry, Catherine Mermet, Bessie Brown, Dupuy Janain, A. K. Williams, and Countess of Caledon. Mr. O. G. Orpen was second, his best varieties being Comtesse de Ludre, Maman Cochet, Bessie Brown, Mme. Cousin, White Maman Cochet, and Muriel Grahame.

Mrs. Osmond G. Orpen was an easy first for six distinct, with beautiful blooms of White Lady, Mrs. J. Laing, Caroline Testout, Maman Cochet, Bessie Brown, and Catherine Mermet. Mr. F. H. Cook was second, and had in his stand good blooms of Maman Cochet, Mrs. W. J. Grant, and Bessie Brown. In the class for six blooms of any Tea or Noisette, Mr. R. Steward was placed first with Mrs. W. J. Grant, and Mr. O. G. Orpen second with Mme. Cousin. For nine bunches of Garden Roses, Mr. O. G. Orpen was first, and Miss Zoull, Woodbridge, second. There were several Rose classes open only to the district, but they did not bring forth anything of striking merit.

Mrs. O. G. Orpen had a most beautiful table decoration of Roses, and was accorded the premier prize. Miss Adelaide F. Harwood, Colchester, also using Roses, was second. Both of these exhibits displayed excellent artistic taste, and there could not have been many points between them. Mr. E. Jacobi had the best collection of herbaceous flowers, and was closely followed by Mr. R. C. Notcutt, Woodbridge. The set of fifteen bunches of Sweet Peas from Mr. E. Johnson was splendid, the flowers being clean, fresh, and of splendid colour. Plants in pots were varied in quality, as well as in kind; but some good examples of culture were noticeable. Fruits and vegetables were numerous and fairly good in quality. The chief honours in the former section were with H. Berners, Esq., Wolverstone Park, Ipswich, whose gardener, Mr. Messenger, staged well.

Nurserymen contributed handsomely to the show, and their exhibits were greatly admired. Mr. R. C. Notcutt, Woodbridge, arranged a miscellaneous group of greenhouse plants, and had also some splendid plants of Arctotis grandis, as well as herbaceous flowers. Messrs. Thompson and Morgan, Ipswich, and Mr. A. W. Wade, Colchester, had many fine herbaceous plants, while Messrs. Daniels Bros., Limited, Norwich, staged good Carnations and Sweet Peas. Lord Rendlesham's gardener, Mr. Rogers, exhibited a group of well-grown Malmaison Carnations, and Messrs. Hobbies, Limited, Dereham, arranged splendid Sweet Peas and Roses. Messrs. Cutbush and Sons, Highgate, were represented by a beautiful collection of Carnations, in which such varieties as Mrs. Trelawny, Maggie Hodgson, Cecilia, La Villette, Lady Middleton, Uriah Pike, Nantilus, and Princess of Wales were shown.

## FOR MBY.

THIS society proved fortunate in postponing their exhibition for seven days, as the date was considered too early for Sweet Peas; the original date proved most unfavourable for outdoor festivities, whilst the 16th inst. was a most beautiful day. The district is well known as one producing fine Roses, and this year proved no exception to the rule, for they were present in quantity and of fair quality. Sweet Peas have made a home in the district, if we are to accept a heavy entry as proof, no less than twenty-four entries being sent in for the silver challenge cup presented by Mr. Henry Middlehurst of Liverpool.

## CUT ROSES.

For twelve distinct varieties, Mr. B. Kennedy, the successful grower, won with a box fully up to average merit, the best being Mrs. W. J. Grant, Captain Christy, Victor Hugo, &c.; the Rev. J. B. Richardson was second; Mr. E. Storey third. For six distinct varieties, Miss M. A. Rimmer scored with a good box. For twelve Teas, hybrid Teas, or Noisettes, Mr. Kennedy again took the lead, and for the six varieties, Mr. Luther Watts was first. For the best bloom in the larger class, Mr. Carlyle won the National Society's silver medal with a small but beautifully-coloured Mrs. R. G. Sharman Crawford, and in the smaller classes Mr. E. Sergenson was awarded the bronze medal for the best bloom. In the

## SWEET PEA

section the competition was keen. Mr. W. Dodd, jun., last year's winner, proved the victor, and therefore becomes the possessor of the first silver challenge cup. The best of the flowers were Salepian, Hon. Mrs. Kenyon, Blanche Burpee, Duke of Westminster, Black Knight, &c. The ladies, as usual, were well to the fore in their various classes, but Miss M. A. Rimmer showed in fine form, securing the chief honour in each of the five classes, her basket of Roses being exceptionally noteworthy.

Mr. Luther Watts won with very fine plants of single Begonias; Mr. J. Formby had excellent double and single Geraniums; Mrs. Rathbone good Petunias; Mr. Storey the

best Maidenhair Fern; whilst Mr. F. A. Rockliffe led for exotic and hardy Ferns, stove and greenhouse plants, &c.

For fruit, which was of good quality, the leading prize takers were Rev. W. J. Humberstone, Messrs. J. Ambrose, J. Bruce, J. Howard, W. Mathias, W. Mackerall, and J. Aindow; for vegetables, Mrs. Rathbone, Messrs. J. Bruce and B. Sykes.

As usual the non-competitive collections added greatly to the interest of the show, and awards of merit were given to Mrs. Fornby for baskets of cut flowers. Messrs. A. Dickson and Sons, Belfast, for highly cultivated Sweet Peas and cut Roses, the dark varieties being of splendid colour. Rose Queen Alexandra was also well shown.

Mr. H. Middlehurst had a fine collection of Sweet Peas, with a suitable background and Smilax trailing between the vases.

Mr. H. Eckford was strong in his favourite Sweet Peas, including Dorothy Eckford, a pure new white of great promise.

Mr. B. Kennedy, for a vase of La France Roses of good form, set up to show that form of staging.

The duties were ably carried out by Mr. T. Pugh, secretary; Mr. E. H. Bushell, treasurer; and an energetic committee.

## MANCHESTER ROSE SHOW.

ON Saturday, the 19th inst., the northern exhibition of the National Rose Society was held in the Botanic Gardens, Old Trafford, Manchester, and proved to be possibly the best Rose show held this year. Mr. P. Weathers, the curator of the gardens, had made admirable arrangements, and everything passed off successfully. The Lord Mayor of Manchester visited the exhibition, and presided at the luncheon. There were many well-known rosarians present from the south, both professional and amateur. Most of the classes were well contested, and the prizes went to really good flowers.

## NURSERYMEN.

Messrs. R. Harkness and Co., Hitchin, won the first prize, and Jubilee trophy, and gold medal for the best exhibit of thirty-six blooms, distinct, with, needless to say, a remarkably fine display. The flowers were of good quality throughout, and one of the boxes had probably the best eighteen blooms that have been shown this season. Comtesse de Nadaillac, Mrs. J. Laing, Mildred Grant, Muriel Grahame, and Bessie Brown were some of the best. Messrs. B. R. Cant and Sons, Colchester, were a very close second with blooms of excellent form, substance, and colour. The flowers of Ben Cant, Horace Vernet, Fisher Holmes, Ulrich Brunner, and Papa Lambert were, perhaps, the best. The third prize fell to Messrs. Alex. Dickson and Sons, Limited, Newtonards, and there were here also some splendid flowers. There were several other entries.

For sixty blooms, distinct, Messrs. B. R. Cant and Sons, Colchester, won the first prize with a very good collection of moderately large flowers. Some of the most notable were Mrs. John Laing, Ben Cant, Clio, Mrs. Cocker, Fisher Holmes, and Mme. Eugene Verdier. Messrs. Alex. Dickson and Sons, Limited, Newtonards, were a good second, some of their best blooms being Mrs. John Laing, Mrs. W. J. Grant, Mildred Grant, Captain Hayward, and Mrs. Edward Mawley. Messrs. Harkness and Co., Hitchin, were third with very good exhibit also.

Messrs. R. Harkness and Co., Hitchin, won the first prize for twenty-four distinct varieties, three blooms of each, with a splendid lot. Mrs. John Laing, Ulrich Brunner, Mildred Grant, and Killarney being of the best. Messrs. Alex. Dickson and Sons, Limited, Newtonards, were a very good second with choice flowers. Comtesse de Nadaillac, Mildred Grant, and Maman Cochet were splendid. Messrs. B. R. Cant and Sons, Colchester, were third, and there were several more exhibitors.

For thirty-six blooms, distinct, Mr. Hugh Dickson, Belfast, was first with an exhibit that contained some splendid blooms—Captain Hayward, Comtesse de Ludre, Oskar Corail, Mrs. John Laing, and Rev. Allan Cheales were excellent examples. Messrs. James Townsend and Sons, Worcester, were second with a somewhat uneven stand, in which were very good flowers of Mrs. J. Laing, Ulrich Brunner, and Mrs. E. Mawley.

Mr. Hugh Dickson, Belfast, won the first prize for sixteen distinct varieties, three blooms of each. The flowers were of fine form and colour. Mrs. John Laing, Captain Hayward, Comtesse de Ludre, and Marquise Litta were particularly good. Mr. John Mattock, Oxford, was second with smaller blooms. Marie Van Houtte, Ernest Metz, and Comtesse de Nadaillac being of the best. Mr. W. H. Frettingham, Beeston, Notts, was third.

## TEA AND NOISETTES.

Messrs. Alex. Dickson and Sons, Newtonards, won the first prize for eighteen blooms, distinct, with fine flowers of Maman Cochet, Medea, Bridesmaid, Mme. Cousin, and others; Mr. George Prince, Oxford, was second, his exhibit including splendid Maman Cochet, White Maman Cochet, and Bridesmaid; Messrs. D. Prior and Sons, Colchester, were third.

For twelve blooms, distinct, Mr. John Mattock, Oxford, was first with choice well formed flowers; Messrs. Townsend and Sons were second, and Messrs. J. Burrell and Co., Cambridge, third.

## OPEN.

Messrs. Alex. Dickson and Sons, Newtonards, won the first prize for twelve blooms of new Roses, distinct. The following were the varieties shown: Florence Pemberton, Lady Moyra Beauchler, Mildred Grant, Munster, Ard's Pillar, Bessie Brown, Manie, Alice Lindsell, Lady Clannoris, Irish Maiden, Mrs. David McKee, and Exquisite; Messrs. B. R. Cant and Sons were second; and Messrs. Frank Cant and Co. third.

For twelve blooms of any white or yellow Rose, Messrs. Frank Cant and Co., Colchester, were first with very good blooms of Bessie Brown; Mr. George Prince, Longworth, Berks, was second with White Maman Cochet and Messrs.

D. Prior and Sons, Colchester, third, with the same variety. There were nine entries in this class.

For twelve blooms of any light pink or rose-coloured Rose, Messrs. Alex. Dickson and Sons, Limited, were first with a grand lot of Mildred Grant, all splendid flowers; Messrs. Frank Cant and Co. were second with very good blooms of the same variety; and Mr. George Prince was third with Maman Cochet.

Mr. Hugh Dickson, Belfast, was first for twelve blooms of any light or dark crimson Rose with grand blooms of Captain Hayward; Messrs. Prior and Son, Colchester, were second with Horace Vernet; and H. V. Machin, Esq., third with Ulrich Brunner.

#### EXHIBITION ROSES IN VASES.

Mr. George Prince, Longworth, Berks, was first for twelve distinct varieties with a very good display, Marie Van Houtte, Comtesse de Nadaillac, and Maman Cochet being perhaps the best; Mr. John Mattock, Oxford, was second; and Messrs. R. Harkness and Co. third.

Messrs. D. Prior and Son, Colchester, won first prize for twelve distinct varieties of Teas or Noisettes (trebles) with some excellent blooms, especially of Mrs. Edward Mawley, White Maman Cochet, Maman Cochet, &c.; Mr. George Prince was second, and Messrs. Alex. Dickson and Sons third.

#### GARDEN ROSES.

Mr. John Mattock, Oxford, won the first prize for an exhibit of eighteen distinct varieties with a beautiful display of such as Hebe's Lip, Papillon, Ma Capucine, Irene Watts, Meta, &c.; Messrs. Frank Cant and Co. were a good second, and Mr. George Prince and Messrs. Paul and Son, Cheshunt, an equal third.

#### AMATEURS.

For twenty-four blooms, distinct, E. B. Lindsell, Esq., Hitchin, was first with splendid flowers, many of them almost perfect, Her Majesty, Mrs. J. Laing, Maréchal Niel, and Comtesse de Nadaillac were some of the best; H. V. Machin, Esq., Worksop, was second, but considerably behind the first prize exhibit; and the Rev. J. H. Pemberton, Havering-atte-Bower, was third.

E. B. Lindsell, Esq., was first for thirty-six blooms, distinct, with an exhibit that included some very good flowers; Rev. J. H. Pemberton was a good second; and Richard Park, Esq., Bedale, third. All these displays were excellent. Rev. J. H. Pemberton was first for eight distinct varieties (three blooms of each); H. V. Machin, Esq., second; and E. B. Lindsell, Esq., third. The Rev. J. H. Pemberton won also for nine blossoms of any Rose, except Tea or Noisette with good flowers of Bessie Brown; H. V. Machin, Esq., was second with Her Majesty; and W. Boyes, Esq., Derby, third.

#### OPEN ONLY TO GROWERS OF LESS THAN 2,000 PLANTS.

R. Foley Hobbs, Esq., won for eighteen blooms, distinct, with splendid flowers; C. Burgess, Esq., Knutsford, was second; and Dr. J. C. Hall, Monaghan, Ireland, third.

R. Foley Hobbs, Esq., was first for six distinct varieties (trebles), Killarney being splendidly shown; C. Burgess, Esq., Knutsford, was second. R. Foley Hobbs, Esq., also won for six blooms of any Rose except Tea or Noisette; C. Burgess, Esq., was second; and Dr. J. C. Hall, third.

#### OPEN ONLY TO GROWERS OF LESS THAN 1,000 PLANTS.

The Rev. Richard Langtree, Grange-over-Sands, was first for twelve blooms, distinct, with very good flowers; R. L. Garnett, Esq., Lancaster, was second; and M. Whittle, Esq., third.

#### OPEN ONLY TO GROWERS OF LESS THAN 500 PLANTS.

Henry Adamson, Esq., Bedale, was first for six blooms, distinct, W. Upton, Esq., Leicester, second; and R. Boswell, Esq., Hitchin, third.

#### EXTRA CLASSES.

For four distinct varieties (trebles) Henry Adamson, Esq., was well first; R. L. Garnett, Esq., second; and Rev. Richard Langtree, third. F. Curtis, Esq., Colchester, won for six blooms of any Rose except Tea or Noisette with excellent Mrs. J. Laing; Henry Adamson, Esq., was second; and G. W. Cook, Esq., Muswell Hill, a close third.

#### TEA AND NOISETTES.

Richard Park, Esq., Bedale, was first for twelve blooms, distinct, with small though well formed flowers of which Maman Cochet and Caroline Kuster were the best; E. B. Lindsell, Esq., was second with good blooms that were brilliant, and H. V. Machin, Esq., was third.

For nine blooms of any one variety, Rev. F. R. Burnside, Great Stanbridge Rectory, Essex, was first with splendid flowers of White Maman Cochet; E. B. Lindsell, Esq., was second with Maman Cochet finely coloured.

In the class for nine blooms, distinct, open only to growers of less than 500 plants, R. Foley Hobbs, Esq., Worcester, won with excellent blooms, especially of Elise Vardon, White Maman Cochet, and Comtesse de Nadaillac; M. Whittle, Esq., Leicester, was second.

For six blooms, distinct, open only to growers of less than 200 plants, George Montes, Esq., Hitchin, and W. Upton, Esq., Leicester, were equal firsts; F. A. George, Esq., Worcester, was third.

#### EXTRA CLASSES.

Rev. F. R. Burnside won for six distinct varieties, three blooms of each, with a very regular lot of well formed blooms, Mme. Cusin and Maman Cochet being the best; R. Foley Hobbs, Esq., was second, and Richard Park, Esq., third.

For six blooms of any one variety, G. W. Cook, Esq., Muswell Hill, won the first prize with small White Maman Cochet; R. Foley Hobbs, Esq., second, with Maréchal Niel, and M. Whittle, Esq., Leicester, third.

The Rev. J. H. Pemberton won, for twelve distinct varieties of garden Roses, with an excellent lot, Gustave Regis, Crimson Rambler, Rosa Mundi, R. macrantha, &c., were included; H. V. Machin, Esq., was second. Edward Mawley, Esq., was first for six distinct varieties of garden

Roses; G. W. Cook, Esq., second; and the Rev. F. E. Triford third.

#### GOLD MEDAL ROSE.

Messrs. Alex. Dickson and Sons, Limited, Newtownards, Ireland, gained the gold medal offered for any new seedling Rose or distinct sport with the variety Florence Pemberton, a hybrid Tea.

#### SILVER MEDAL ROSES—NURSERYMEN.

*Best Hybrid Tea.*—Messrs. Frank Cant and Co., Colchester for Mildred Grant.

*Best Tea or Noisette.*—Messrs. D. Prior and Son, Colchester, for White Maman Cochet.

*Other than Tea or Noisette.*—Messrs. Townsend and Son, Worcester, for Mrs. John Laing.

#### AMATEURS.

*Best Hybrid Tea.*—Mildred Grant, shown by R. Foley Hobbs, Esq., Worcester.

*Best Tea or Noisette.*—White Maman Cochet, shown by the Rev. F. R. Burnside.

*Best Rose other than Hybrid Tea, Tea, or Noisette.*—Prince Arthur, shown by the Rev. R. Langtree, Grange-over-Sands.

#### NON-COMPETITIVE EXHIBITS.

Messrs. Dickson and Robinson, Manchester, had a very pretty display of hardy flowers, including choice Delphiniums, English and Japanese Irises, Lilliums, Sweet Peas in variety, Gladioli, and some finely flowered plants of Verbena Miss Ellen Willmott.

Messrs. Jones and Sons, Shrewsbury, displayed a beautiful lot of Sweet Peas, arranged in vases. The flowers were of splendid quality, and included many choice varieties.

Mr. W. L. Pattison, Cherry Orchard, Shrewsbury, exhibited a pretty lot of Violas, arranged in sprays on a black background. Some of the flowers were remarkably good and distinct in colouring.

Messrs. Dicksons, Chester, arranged an interesting and choice display of hardy flowers. Towards the back of the group were splendid Lilium auratum, Delphiniums, Spiraea, Eryngiums, Gladioli, Alstroemerias, Phlox Miss Roberts (pure white), Agrostemma Walkeri (rich crimson-lake flowers), &c., while bunches of Roses were arranged in boxes along the front; sprays of foliage, interspersed with the flowers, much improved the appearance of this portion of Messrs. Dicksons' exhibit.

Messrs. Hodgkins and Co., West Didsbury, Manchester, had a most interesting exhibit of floral anatomy, skeleton flowers and leaves, showing all the delicate tracing of the minutest veins.

Mr. John Robson, Bowdon Nurseries, Altringham, exhibited a group of good Malmaison and other Carnations.

A specimen plant of Lilium auratum (gardener, Mr. W. G. Sharpe) was shown by J. L. Williamson, Esq., The Grange, Stretford.

#### SOUTHEND ROSE SHOW.

THIS, the first venture of the Southend District Rose Society, was held on Saturday, July 12, in the grounds of the Shrubbery, the Cliff Gardens, so well known to the frequenters of this popular seaside resort. The weather was all that could be desired, the arrangements generally excellent, the only thing lacking to crown the day with the success that those concerned with the management deserved was the attendance of the outside public. This, we are afraid, was not what one might reasonably have expected. As far as the Roses were concerned, it was the general opinion of the exhibitors and those best qualified to judge that for its size the show contained the best lot of blooms that had so far been exhibited this season.

The winning stand of Messrs. B. R. Cant and Sons (forty-eight varieties), Mr. Lindsell's first prize (twenty-four varieties), and Mr. Orpen's box of twelve Teas were all deserving of special mention, the last-mentioned box being the finest exhibit of twelve Teas seen for the year, and were remarkable for size, form, and general finish and colour. The Rev. Pemberton staged an excellent exhibit of garden Roses that was well worthy of notice, being arranged with the lightness and with a view to show the habit of growth of the Rose that is so generally lost sight of by the trade exhibits of a similar character.

The competition throughout was very keen, and a glance at the list of the prize winners will show that the best known exhibitors, both professional and amateur, paid the hon. secretary, the Rev. F. R. Burnside, of Great Stanbridge Rectory, the highest compliment in their power by exhibiting, and exhibiting of their very best.

#### NURSERYMEN.

Forty-eight blooms, distinct varieties, five competitors.—First, Messrs. B. R. Cant and Sons, Colchester, with a grand box, well staged, and remarkable for colour and general finish.

The most notable blooms were A. K. Williams, a fine bloom of Ben Cant, the new Frau Karl Druschki (that promises to be the best white exhibition Rose), Horace Vernet, Xavier Olibo (a grand flower), Lord Bacon, Papa Lambert, Mrs. Edward Mawley; second, Messrs. R. Harkness and Co., of Hitchin, close up, only a few points behind the winners; third, Messrs. Prior and Co., of Colchester, with blooms not quite so well finished. The other two boxes would have been quite good enough in ordinary competition to have won. Altogether a fine class.

For eighteen varieties, three blooms of each.—These were an even lot throughout. Messrs. Harkness, of Hitchin, were first with good trebles of Mrs. John Laing, Rev. Alan Cheales, Ulster, Her Majesty, Bessie Brown, and Mrs. Edward Mawley; Messrs. Prior and Son, of Colchester, second; and Messrs. B. R. Cant and Sons third with a treble of Frau Karl Druschki; three other exhibits.

For eighteen varieties, three blooms of each.—These were an even lot throughout. Messrs. Harkness, of Hitchin, were first with good trebles of Mrs. John Laing, Rev. Alan Cheales, Ulster, Her Majesty, Bessie Brown, and Mrs. Edward Mawley; Messrs. Frank Cant and Co., of Colchester, being a remarkably good second with a grand bloom of Golden Gate and fine flowers of Souv. d'Elise, Nipheta, Mrs.

Edward Mawley, The Bride, &c.; Messrs. B. R. Cant third, with smaller blooms of good quality.

Class 5.—Twelve varieties, three of each, Teas or Noisettes. The placings in this class were similar to class 7, Messrs. Pria's best blooms being Golden Gate, White Mamao Cochet, Comtesse de Nadaillac, and Maréchal Niel. Messrs. Frank Cant had a very fine bloom of Muriel Grahame.

In the garden or decorative Rose class for twelve bunches Messrs. Paul and Sons, Cheshunt, were first with big bunches of Mme. Jules Groléz, Crimson Rambler, Camiens, Mme. Ravary, Marquise de Salisbury, Mme. Pernet Ducher, Liberty, Killarney, Lady Battersea, Mrs. Helen Richardson, Alister Stella Gray, and others. Messrs. Frank Cant second, with rather looser bunches, not so many blooms, but making a more effective display, their stand had very fine bunches of Bardot Job, Souvenir de Catherine Guillot, and Papa Goutier. Messrs. B. R. Cant and Sons third, almost entirely composed of the summer-flowering Roses and singles; a good stand.

#### AMATEURS.

It is a long time since a better lot of flowers, especially in the larger classes, have been staged at a show of this kind in the amateur classes, the Teas being especially good, and a long way ahead of the trade exhibits. A well-known grower and exhibitor described Mr. Orpen's box of Teas as the best box of twelve he had ever seen; they were certainly very fine. For twenty-four varieties, distinct; a fine class of exhibitors, Mr. Lindsell being first with blooms of grand size, remarkably even all through, staged as only Mr. Lindsell can stage them. Where all were so good it is not easy to pick out the best, but Duke of Wellington in this stand obtained the silver medal for the best H.P. in the show, a grand flower of unusual size for this variety. Other good flowers were Maman Cochet, Mme. de Watteville, Horace Vernet, Fisher Holmes, Comte de Rainband, Mrs. E. Mawley, and The Bride; Mr. O. G. Orpen was second, and Mr. Foley Hobbs third with younger flowers.

In the treble class, twelve varieties, three of each, Mr. Lindsell was again first with good trebles; Mr. R. Foley Hobbs was second, and the Rev. J. H. Pemberton third. There were three other exhibitors.

Class 5, twelve varieties, single blooms.—First, Mr. O. G. Orpen, with an excellent box, Her Majesty, Killarney, Bessie Brown, Maman Cochet, Horace Vernet, White Maman Cochet, Mrs. John Laing, Mrs. E. Mawley, Mrs. Cocker, and Xavier Olibo; second, Mr. E. M. Bethune, fine blooms of every character, but smaller; third, Miss Langton; four other competitors, a very strong class.

Class 6, six varieties, single blooms.—First, Mr. G. H. Baxter; second, Mr. H. E. Molyneux, close up (the judge had considerable difficulty in separating first and second), with good blooms of Horace Vernet, Helen Keller, Ulrich Brunner, Bessie Brown, White Maman Cochet, and Her Majesty.

For twelve varieties of Teas and Noisettes.—First, Mr. Orpen; this box has already been referred to. His flowers were Maman Cochet, Muriel Grahame, Mrs. E. Mawley, White Maman Cochet, Souv. de S. A. Prince, Comtesse de Nadaillac (very fine), Medea, Catherine Mermet, E. Metz, Innocente Pirola, Mme. Cusin, and The Bride; there was not an inferior bloom in the box; second, Mr. E. M. Bethune, a beautiful stand of flowers, not quite so heavy or as well finished as the first prize; third, Mr. E. B. Lindsell, an even stand, very close up, losing by two points only, quite good enough to win in ordinary competition. The Rev. F. R. Burnside also had a box with many good flowers, especially Comtesse de Nadaillac and Maman Cochet; there were two other competitors. For six Teas, Mr. R. Foley Hobbs was first with an even box of neat blooms; second, Mr. G. H. Baxter. For six Teas (trebles), Mr. E. M. Bethune was first with fine flowers well finished of Maman Cochet, White Maman Cochet, Mrs. E. Mawley, Bridesmaid, Catherine Mermet, and Mme. Cusin; second, Mr. O. G. Orpen, with flowers of better colour than the winner's, but lacking weight; third, Rev. F. R. Burnside, neat box, close up.

#### OPEN CLASSES.

Twelve blooms of any dark Rose, first, Messrs. B. R. Cant and Sons with A. K. Williams; second, Messrs. Harkness, with Fisher Holmes; third, Messrs. Frank Cant, with several other competitors. Twelve blooms of any light Rose, first, Mr. O. G. Orpen, with a grand box of White Maman Cochet; this box contained the medal bloom awarded for the best Tea in the show. We understand that the identical Rose was also awarded the medal at Brentwood show on the Thursday previous. Second, Messrs. Frank Cant, with a very fine box of Bessie Brown; third, Mr. J. T. Thompson, of The Laurels, Bowes Green, N., an excellent box of Mrs. John Laing that must have run the second very close. Mr. Thompson, who grows less than 500 Roses, is to be congratulated on beating several exhibits by the trade of the same Rose. Altogether a very strong class.

For twelve blooms of any yellow Roses, open to amateurs only, Messrs. D. Prior and Son, a fine box of Maréchal Niel, and for twelve blooms of any Tea or Noisette: First, Mr. Lindsell, with a beautiful box of very highly-coloured Mme. Cusin; second, Mr. E. M. Bethune; third, Mr. O. G. Orpen, both White Maman Cochet.

For twelve bunches of garden Roses, open to amateurs: First, Rev. J. H. Pemberton, with a well-arranged stand, containing fine bunches of the garland and other good Roses; second, Mr. O. G. Orpen, with good bunches of Rugosa rubra, Claire Jacquier, and Olga de Wurtemburg; third, Miss Langton.

#### LOCAL CLASSES.

Judging from the exhibits there is a grand field for mission work amongst the inhabitants of Southend. There were only three exhibits in three classes, and they were very poor in character. No doubt the society will alter this by next season. They are, at any rate, to be heartily congratulated on their first show.

## NATIONAL CARNATION AND PICOTEE SOCIETY.

THE annual exhibition of this society was held on Tuesday last at the Drill Hall, Westminster, under the auspices of the Royal Horticultural Society. Nearly all the classes were keenly contested, especially those for single blooms, and as a result many fine flowers were exhibited. The Carnations almost filled the Drill Hall, leaving but little room for other displays.

For twenty-four bizarres and flakes, Mr. Charles Turner, Slough, won the first prize with a charming lot of flowers, Duke of York, John Keet, George Herbert, Harrison Weir, and Charles Henwood being some of the best; Mr. Rowan, Manor Street, Clapham, was second with considerably smaller flowers; and Martin R. Smith, Esq., Warren House, Hayes, third.

For twenty-four selfs, Martin R. Smith, Esq., won with splendid blooms, Cecilia, Ensign, Daffodil, Bomba, and Anne Boleyn being very fine; Mr. Charles Turner, Slough, was second with an exhibit that contained several good blooms; and Messrs. Blackmore and Langdon, Tiverton-on-Avon, Bath, were third.

The first prize for twenty-four fancy Carnations fell to Martin R. Smith, Esq., for some lovely blooms. Molly Maguire, Pagan, Argosy, Caird, and Siegfried were very beautiful. Mr. Charles Turner was a very good second, Duke of Alva, Falca, Charles Martel, and Voltaire being finely shown; Messrs. Blackmore and Langdon were third.

Martin R. Smith, Esq., won for twenty-four Picotees, white ground, with a choice exhibit. Particularly good were Miriam, Ganymede, Mrs. Wm. Elarson, and Mrs. Payne. Mr. Charles Turner, Royal Nurseries, Slough, was second with good flowers; and Messrs. W. Taplin and Sons, Newton Abbot, third.

The first prize for twenty-four Picotees, yellow ground, was awarded to Martin R. Smith, Esq., for excellent flowers. Gronow, Lady St. Oswald, Dalkeith, Koh-i-Noor, and Miss Aura Mackee were of the best. Mr. Charles Turner was second; and Messrs. W. Taplin and Sons, Newton Abbot, third.

Martin R. Smith, Esq., was first for six Carnations, selfs, one variety, with splendid flowers of Cecilia; Messrs. Blackmore and Langdon were second with Master F. Wall and Messrs. Taplin and Sons third.

Messrs. Blackmore and Langdon, Tiverton Nursery, Bath, were first for six blooms, of any yellow or buff ground fancy Carnations, with very good flowers of Willie Tylee; Martin R. Smith, Esq., was second, showing Mountjoy; and Messrs. Taplin were third.

Messrs. Blackmore and Langdon were again first for six blooms of fancy Carnations other than yellow or buff ground. They showed Millie in good form. Martin R. Smith, Esq., was second with Waterwitch, and Messrs. W. Taplin third.

Martin R. Smith, Esq., was first for six blooms of any yellow ground Picotee, showing Gronow well; Messrs. W. Taplin won the second prize.

The first prize for twelve distinct Carnations, three blooms of each, was won by Martin R. Smith, Esq. He showed Bridgeروم, Cecilia, Hildegarde, Agnes Sorel, Molly Maguire, &c., very finely. Messrs. Blackmore and Langdon were second with good blooms of Snowball, Neatness, Novelty, Alice Brown, &c. Messrs. Taplin were third.

## SINGLE SPECIMENS—CARNATIONS.

Scarlet bizarres: First, M. F. Wellesley, Esq.; second, Mr. R. C. Cartwright; third, Mt. F. Wellesley.

Crimson bizarres: First and second, Mr. F. Wellesley; third, Mr. W. Spencer, jun.

Pink bizarres: First and second, Mr. F. Wellesley, showing Mrs. Skirving; third, Mr. W. Spencer, jun.

Purple flakes: First and second, Mr. F. Wellesley, with the varieties G. Melville and Gordon Lewis; third, Mr. E. Charrington.

Scarlet flakes: First, Mr. Nash, with Guardsman; second, Mr. Robert Sydenham, with John Wormald; third, Misses Thompson.

Rose flake: First, Mr. F. Wellesley, with Merton; second, Mr. J. Keen, Southampton.

## SELF'S.

White or blush: First, Mr. William Spencer, jun., with Much the Miller; second, Mr. Nash, with Eric Hambro'; third, Mr. E. Charrington.

Rose or pink: First, Mr. Charrington, with Mrs. Amy Sebright; second, Mr. F. Wellesley, showing Bomba; third, Mr. Charrington.

Scarlet or crimson: First, Mr. Martin Smith, showing H. J. Cutbush; second, Messrs. Thomson, with The Sirdar; third, Mr. Wootton.

Maroon or purple: First and second, Mr. F. Wellesley, showing Sir Bevys; third, Mr. William Spencer, jun.

Yellow: First, Mr. F. Wellesley, with Germania; second, Mr. E. Andrews, with the same variety; third, Mr. Spencer, jun.

Buff: First, Mr. Spencer, jun., with Beubow; second and third, Mr. R. C. Cartwright, also with Benbow.

Yellow ground fancies: First, Mr. William Spencer, jun., showing Queen Bess; second, Mr. James Fairlie, with Argosy; third, Mr. Nash.

Other fancies: First and second, Mr. Spencer, with the variety Artemis; third, Mr. R. C. Cartwright.

Messrs. F. Wellesley, Robert Sydenham, W. Spencer, jun., Martin Smith, Nash, R. C. Cartwright, W. Pemberton, and Son, and J. J. Keen were the chief prize winners in the classes for Picotees of all descriptions.

*The Second and Third Divisions are unavoidably held over until next week, through pressure on our space.*

## PLANTS.

The first prize for a single specimen was won by Martin R. Smith, Esq., who showed Childe Harold.

Martin R. Smith, Esq., won for twelve specimens of Carnations or Picotees in pots; Mr. Charles Turner, Royal Nurseries, Slough, being second.

The first prize for a group of Carnations (50 square feet)

was won by Martin R. Smith, Esq., Hayes, Kent (gardener, Mr. C. Blick), with a very fine display. The plants were well flowered, the flowers of good substance and pleasing variety of colour; many choice sorts were also represented. Mr. Charles Turner, Slough, won the second prize.

A second prize for a smaller group of Carnations was awarded to A. F. Fitter, Esq., 15, Streatham Hill, S.W. (gardener, Mr. A. W. Huret).

Mr. James Douglas, Epsom, Great Bookham, Surrey, showed a collection of splendid Carnation blooms arranged in vases. There were some beautiful flowers amongst them, including Pagan, Nellie Ryan, Benbow, Rose Celestial Clove, Boreas, Bendigo, Evangeline, Lady Hermoine, &c. Mr. Douglas also exhibited very fine single blooms of some of the best varieties.

## PREMIER BLOOMS.

*Bizaire*.—Master Fred, exhibited by F. Wellesley, Esq., Woking.

*Flake*.—Sportsman, from Messrs. Pemberton and Sons.

*Self*.—Mrs. Guy Sebright, sent by E. Charrington, Esq.

*Fancy*.—Queen Bess, shown by W. Spencer, Esq.

*Heavy-edged white ground Picotee*.—Mrs. Foster, shown by Mr. Robert Sydenham.

*Light-edged white ground Picotee*.—Fortrose, shown by F. Wellesley, Esq.

*Heavy-edged yellow ground Picotee*.—Dalkeith, from Mr. C. Blick, gardener to Martin R. Smith, Esq.

*Light-edged yellow ground Picotee*.—Mrs. Walter Heriot, from Mr. C. Blick.

## ROYAL HORTICULTURAL SOCIETY.

A SECOND meeting of the fruit and vegetable committee, chiefly to examine the later Peas of the great trial of eighty-five varieties presented this year, was held at Chiswick on the 17th inst. Present: W. Marshall, Esq. (in the chair), Messrs. G. Wythes, O. Thomas, J. Willard, G. Woodward, G. Kelf, W. Bates, S. Mortimer, and A. Dean.

Prior to examining the Peas, Mr. Woodward placed before the committee a large dish and fruiting branches of the Black Currant Boskoop Giant, put into commerce by Messrs. George Bunyard and Co., and grown on ordinary bushes three years planted at Barham Court, Kent. The wood was vigorous, the bunches from 3 inches to 4 inches long; berries very large, black, sweeter than other varieties, and it is evidently a great cropper. It has not, so far, been attacked by the mite. A first-class certificate was unanimously awarded to it.

Of Peas, amongst the many varieties sent by Messrs. Sutton and Sons, Reading, the following received awards of merit: Lord Roberts, 30 inches; Selected Dr. Maclean, a great improvement in quality on the old variety of that name, 3 feet; Prolific, 3 feet, a great cropper; and Royal Jubilee, 4 feet, a superb late variety. These were all of high excellence. From Messrs. James Veitch and Sons, Chelsea, came Lord Rosebery, 5 feet, a great cropper; and Late Prolific, 5 feet, also a splendid variety. These also obtained awards of merit. A similar award was given to a very great cropping and fine variety, Champion Marrow, 3½ feet, from Messrs. Dickson and Sons, Chester; whilst to that superb late variety, The Gladstone, here a wonderful cropper, 3 feet, from Messrs. Alex. Dickson and Co., Belfast, a first-class certificate was awarded. The Pea trial elicited the warmest admiration from the committee, great credit being given to Mr. S. T. Wright and his very limited staff for such excellence. To Cabbage Lettuce Carter's Perpetual, from Messrs. James Carter and Co., Holborn, a very fine and peculiarly long standing variety, an award of merit was given.

So much care is exercised in the sowing and culture of the Peas at Chiswick, and the committee in examining them act with such entire impartiality, giving awards only to the best, that it is hoped another year more seedsmen and raisers will send their very best varieties for trial, as none really good should be left out.

As mentioned elsewhere the Drill Hall was on Tuesday last almost entirely given over to the exhibition of the National Carnation and Picotee Society, so the display of hardy flowers, Orchids, fruit, &c., was necessarily not extensive.

## ORCHID COMMITTEE.

Present: Messrs. Harry J. Veitch (chairman), James O'Brien, H. Little, de B. Crawshay, Jeremiah Colman, J. Wilson Potter, H. A. Tracy, W. H. White, W. H. Young, F. J. Thorne, H. T. Pitt, N. F. Bilney, Frank A. Rehder, James Douglas, H. Ballantine, H. M. Pollett, and E. Hill.

But few Orchids were shown on this occasion, yet several were of considerable interest and merit.

*Cypripedium antionga, lawrencianum × niveum*, came from Baron Schroder, The Dell, Egham (gardener, Mr. Ballantine).

Messrs. James Veitch and Sons, Limited, Chelsea, showed *Cypripedium W. R. Lee*, in which the dorsal sepal is heavily lined with black, the sepals lightly dotted brown, and the lip of a chocolate colour. *Laelia Helen* is a cross between *L. digbyana* and *L. tenelliflora*. *Laelio-Cattleya Aphrodite alba* is very fine, and *L. C. Norba* is a result of crossing *C. Mossiae* and *L. xanthina*. *Cattleya atlantica* is a good form with a fine purple lip.

H. F. Simond, Esq., Beckenham (gardener, Mr. G. E. Day), showed a splendid specimen of *Grammatophyllum ellisi*, an importation from Madagascar, with an arching raceme of some twenty-six flowers. The chief colour of the sepals is golden brown, with a bar of yellow near the apex. A cultural commendation was awarded.

A similar award was also made to Walter C. Walker, Esq., Percy Lodge, Winchmore Hill, for a finely flowered example of *Dendrobium Falconeri*.

A fine bold *Cypripedium* was sent by Mrs. Haywood, Woodhatch Lodge, Reigate, and named *C. Harriet-leeanum*, having resulted from a cross between *C. hirsutum* and *C. leeanum*.

A *Sobralia* hybrid came from J. Foster Alcock, Esq., Northchurch; and *Physosiphon loddigesii* from R. J. Measures, Esq., Camberwell.

## CERTIFICATED ORCHIDS.

A first-class certificate was awarded to:

*Cattleya × wigriana (wigriniana var.)*.—Shown by Sir F. Wigan, Bart., Clare Lawn, East Sheen (gardener, Mr. W. H. Young). This handsome and distinct plant carried a two-flowered raceme. The dorsal petal is a brownish salmon colour and about 4 inches long, the wavy sepals being of a most delicate tint of rose with salmon shading, lip rosaceous, lightly freckled gold.

## FRUIT AND VEGETABLE COMMITTEE.

Present: Messrs. George Bunyard (chairman), H. Balderston, Joseph Cheal, Henry Esling, S. Mortimer, Alex. Dean, Edwin Beckett, J. Jaques, G. A. Nix, F. L. Lane, H. Somers Rivers, Owen Thomas, and G. Reynolds.

The exhibits before this committee were by no means numerous. Black Currants of a good type, named Campsea Ashe, came from Mr. Andrews, The Gardens, Campsea Ashe.

Peach Libra is one of the late Mr. R. D. Blackmore's seedlings, of which two fine fruits were shown by Mr. Will Taylor, Hampton. They were taken from a tree planted in a cold house in December, 1901. The variety is certainly full of promise.

Pea Essex Herd is a full-podded kind of excellent quality, and was shown by Mr. G. Hobday, Romford Park.

Pea Glory of Devon, from Messrs. R. Veitch and Sons, Exeter, is a flat-podded kind that promises well.

Gooseberry Scorpion, with Red Corrants Versailles, came from Mr. George Lee, Clevedon, and a handsome Tomato called Coronation was shown by Henry Parr, Esq., Treot Park, New Barnet.

Three dishes of Apple Early Victoria were shown by Messrs. Cross and Sons, Wisbech.

A tray of splendid Peaches of the variety Duke of York, from pot trees in cold house, were from Messrs. Thomas Rivers and Sons, Sawbridgeworth. Vote of thanks.

The largest exhibit was that of Cherries, of which Messrs. W. Ray and Co., Teynham, Kent, had some thirty dishes in many leading kinds. Some of the finest shown were Frogmore Bigarreau, one of the best white early sorts; Florence, Elton Heart, Amber Heart, very good in size, but too firm for use; Napoleon Bigarreau, excellent in every way; Governor Wood, Bedfordshire Prolific, Noble, very fine sample; Early Circassian, and Webb's Black Heart, &c. The exhibit attracted a good deal of attention, and was awarded a silver gilt Knightbridge medal.

A vote of thanks was given to Dr. Bonavia, Richmond Road, Worthing, for a basket of the Strawberry Grape, a distinct flavoured variety not grown so often as it should be.

## NEW FRUITS.

A first-class certificate was awarded to:

*Strawberry Girons Late Prolific*.—A bright scarlet-fruited kind, the oblong fruits uniform in size and finely flavoured. The variety resulted from crossing Waterloo with Latest of All, and received an award of merit July 2, 1901. Being in such good condition on the 22nd inst., when plants, as well as fruits in boxes, were shown, and coming from a district of comparative earliness, augurs well for its lateness generally. It was shown by H. P. Sturgis, Esq., Givens Gardens, Leatherhead (gardener, Mr. W. Peters).

An award of merit was granted to:

*Strawberry The Khedive*, a dark-coloured fruit, which will undoubtedly prove valuable as a late variety. This was shown by Messrs. James Veitch and Sons, Limited, King's Road, Chelsea.

## CERTIFICATED PLANTS.

The following received an award of merit:

*Martanta insignis*.—The leaves of this Martanta are narrow and green. The spots or blotches upon them are a distinct feature. From Messrs. William Bull and Sons, Chelsea.

*Rose Field-Marshall*.—A monthly climbing Rose, possessing vigour and freedom, with very large and full, richly-coloured crimson flowers. It should prove a most useful addition to climbing Roses. Shown by Messrs. Paul and Son, Waltham Cross.

*Rose Bent Catt. (H.P.)*.—This magnificent novelty is already well known, and, in addition to what we have said before, we may say we believe it to be the finest crimson Hybrid Perpetual that has yet been raised. Size of bloom, enormous size and great texture of petal, with the finest form and fragrance, are features that may be seen at a glance. Shown by Messrs. B. R. Caot and Co., Colchester.

## FLORAL COMMITTEE.

Present: Mr. W. Marshall (chairman), and Messrs. C. T. Drury, R. Dean, H. B. May, Geo. Nicholson, Jas. Walker, Geo. Reutte, W. Howe, C. R. Fielden, Chas. Dixon, C. J. Salter, Chas. E. Pearson, R. C. Notcutt, W. P. Thomson, E. H. Jenkins, Wm. J. James, Geo. Paul, Edward Mawley, John Jennings, Harry Turner, and H. J. Cutbush.

The Carnation group from Messrs. Wm. Cutbush and Sons, Highgate, contained many good Malmaisons. Of these we noted Princess of Wales, one of the best in pink shades, and of which a large number of one year old plants were shown bearing from sixteen to nineteen flowers. Maggie Hodgson (crimson), Sir F. Freemantle, Baldwin (warm rose pink), Nautilus (deep blush), Herbert J. Cutbush (scarlet), Lady Mimi (salmon, with rose), and Brodrick (yellow ground) were among others that, with the renowned yellow self Cecilia, made up quite a feast of these flowers alone. Palms and other things were employed in the setting with good effect. Silver-gilt Banksia medal.

Mr. Amos Perry, Winchmore Hill, exhibited a group that in some degree recalled his fine group at Holland House recently. Some fine Campanulas were shown, notably *C. lactiflora* and its varieties *palida* and *corulea*, which form a trio of the showiest bell-flowers for July. Among rare plants the Fire Pink (*Silene virginica*), with scarlet-crimson flowers is excellent, and the pretty Spigelia marilandica with tubular flowers was also noted. Fine heads of *Ostrowskia magnifica*, and of several fine Phloxes, together

with *Platycodon autumnale* and *P. grandiflorum* made a good show. Silver-gilt Banksian medal.

Sweet Peas of which there were some fifty or sixty vases, in all the most approved kinds were shown by Messrs. Jones and Son, Shrewsbury. Some of the kinds, as *Othello*, very dark, and *Countess of Radnor*, pale blue, were very pleasing. Miss Willmott, one of the best of the rose-scented shades, is also a fine sort. Silver Flora medal.

From Christchurch, Mr. M. Pritchard brought a really fine lot of things and in handsome bunches; among the best of his lot were *Iula macrocephala*, *Centaurea ruthenica*, with sulphur-yellow heads; *Liatris spicata*, *Cimicifuga americana*, white or creamy; fine masses of *Alstroemeria*, *Helianthus rigidus*, *Clematis integrifolia*, *Gladoli*, *Lemoinei* var., *Monarda didyma*, and several handsome Phloxes, as *Ball of Fire*, *Coquelicot*, &c. *Lilium dalmaticum* was good, and several *Iris kaempferi* were shown in this fine group. Silver-gilt Flora medal.

Messrs. J. Cheal and Sons, Crawley, set up a choice assortment of Sweet Peas in a large number of the best kinds, the flowers good and very fresh looking; around the back large vases filled with *Alstroemeria aurantiaca* were arranged.

Messrs. J. Veitch and Sons, Ltd., Chelsea, had a handsome group of the new aquatics enclosed by Bamboos, &c. The former included the best of the Marliac Lilies, e.g., *N. Marliacea alba*, very fine; *N. M. chromatella*, *N. M. carneae*, *N. Laydeckeri lithacae*, *N. Jas. Brydon*, rose-coloured, very large; *N. Collossea*, *N. Seignouretti*, &c. Greater sunlight was needed to expand the flowers more fully, however. *Yucca recurva* and *Glyceria spectabilis* fol. var. were also included. Silver Banksian medal.

Near by Messrs. J. Peed and Sons, Norwood, set up a group of Malmaison and other Carnations in pots. The yellow *Cecilia* was well shown, as also were the varieties Mrs. W. Smith, soft pink, and R. H. Measures. There was a large number of the Princess of Wales, a popular kind and very showy.

Messrs. Barr and Sons contributed a showy group of mixed hardy flowers, Delphiniums, Sweet Peas, Gaillardias, together with early-flowering and *Lemoinei* Gladioli, *Iris kaempferi* in variety, the red and pure white perennial Peas, several fine Marguerites of the perennial class, and various Phloxes. *Enothera speciosa*, *Galega officinalis* alba, *Aconitum pyrenaicum*, and some handsome spikes of *Lilium pardalinum* were exceedingly showy. *Coreopsis verticillata* is a welcome change from the common *C. grandiflora*, and very pretty are the numerous flowers. Border Carnations in variety were also shown. Silver Banksian medal.

Mr. A. Wade, Colchester, had three capital vases of Lilies, two of these filled with *L. excelsum* and the third with *L. Brownii*. The flowers were very good, and the last-named kind very bold and telling.

Messrs. Paul and Sons, Old Nurseries, Cheshunt, had a small exhibit of cut Roses, in which Lady Battersea, Corallina, Bessie Brown, and Sony de William Robinson were notable, the last being very striking in its colour combination.

Another lot of Roses from Messrs. B. Cant and Sons, Colchester, included some very choice things. For example, Beryl, golden orange; Mrs. Cocker, pink; Beaute Inconstante, Mrs. B. Cant, Killarney, pink; Frau Karl Druschki, white; Mildred Grant, Mrs. Grant, Papier Gontier, and Himalaya Briar, a single white, very pretty. These, with some six or eight handsome blooms of the new Ben Cant, which is referred to under awards, formed a most attractive group of beautiful kinds. Silver-gilt Banksian medal.

Messrs. William Paul and Son, Waltham Cross, showed Waltham Rambler, a most profusely flowered kind of rose and white colonizing.

*Athyrium f. ranullossimum lineare* was shown by Mr. J. Edwards, Herbert Street, Blackley, Manchester. It is curious and distinct crested fern.

*Lilium concolor* with self scarlet flowers was shown by Messrs. Veitch and Sons, Limited, Chelsea, and two hand-some vases of Roses came from Mr. Chas. Turner, Slough. Muriel Pike and Caroline Testout being the two kindsshow.

chance of ripening is to lift the clusters of fruit bodily from off the ground so that they hang in the air, where they can more readily dry. Very good supports are made by using lengths of fairly stout wire, 16 inches long, bending down the ends each 6 inches, then fixing the points of those in the ground beside a plant, and lifting the clusters of fruit so that they rest on the bar of wire thus left between the two ends. A very simple plan also is to get ordinary laths, cut some of them into 6-inch lengths, point all at one end, and at the other cut out a little form of rest or crutch. Fix these with the crutch ends upwards 2 inches into the soil near the plants, and place a thin strip of wood across the tops to form rests for the fruit clusters.

#### Lilium Martagon album "diseased" (S. T.)

—The samples sent show no trace of disease. They have doubtless been injured by late frosts, and the injury has been all the more severe owing to sunshine having promoted a rapid thaw. Your best course will be to move the plants to a site screened from early morning sunshine or to protect the plants another year where they now stand with fir branches or similar material should late frosts threaten. We have seen several specimens in various parts of the country that have similarly suffered this season.

#### Diseased Cucumber root (A. F. S.)

—The Cucumber plant you sent was badly attacked by the Root eelworm (*Heterodera radicola*). There is no known remedy short of pulling up the plants and burning them as soon as the disease is recognised and removing all the soil which could possibly contain any of the pest. This you appear to have done. I suppose this disease may be said to be infectious, but one plant cannot "catch it" from another unless the worms or their eggs pass from one to the other,

fungus or auburny. The fly breeds rapidly, so that there are several generations of the maggot in one season. Entomologists describe the fly and its habits freely enough, but in the matter of remedies they have to rely on those traditionally advised or on the experience of Cabbage growers. Of positive remedies there are, perhaps, none, but of palliatives considerable. Dressings of lime and soot are well-known; so, also, is gas-line, the most potent of all, but a palliative that cannot be applied to growing crops very well, although when, as in your case, the soil year after year seems full of the maggot, nothing but drastic action will do any good. When plants show signs of injury at the roots, lift each one carefully with some soil attached, and either bake the whole or cast into a pan of boiling water. If the trouble spreads and there is every prospect of the entire breadth being destroyed, get gas-line, break it up fine, and strew it about thinly, then at once fork it in. No matter if it at once kills the Cabbages, it will also kill the maggot. Also in the winter, on ground it may be proposed to plant with Cabbages in the spring, spread over a bushel of gas-line per rod. Let it pulverise for a month, then re-spread, and dig it in. A light dressing of salt to wash in during hot weather should do good. Individual waterings of the affected plants with strong soot-water should also do good service.

#### The best zonal Pelargoniums (IGNORAMUS).

We conclude that your enquiry refers to the zonal section of Pelargoniums, popularly called Geraniums, and not to the show and decorative classes which are usually referred to as Pelargoniums. The names of a dozen good varieties both of single and double-flowered forms of zonal Pelargoniums are—Single: Comtesse de Morella, scarlet, large

white centre; Countess of Buckingham, deep rose pink; Duchess of Marlborough, soft salmon; Hall Caine, cherry red; J. II. Arderne, orange; Lilacina Improved, lilac; Lord Rosebery,

bright crimson; Menelik, deep magenta - rose, large white centre; Niagara, white; Royal Purple, purple; The Khalia, deep salmon; W. E. Corden, scarlet, white eye.

Double: Aglaia, purplish; Apotheose, deep rose, large white centre; Charles Gounod, scarlet, large white centre; Fraicheur, white edged pink, like a Picotee; Gustave Enrich, clear scarlet; Hermine, white; H. M. Stanley,

Aglaia, purplish;

Apotheose, deep

rose, large white

centre; Charles

Gounod, scarlet,

large white

centre; Fraicheur, white

edged pink, like

a Picotee; Gustave Enrich, clear scarlet; Hermine, white; H. M. Stanley,

just the same as in human diseases. The germs or microbes from an infected person must pass to the other before the latter can be attacked by the disease.—G. S. S.

**Periwinkle (M.)**—You cannot have a more beautiful flower for your rough bank than the large Periwinkle.

**Peonies dying (W. A. P.)**—The cause of failure is in the first place due to position. The plants were grown where they caught the early morning sun whilst in a frozen condition some time during May or early June. This is the cause in the first place of the flower buds being burned up and the plants falling over, as decay sets in in the part which has been caught by frost and sun, and if this happens to be near the ground where the sap is rising it becomes attacked by millipedes or any other insects (drawn by decaying vegetable matter) which may be in the neighbourhood. The upper growths or flower buds become burnt up and the sap is dried up. Your friend doubtless planted his in a south-west, west, or north-west aspect.

**Apples for profit (H. WOODWARD)**—“Question 1.

Do you advise planting bushes on the Paradise, 302 to the acre, for market or standards?” Bushes on the Paradise stock will yield better crops in less than half the time that standards on the Crab would. We therefore advise you to plant bushes. Your loamy soil on gravel is well suited to the growth of both the Apple and the Plum, and the distance you propose planting the trees apart is correct, seeing that you propose growing other fruits between. The land should be well manured and bastard trenched before planting. “Question 2. What is the average yield per bush on Apple trees on Paradise? Is 100lb. too much to expect?” Yes, certainly, for at least six or seven years. It is scarcely possible to give the yield of trees, so much depending on the position, quality of the soil, the seasons, and, more than all, perhaps, on how the land has been cultivated and prepared before the trees were planted as to future profitable returns, but all the conditions being favourable the planter may rest assured of a generous return in due time. “Question 3. As to varieties.” Those mentioned are good. We would add the following; they are placed in the order of ripening: Kitchen—Lord Grosvenor, Frogmore Prolific, Cellini, Rymer, Beauty of Stoke, Blenheim Orange, Newton Wonder (this is the coming Apple, and should be planted largely), and Annie Elizabeth. Dessert—Early Harvest. Duchess of Oldenburgh, Devonshire Quarrenden, Worcester Pearmain, James Grieve, Allington Pippin, Rosemary Russet, Brownlee's Russet, Lord Burleigh, and Sturmer Pippin.

**Cabbage maggot (C. B.)**—We have not in all the range of vegetable pests one more difficult to deal with than is the Cabbage maggot (*Anthomyia brassicae*). Of course, it is not to be confounded with the moth (*Manistria brassicae*), the caterpillar of which preys on the leaves and can be kept down somewhat by hand picking and fine salt sprinklings. The maggot, on the other hand, preys on the stems and roots, and produces in rapidly flagging and eventually dying leafage very much the same results as is seen when the plants are attacked by the formidable club

deep rich pink; Joyful, salmon-edged white; Lady Candashar, bright salmon; M. Alfred Erckener, yellowish vermilion; Raspail Improved, deep scarlet; Sombre Horizon, deep rich crimson. The principal sweet scented varieties are: Crispum, citron scented; Dale Park Beauty, prettily divided fragrant leaves; Dentifoliatum majus, leaves finely cut; Duchess of Devonshire, sweet scented, pretty blush-tinted blossoms; Fair Ellen, large Oak-shaped leaves; filicifolium, leaves divided like a fern; Lady Mary, nutmeg scented; Lady Plymouth, variegated Oak-shaped leaves; Little Gem, compact grower, with bright rose flowers; Lady Scarborough, leaves much cut and highly fragrant; Pretty Polly, almond scented; Prince of Orange, small leaves with the fragrance of an Orange; Prince of Orange, variegated like the last, but with variegated leaves; Pheasant's Foot, large fragrant leaves; queriefolium, Oak-like leaves with black centre; queriefolium minor, like the last, but much smaller; Radula, handsome, much divided leaves; Radula major, larger than the last; Shottesham Pet, has a distinct and pleasing fragrance; tomentosum, large woolly leaves with the scent of peppermint. Besides these, which are all more or less of a bushy habit of growth, there are two or three forms of what is known as the old Unique, which are of a loose rambling character with fragrant leaves and shiny blossoms. They are: Old Unique, deep lilac; Scarlet Unique, scarlet; Rollinson's Unique, rich violet-crimson. Messrs. Cannell, of Swanley, grow Pelargoniums very largely.

**Grafting Cianthus (H. T. E.)**—The best time to graft the Cianthus is in the latter part of the spring, the scions employed being young seedling plants, and not shoots from an old flowering specimen. The Colutea stock should be young and vigorous and established in small pots. In order to get the sap active they must be taken under glass a fortnight or so before they are wanted. Cleft grafting may be employed, and after the operation is performed the plants must be kept in a close propagating case in a warm greenhouse temperature till an union is effected.

## ANSWERS TO CORRESPONDENTS.

**Names of Plants.**—*H. Birkinshaw*.—1, *Polemonium ceruleum album*; 2, *Phlox congesta*; 3, *Geranium armeniaca*; 4, *Centaurea ruthenica*; 5, *Helianthus coronarium*.—*T. and P.*—1, *Genista tinctoria* var. *floripendula*; 2, dark-coloured *Veronica* (*V. Teucrium*); 3, *Campanula Schenckieri*; 4, light-coloured *Veronica* (*V. austriaca* var. *pinnatifida*); 5, *Senecio Doronicum*; 6, *Senecio Smithii*.

—*A. R.*—*Mesembryanthemum curviflorum*; 2, *Mesembryanthemum tricolor*; 3, *Mesembryanthemum edule*; 4, *Sedum pectinatum*. The Corsican Thyme is *Mentha requienii*. The Cratagus appears to be correct. Both Elaeagnus appear to be longipes, but the specimens were too small for correct identification.—*J. C. L.*—1, *Gentiana cruciata*; 2, *Astragalus*, but specimen insufficient for identification; 3, *Vicia Cracca*.—*J. F. A.*—1, *Veronica saxatilis*, pink variety; 2, *Alyssum* sp. (specimen too poor for identification); 3, *Verbascum phoeniceum*; 4, *Philadelphus Lemoinei*; 5, *Campanula pusilla alba*; 6, *Dianthus* sp. (kindly send a better specimen); 7, *Sedum rupestre*; 8, *Neilia opulifolia* var. *lutea*; 9, *Spinosa Menziesii* var.—*E. A. B.*—Flower is *Calochortus esculentus*, Lord Acrea *ovalifolia*.

**Strawberries damping (BERRIES).**—Your complaint as to your Strawberries failing to swell and damping or rotting on the ground in this season a very common one unhappy, and is entirely due to the continuous cold rains and absence of sunshine. Your only hope to improve the

## ROSE EXHIBITIONS.

**W**E publish the following letters concerning our remarks about the class for Rose flowers in vases in our issue of the 12th ult. Makers of schedules should strive and lift the present day exhibition from a commonplace groove, and not follow in the steps of their predecessors, whose ideas were seldom either beautiful or original.

Those trade exhibitors are wise, too, who seek to show the individual beauty of a flower. It is against their own interests to jumble up flowers as if with a desire to pack the whole nursery in a set space. One good thing well shown is better than a dozen crowded into a meaningless and ugly mass.

YOUR remarks on the better way of showing Roses will, I hope, receive the attention they deserve from Rose exhibitors. To those of us who are on intimate terms with the flowers of the garden, the show table has long been a sad and sorry spectacle. The beautiful exhibit at the National Rose Show this year of Roses shown freely and naturally in jars and vases ought to sound the death-knell of the ugly green coffins in which the Queen of Flowers is usually shown. There is no reason whatever why flowers should not be shown naturally, even at a flower show! It would be so easy to revolutionise the appearance of our shows by inserting a rule that all flowers must be shown as grown, and, in spite of the momentary rebellions this would cause, there would be so wonderful a change in the exhibition tents of the future that a flower show might become a source of delight to the garden lover, and at the same time increase the sales of the nurserymen exhibitors. Imagine the noble plants of the herbaceous border shown so as to represent their natural growth. Who that has not seen the tall and stately growth of the Delphinium would

believe that the poor decapitated specimens we see stuck in mean glass vases at a show were capable of giving such splendid effects, as some of us are fortunate enough to be familiar with in the garden? A flower show should be the means of representing free and natural growth. At present it is little more than a society function, in which the humbler and often truer lovers of flowers are excluded by the high price charged for admission until the heated atmosphere of the crowded tents has rendered the exhibits worthless. Here, again, is a chance of making marked improvements. Why should the tents not be constructed with double canvas roof and sides, having a space between where a free circulation of air would modify the fierce heat of the sun? There are now means of ventilation by electric fans, employed with excellent results in restaurants and other places. The additional expense would be little compared with the gain to all concerned in the welfare of flower shows.

SYDNEY SPALDING.

THE Editorial notes on the "New Way of Showing Exhibition Roses," more particularly referring to the classes for twelve varieties, seven blooms of

each, shown in vases, exhibited at the show recently held by the National Rose Society in the Temple Gardens, are to the point, and I am quite in accord with the sentiments therein expressed.

There is no doubt from a decorative point of view the two classes (for there was one for nine Teas and Noisettes as well) were exceedingly attractive, this being due as much to the method of staging as to the excellence of the flowers shown by Messrs. Prince, Monnt, and the other prize winners. It was a great pleasure to judge these classes, but I am afraid from its very nature this method of showing the Rose cannot be extended or developed in the way the writer of the leader seemed to hope might be the case. Only nurserymen or the amateur who counts his trees by the thousand (if the standard reached is to be maintained) could ever hope to put up eighty-four blooms in twelve varieties of Roses cut with long stems such as these must be. We might have a class for five blooms in a vase as well as seven, but I do not think a smaller number of Roses in a vase would be satisfactory. The number of vases again could be reduced from twelve to six, and no doubt classes could be arranged for light Roses, dark Roses, &c. At any rate when the schedule for next year comes up before the committee of the National Rose Society no doubt the matter will be discussed.

The great difficulty in arranging for new classes is the financial one, but in a society such as the National Rose Society, whose sole aim after all is to wisely expend the whole of its income (and sometimes it expends a little more) in the cause of the Rose, one may express and entertain the hope without being too sanguine that a few pounds may be spared towards developing this new phase of Rose exhibiting.

The Editorial notes would seem to imply that this method of showing exhibition Roses was employed for the first time this year, but I remember judging a similar class at the Temple show of 1901, and think I am right in stating that even that was not the first year it had been tried.

At any rate the best thanks of Rose lovers are due to the initiator of the idea, and to Messrs. Prince, Cant, and Mount for so well carrying it out.

HERBERT E. MOLYNEUX.

THE opportune remarks in THE GARDEN of the 12th ult. will be welcome to all who desire to see our national flower exhibited in the most beautiful way. As you well remark, one of the best exhibits at the Temple Rose show was that which gained the first prize for twelve varieties of exhibition Roses, seventeen blooms of each. Here one found flowers of the highest quality shown as cut from the bush or tree, excepting a slight addition of wire sufficient to support the heavy blooms so that their beauty might be well seen. Each flower was surrounded by more of its beautiful foliage than is possible in the ordinary show box. I am not sure I would not even go further than the schedule, and stipulate that no buds should be removed, but that the blossom be naturally exhibited. A flower is not really naturally produced if it is dishuddled, and there can be no reason why the lovely buds should not be retained. If a Rose plant is in good soil, and receives the highest and most intelligent cultivation, it is quite able to support the surrounding buds, as well as develop the centre flower to its greatest perfection. From a utilitarian point of view a Rose should not be dishuddled, for unless one possesses a large number

of plants the season of flowering is much curtailed, and even where a quantity is grown, if the centre bud is retained and the side buds removed, the flowers appear almost simultaneously, and, moreover, far too often we find the bud retained is imperfect. Of course, one could not expect the class for seventy-two distinct blooms to be shown in vases, but there is no reason why the trebles should not be exhibited in this way, and why not start a class for five blooms of a sort? This would give as true a representation of a variety as seven blooms. I have often thought such a Rose society as the "National" should provide the necessary vases for exhibits of the kind described as heavy, and breakable ware are not transported without considerable trouble and expense.

I fail to see why exhibitors should be compelled to place the vases upon a flat surface, as stipulated in the schedule. Such arbitrary rules discourage original ideas, and I would not undertake to say this is the best way of displaying the vases. I certainly think some attempt should be made to exhibit a show Rose as it grows, even dispensing with wire entirely. It might not promote the beauty of certain kinds that have slender stems, but it would assist visitors to form some idea of the kinds that are produced upon stiff stems, a point so essential when required for garden display.

No one will find fault with the variety Bessie Brown as a show flower, but how disappointing it is on the plant. This is an instance where Rose and other shows are a failure. They afford very little clue as to habit of growth. Some of the earlier forms of the Cactus Dahlias, when exhibited in the prevailing style, were irresistible, and eagerly purchased, only to find they are most unattractive in the garden, unless barbarously thinned of their growths. So it has been with some of the so-called decorative Roses. We require all Roses exhibited in such a way that their true merits are observable, and for this reason I object to the huge bunches of garden Roses packed in vases.

The Rose is rapidly gaining in favour as a decorative plant, and we have much to learn before this type is placed before the public in its most attractive form.

PROGRESS.

YOUR remarks in THE GARDEN of the 12th ult. were most opportune, and should carry weight with the committee of the National Rose Society when they are preparing their schedule for another season. The class you refer to should be extended, and you will earn the thanks of many readers of THE GARDEN if by your timely allusion to the charming display of seven good blooms in each of the twelve vases that were so deftly arranged, other classes of a similar character can be included in subsequent displays. The class you refer to may be the beginning of better things, and any break away from the stereotyped method of staging the flowers in Rose boxes, which has been regarded as the only orthodox way of exhibiting blooms of good quality, should receive the hearty support of all who are interested in this delightful hardy flower. Exception might also be taken to the way the garden Roses are bunched. This is not confined to competitive displays, as many of the trade exhibits leave much to be desired in this respect. The great idea of each exhibitor appears to be to crowd as many sprays of blossoms as possible into the bunch, and in this way much of

the charm and interest which should centre around each individual bunch is lost, because the grace and beauty of the individual sprays are absent. Other special societies offer prizes for bunches of their speciality, but in their schedule of prizes it is stated that points will be awarded to bunches arranged artistically. This method applied to exhibits of freely-flowered Roses should have the effect of bringing about a desirable change.

D. B. C.

## NOTES OF THE WEEK.

### FORTHCOMING EVENTS.

August 4.—Grantham and District Horticultural Show.

August 5.—Royal Horticultural Society's Committees meet, Drill Hall, Westminster; Leicester Flower Show (two days).

August 7.—Midland Carnation Show, Birmingham (two days).

August 9.—Manchester Carnation Show; Crewe Horticultural Exhibition.

August 12.—Clay Cross Flower Show.

August 13.—Salisbury Horticultural Show.

August 14.—Tannent Dean, Rock Ferry, and Sheffield Horticultural Shows.

**Victoria Medal of Honour.**—The President and Council of the Royal Horticultural Society have conferred the Victoria Medal of Honour in Horticulture, vacant by the deaths of Mr. G. F. Wilson, Mr. Wm. Bull, and Mr. E. J. Beale respectively, upon Mr. John T. Bennett-Poë, Mr. George Massee, and Mr. Henry Cannell. W. WILKS, Secretary.

**Roses Crimson Rambler and White Pet at Kew.**—In the Rose garden, near the Pagoda, at Kew, these two varieties are making a fine display, the crimson and the white helping each other by the contrast. The plants of Crimson Rambler are planted on a terrace faced by tree roots, the crevices in the roots forming positions for groups of White Pet. Planted several years ago both varieties have grown and grouped themselves in a free and natural way, the absence of stiffness being a great aid to the general effect. Grown in such a way as this Crimson Rambler is seen to much better effect than when planted against a wall or trained stiffly against a fence, as is sometimes the case.—D.

**Campanula mirabilis.**—I should like to know if other people have been more successful with Campanula mirabilis than I have been. I raised a good many plants from seed about three or four years ago. Since then many of them died, and I have only three or four plants left, but one is now in flower. The whole plant is covered with its big bell-shaped flowers; it makes one long to have more of them. Campanula Vidallii I find is not hardy in Cheshire. I cannot keep it on my rockwork. During the winter it always dies, but by keeping it in a frame during the winter in a pot, and then planting out, it flowers well. I have many plants in flower now, and it is a desirable campanula.—GEORGE DIXON, Ayle Hall, Chelford, Cheshire.

**Nature study exhibition.**—On the occasion of the opening of a Nature study exhibition in the Royal Botanic Gardens last week, the Duke of Devonshire made some interesting remarks. As President of the Board of Education he assured those present that the movement had the warm sympathy of that department; if there were any truth in the statement that education is not so fully appreciated in rural districts as in towns and urban districts, the cause is that we have not succeeded in bringing education into the same relation with rural life and occupations, as it has been brought in the case of the towns and the urban districts. Last year the Board issued to managers of elementary schools circulars impressing upon them the importance of making education in the village school more consonant with the environment of the scholars, and especially of encouraging children to gain a knowledge of the common things around them. The Board now requires that Nature study shall be

taken as one of the subjects of examination. The idea which underlies this movement is, that while we know there is much to be learned from books, at the same time there is much to be learned only from the facts of Nature itself. The promoters of this exhibition were anxious to show that for every child, urban and rural, Nature study affords one of the most reliable means of developing certain faculties, and upon the development of which success in life must be based.

### Exhibition Rose blooms in April.

—It may interest some of your readers to learn that the illustration of a box of exhibition Roses, reproduced on page 57 from "Roses for English Gardens," is from a photograph taken, not in the height of the exhibition season, but on April 3 last, when of course no Roses were obtainable from the open ground. It came about in this way. Mr. George Mount, of the Rose Nurseries, Canterbury, very kindly sent me a present of a box of Rose blooms, all of which were so remarkably fine that the idea occurred to me that an illustration I much wanted at the time might be obtained by arranging the Roses in an exhibition box and having them photographed. In order to show the lasting character of the flowers I may mention that the photograph was not taken until the second day after I had received them.—EDWARD MAWLEY, Berkhamsted.

**The Irish Gardener.**—We are sorry to hear that this—the only Irish journal, so far as we know, that is exclusively devoted to horticulture—will cease to appear in its present form after this week's issue.

**Mr. J. Tunnington.**—Owing to a temporary breakdown in health, Mr. J. Tunnington has resigned the post of head gardener to Sir H. Ingilby at Ripley Castle, Yorks, which he has managed so well for the last twelve years, and his many friends will wish him a speedy recovery and a career of extended success. Mr. H. Fox, gardener to the late Mr. Lawson Johnston, Kingswood, Sydenham, and formerly foreman at Ketton Hall, succeeds Mr. Tunnington early in September.

**Yucca angustifolia.**—A group of this pretty, small-leaved Yucca may now be seen in flower in the Bamboo garden at Kew, the plants having occupied the position for the last ten years, during the last five of which flowering has been an annual occurrence. When out of flower it is an exceedingly pretty plant, the leaves being long and graceful, freely produced, and glaucous in colour. It is an American plant, being widely distributed through Missouri, Colorado, and New Mexico. In habit it is dwarf, the stem being very short, and increasing very slowly in height. The leaves are in a large head, each leaf being about 3 feet long and little more than half an inch wide; as previously stated they are glaucous in colour, and along the margins numerous greyish filaments are borne. The inflorescence is in the form of a large upright raceme, rising from the heart of the plant to a height of from 4 feet to 5 feet. The flowers are campanulate, 2½ inches or more across, greenish and fleshy. Individually they do not last very long in good condition, but early flowers are replaced by later ones, which keep the raceme well furnished for at least a fortnight. At Kew it is growing in a sheltered position facing south in loamy soil.—W. D.

**Ligustrum sinense.**—The usefulness of this shrub for summer flowering is very apparent every July at Kew, where many large bushes are planted. It never fails to bear a profusion of flowers, which, coming as they do after the glut of flowering shrubs are over, are doubly welcome. It makes a very large bush, some specimens at Kew being upwards of 12 feet high and the same through. The leaves are evergreen, or almost so, ovate, pale green, and much thinner in texture than those of the common Privet. The flowers are small and white, and are borne in good-sized panicles, the inflorescences being more numerous than in the case of the majority of the Privets. After the flowers are over the plants again become conspicuous by reason of the small black fruits which thickly cover the branches. When grown to a large size it is more difficult to transplant than most of the other Privets, consequently a per-

manent position should be provided when it is first planted. It is in no way fastidious regarding soil, for although it prefers good loam it grows and blossoms quite satisfactorily in poor sandy soil. As the name implies, it is a Chinese plant. There is a variety in cultivation with variegated leaves, but it is inferior to the type.—W. D.

**Kalanchoe kewensis.**—The plants of this new hybrid Kalanchoe which were noted in THE GARDEN for May 24 as being in flower at Kew, and illustrated on the 12th ult., are still in bloom, so that its flowering period extends over as long a time as that of its better known relative, the popular Kalanchoe flammea, which, though of comparatively recent introduction, rapidly made its way into most gardens. Though this newer hybrid may not for general purposes be regarded as equal to K. flammea, it is a very beautiful plant, and as above stated its bright rose-pink blossoms maintain a display for a lengthened period.—T.

**Trichinium Mangessii.**—A particularly fine specimen of this delightful Australian everlasting is just now in flower in the cool portion of the T range at Kew. It is a plant rarely seen outside a botanic garden. According to "The Dictionary of Gardening" there are about fifty species of Trichinium known, but the only one that figures in the "Kew Hand-List" as being in cultivation at Kew is that at the head of this note. With the exception of the flower spike the entire plant rises but a short distance from the soil, and the small narrow leaves are not particularly noticeable. The inflorescence consists of a comparatively large white oval-shaped head, like a ball of fluffy cotton, from which the bright pink tips of the perianth protrude. Each head is borne on a thin wiry stem from 6 inches to 9 inches long. The specimen at Kew, which by the way is in a pot only 5 inches in diameter, is carrying no less than twenty-four of these heads, and as may well be imagined forms a charming feature. This Trichinium has long been well grown at Kew, but the specimen there now has certainly not been surpassed. Not the least notable feature is the fact that the flower heads remain fresh and bright a very long time. It is a native of the sandy districts of Australia, and was first introduced in 1838. Under cultivation it will not conform to the rough and ready methods so generally followed with many things, but at the same time with a reasonable amount of care success may be anticipated. A soil composed principally of good friable loam, with a little well-decayed cow manure and silver sand, will suit it well, and a light airy shelf in the greenhouse is just the place for it. Repotting should be done as soon as possible after the flowering season is past, and in carrying this out the greater portion of the old soil should be removed. Propagation is effected by means of root cuttings, taken off when potting, cut up into lengths of about an inch, and dibbled into well-drained pots of sandy soil. If placed in an intermediate house temperature they will soon grow.—H. P.

**Clitoria Ternata.**—Flowers of a clear decided blue are admired by nearly every one, yet among indoor plants they are very limited. One of the most pronounced is this Clitoria, which has flowers of a clear rich indigo blue, that is in what is regarded as the typical form, for like its near allies the Peas and Beans it is somewhat variable. There is a variety with white blossoms, while parti-coloured and semi-double flowers also occur. It is, however, to that form with brilliant blue flowers, showing sometimes more or less of a white eye that my remarks particularly apply. It is an annual plant that should be sown in heat early in the spring, and the plants grown on freely afterwards. The slender climbing shoots soon drape a considerable space, either in the stove or intermediate house, that is if they are liberally treated at the roots and freely syringed, for without this red spider will often attack the foliage and quickly disfigure the plants. When in good health and studded with its brilliantly coloured Pea-shaped blossoms this Clitoria is surpassed by no other climbing plant. It was first introduced from the Malayan Archipelago about 160 years ago, but it is now widely spread throughout many parts of the tropics.—H. P.

**National Sweet Pea Society.**—In our report of the exhibition recently held by this society at the Royal Aquarium, we referred to three varieties shown by Messrs. Dobbie and Co., Rothesay, as having obtained certificates. These, it appears, were given certificates at the Wolverhampton Show, and not at the Aquarium. Messrs. Dobbie write: "Only one of our new varieties was honoured by the National Sweet Pea Society, viz., Florence Molyneux, but no certificate cards were forthcoming."

**Curious Strawberry fruit.**—Lady Fowler, Lowerbroom House by Garve, Ross-shire, N.B., sends a Strawberry fruit with the petals of the flower retained. This is certainly unusual.

**Eremurus robustus near Kelso.**—I hear this noble plant has flowered exceedingly well so far inland as Newton Don, near Kelso, in Lady Nina Balfour's garden. This is the more remarkable as near the sea coast the growths were cut back by the severe frosts in early spring, but not improbably backwardness in growth would save it in the colder districts, as has happened with the Apple crop in not a few instances.—R. B.

**A good Potato.**—Ringleader (Sutton's) is now lifted, and the produce from my cold soil has surprised many, the cooking qualities of the tubers being exceptionally good. The crop is excellent, and the clear skin and shape of the tubers is a point of importance. On February 1 I began taking them from pots, and when lifted last week for the seed, &c., thirty-four good-sized Potatoes were lifted from one root. They were planted in half-rotten manure. Where the manure was very decayed the produce was not so good.—T. JOHNSON.

**A few good Peas.**—Many probably have never tried Telegraph by sowing it in January in a cold frame and planting out first week in April. My plants came through the late frosts unburnt in any way, and the strong haulm carried larger pods than I have seen for some time in Norfolk. I used to sow this variety in January on Celery trenches on an east border, and they always came in directly after Earliest of All, and before that variety was over. This year they came in after Chelsea Green and Marvel. Seed of the latter was sown in pots in a cold frame on the same date. They were protected from frost and the frame removed when warm weather came; the result was an earlier gathering, a week before those that were transplanted. Autocrat came through the frosts untouched here (Norfolk), and has podded well.—T. JOHNSON.

**Royal Horticultural Society.**—The next fruit and flower show of the above society will be held on Tuesday next, in the Drill Hall, Buckingham Gate, Westminster, 1 to 5 p.m. A silver Flora medal will be offered for the best collection of Cactaceous plants, open to amateurs. For other Cactus prizes address Mr. Blogg, 65, Brighton Road, Croydon. A lecture on "Small Fruits from a Private Garden Point of View" will be given by Mr. J. Smith, V.M.H., at three o'clock. At a general meeting, held on Tuesday, the 22nd ult., thirty-three new Fellows were elected, amongst them being the Countess of Kingston, Lady Mary Morrison, Lady Stradbrooke, and the Right Hon. A. H. D. Acland, making a total of 859 elected since the beginning of the present year.

**The National Chrysanthemum Society and the sale of the Royal Aquarium.**—The first thought to enter the minds of those interested in promoting the cultivation of the Chrysanthemum on hearing the news of the sale of the Royal Aquarium was how it would affect the three exhibitions of the National Chrysanthemum Society arranged for the present year. It was pleasing therefore to be reassured by Mr. Josiah Ritchie, in one of the morning papers, that the series of shows for the current year would be carried out as originally intended. The Royal Aquarium has been the home of the National Chrysanthemum Society for many years, and the directors have treated the National Chrysanthemum Society in a most liberal manner, their contributions for some years past reaching an annual total of £375. Although many will regret the need for acquiring a new place of exhibition,

others will no doubt be glad to transfer their interests to a better lighted and more beautiful place for holding their shows. The agitation of a few years ago, in which a number of members and others endeavoured to find new quarters, and who in so doing gathered much useful information respecting other large buildings in the metropolis, should now prove useful. The proposed horticultural hall may after all be the one thing needed by the National Chrysanthemum Society, and to what better purpose could it be put? In any case the executive committee of the National Chrysanthemum Society should bestir themselves that no time be lost.—C. A. H.

**A visit to Messrs. Sutton's.**—His Excellency the Prime Minister of Uganda, accompanied by his secretary and the Rev. Ernest Millar, who acted as interpreter, visited Reading recently, and whilst there the distinguished visitors were driven to Messrs. Sutton's trial grounds, where they were much interested in the flowers and vegetables, many of which varieties are now in use in Uganda; they afterwards attended a luncheon given in their honour by Mr. and Mrs. Martin Sutton in the Abbey Hall.

**Messrs. James Veitch's Feltham Nursery.**—In the process of remodelling their nurseries, Messrs. J. Veitch and Sons, Limited, having transferred the soft-wooded plants from Chelsea to Feltham, have left to Mr. Weeks, who for many years has had charge of these, the responsibility of managing the same department at Feltham, where he will no doubt find his work simplified by the purer atmosphere. On his departure from Chelsea his colleagues and friends presented him with a suitable memento expressive of their appreciation of his good fellowship. Mr. John Heal presided on the occasion of the presentation. The proceedings were of a most genial character, and illustrated the good feeling which exists between Mr. Weeks and his colleagues.

**Sweet Pea Dorothy Eckford.**—At a meeting of the committee of the National Sweet Pea Society, held on the 15th ult., no less than five pure white Sweet Peas were shown. These were named White Queen, White Wings, Lily, Purity, and Dorothy Eckford, and all were identical. Each had been sent with seed of the variety Miss Willmott, and some discussion took place as to which name should be recognised. It was decided that if Mr. Eckford could prove that the seeds of the white variety were accidentally mixed with those of Miss Willmott the certificate of merit should go to him as raiser. This Mr. Eckford has done, and the accepted name is Dorothy Eckford. The exhibitors—Messrs. Dobbie and Co., Hobbies Limited, I. House and Son, and Jones and Sons—will, it is hoped, recognise the name so as to prevent needless multiplication.—H. J. WRIGHT, Hon. Sec.

**Central Park, Liscard.**—This beautiful park, which proved such a desirable position in which to hold the summer show, should be highly prized by the residents of Wallasey, and Mr. W. Rocking, superintendent for the past twenty years, is to be congratulated upon the high efficiency that is apparent throughout the park. The groups of Rhododendrons, which are worth a journey to see when in bloom, give evidence of the best of culture, and the Rose beds are quite a feature. The herbaceous borders are bright with Phloxes, Delphiniums, Hollyhocks, Gaillardias, Spiraea in variety, Alstroemerias, Irises, Eryngiums, &c. An unusual sight in the neighbourhood of Liverpool is that of plants of Camellias and Magnolias on walls; the Camellias still occupy the same position as when glass houses covered them, and although they have lost their shelter they still continue in good health. On the borders yellow and dwarf crimson Celosias are most effective in their colouring.—R. G. W.

**Sweet Peas in Essex.**—One of the finest sights in the seed-growing district of Essex is a field, 6 acres to 7 acres, belonging to Messrs. E. W. King and Co., seed growers, Coggeshall, on which they are growing for seed sixty of the choicest-named varieties of Sweet Peas and ten varieties of the Cupid race. The field is on the

Kelvedon Road, and has been a great attraction, people driving miles to see the flowers. On entering the field the first to strike the eye are the Cupid varieties, which look like a huge carpet, the pink being very striking. Next to them is an acre of very fine mixtures containing all the giant-flowered varieties. Further on are the crimson varieties, such as Mars, then the beautiful orange Lady Mary Currie, but the most striking to visitors is the large acreage of Lady Grisel Hamilton, the finest lavender variety, and of perfect form. Many favour the American-striped kinds, such as Mrs. Joseph Chamberlain and Princess of Wales; in fact, every imaginable colour is to be seen, and being in a mass they appear very pleasing. Such an acreage of Sweet Peas is seldom met with in England. This firm make a speciality of Sweet Peas, and have trial rows of nearly 160 varieties. Besides numerous first prizes they have obtained at various shows, they have again been awarded a silver medal at the Sweet Pea show held at the Royal Aquarium for a display of seventy-two varieties, which were gathered from the field growing for seed and not for show.

**Comments on the Manchester Rose show.**—After the long interval of seventeen years the Rose has again held high court in Cottonopolis, for undoubtedly no Rose exhibition of such magnitude and beauty has before been seen in the neighbourhood of Manchester. The exhibition house of the Royal Botanical and Horticultural Society may be termed an ideal one; it is a lofty glass structure some 350 feet long and 60 feet wide, with a luxuriance of Ampelopsis drooping from the roof, but whether the large Palms that were arranged down the centre of the building served any good purpose is doubtful. Some idea of the quantity of flowers shown may be had when it is stated that the number of exhibitors was fifty-six with 319 entries, the nurserymen sent 2,624 blooms, the amateurs 1,928, and in the open classes were 360, making a total of 4,912. Of bunches of Roses there were: Amateurs, 54; open, 216; total, 270. Many points of superior excellence might be noted, the winning lot for the nurserymen's trophy and gold medal, won by Messrs. R. Harkness and Co., were remarkable for the symmetry and finish of the blooms. The box of thirty-six distinct varieties from Mr. Hugh Dickson, Belfast, was a notably fine exhibit, and Messrs. Alex. Dickson and Sons, Newtowndale, in the classes for eighteen Teas or Noisettes, and for twelve light coloured Roses, showed some beautiful flowers. Messrs. Alex. Dickson also secured the society's gold medal for the Hybrid Tea Rose Florence Pemberton, which promises to make an excellent exhibition flower; it is evidently a most vigorous grower. Of the white blooms which gained silver medals both nurserymen and amateurs exhibited excellent flowers of the beautiful White Maman Cochet, and of the light coloured ones similarly honoured Mildred Grant. A magnificent bloom of Prince Arthur, another of the silver medal blooms, was shown by the Rev. R. Langtree. Of newer Roses, Benjamin Cant and Frau Karl Druschki, a bright crimson and snow white respectively, were greatly admired and promise to prove valuable acquisitions. Amongst other points of interest may be noted the twelve vases (seven blooms in each) set up by Mr. G. Prince as a means of showing the true beauty of the Rose. The newer introduction of showing bunches of garden flowers brings into use many kinds that are unique in colouring, as might be seen in the exhibits of Messrs. John Mattock, Frank Cant and Co., and Paul and Son. These few notes of a grand show would be incomplete without some recognition of the valuable help of Alderman James Hoy, Lord Mayor of Manchester, who presided at the luncheon; of Mr. Edward Mawley, the secretary of the National Rose Society; Mr. P. Weathers, the curator of the Botanical Gardens; and to the small army of exhibitors who made the grand show. The attendance proved highly satisfactory, especially towards the evening; it was then difficult to get near the exhibits. It is to be hoped that this may act as an incentive to the council to invite the National Rose Society before the lapse of another seventeen years.—R. G. W.

## THE KITCHEN GARDEN.

### VEGETABLES OF LATE SPRING.

**I**T may appear out of place to write about spring vegetables at this season, when there is an abundance of every sort, yet to have a good supply we must prepare some months in advance, and July and August are important months in this respect. There can be no doubt but that the spring Cabbage comes first in importance at the season named, and the Borecole or Kales are important also. I know that some will look upon the Broccoli as an excellent spring vegetable, but in many gardens the crop is uncertain. I do not advise planting large breadths of this vegetable in any garden where regular supplies must be maintained. For instance, at Syon we have planted thousands of Broccoli and frequently had only a few hundreds to cut from, whereas in Northumberland the crop has been much more reliable. This shows how uncertain this plant is; only last season in February our plants were very much injured by spring frosts. I note this difficulty as many may think I had overlooked one of the most important of the winter Brassicas.

I now come to the spring Cabbages for cutting in April and May, the time of year good green vegetables are much appreciated. It is well to make two sowings, in the middle of July and early in August. There can be no doubt but that the most reliable crop is that sown at the later date, as if the plants in the seed bed are attended to they make good roots before severe weather sets in. I would advise ample room and early planting, and as regards the planting I differ from many as to the way the plants should be grown. Many excellent cultivators advise newly-dug—often deeply-dug—land, and well enriched with manure. I say rather plant on very firm land—that is, not dug—and by so doing get a sturdy growth. The earliest supply of spring Cabbages invariably follows spring-sown Onions; our land, being very light, is trodden and rolled for the Onion crop, and when the latter is cleared drills are drawn for the Cabbage, and no fresh manure given; but I should add the land was well manured for the Onions. By planting in firm land we get a plant better able to withstand cold and fogs. It is an easy matter to give manure when new growth begins early in the season. It will be seen at a glance that the seedling, when planted in rich manure, must naturally make a soft growth. Now a hard, firm—if somewhat smaller—growth is much better. The plants have a natural tendency to grow away freely when manured early in the year. I am aware even with every care there are losses, but I would advise early planting before the seedlings become drawn, and I prefer an open situation and such varieties as Elam's Dwarf, Sutton's April, and Imperial.

I now come to the Borecole, which give a supply even when the Cabbage fails. We plant large breadths of this most useful spring vegetable for March, April, and early May cutting. The culture is so simple a few words will describe it. We usually plant after early Strawberries; this season, I regret to say, we are behind in this matter, our Strawberry crop being later. We treat the land well for Strawberries—double dig, liberally manure, and take only one crop of fruit. As soon as the fruits are cleared the plants are hoed up, and drills drawn for the Kales in the hard Strawberry bed, as in our light soil we find a hard bed much best. By planting in loose, freshly-dug soil a larger plant results, but one not so well able to stand our very variable climate. We require Kale as late as possible, and I find by this mode of culture a sturdier plant is much later running to seed. It is useless to plant poor seedlings late; the plants should have good roots and be vigorous. I would advise sowing Kales much later than is often done, and by all means give ample room. I know there is a difficulty in late sowing in dry seasons, as the seeds take longer to germinate. In the north sowings must be early, also planting,

and in many cases ground can be cropped that has been at rest for a time, no hard line need be drawn, as soils and situations produce varying results. As regards varieties there are some splendid Kales—Read's Improved Hearting is one of our best late Kales; the newer Arctic Kales are equally valuable. These Messrs. Sutton have recently sent out, and they are extremely hardy and of good quality. The older Asparagus and Cottager's Kale should not be overlooked for a later supply of good tender sprouts.

G. WYTHES.

## FOREIGN NOTES.

### NOTES FROM FLORENCE.

#### A REMINISCENCE OF THE LATE MR. WM. BULL.

**T**HE obituary notice in THE GARDEN of the late Mr. Bull recalls to me that in one of the old historical gardens of Florence there is a very large crimson Rhododendron, said by the late owner of the garden to have been sown fifty years or even more ago by an Englishman of the name of Bull, then head gardener of the Royal Boboli Gardens. The garden in which this Rhododendron stands in a huge *courta* is that lying between what is now the Etruscan Museum (formerly the Palace of the Ambassadors) and the Church of the Annunziata Santissima. It is bounded on the side of the Via della Colonna by a very high wall, over which the Roses nod their heads, and on the opposite side by a kind of covered gallery, or loggia, running all the way from the Palazzo, by which the foreign ambassadors when lodging in it wended their way to their pew in the church. This loggia has now fallen somewhat into decay, but the covered bridge in which it terminates and leads into the church is still standing; it is best viewed from the corner of the Via Colonna just at the Hospital of the Innocenti.

It is a beautiful old garden, and the old nurseryman—now dead—who leased it from the Government had a real affection for his plants and did not regard them only from the ordinary Italian point of view, i.e., that of "commercio," and he used to point to this Rhododendron with great pride and speak of its English origin. It would be interesting to know if it was one of the late Mr. Bull's family who was the raiser thereof.

Florence.

TUSCAN.

### THE UNHEATED GREENHOUSE.

#### XIII.—ANNUALS AND BIENNIALS.

NOTHING is more dismal and ugly than a greenhouse left bare and empty of its proper occupants. Not seldom, indeed, it then becomes a storehouse for all sorts of garden lumber, the untidiness of which it fails, unluckily, to hide. Yet it is not an unlikely thing to happen that one finds oneself at some time or other with a greenhouse on one's hands, yet for a period too short to accomplish much in the way of plant growing. A year's tenancy of house and garden is, in truth, for gardening purposes, an awkward gap to fill. It is, of course, open to any such tenant to put the conservatory into the hands of some neighbouring florist should there be one within easy distance, and under some circumstances this is, doubtless, the best way out of the difficulty. If the greenhouse, however, happens to be unheated a professional gardener will probably shake his head in despair of doing himself any credit during the winter months, and, beyond supplying a few evergreens in pots, may even decline altogether to attempt any floral decoration until the spring. It is not to be denied that there are considerable obstacles in the way, and for the winter almost everything depends upon the time available for preparation, but a good deal may be done at the cost of a few shillings and a little time and trouble with annuals and biennials or certain other plants, possessing, strictly speaking, a longer

term of life, but which may be treated as such. A few suggestive hints as to the most suitable may be useful, not only to those who mean to depend entirely upon such yearlings, but for others, who will find many of them exceedingly valuable if not indispensable additions to their flowering plants. Where time fails to raise these for ourselves it is generally possible to buy strong seedlings of ordinary sorts ready for potting, so that we need not wholly despair of procuring decorative material of this temporary nature and with little outlay.

Annuals are often regarded with some contempt, but it may be traced in most cases to failure in growing them well, resulting mainly from the initial mistake of sowing the seed too thickly. Seed is often minute, marvellously so when one thinks of the germ of life and the earliest food for that germ, which is, in one way or another, packed up in it. It does not at all follow, however, that the plant produced from a microscopic seed should require to be looked at through a magnifying glass when full grown, and this we must always take into account. A single seedling of Nemophila or Limnanthes will make a grand free-flowering specimen if allowed proper scope, when a dozen cramped into the same space will be utterly worthless and disappointing. Seeds, minute or otherwise, cannot be sown too thinly, and with the larger kinds, like Tropeolum or Lupine, it is a good plan for indoor work to put them singly into the smallest pots and to shift them as required into larger sizes. Annuals, again, under these circumstances must never in the earlier stages be allowed to get pot-bound, needing constant attention from the first, until they get their final transfer into the flowering pot. Hardy biennials may often, on the contrary, be planted outside with advantage to make their growth before being potted for the greenhouse, for these require a somewhat longer time to bring them to the flowering stage, and are generally sown one year to flower the next. The time of their flowering depends in most cases on the time of sowing and subsequent culture, a statement not so obvious as it may seem at first sight, because they are sometimes contrary in their ways, and may, if they are in sultry mood, pass over a whole season.

A handful of Wallflowers in midwinter, some in flower and some coming on, would be no mean success to attain. The full red-brown of Harbinger and the clear yellow of Belvoir Castle, which are amongst the earliest to bloom, are at all times beautiful, and other later well-known varieties, to be found in every seed list, will give intermediate shades never out of harmony with each other. Wallflowers are really perennial in duration, though not very long-lived, but as they flower within a few months of sowing they are commonly treated as annuals. For very early winter the first sowing is best made in April, and a second may follow three weeks later. Where there is a bit of garden ground the young plants may be pricked out 3 inches apart in rows with not less than 6 inches between the rows. Later on, when they begin to require more room, every second plant may be transferred to a new row, allowing 6 inches between each of them. Here they may remain until October, when they can be potted in 5-inch pots for flowering in the greenhouse. Where there is no garden, boxes or zinc trays may be made to serve the purpose. In either case care must be taken to keep the plants weeded and watered in dry weather. Wallflowers are hardy things—never more so than when grown on the scanty foot-hold of a crumbling wall, their natural home. Cultivation in rich soil tends to make them less hardy, and the shelter of glass, therefore, is very welcome in severe and especially in windy weather, and will also hasten the flowering time. Double German Wallflowers are very popular and handsome with their quaint purple and primrose tints, but they are more tender and not so fragrant as the smaller-flowered common sort. They come into flower later, and the seed need not be sown till May.

Stocks, which are mostly biennials, are neither so hardy nor so early as Wallflowers, but they are very useful, and if seed of the intermediate section

be sown in June and treated much in the same way as recommended for Wallflowers they will flower quite early enough to take their place when the Wallflowers begin to grow shabby. Some experts prefer to grow them entirely in pots, giving them shifts into larger sizes as soon as the roots touch the sides. All the Year Round is a very fine white variety, and there are crimson and purple shades in the same strain. For a later display the annual Ten Week Stocks may be sown as early as February under glass, and with good cultivation will be in fine flower long before any of their kind out of doors. The large, sweet-scented flowers of this section are very beautiful in the infinite variety of their delicate tints.

Scarcely any introduction of recent years has been more welcomed than that of the annual Margherita Carnations of Italian origin. Sown early under glass, planted outside as soon as the seedlings are strong enough and allowed room enough to develop, they will grow during the summer into vigorous plants well set with buds in time to be potted with other things for winter flowering. If the season be favourable many buds will open before Christmas, and with a good strain of seed, which is always a most important factor in the case, a very large percentage of the plants will give fine double fringed flowers of refined hues. The single "rogues" are also extremely pretty, and by no means to be despised as decorative plants. Few people realise how well the common white Pink, as well as its rose-coloured form, treated practically as annuals, respond to gentle forwarding under glass. Tufts of cuttings or divisions of old plants put out in new soil in rows in May can be lifted and potted in September. They may then stand out of doors with the pots plunged in ashes until Christmas or thereabouts, and will come into flower about nine weeks after being brought in. How welcome they are, filling the greenhouse with sweetness on an April day, none can tell but those who have tried them.

Sweet Peas are a great stand by, but it is essential that they should be sown about midsummer to come in for very early blooming. Three seeds sown in a small pot and transferred with as little disturbance of the roots as possible into larger sizes and grown out of doors will make beautiful specimen plants. They may be pinched back now and then to make them bushy, and will flower well in a 10-inch pot; but they should be brought under shelter before the first early frosts at the end of September or they may receive a check which will retard their blooming. Eckford's good varieties offer abundant choice of colour, and these should be kept distinct, as mixtures are seldom desirable or effective.

Any of the hardy annuals which are recommended in the seed lists for autumn sowing, which usually means August and onwards, may be tried with a fair chance of success, and should flower by relays from early spring. Mignonette will scarcely be overlooked. The old-fashioned kind, though not so large or handsome as Machet, Parson's White, and some of the Covent Garden strains, is the sweetest of all. Three seeds sown in a small pot, the strongest only to be retained, and repotted as required in rich soil will give very satisfactory results.

Tender annuals for summer and autumn blooming, such as Asters, Tropaeolums, Mimulus, Nemesia strumosa, Salpiglossis, Celosias, Martynia fragrans, &c., must be sown under glass in March, April, or May, according to circumstances, and require a good deal of care in pricking out, potting, and in some cases pinching back, with as much open air as possible to prevent their spindling. These may be so arranged as to flower until late autumn. Greenery should not be forgotten, for which the Japanese Hop, Zea Mays, and some of the elegant annual grasses will answer well. The biennial Fish-bone Thistles (*Chamæpætia Casabonæ* and *C. Diacantha*) are also very useful for this purpose. Cosmos

*bipinnatus*, with its finely cut leafage, makes an effective foliage plant while it is young, and a few out of a batch of seeds might be headed down and reserved for this purpose, but the plants intended to flower will do better if summered out of doors. This, being one of the latest of autumn-blooming annuals, is not very satisfactory out of doors for our climate, but if grown under generous conditions it is exceedingly ornamental in the greenhouse during October and November, either in its white or light purple form. One or two dwarf annuals of a succulent character are well adapted for summer flowering under glass—Portulacas, which enjoy the extra heat and are delightfully gay in their vivid colouring of crimson, yellow, and purple, and the free-flowering *Mesembryanthemum tricolor*, pink and white, with a dark eye. These should all be sown very sparingly, as they are apt to resent transplanting, and do better if they are thinned rather than pricked out, looking best when grown in shallow troughs or pans. The different varieties—orange, yellow, and white—of Iceland Poppy (*P. nudicaule*) do well treated as biennials, and, sown in autumn, make charming pot plants for early spring.

More distinctly a greenhouse plant and easily grown as a biennial is *Celsia Arcturus*. The spikes of yellow Mullein-like flowers, purple tufted, on wiry, upright stems, set off by the grey-green foliage, are unusually bright and attractive. Seedlings from an early sowing grow quickly and come into flower comparatively soon. It is a plant of neat, compact habit, and is singularly amenable to circumstances. Another species, *C. cretica*, very different in habit and still more Mullein-like, may be treated in the same way, and is very handsome and distinct. Something may be found to suit all positions and all tastes. The well-known border biennials called Canterbury Bells (*Campanula Medium*) have come into fashion of late years for conservatory decoration, and give a great variety of colour—purple, blue of various shades, pink, and pure white. Sown in April, pricked out, and finally, when large enough, transplanted to a shady border, they may be lifted in September and potted. They are strong-growing plants, somewhat coarse perhaps, and only suitable where there is ample space, but they are undoubtedly handsome. Much more elegant is the autumn-flowering Chimney Campanula (*C. pyramidalis*), and its tall spikes of pale

blue or pure white are always admired. This species is almost better suited for house than for border decoration, though it is quite hardy from a certain flimsiness of texture in the flowers, which are easily spoilt by weather.

Two beautiful species of Pentstemon not very often met with may be added to the biennial list. *P. Cobaea* is a Texan plant which blooms naturally late in autumn and has long shining deep green leaves and spikes of bell-shaped lilac or white flowers. Being very viscid they attract insects to such a degree out of doors that their beauty is sometimes marred by the small victims which cannot get free from the sticky trap, but they make very fine pot plants. *P. murrayanus* is quite distinct from the last, having glaucous leaves and bright scarlet tubular flowers, but there are garden varieties distinguished, as *grandiflora* of different shades of rose and violet. Both these species, which are quite different to the well-known border Pentstemons, do better sown in early autumn and protected during the winter either in a cold frame or greenhouse, as they are somewhat tender, but are well worth growing by those who do not begrudge time and trouble.

Annuals and biennials are rather undeservedly out of favour, because for their short duration they demand a considerable amount of labour and care, especially when intended for indoor purposes; but by growing in most cases single plants to allow full development and by cutting off all dead flowers before they have time to form seed the blooming season can be much prolonged. Some may be found to suit all seasons, and, as if to make up for a short life, most of them are lavish of their fine flowers. As a garden experiment, which probably has never been attempted, it would be interesting to prove what could be done in the way of cold greenhouse decoration by the use of annuals and biennials alone. The garden lad's definition of gardening, instilled no doubt by a past-master of the craft, was "A doing of things at the right time." The adage may be applied with double force in the case of this handsome but short-lived section of plants.

#### ROSE FELLENBERG (NOISSETTE)

THIS beautiful and free-flowering Rose is one of the features of the Rose garden at Kew, at

A FREE GROUPING OF NOISSETTE ROSE FELLENBERG IN THE ROSE DELL AT KEW.

least it was a week ago. It is almost as bright as the yards of Crimson Rambler, and almost perpetual, maintaining a display until the autumn. It is an excellent Rose for making a group of, as suggested in the illustration. In pruning, the shoots must be left a good length, for the following season side shoots will appear, which will produce flowers the following year.

## TREES AND SHRUBS.

### HARDY HYBRID RHODODENDRONS.

(Continued from page 63.)

#### SMIRNOWI GROUP.

**A** GROUP entirely new, and it is doubtful whether any of the hybrids are in cultivation except in the places where they have been raised. The species is a native of the Caucasus and flowered for the first time in England at Kew in 1893. It is a dwarf, compact species, increasing in width at a much greater rate than it grows in height. The leaves are large, deep green, and covered on the under-side with a dense, white felt. The flowers are  $2\frac{1}{2}$  inches to 3 inches across arranged in medium sized shapely trusses, and are rosy-lilac in colour. The dwarf, dense habit of the plant with the large trusses of flowers led to its being used as a parent with a view to producing a race of dwarf, compact plants bearing large trusses of flowers which would be useful for places where large fast growing varieties would be useless. Both at Kew and in the nursery of Mr. George Paul numerous hybrids have been raised. The first raised at Kew was by crossing the species with the scarlet flowered garden hybrid Johnsonii in 1893. It flowered when four years old, and was of dwarf habit with rosy red flowers. Of numerous other hybrids raised since that time three which were raised from crosses made in May, 1896, and which flowered in May of the present year, are so far the best. One of these was raised by crossing with the variety *purpureum splendens*; this has good sized trusses of purplish flowers. Another claims *Fortunei* as its male parent; it has fragrant flowers of large size with five or six petals, pink in colour, arranged in shapely trusses. In the third case *Kewense* was selected as the male, and this is the prettiest of the three. The flowers are on long stalks, semi-pendulous, large with prettily fringed petals, fragrant, rose-coloured, and prettily marked with dark spots in the throat. Although the beauty of the flowers is somewhat marred by the half pendulous habit the plant has much to recommend it.

A hybrid named *Cunninghami*, which originated by crossing *R. cinnamomeum* and *maximum*, may be seen in the Rhododendron dell at Kew, and also in the Himalayan house. It is a very fine hybrid, but does not flower freely. It is of exceptionally good habit and a strong grower, with very handsome, dark green leaves, which are thickly covered on the underside with a brownish felt. The flowers are pure white, large, and borne in immense trusses. In one of the famous Cornish gardens a very fine plant exists which is said to flower very freely.

Between the evergreen and deciduous

sections of Rhododendron a number of hybrids have been raised, which in some places are erroneously called Azaleodendron. Three of the most attractive of these are *R. azaleoides*, *R. Smithii* var. *aureum*, and *R. roseum odoratum*. The first mentioned grows about  $3\frac{1}{2}$  feet high, making a dense bush with small evergreen leaves, and during June a profusion of fragrant, white, lilac-tinted flowers. It is a hybrid between *R. viscosum* and *R. maximum*, and has been known under the names of *hybridum*, *fragrans*, and *odoratum*. *R. Smithii* var. *aureum* is an old plant; it is said to have been raised by Mr. Smith, a nurseryman of Norbiton, by crossing a variety of *R. caucasicum* with a yellow form of *R. sinense*, and he is said to have exhibited it at Chiswick in 1841. It is a dwarf loose habited plant, bearing fairly large leaves and compact trusses of yellow flowers. A glaucous-leaved form is in cultivation, but the flowers are not so richly coloured as are those of the plain leaved one. *Roseum odoratum* is a fragrant hybrid with reddish flowers. It grows 4 feet high, and was raised by crossing a white deciduous variety with a red evergreen one. All three plants are hardy and well worthy of attention.

With the arrival of so many new species from Western China, of which *rubiginosum*, *racemosum*, and *yunnanense* are good examples, we may expect in the near future to have several other distinct races of garden Rhododendrons.

W. DALLIMORE.

## THE PLANTING OF VINES.

(Continued from page 60.)

#### TREATMENT AFTER PLANTING.

HAVING now given details as to the preparation of the Vine border, the plants best suitable for placing therein, and the proper method of doing this, I will endeavour to explain the method of treatment most likely to bring the preliminary labours to a successful issue. I think the simplest and most satisfactory way to do this will be to commence with the newly-planted Vine and show how this should be cultivated during its first year

of growth, and then point out the somewhat modified treatment required afterwards. Supposing the Vines to have been planted in late July or early August, or, in fact, any time during the summer, the object of the cultivator is to first enable them to complete their growth quickly as vigorously as possible, and then to aid the thorough ripening of this growth so far as lies in his power.

For a week or two after planting it will be advisable—and, perhaps, necessary—to shade the Vines during the hottest part of the day, otherwise the leaves will droop and probably be scorched by the sun, a circumstance that would considerably retard their establishment in the new soil. It is essential that the leaves of the young Vine be treated with the greatest care, for upon the health and vigour of the foliage the activity of the roots depends, and, unless the latter are in an active state, there is not much likelihood of the Vine becoming quickly established. Shade then for a time after planting is invariably necessary. The temperature and condition of the house should be such as is most suited to the encouragement of generous and healthy growth. On bright mornings a little air can be admitted early—that is to say, before eight o'clock—and then as the solar heat increases the amount of air given must also be augmented. All the ventilation that is essential may be given before midday unless the Vines have been planted exceptionally early in the season, and even then it is not often that it will be found necessary to admit air in the afternoon. Nothing helps the young Vines to grow and make root better than the practice of closing the viney early in the afternoon—say, about three o'clock—and earlier as the summer advances and the sun's heat declines. Supposing that the sun is about that time beginning to shine indirectly upon the viney, if the amount of air were not reduced it is astonishing how quickly the temperature of the house would decrease, with the result that the Vines in a very short space of time would have been subjected to two extremes of temperature, a condition that could not fail to be injurious. From a heat of perhaps  $87^{\circ}$  Fahr. the atmosphere of the viney would fall  $10^{\circ}$  or more so soon as the direct rays of the sun had left it, and the air that before was beneficial and necessary to the maintenance of a proper temperature would now be but the source of draughts. If, however, the viney is closed up altogether just before the sun

VIEW OF THE OLD WALL ON SOUTH-EAST SIDE OF THE GARDEN, SHOWING ENTRANCE GATES FOR STUDENTS.

ceases to strike directly upon it (the air having been partially reduced earlier in the afternoon, so that the change of temperature may not be too sudden), and the vines themselves, together with the walls, floor, and pathways, are well syringed at the time, a warm, moist atmosphere (most congenial to growth) ensues, and the heat thus preserved—caged up as it were—helps very considerably to maintain an equable temperature in the house throughout the night, and does away with to a great extent the need of heat from the hot-water pipes—a saving so far as expense is concerned, and it is also more suitable to the healthy growth of the vines that a natural warmth should be taken advantage of in preference to the use of artificial heat.

The heat that proceeds from the hot-water pipes is dry and arid, and has a tendency to create an atmosphere that is conducive to the increase of an insect pest known as red spider, and one that sometimes does a very great deal of harm to the foliage. Occasionally, indeed, if the attacks of this insect are very severe, the vine becomes so enfeebled that it is not able to properly mature its crop of fruit. It is during the night time that artificial heat is most required, and it is then also that there is the least moisture in the atmosphere. I believe that many of the attacks of red spider are traceable to the careless regulation of the night temperature of the viney.

We see that a dry and hot atmosphere is suitable to the increase of this pest, and that during the night, when most artificial heat is required, it is the least possible to give atmospheric moisture. It is most essential, therefore, to do all that is possible to minimise the necessity of much fire-heat, and this point is best achieved by judiciously closing the viney more or less early during the day, according to the weather. A simple, yet very good, precaution to take against the increase of red spider, or to prevent its appearance at all, is to thoroughly damp the viney, walls, floors, and vines as late at night as one conveniently can. It is a work that does not occupy many minutes when one has a syringe and a can of water, and its beneficial results are undoubted. In some of our large fruit-growing establishments this is made a duty. Every night the man who happens to be left in charge of the houses is expected to damp the vines and their surroundings as his last duty. Although but a simple precaution, it may be the means of preventing much subsequent annoyance.

A. P. H.

(To be continued.)

PHYSIC GARDEN AT CHELSEA: VIEW OF LABORATORIES AND LECTURE ROOM.

Chelsea from Lord Cheyne in 1712. The result of this interview was that in 1722 he granted them the land for ever in consideration of a yearly rent of £5. As the quaint old indenture goes on to say: "That the said garden may for ever be continued as a physic garden, and for the better encouraging the said society and enabling the said society to support the charge thereof for the manifestation of the power, wisdom, and glory of God in the works of Creation, and that their apprentices and others may distinguish good and useful plants from those that bear resemblance to them and yet are hurtful, and other like good purposes."

It is very fitting that the Society of Apothecaries should have placed a marble statue of Sir Hans Sloane in the prominent position it now occupies in the centre of the garden, and no account of the garden would be complete without a short reference to this remarkable man.

Sir Hans Sloane, Bart., was born in Ireland, of Scotch parentage, in 1660, and from his sixteenth to nineteenth year was very delicate in health. When he got strong enough he came to London, and devoted himself to the study of medicine and the collateral sciences. His fondness for botany brought him into contact with Ray, the famous naturalist.

In 1683 he went to Paris, and there attended the lectures on botany by Tournefort, afterwards going for a year to Montpellier, having been furnished by Tournefort with introductions to all the leading men of science in that city. Whilst at Montpellier he collected a large number of plants in the vicinity of the city, many of which found their way to Ray, and are described by him in his "Historia Plantarum."

In 1685 he was elected a Fellow of the Royal Society, and in 1687 a Fellow of the Royal College of Physicians of London. In this same year he was appointed physician to the Duke of Albemarle, who was going out as Governor to Jamaica. The duke, however, unfortunately died shortly after his arrival,

and Dr. Sloane was obliged to hasten his return to Europe, but it is characteristic of the man that during his fifteen months' stay at Jamaica he made a collection of upwards of 800 species of plants.

In 1693 he was elected secretary of the Royal Society, and in 1712 one of its vice-presidents, and in 1727 he succeeded the illustrious Sir Isaac Newton in the presidency. Sir Hans died in 1753, in the ninety-third year of his age, leaving two daughters to inherit his vast wealth, which was eventually united to the noble families of Stanley and Cadogan.

Sir Hans had directed that at his death his museum should be offered to the nation for £20,000, which was stated to be a quarter its real value. The Treasury of the day showed its wisdom in accepting the offer, which helped largely to found the British Museum. His cabinets contained 200 volumes of dried plants, 30,000 specimens of other objects of natural history, besides a library of 50,000 volumes, and some 3,566 manuscripts.

During the visit of Linnaeus, the great Swedish botanist, to this country in 1736 he reports in his diary his visit to Chelsea, and says: "Miller permitted me to collect many plants in the garden and gave me several dried specimens collected in South America." This event is interesting as showing the high estimation in which the Chelsea garden was held by scientific men of foreign countries as well as our own, and its character may be further appreciated by the fact that only two botanic gardens in England were mentioned by Linnaeus as having been visited by him, namely, the Oxford one, then under the care of Professor Dillenius, and that at Chelsea under the care of Rand and Miller, to both of whom, together with Hudson, also a demonstrator at Chelsea, Linnaeus often refers in the most commendatory terms.

Philip Miller, who will always be remembered as the father of horticultural literature, presided over the fortunes of the garden for nearly fifty years. His best known work, "The Gardeners Dictionary," went through no less

## THE PHYSIC GARDEN AT CHELSEA.

ON Friday, the 25th ult., the historic Physic Garden at Chelsea was, by Earl Cadogan, again reopened to students after having been closed for several years during its reorganisation and transference to a new governing body. The garden was founded about 1673, when the Society of Apothecaries ordered that a spot should be chosen upon which to erect a barge house for the ornamental barge the society—like other City companies—then possessed for the use of its members in the water pageants so common at this date. A portion of the ground then obtained was set apart for growing herbs of reputed medicinal qualities.

The ground was first leased from Lord Cheyne, but the undertaking appears from the first to have been a considerable burden on the corporate funds of the society. With a view of lessening this burden the society approached Dr. Sloane (afterwards Sir Hans), who had purchased the lease of the manor of

than eight editions, and was translated into the Dutch, French, and German languages. Miller was buried in the churchyard of the old parish church at Chelsea, and fifty years after his death a monument was erected to his memory by the members of the Linnean and Royal Horticultural Societies of London.

No apology need be asked for briefly mentioning the names of a few eminent men who have presided over the rise and progress of the garden, names which, it is safe to say, will always be memorable in the annals of horticultural and botanical science : James Sherard, brother of the founder of the famous Sherardian Professorship of Botany at Oxford ; Isaac Rand, after whom the genus *Randia* is named ; William Hudson, author of "Flora Anglicana" ; William Curtis, author of the splendid but ill-fated "Flora Londinensis" and founder of the *Botanical Magazine*, now edited by Sir Joseph Dalton Hooker ; William Forsyth, immortalised in the genus *Forsythia* ; Robert Fortune, who went to China and sent home so many beautiful plants for our gardens ; Dr. Lindley, the most famous botanist of his day ; and Thomas Moore, author of numerous works on Ferns and general horticulture.

After presiding over the fortunes of the garden for two and a quarter centuries, the Apothecaries Society found themselves unable to support it any longer out of their corporate funds, and in 1893 they applied to the Charity Commissioners with the intention of being relieved of their trusteeship.

It was urged on their behalf that the garden was unsuitable for a botanic garden, and that it was impossible to grow anything satisfactorily owing to the degeneration of the soil and the deleterious effects of the London atmosphere.

How far this was correct the photograph of *Veratrum viride*—the plant from which the hellebore powder of commerce is obtained—recently taken in the garden will speak for itself.

In 1897 the question as to the suitability of the garden for botanical purposes was gone into by a treasury committee, consisting of Sir Henry Longley, Sir W. T. Thiselton-Dyer, and Mr. Spring Rice. This committee reported that they were sure that if properly administered the garden was capable of being usefully employed for botanical science at the present time, and that there was a large number of students of botany to whom the garden would be an immense advantage, both as a place to see growing plants and from which specimens could be obtained.

In the scheme sanctioned by the Charity Commissioners the trustees of the London parochial charities are the sole trustees of the garden, the management being vested in a committee of seventeen members, nine of which are appointed by the London parochial charities, one each by the Treasury, the Lord President of the Council, the Technical Education Board of the London County Council, the Royal Society, the Pharmaceutical Society, the

University of London, the Society of Apothecaries, and the Royal College of Physicians, in turns.

A new two-storied building has been erected (see illustration) for use as a lecture room, a laboratory for research work, with several smaller rooms for private use, and leading out of the laboratory is a greenhouse for use for physiological experiments. Adjoining this building is the house of the curator of the garden. A new range of greenhouses has also been erected, which it is hoped to stock with plants of special botanical interest from a teaching point of view. A large collection of Liverworts has already been brought together, and many

many cases duplicate plants, so as to be able to provide for the needs of all elementary students. While the alterations have been in progress specimens have been regularly supplied to the Royal College of Science, several Polytechnic classes, the School Board for London day classes, and several private colleges.

W. HALES, Curator.

## TENDER SHRUBS AND TREES IN THE SOUTH-WEST.

(Continued from page 54.)

**ASTER (OLEARIA) ARGOPHYLLUS.**—Australia. The Silver Musk Tree, with Musk-scented leaves and dull red flowers in summer. Three gardens. Height, 12 feet.

*Athrotaxis laevis.*—Tasmania. A tender conifer. A fine example, 20 feet in height, fruited profusely at Menabilly two years ago.

*Banksia grandis.*—Australia. Evergreen shrub bearing yellow flowers in dense spikes. *B. serrata*, red flowers ; and *B. littoralis*. All at Trese. *B. quercifolia*, handsome leaves with white reverse. Abbotsbury. Banksias were at one time in request as greenhouse plants.

*Bauera rubioides.*—New South Wales. A pretty little evergreen shrub, not unlike a Heath, but more branching, bearing solitary pink saucer-shaped flowers half an inch across, each petal striped with white down the centre.

*Bethamia (Cornus) fragifera.*—Nepaul. A strikingly handsome evergreen tree, first introduced into England in 1823, when seed was sown at Heligan, Cornwall, and where there are now specimens some 60 feet in height. It is largely represented throughout Cornwall, being used in some places as a woodland tree. In June, when the leafage is hidden by the widespread platter-like flowers of pale yellow, its effect is very beautiful, especially when thrown up by a background of green foliage. In the autumn the fruits, from which it takes its name of Strawberry Tree, some an inch or more in diameter, become bright crimson.

*Boronia.*—Australia. These are almost universally treated as greenhouse plants, but succeed in the open in the south-west. At Tregothnan, at the end of March, two bushes of *B. megastigma*, planted in front of a wall, the larger of which was about 3 feet in height, were coming into profuse bloom, and already scented the air with the first of their brown-yellow lined drooping cups. *B. heterophylla*, with its purple-red flowers, was also expanding blooms, and *B. Drummondii*, *B. elatior*, and *B. polystachys* were also growing in the same garden.

*Brachyglottis repanda.*—New Zealand. A handsome tree with leaves nearly a foot in length, and numerous minute flower heads. Trese.

*Buddleia Colvillei.*—Sikkim. The finest of the race, with pendulous racemes nearly a foot in length, of crimson Pentstemon-like flowers, paler round the centre, an inch across. Leaves large and dark green, 6 inches or more in length. Several gardens.

*Callistemon salignus.*—Australia. There are two forms of this Bottle-brush, one bearing pale yellow flowers and the other crimson. Others are *C. lanceolatus*, carmine-flowered, and *C. speciosus*, scarlet-flowered. These grow well as bushes, specimens of the first-named being sometimes 10 feet

STATUE OF SIR HANS SLOANE, BT., SHOWING RHEUM OFFICINALE ON THE RIGHT.

other plants of an interesting nature. The entrance for students is in Swan Walk, and on the old wall skirting this side of the garden are a few very interesting subjects, among others an old plant of the Pomegranate and a very large plant of *Styrax officinale*, now rarely seen in cultivation. It yields a fragrant gum resin called storax, formerly largely used by perfumers, and medicinally as a stimulating expectorant.

The whole of the beds in the garden have been rearranged, and many more new ones made. The work of restocking the beds with suitable plants has gone on apace, and now over 100 natural orders are represented. The common orders which are most used have in

in height and as much in diameter. There is much confusion between this genus and Metrosideros, *C. lanceolata* being almost universally sold as Metrosideros floribunda. Callistemons are to be found in many gardens.

*Candollea tetrandra*.—Australia. An evergreen bush bearing clear yellow cup-shaped flowers, somewhat resembling Sun Roses, but of firmer texture. Tresco.

*Camellia reticulata*.—This is hardy, but rarely flowers satisfactorily in the open, except in the south-west, where it is grown both against walls and as a bush plant. It is by far the finest of the Camellias, bearing lovely pink semi-double flowers, 6 inches in diameter, with bright yellow spreading stamens.

*Cantua buxifolia*.—Peru. An evergreen shrub, bearing in corymbs at the end of the branches pale red trumpet flowers, something after the style of *Fuchsia corymbiflora*. Tresco.

*Carpenteria californica*.

—A well-known evergreen shrub in the south-west, bearing fragrant, white, yellow-centred flowers. In some gardens it suffers from browning of the leaves; but this is apparently not the effect of cold winds or frost, as often the most exposed plants are the least affected, and the most sheltered are in the worst plight. The finest specimen known to me, about 8 feet high and as much through, is growing near Teignmouth. It may be considered fairly hardy since it has been grown in the open in Scotland.

*Caryopteris Mastacanthus*.—Chili. A most valuable much-branched evergreen shrub, growing to a height of 4 feet or more, bearing lavender-blue clusters of flowers in October. There is also a white form. The type is common.

*Cassinia leptophylla*.—New Zealand. A small evergreen shrub, bearing white flower heads. Tregothnan.

*Ceanothus*.—California and Mexico. Many species and varieties are grown both as bushes, in which form they soon make small trees, and trained against walls. Of the early-flowering varieties *C. veitchianus* is the brightest coloured, and of the autumn-blooming Azurens section *Gloire de Versailles* is the favourite. Common in most gardens.

*Citharexylum quadrangulare*.—West Indies. The Fiddle-wood. Bears white, fragrant flowers. There is a fine specimen at Abbotsbury, Dorset.

*Citrus trifoliata* (*Eyle sepiaria*).—Japan. This fiercely-spined Citrus is hardy, but rarely flowers and fruits in the north. In the south-west it flowers freely, and one specimen I know of fruits almost annually. It is 7 feet in height, and last year carried over thirty fruits.

*Cleodendron trichotomum*.—Japan. A deciduous shrub, also hardy, but flowering best in the south-west. The finest specimen I know is over 15 feet in height and as much through at Greenway on the Dart.

*Clethra arborea*.—Madeira. The Lily of the Valley Tree. Evergreen. It bears panicles of white, bell-shaped flowers in the summer, at which time it is quite a feature at Tresco. There are good bushes, the largest about 7 feet in height, at Trewidden, near Penzance.

*Corokia buddleoides*.—New Zealand. A tall-

growing evergreen shrub, with leaves 2 inches to 6 inches in length. *C. cotoneaster* is a spreading shrub with small leaves. Both species bear yellow, sweet-scented flowers. The first I saw at Ludgvan

Rectory, Cornwall, the second at Bishop's Teignnton, South Devon.

*Correa*.—Australia. Greenhouse evergreen shrubs which do well at Tresco and also in some gardens on the mainland. *C. cardinalis* is the most brilliant, but *C. ventricosa* is almost as highly coloured. I have seen the two named as well as *C. alba*, *C. bicolor*, *C. carnea*, *C. glauca*, *C. magnifica*, and *C. virens* in good health and flower on the mainland.

S. W. FITZHERBERT.

(To be continued.)

## THE MOUNTAIN PRIMULAS.

(Continued from page 30.)

### MARSH-LOVING SPECIES.

*P. luteola* (Rupr.). From the Eastern Caucasus.—It is rather near *P. auricula*, from which it is distinguished by the long pedicels of the flowers, which are yellow instead of purple, and by its being much larger in all dimensions.

*P. Olge* (Regel). From the mountains of Turkestan, between 7,000 feet and 12,000 feet.—This may be called an oriental form of *P. longiflora*, for it comes very near this alpine species, though it is distinguished from it by its leaves being smooth and shining on both sides, and by the bracts of the involucre being continued downward towards the base. It is of the same easy culture as *P. longifolia*, and flowers in April and May.

*P. Parryi* (A. Gray). Figured in *Bot. Mag.* t. 6185. From the Rocky Mountains of Colorado, Arizona and Nevada in the alpine regions.—Leaves upright, ovate-elliptical, obtuse or nearly acute, sessile, or contracted on a thick petiole; flowers intensely bright crimson, large, eight to twelve at the top of the stalk 3 inches to 5 inches long. It blooms in May and June. It flowers badly at Geneva, but admirably at La

Linnaea, where for many years it has been one of the handsomest of the genus. It must have a moist, spongy soil, well drained and in full sun, and be frequently watered.

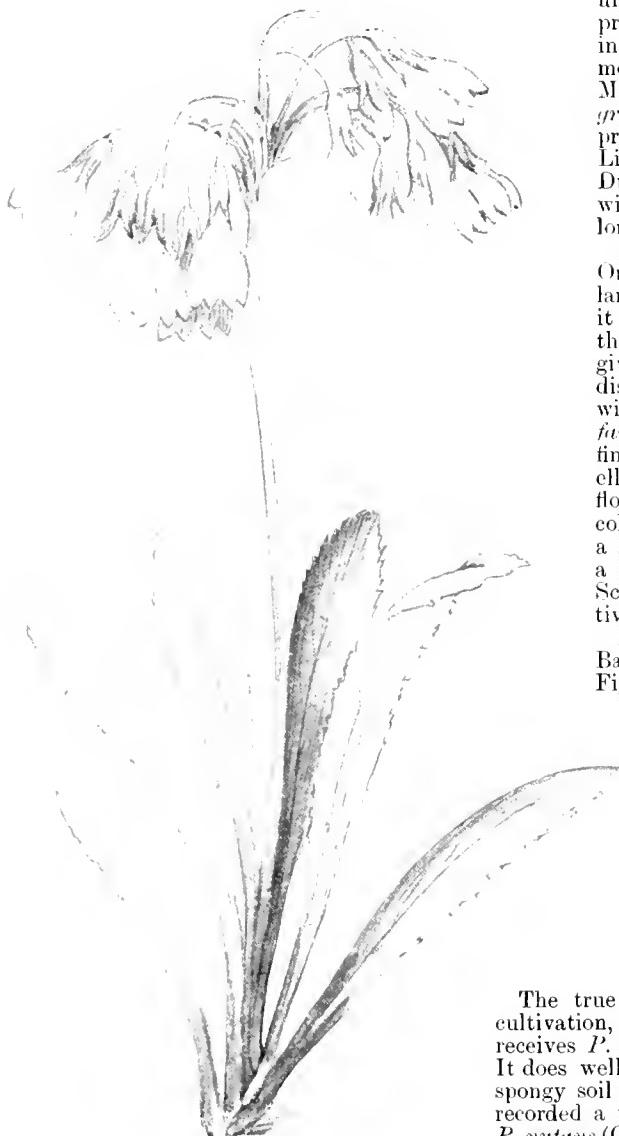

*P. Poissoni* (Franch.). From the mountains of Yunnan in Southern China.—This species is something like *P. japonica*, but is distinguished from it by its glaucous leathery leaves, widely dilated, enveloping at the base; the violet-rose flowers are large and are disposed in whorls, but much less regularly than in *japonica*. It is nearly hardy at Geneva, but for safety we winter it in a cold frame; it is quite easy to grow and yields flowers in abundance.

*P. reticulata* (Wall.). From the Eastern and Central Himalayas.—The true *P. reticulata* does not appear to be in cultivation, for whenever I have had it from nurserymen who offer it in their catalogues I have always received *sikkimensis*. I observe that "Nicholson's Dictionary" gives these two species as very near each other (at any rate it is so in the French edition that I have). I am also aware that Dewar notes *P. reticulata* having been shown at the Primula conference\*, which is quite possible, as the plant may exist, unknown to me, in English gardens. *P. reticulata*, however, differs clearly from *P. sikkimensis*.

\* "Journal of the Royal Horticultural Society," Vol. XII., No. 2, page 288.

PRIMULA POISSONI (LIFE SIZE).

PRIMULA SIKKIMENSIS (LIFE SIZE).

Pax does not include them in the same section, and even puts them rather far apart. Moreover, the description given by Pastor Duby in his "Monographie des Prumulacées" does not correspond to the characters of *P. sikkimensis*, which, however, he then did not yet know. Pax places *reticulata* in the *cordifolia* section, characterised by distinctly stalked leaves which are heart-shaped at the base, while *sikkimensis* is in the *Nivales* section, whose leaves narrow gradually into the winged petiole, as for example in *P. acaulis*. Further, while *P. sikkimensis* has the flower drooping and on long pedicles, *reticulata* carries them upright, the involucre is more or less mealy, and formed of pointed leaflets; the calyx is bell-shaped and toothed only half the length of the tube. As I have never had *P. reticulata* I am unable to say whether it is in cultivation or not, but it probably is for it is unlikely that Mr. Deewar, who followed the Primula conference very closely, should not have known it.

*P. rosea* (Royle). *Bot. Mag.* t. 6437. From the Western Himalayas.—A beautiful and well known species, introduced from Kashmir in 1879, with brownish leaves and many pure rose-coloured flowers, very brilliant in the

unopened bud. It is one of the most precious of our rock plants, flowering in March and April. It requires moisture, porous soil, and half sun. Mr. Leichtlin has raised a variety *grandiflora*: he was good enough to present it to the garden at La Linnea, where it succeeds admirably. Duby has also recorded a var. *elegans* with the flower smaller, the tube longer and the lobes narrower.

*P. scotica* (Hook.). From the Orkney Islands to the north of Scotland.—Very near *P. farinosa* to which it is attached in "Index Kewensis," though Pax in his "Monographie" gives it specific rank. It is clearly distinguished from *P. farinosa* by the widely rounded teeth of the calyx—in *farinosa* they are triangular—by the fine and regular toothing of the large elliptical leaf, by the very short flower-stem, and the dark purple colour of the corolla. There is also a *P. scotica* of Blyth, which is simply a form of *farinosa*, and is near the Scotch plant, but is very rare in cultivation.

*P. sibirica* (Jacq.). From the Altai, Baikal, and eastern regions of Siberia. Figured in *Bot. Mag.* t. 3167 and t. 3445.—It is rather near *involuta*, with flat, smooth, obovate, entire leaves, slightly undulated at the edge, long stalked, highly glabrous; the flower-stem is 3 inches to 4 inches high. Flowers three to five, rose-coloured, supported by an involucle, whose bracts are the same length as the pedicels. It flowers in April and May.

The true *P. sibirica* is extremely rare in cultivation, and in its place one generally receives *P. stricta* or even common *farinosa*. It does well in sphagnum in moist, spongy soil in half sun. Pallas has recorded a variety *rotundifolia* syn. *P. nutans* (Georgi).

*P. sibirica* var. *kashmiriana* (Hook.) has longer flowers and rounded leaves, and Trantwetter has published a variety *brevicalyx*, with the calyx twice as short as the tube of the corolla.

*P. sikkimensis* (Hook.). From the Himalayas, between 12,000 feet and 15,000 feet, and from Yunnan.—An extremely characteristic plant; leaves long, rough, wrinkled, obovate-elliptical, crenate-dentate, narrowing gradually to the wide, winged petiole; flower-stem lightly powdered, 18 inches to 2 feet high, bearing at the top a bouquet of drooping flowers of a bright citron-yellow colour, often fifty to sixty at a time, forming a beautiful umbel. This plant requires a moist porous soil in half sun or shade. It is excellent for the side of a stream or pond.

*P. stricta* (Horn.) syn. *P. hornemanniana* (Lehm.), *P. glabrescens* (Fr.), *Androsace stricta* (Hartm.). Northern and arctic Europe and Iceland. Figured in Hornem. Fl. Danica 8, t. 1385.—A small species near *farinosa*, from which it is distinguished by its very short flower-stalk, by the undersides of its leaves

not being mealy, by the much blunted, almost rounded teeth of the calyx, and by the lobes of the pale pink corolla being very slightly indented. We grow it easily at Geneva in moist spongy soil in full sun. It is the daintiest species in this section.

*P. Warei* (Stein). See *P. farinosa* var. *Warei*. Geneva.

H. CORREVON.

(To be continued.)

## NOTES ON HARDY PLANTS

### DAPHNE CNEORUM.

**D**APHNE CNEORUM, with its neat trailing habit and profusion of rosy lilac flowers, should be grown wherever the soil appears favourable. It rarely exceeds 6 inches to 10 inches in height, and half a dozen plants make a most interesting group for the rockery. It thrives best in a moist peaty soil, and invariably fails where the soil is stiff and dry. It is well worth a place on the rockery on account of its sweetly fragrant flowers alone. *D. rupestris*, the pretty rock Daphne, is a neat, diminutive shrub, forming dense tufts 2 inches or 3 inches high, and covered with a mass of rosy pink blooms. It requires a stony, peaty soil, and should be planted where there is no fear of its being overcrowded, as so often happens with these small plants. *Daphne blagayana*, though a very beautiful species, with white fragrant flowers, is one of the most tantalising in the genus. I have seen robust

PRIMULA ROSEA (LIFE SIZE).

† "Prodromus, De Candolle," Vol. VIII., page 41.

healthy specimens die off in a few days. On the other hand, where everything suits, this Daphne may be grown without any trouble. It seems to require a loamy, well-drained soil. K.

#### MICHAUXIA TCHIATCHEFFII AT EDINBURGH.

As one who has to acknowledge want of success in endeavouring to flower this Michauxia, which is burdened with such a troublesome specific name, I was delighted to observe a good plant of it coming into flower in front of the range in the Edinburgh Botanic Gardens in the middle of July. With me it comes up annually, makes some growth, and then goes to rest until another year has well come in. At Edinburgh it seems to grow far more vigorously, and it was a pleasure to see the healthy appearance it presented with its tall stems thickly clothed with flowers just ready to open. So far as I can learn it does not usually flower freely, and I have known a good many who are no more fortunate than myself in blooming it. It is an Asia Minor species, and seems to be, so far as its white blooms go, a better plant than *M. campanuloides*, whose singular-looking flowers are not too often seen either. Seeds were obtainable a year or two ago, if not now, and as it is of perennial habit, it has this additional advantage over *M. campanuloides* that it lives from year to year. S. ARNOTT.

#### SINGLE PINK GRACE.

THIS beautiful Pink is one of a pleasing set which comprises a number of single varieties of *D. plumarius*. Less striking, perhaps, in its appearance when seen a little distance off than such dark-zoned varieties as *D. Beauty*, it is still one of great attraction from its large, beautifully fringed, fragrant white flowers, whose beauty is heightened by the rose zone which encircles the base of the petals. One of its merits is its erect habit of growth and its bold appearance when raised above the eye. I have a good plant on the top of a double wall, and it there presents a most pleasing appearance with its numerous flowers upheld on stout stems. It is one of the best of its class here, and one is glad to be able to recommend it to those interested in these fragrant flowers.

*Carsethorn, N.B.* S. ARNOTT.

#### SYMPHYANDRA PENDULA.

WE have some plants of this pretty Bell-flower on a dry rockery, and just coming into bloom. I think if the plant is grown thus, only about 1 foot high, it is the very reverse of weedy which, I have been told, is the reason why it is not grown by many. The foliage is very plentiful, but so are the flowers, which are 1½ inches or 2 inches long by 1 inch wide at the mouth of the bell, and of a soft creamy white. It may be short lived, but is easily raised from seed, and is really a perennial. J. WOOD.

#### THE DOUBLE DWARF SWEET WILLIAM (DIANTHUS BARBATUS MAGNIFICUS PLENUM).

OF all the Sweet Williams I do not think there can be one neater in habit and brighter in colour than this. Not more than 6 inches high, it has been making a brave show for weeks, and looks as if it will continue for a few more. I consider it a better thing than its taller relations, as there always seems to be plenty of growth left for another season when it has finished flowering. The colour is a rich ruby, surpassing that of *Dianthus Napoleon III*. This is a grand plant to follow on the earlier Pinks and for border edging.

*Hardy Plant Club, Kirkstall.*

J. WOOD.

## THE ROSE GARDEN.

### ROSES IN NORTH-EASTERN SCOTLAND.

**S**COTLAND'S climate generally is not an ideal one for Rose growing, but with a little trouble many sorts can be tolerably well done, the chief means of assuring success being a proper selection of the varieties to be grown. For instance, it would be quite useless for us northerners to have anything to do with that beautiful Rose *Comtesse de Nadaillac* for the open ground. Again, many of the dark Hybrid Perpetuals stain and lose their colour terribly in this climate; why I do not know, as one would have thought that in this respect we might have had the advantage over our ancient foes, the Sassenachs, but it is not so, and I cannot even do much with *Charles Lefebvre*. Also some very full Roses, for instance *Marchioness of Londonderry*, cannot

*Grace Darling* (H.T.)—Creamy pink, about the earliest in this class to flower.

*Grand Duc A. de Luxembourg*.—A beautiful and most distinct Hybrid Tea, the inside of the petals being white and the outside deep rose; free, hardy, and most decorative.

*Kaiserin Augusta Victoria* (H.T.)—Very good indeed. Creamy white. A good grower and hardy; nearly every flower comes good. Buds get a little spoiled in very wet weather.

*La France* (H.T.)—Usually good.

*La France de '89* (H.T.)—A good hardy Rose and a good grower.

*Mme. Isaac Pereire* (Bourbon).—A useful, strong growing Rose.

*Margaret Dickson*.—The best white H.P. in the north. Almost every flower comes good, but the plant is very liable to mildew late in the season.

*Marquise Litta* (H.T.)—Not a strong grower, but free flowering and hardy; very well shaped rosy red flowers.

DAPHNE CNEORUM ON A SUNNY BANK IN THE BOTANIC GARDENS, EDINBURGH.

often be induced to open; or, if they do so, they take so long about it that the tips of all the petals get badly stained and weather-worn, and the flower is worthless. Doubtless there are many other Roses that can be well done north of the Grampians, but the following lists contain what I consider the best from experience in my own garden. I may add that I have included none that I have not had under observation for at least four years, although a good few of the newer Roses promise very well, especially of the Hybrid Tea class.

#### HYBRID PERPETUALS AND HYBRID TEAS.

*Captain Hayward* (H.P.)—The best bright red Rose for the north; good sturdy grower, free flowering, and very hardy.

*Caroline Testout* (H.T.)—Large pink flowers, free and hardy.

*General Jacqueminot* (H.P.)—Very bright in colour. This Rose will grow quite a long way up a wall.

*Mrs. John Laing* (H.P.)—Good. Rosy pink.  
*Mrs. Sharman Crawford* (H.P.)—Good. Bright pink.

*Mrs. W. J. Grant* (H.T.)—The best of all Roses in the north, of splendid colour and foliage; a fair grower, very free flowering; every flower coming good and not opening too quickly, which, I fancy, would be its chief fault in the South. It is, in addition, an excellent autumnal.

*Souvenir de la Malmaison* (Bourbon).—An old Rose, excellent for its autumnal bloom.

*Ulrich Brunner* (H.P.)—A good bright red Rose, strong grower and very hardy.

#### TEA ROSES.

Very few of these are really satisfactory, and it is really best to rely chiefly on the Hybrid Teas. However, the following are the best I have tried in respect to hardiness:

*G. Nabonnand*.—Rosy cream, very free and quite hardy; a good grower, quite one of the best Teas as a garden Rose in the North.

*Anna Olivier*.—Creamy, buff centre, the reverse of the outer petals reddish.

*Hon. Edith Gifford*.—Almost pure white here.

*Mme. Lambert*.—About the best Tea of its colour for the North.

*Maman Cochet*.—A very good grower and about the hardiest of the Teas; sometimes the blooms do not open well, but when they do they are splendid.

*Marie d'Orleans*.—A strong, hardy plant. The flower is rather of the Gloire de Dijon shape, but of a rosy colour. A very good garden Rose.

*Marie Van Houtte*.—Grows well, and is fairly hardy.

*Papa Gontier*.—Good grower, and fairly hardy. A beautiful bud.

*Safraino*.—Good apricot-coloured buds and hardy. I have it growing 8 feet or 9 feet up a wall facing south-east, in which position it blooms very early.

*Sombreuil*.—Makes a good bush, very free-flowering, and most useful for cutting. Almost a climber, and very hardy.

*Souvenir de S. A. Prince*.—The best white Tea here. A good grower, and fairly hardy.

*Souvenir d'un Ami*.—Of much the same habit and growth as the last-named, but with pink flowers. Good.

Of Roses belonging to other than the above classes, the Austrian Copper and Austrian Yellow should be grown with any of the Penzance Sweet Briars (Meg Merrilles, Lady Penzance, Amy Robsart, and Green Mantle are a good quartette), and the Scotch Roses, especially the yellow. These three classes should be allowed to grow much as they please, when they will make large bushes, the knife only being used after flowering to cut away any old or exhausted wood. The Scotch Roses make a capital low garden hedge, and are very sweet-scented. Moss Roses I cannot do well. The best is the common Moss.

All the Rugosas and their hybrids are very hardy, and are useful shrubbery Roses. Then the Ayrshire and evergreen Roses, that grow anywhere and anyhow, and are never sick or sorry, must not be forgotten. Of these the best are Bennett's Seedling, splendens (Ayrshire), and Félicité Perpetue (evergreen). Of other climbing Roses the following are the best with me:—

*Gloire de Dijon*.

*Mme. Alfred Curriere*.—The best white climber, and very hardy. Good either on wall or trellis.

*Mme. Berard*.—A better-shaped Gloire de Dijon; not so liable to get bare at the bottom, but not quite so free-flowering. Good.

*Pink Rover*.—Very useful, strong growing plant, good as a bush, and will climb quite a long way. Very hardy.

*Reine Marie Henriette*.—A strong climber, with bright red flowers, which, however, fade off rather an objectionable colour. A useful Rose.

*Reine Olga de Wurtemberg*.—The best red climber for an arch, most floriferous, strong and hardy.

*Waltham Climber L*.—A good crimson Rose, free and hardy. Best here as a bush.

*Crimson Rambler*.—Very hardy, good on an arch or trellis, but useless on a wall; requires high feeding to show its true character; in fact, it can hardly be over fed.

*Polyantha simplex*.—Very free flowering, makes a splendid bush if allowed to grow as it likes, only cutting away any old wood after flowering.

Then one cannot omit some of the China Roses. The common China is the hardiest,

and Fellenberg (classed usually as a Noisette) is very useful, especially in late autumn.

Then last and least (in respect of stature) the dwarf Polyanthas must be included. The two best here are Anne Marie de Montravel (white) and Gloire des Polyantha (pink). These never fail. They start flowering early, and are about the last to give in; they are very hardy and make splendid beds. N. B.

P.S.—Some of the old, so-called, Hybrid Chinas are very useful in the North, especially Charles Lawson. Two other summer Roses that should be grown are Celestial and Maiden's Blush, both classed as "Alba" Roses. Macrantha and Paul's Single White should also be included; they make good bushes and the latter is very useful for cutting. N. B.

## GARDENING OF THE WEEK.

### INDOOR GARDEN.

#### BULBS.

**V**ARIOUS kinds will soon be coming to hand from the growers. It suits some growers to send them out in bulk late, which is not a satisfactory way when they are required to bloom at different periods of the year. Growers should be urged to send on each variety as soon as they are ready. For a general collection of bulbs the bulb catalogue is the best guide. Space will only permit me to mention the very early flowering sorts. A very early and free flowering Narcissus is Single Trumpet Major, and another grand large single is Yule Tide. Early Double Golden blooms at the same time. I have had these Daffodils in flower during November and December with but very little forcing. I believe these bulbs were grown in France, and ripen earlier than Dutch grown. I obtained them through a noted Southgate nurseryman. Trumpet Major is considered by many to be a shy bloomer, but given an open porous soil, with plenty of broken crocks or charcoal mixed in the compost and liberal drainage, and not hard forced with fire-heat, which means failure, I know of no better variety for early flowering. There is nothing more welcome or charming for conservatory or room decoration than these beautiful fresh-coloured Daffodils, and coming into flower without hard forcing they are a great boon to gardeners. These bulbs are cheap, and if obtained through a reliable source are very certain. A serious mistake is ordering bulbs through an unreliable source. Remember that within the bulb the coming flower is already stored. Polyanthus varieties, such as the early Paper White and Double Roman, are particularly precious for early forcing. Roman Hyacinths, too, are indispensable.

**RETARDED LILY OF THE VALLEY**  
can be had in bloom any time during the summer and autumn months. Pot up on arrival, place in a cold frame, and expose to full light, where they will open their flowers and develop their foliage in about two or three weeks. Do not upon any account give them bottom heat.

Spiræas and Azalea mollis will flower in about five weeks from time of starting. Lilliums will flower in about ten to twelve weeks.

#### SEASONABLE PROPAGATING.

*Fuchsias*.—Cuttings of the young growing shoots should be taken and placed in small pots in a light sandy soil. If possible, place them in a half-spent hot-bed. These plants, if kept going all through the winter in a light and warm position, will make strong flowering plants next year. Cuttings of Heliotropes, Coleus, Lantanas, and the like may also be struck.

*Zonal Pelargoniums*.—For next season's flowering these should be inserted singly in small pots. Choose strong growth and press the soil firmly round the cutting. They do not like a close moist atmosphere or much shade; indeed, we strike

them in a cold frame fully exposed to the sun. Winter-flowering Pelargoniums that are well rooted in their flowering pots should have weak manure and soot water given to them twice a week. Pick out all premature flower trusses and pinch the strong shoots until the end of the month. From that time growth should be free. Turn the plants round to the sun occasionally to regulate the growth.

JOHN FLEMING.

Wexham Park Gardens, Slough.

## THE FRUIT GARDEN.

#### APRICOTS.

THE crops of these are more satisfactory this year than are those of some other hardy fruits, but owing to the dry weather we have found it expedient to thoroughly water and mulch the borders. The fruit is now approaching maturity, and will require to be protected by hexagon netting or some similar material from wasps and birds. The colour will be improved if fruits are fully exposed to the sun. Once it is gathered the trees should be thoroughly cleansed by the aid of a garden engine, and the young shoots that require it fastened to the wall, at the same time closely stop sub-lateral growths and carefully remove suckers, which are at times freely produced.

#### STRAWBERRY PLANTING.

In a recent calendar instructions were given for preparing land for this fruit, and a list of good varieties was given. Where the plants have to be purchased there should be no further delay in giving orders for them, and those established in small pots should be preferred. Home-raised plants should be severed from their parents after they have become well rooted, placed for a few days before being planted in a shaded position, and kept watered and daily syringed. It is advisable to choose showery weather for the operation, and a suitable distance is 2½ feet between the rows, and the plants 2 feet apart in the rows. Where space is limited, however, they may be more closely placed, especially in the case of compact growers; at the same time, a greater distance may be advantageously afforded such strong growers as Royal Sovereign, for instance, when they are planted for the purpose of supplying runners for layering. When planting be careful that the balls of soil are moist, and make them perfectly firm; should dry weather prevail see that the plants are adequately supplied with water and damped overhead each evening, and in any case keep them free from runners.

#### APPLES.

Although early summer pruning of the Apple is not advisable, owing to it producing a profusion of sappy growths, the summer pruning of the bush, espalier, and similar trees that have their growth restricted, should now be completed. If it is convenient to do the work upon the piecemeal principle, a sudden check to the tree's energies, which a wholesale removal of young shoots occasions, will be avoided. In pruning it is essential that the operator knows the difference between ordinary wood growths and fruit-bearing spurs, i.e., short sturdy growths which ultimately terminate with a fruit bud. Some varieties of Apples, such, for example, as Cornish Gilliflower, produce a great portion of their fruit upon this principle, and the removal of such growths would consequently cause failure. Young trees should have sufficient terminal and other shoots to properly furnish them, carefully selected and retained. I have previously advised the thinning of fruit where it is necessary, but in our case, except with a few varieties, it has not been called for this season. Any fruits that drop, the result of the codlin moth maggot, should be gathered up and destroyed before the grub escapes. Where aphid has been troublesome the trees and their fruit will be benefited by being thoroughly washed by the garden engine, and where (as is the case here) the rainfall has been deficient, copious supplies of water and liquid manure will be beneficial, while the utility of mulching with short litter, especially for newly-planted trees, should not be overlooked.

### THE FLOWER GARDEN.

At the present time there is no plant in the hardy herbaceous border more effective than the

#### DELPHINIUM.

whether it be the annual or perennial, though the tall hybrids of the latter are especially so. The great difference in their height, they range from 1 foot to 12 feet high, and their variety of colours, from pure white to scarlet, and every shade of blue, from bright lavender to deep indigo, make them splendid subjects for using in many ways, either in groups or masses of distinct colours or as single border plants in combination with other plants. The effects of these combinations are sometimes very beautiful, and now that the Delphinium is in flower it is a good time to observe and think of fresh effects with them for next summer. Their cultivation is very simple, as they are so perfectly hardy and thrive in the most ordinary soil, though of course they do best in rich deep soil. Seeds sown now or a little earlier of the perennial sorts will supply flowering plants for next year, but if there are certain colours it is desired to retain distinct the best plan is to propagate by dividing the stock of the particular plant in the spring just as it is starting into growth. It is advisable to lift the perennial plants every three or four years and trench the ground and manure it thoroughly before replanting. This is best done in spring. Like a good many other things if they seed the pods should be removed to encourage flowers for the late autumn. The annual varieties should always be sown where intended to flower, and thinned out when the seedlings are large enough. If sown in boxes and afterwards planted out they are not nearly so successful.

Delphinium nudicaule is a most desirable dwarf compact little perennial, about 12 inches to 15 inches in height, with light scarlet flowers, and is very easily raised from seed. On a light dry border it comes into flower very early and lasts for a long time; it is most effective if grown in small groups. D. cardinalis is another scarlet flowering one, but is much larger growing. D. formosum and its varieties Belladonna and lilaceum are very effective, and are worth growing in any border. Of the hybrids sulphureum, with long spikes of beautiful clear yellow flowers and attaining 3 feet or more in height, is very pretty, while Sutton's Queen of the Blues, which I have already referred to in a previous note, should be in every collection because of its charming colour.

H. A. PETTIGREW.

*Castle Gardens, St. Fagans.*

### KITCHEN GARDEN.

#### LATE PEAS.

EVERY endeavour should be made to prolong the season as much as possible, and to attain this end the growths should be well thinned, the surface mulched with manure, copious supplies of water given during spells of hot, dry weather, and the haulm well syringed during the evening to promote a healthy growth. When suitable varieties are grown, Green Peas may be had quite till the end of October, and often in favourable weather in many parts of the country well into November.

#### COLEWORTS.

Good breadths of these should be planted on heavily manured and deeply dug ground immediately they are ready, allowing a distance of 1 foot all ways. Every spare piece of ground should be planted, as they are much appreciated during the winter months. Well water in at the time of planting, also two or three times after to give them a good start should the weather be dry. The ground should be kept constantly moved with the hoe to encourage a free growth.

#### RUNNER BEANS.

These in many places, owing to the late spring, are in a very backward condition. Keep the roots well supplied with clear and farmyard manure water, and syringe the growths freely. This will materially assist the blooms to properly set. Make a good sowing of French Beans on a south border,

AZALEA TIME IN THE NURSERY OF MESSRS. H. LANE AND SON, GREAT BERKHAMSTED.

when protection can be afforded them should it be necessary. This sowing will give a good supply of pods late in the season.

#### MUSHROOM BEDS

which were made up in cool places in the open will now be yielding good returns. The covering of long litter should be renewed with fresh material occasionally, and where the bed has been in bearing for some time apply a good soaking of farmyard manure water. Syringe the beds morning and evening. Make up beds in the Mushroom house at intervals for autumn use, keeping the structure as cool as possible.

#### CUCUMBERS

in pots and frames should be kept well thinned. Apply a good mulching of rotten manure and turfy loam. Syringe and shut up early in the afternoon, but admit air early in the morning. Ridge Cucumbers will now be about at their best, and be bearing freely. Give manure water frequently, and keep the plants well syringed in the afternoon. Relieve the plants by cutting the fruit as fast as it becomes fit, as these are much superior in flavour when used before becoming too large. Seed of a good free-bearing variety should now be sown in small pots for planting in the Cucumber houses and giving a supply during autumn. Encourage a short, stout-jointed growth before planting, when they will continue to bear for a much longer period.

#### TURNIPS.

Choose, if possible, showery weather for sowing good breadths of these. Give a good surface dressing of soot and burnt garden refuse, make firm, and sow in shallow drills in dry weather. Thoroughly water the drills before sowing, rake in immediately after, and sprinkle over the surface a little short grass from the mowing machines. Several sowings should yet be made, as frequently the later ones prove the most serviceable. Snowball and Prizetaker are two of the best for sowing at this season. The latter is a green top variety, but of excellent quality and appearance, and very hardy. Thin out the earlier sowings; but this ought to be done twice, leaving them the first time just as thick again as they will have to remain. Dust with soot and wood ashes and hoe repeatedly.

#### CABBAGE.

Make one sowing at once and another quite at the end of the month. The premature running to seed in spring is generally caused through

sowing too early and not making a suitable selection of varieties. I know of no kind to equal Ellam's Early for the first sowing, or indeed for any other at this season. Flower of Spring is also reliable but larger.

E. BECKETT.

### NURSERY GARDENS.

MESSRS. H. LANE & SON, BERKHAMSTED.

BY reason of the introduction of that sterling Apple Lane's Prince Albert, if for no other, the name of Lane is widely known throughout the world of horticulture, for it is seldom now that one visits a fruit garden where this valuable variety does not find a cherished place. But the visitor to the home of this splendid Apple will find not only that largely and well represented, but there are many other items of sufficient interest to attract his attention. He will, indeed, find that it is a very extensive nursery, containing a comprehensive collection of hardy and indoor plants thriving luxuriantly. No less than

#### 150 ACRES OF LAND

around Berkhamsted are planted with ornamental trees and shrubs, so some idea of the quantity and variety of the stock of these can be obtained. Messrs. Lane's various nurseries and orchards practically encircle the town of Berkhamsted, although the most extensive of them is that known as the Balshaw Nursery. It is here that the photograph from which the accompanying illustration was made was taken. This gives one some idea of the extent to which just one class of plants is grown by Messrs. Lane, viz., Azaleas and Rhododendrons: indeed, Azalea time in the Berkhamsted nurseries is quite an event in the neighbourhood. There are many acres devoted to these plants, and they seem to delight in the soil of the district. In early summer, as far as one can see in several directions, are sheets of colour. It would serve no useful purpose to enumerate the leading varieties of

RHODODENDRONS AND AZALEAS, for they are continually mentioned in these columns by one writer or another. Particularly fine are the standard Rhododendrons in Messrs.

Lane's nurseries, plants sturdy and strong, well developed, and flowering grandly. The standard Rhododendron is not met with nearly so often as its merits entitle it to be, for a good plant is stately and handsome; and, if the variety is well chosen, will add much to the early summer beauty of any garden. Everestianum, Lady Helen Cathcart, Hendersoni, and Purity are just a few varieties that make particularly good standards. Of Messrs. Lane's Azaleas the illustration will convey a far better idea than can a pen description.

#### HARDY HEATHS

that of recent years have much increased in popularity are largely grown in the Balshaw nurseries, and allied plants, such as Andromeda, Kalmia, Menziesia, and Pernettya also are extensively cultivated. One of the principal features of the Berkhamsted nurseries is

#### THE COLLECTION OF CONIFERS.

One sees them in all sizes, from recently-rooted plantlets to specimens quite suitable for isolated planting on lawns or in other conspicuous positions, and of all ages between these extremes. Sturdy and hardy, frequently transplanted, they are the picture of healthy plants, and give promise of full satisfaction when permanently planted. Of *Cupressus lawsoniana*, one of the commonest yet most satisfactory of evergreens, Messrs. Lane grow several pretty varieties, of which they specially recommend the following: *L. erecta viridis*, bright green foliage, symmetrical habit; *L. lutea* and *L. nana*, distinct and compact-growing varieties; and *L. stricta*, of upright growth. Of Pines we have rarely seen a better lot (*P. austriaca* particularly), and the collection of Retinosporas contains

#### MANY BEAUTIFUL THINGS,

of which *R. plumosa aurea*, a lovely golden sort that retains its colour well throughout the year, is perhaps the best. All the most useful genera of Conifers are represented both extensively and well, but we need not mention more of them individually. The quantities of

#### EVERGREEN TREES AND SHRUBS

are immense, especially of such sought for things as Aucuba, Holly, Box, Laurel, Berberis, &c. Of Hollies we remarked some grand old plants, wonderful bushes, and the Aucubas, too, deserve special mention. Messrs. Lane state that they find the following to be the most useful and distinct forms: *femina vera*, compact, green leaved, berry bearing; *longifolia*, with narrow leaves, showing the berries to better advantage; *mascula*, green-leaved, producing the pollen to fertilise the others; and, of course, *Aucuba japonica variegata*. The Berkhamsted

#### VARIEGATED BOX

is also worthy of special note, both with reference to its good colouring and the quantity of plants grown. Of Yews, Messrs. Lane in common with other firms have hardly sufficient to meet the enormous demand there is for this indispensable evergreen, although the ground covered with

#### ENGLISH AND IRISH YEWS

and the varieties of them is of considerable extent. One of the prettiest Yews and one that every collection of trees should comprise is *elegantissima* (bushy and of a silvery tint), and of this Messrs. Lane have an unusually large stock. We have not the space to enter into detail with regard to the deciduous trees and shrubs, the weeping trees, climbers, forest trees, &c., that are largely grown in the various nurseries of this firm, but we must not omit reference to the

#### FRUIT TREES,

for one does not often meet with acres of them that can show so uniform and vigorous a growth as do the Apples, Pears, Plums, &c., on Messrs. Lane's fruit farm. Plants one year old were making, in fact had already made, surprising growth, especially so the standard Plums and Apples. Needless to say trees of the best varieties of hardy fruit are grown, and Apple Lane's Prince Albert, already incidentally mentioned, is of course not the least numerously represented.

The Berkhamsted nurseries have long been famous for the culture of

#### POT VINES,

and after seeing the really splendid examples now growing in the Vineries here one recognises that the reputation is still maintained, and one no longer wonders why or how it has been obtained. Numerous varieties of Grapes not generally met with are grown by Messrs. Lane, as well as the better known ones; for instance, Dr. Hogg, Ferdinand de Lesseps, Grizzly Frontignan, the Strawberry Grape, &c.

#### FIG CULTURE IN POTS

forms also a feature of the indoor department of this nursery, and of this fruit we noticed a good collection of varieties, Black Ischia, Negro Largo, Brown Turkey, White Ischia, Brunswick, &c.

Of the collection of Roses, both out of doors and in pots under glass, we will not now attempt to deal, and there are other features that might well lay claim to the right of mention. Some at least of the more noteworthy items in an old-established and thoroughly representative nursery have been mentioned.

## SOCIETIES.

#### NATIONAL CARNATION AND PICOTEE SOCIETY.

(Continued from page 71.)

##### SECOND DIVISION.

F. Wellesley, Esq., Woking (gardener, Mr. J. Gilbert), was first for twelve bizarre and flake Carnations, with good bright blooms; and Messrs. Pemberton and Son, Walsall, second.

F. Wellesley, Esq., was also first for twelve self Carnations, showing excellent blooms of Cecilia, Mrs. William Mostyn, Bomba, &c.; Messrs. Thompson and Co., Birmingham, were a good second; and Messrs. Phillips and Taylor, Bracknell, Berks, third.

F. Wellesley, Esq., was also first for twelve fancy Carnations, with splendid blooms. Messrs. Thompson and Co. were second; and Messrs. Phillips and Taylor third.

The first prize for twelve white ground Picotees was awarded to F. Wellesley, Esq., for a choice exhibit; Messrs. W. Pemberton were second; and Messrs. Thompson third.

F. Wellesley, Esq., was first for twelve yellow ground Picotees with splendid flowers of H. Falkland, Lady St. Oswald, Lady Bristol, &c.; B. Nash, Esq., Old Woking, was second; and Messrs. Thompson and Co. third.

F. Wellesley, Esq., was again first for six self Carnations, showing the variety Benbow; Messrs. Thompson and Co., Birmingham, were second with Mrs. Eric Hambr' and; and Messrs. Phillips and Taylor third.

F. Wellesley, Esq., was first for six yellows or buff ground fancy Carnations, with excellent blooms of Argosy; and Messrs. Thompson and Co., Birmingham, were second, with Galileo; and Messrs. Phillips and Taylor third.

The first prize for six fancy Carnations was won by Messrs. Phillips and Taylor, Bracknell, with good Artemis; F. Wellesley, Esq., being second.

For six yellow ground Picotees, F. Wellesley, Esq., was first with excellent flowers of Lady St. Oswald; B. Nash, Esq., Old Woking, being second; and Messrs. Thompson and Co. third.

For six varieties of selfs and fancies, F. Wellesley, Esq., was first; Messrs. Thompson and Co. second; and Messrs. Phillips and Taylor third.

##### THIRD DIVISION.

For six blooms bizarre and flakes, J. J. Keen, Esq., Southamptpn, was first; J. Fairlie, Esq., Acton, W., second; and A. Greenfield, Esq., Sutton, third.

W. Spencer, Esq., won for six self blooms; R. C. Cartwright, Esq., was second; and E. Charrington, Esq., Chislehurst, third.

For six fancy Carnations, W. Spencer, Esq., was first; E. Charrington, Esq., second; and R. C. Cartwright, Esq., third, all showing beautiful flowers.

For six white ground Picotees, W. Spencer, Esq., Bexley Villa, Windsor, was first; R. C. Cartwright, Esq., second; and J. Fairlie, Esq., third.

For six yellow round Picotees W. Spencer, Esq., was first; E. Charrington, Esq., second; and R. C. Cartwright, Esq., third.

For a vase of Carnations, E. J. Wootton, Esq. (gardener, Mr. G. Neal), Winchester, was first with a handsome exhibit of a yellow variety; W. Spencer, Esq., Windsor, was second with rose-coloured flowers; and T. W. Euston, Esq., Chadwell Heath, Essex, was third.

#### THE HORTICULTURAL CLUB.

THE annual excursion of this club took place on Thursday, the 24th ult., when about forty members and their friends spent a delightful day on the Upper Thames. Among those present were Messrs. H. Veitch, Kay, Ashee, Monroe, Sweet, Watkins, Thomas, Barr, Shoults, Goldring, May, and Drury, most of whom were accompanied by their wives or lady relatives. Meeting at Paddington at 11.15, the party arrived at Cookham in time for an early lunch at the Crown Hotel, prior to a trip on a steam launch. A journey down the river was made as far as Temple Mill, beyond Marlow. On this occasion the excursion committee abandoned the

usual programme of a series of visits to celebrated gardens, owing partly to the inevitable fatigue attendant thereupon, and partly to a desire to vary its experience. However, as demonstrated on this occasion, little or nothing was lost thereby in horticultural instruction and interest, since the beautiful glimpses obtained on the way of the innumerable riverside gardens and picturesque dwellings nestling therein, to say nothing of the unparalleled woodland effects of the Cliveden Heights, were a liberal education in themselves. Every moment new vistas of enchanting river scenery, enhanced to the utmost by ideal weather conditions of lovely cloud-effects and balmy atmosphere, opened out. Under no other conditions possibly could particular arboreal effects of contrast and harmony be studied so well, while every here and there new hints were afforded of what could be done in the garden. As an instance of this, a long, low hedge composed entirely of the Crimson Rambler Rose evoked general admiration, especially as the flowers were at their best. Close thereto a house draped with Ampelopsis Veitchii, varied with Aristochia Siphon, presented one of the prettiest effects of contrasting foliage which we have seen for a long time. Returning to the Crowne at Cookham about six o'clock, a capital dinner was served, and the landlord was heartily thanked for the valuable aid he had afforded Mr. Harry Veitch in perfecting the programme. After the dinner a humorous essay on the "Tater Diseases," ostensibly from the pen of Willyam Grubbins, ed gardner, Dibble All, Beds, was read by Mr. Drury.

Mr. Harry Veitch was warmly thanked for the capital arrangements made and carried out without hitch, great regret being expressed at the unavoidable absence of Mr. E. T. Cook, the secretary, owing to a family bereavement the day previous, and the old secretary and founder of the club, the Rev. H. H. Dombrain, was appropriately cheered in his retirement by the despatch of a telegraphic greeting for "Auld Lang Syne."

#### WOOLTON.

THE annual show was held in the grounds of Woolton Wood, by the kind permission of Hollbrook Gaskell, Esq., J.P. The open classes of the show are few, but are always noted for their excellence, and this year the exhibits fully maintained their reputation.

For the circular group Mr. Jones (gardener to S. Sanday, Esq.), held the premier position with choice material tastefully arranged; Mr. J. Stoney (gardener to F. H. Gossate, Esq.), was second; and Mr. T. Carling (gardener to Mrs. Cope), third. For six distinct varieties of fruit, Mr. J. Clark fed with well-finished Grapes, Peaches, Melons, &c.; Messrs. J. Stoney and T. Carling were the other prize takers.

For herbaceous cut flowers Mr. Jones led with bunches of Lilliums, Alstroemerias, &c.; Mr. J. Stoney followed. For six kinds of vegetables Mr. J. Stoney won with well-finished examples; Mr. Jones second. Sweet Peas, twelve varieties, brought a fine competition with good flowers throughout. The winners were Messrs. Jones, D. McKenzie (gardener to E. Darlington, Esq.), and T. Carling.

Mr. R. Todd (gardener to Hollbrook Gaskell, Esq.), contributed a very good lot of Orchids. Mr. T. Carling staged Tomatoes in pots carrying heavy crops of fruit; Troughton's Prolific was much admired with upwards of forty fruits on a bunch.

#### WALLASEY.

THE first summer exhibition, under the auspices of the Wallasey Amateur Gardeners' Association, was held in the charming grounds of the Central Park, Liscard, on July 23, and proved an unqualified success. For the circular group of plants Mrs. D'Arcy won with a well-arranged lot, in which baskets of Gloxinias, Begonias, Palms, &c., were effective. Mr. H. Ogden followed with a good lot. For four stove or greenhouse plants, distinct, the same exhibitor won, and also for three exotic Ferns, for one specimen plant in bloom, two Palms, and three Petunias; a very good record.

For twelve bunches of herbaceous cut flowers, for twelve and for six Roses, Dr. Bell won in each class, the herbaceous flowers being of high merit. For four dishes of fruit, J. D. Tyson, Esq. (gardener, Mr. R. Gregson) won with a good collection, the same exhibitor securing chief honours for two bunches of black and two bunches of white Grapes.

Certificates of merit were awarded to Mr. H. Middlehurst for a well-arranged collection of Sweet Peas in the leading varieties; Messrs. A. Dickson and Sons, Newtowndale, for a fine lot of Roses; Mr. C. Morgan for a group of plants, *Lilium auratum* being very good; Mr. J. Emmon for a table of stove and greenhouse plants. Mr. John Finnigan and his committee are to be congratulated upon their initial exhibition, which should become highly popular.

#### CARDIFF HORTICULTURAL SOCIETY.

THIS society held its fourteenth annual show on the 23rd and 24th ult., in delightful weather, in the Sophia Gardens, Cardiff, which is an ideal place for such purpose. The show was generally considered the best that the society has held, and the classes were remarkably well filled. The non-competitive exhibits were also numerous, and did much to help to make the show a success. The groups of plants, table decorations, Roses, bouquets, fruits, and vegetables were excellent. Mr. H. Gillett (the secretary) and his committee must be congratulated upon the splendid results attained.

#### CUT FLOWERS.—OPEN CLASSES.

In the class for twelve Roses, distinct, three blooms of each, the first position amongst four exhibitors was secured by Mr. Crossing, Penarth Nurseries, with good blooms of Suzanne Marie Rodocanachi, Mrs. R. G. Sharman Crawford, Marquess of Londonderry, Bessie Brown, Helen Keller, &c.; the King's Acre Nursery Company, Hereford, were second with Mrs. Grant, Reynolds Hole, Baron Rothschild, Mildred Grant, &c. For twelve Teas or Noisettes, three blooms of each, Mr. S. Treseider, Cardiff, was first with good blooms of The Bride, Muriel Grahame, Medea, Mainau Cochet,

Souvenir de S. A. Prince, Souvenir d'un Ami, &c.; Messrs. T. Townsend and Son, Worcester, were a good second. For twenty-four blooms, distinct, the King's Acme Company were first with Suzanne Marie de Rodocanachi, Mme. Eugène Verdier, La France de St. Lady Sheffield, Duchess of Portland, Mildred Grant, Xavier Olivo, Count Raimbaud, &c.; Mr. S. Treseder was second, his best blooms being Alfred Colombe, Suzanne Marie Rodocanachi, Earl of Dufferin, Pride of Waltham, &c. Five exhibitors entered in this class. For twelve blooms, any one variety other than Teas or Noisettes, there were many competitors, Messrs. Townsend and Son taking the lead with a fine stand of Mrs. John Lang. For twelve blooms of Teas or Noisettes, Messrs. Townsend and Sons were first with Mrs. E. Mawley.

For a collection of Roses, staged with their foliage in a space of 6 feet by 3 feet, Mr. Crossling was first, and secured with the first prize the Royal Horticultural Society's silver Flora medal; second, Messrs. Townsend and Son; third, Mr. S. Treseder.

For a collection of Carnations and Picotees, arranged with their foliage and buds in a space 6 feet by 3 feet, Messrs. W. Tuplin and Son, Newton Abbot, were first; second, Mr. Crossling. For Carnations and Picotees, six blooms of each, distinct, Messrs. Blackmoor and Langdon, Bath, were first with good blooms of Willie Tyler, Amelia, Cecilia, Gracie, Mrs. Wall, &c., closely followed by Mr. Pike, of Llanishen, Mrs. E. Smith, Devonshire, being third.

In the class for Sweet Peas, eighteen varieties, arranged in vases, there was much competition, the first position being taken by Messrs. I. House and Son, Westbury-on-Trym, Bristol, with, as their leading varieties, coccinea, Jenny Gordon, Lady Grisel Hamilton, Miss Willmott, Lily Countess of Lathom, Lord Rosebery, Lady M. Ormonde Gore, Hon. Mrs. Kenyon, Gracie Greenwood, &c.; Mrs. Jeuner, Wenlock Castle, was a creditable second; and Mr. Byass, Bridgend, third.

#### PLANTS.—OPEN CLASSES.

For four stove and greenhouse plants in bloom, Mr. Cypher, Royal Exotic Nursery, Cheltenham, was first with excellent specimens; Mr. Lockyer, gardener to C. Hanbury, Esq., Pontypool Park, was a good second; Mr. Carpenter, gardener to W. J. Buckley, Esq., Llanelli, being placed third. For four ornamental foliage plants, Mr. Cypher was again first; second, Mr. Carpenter. For twelve dinner-table plants, Mr. Bastin, gardener to Sir A. Henderson, Buscot Park, Faringdon, was first; second, Captain Matures, Llandaff; third, Mr. Carpenter.

#### GROUPS.

These attracted much notice. For one in the open class, covering a space of 150 square feet, Mr. Cypher arranged a charming group in his usual tasteful manner; Mr. Carpenter was second. In the class open only to amateurs and gentlemen's gardeners (space of 50 square feet), there were four good groups staged, Captain Matures being first, followed by Mr. Carpenter and Mr. W. N. Lawes in the order named. For miscellaneous plants (space of 25 square feet), Mr. C. Waldron was first; second, Mr. Lawes; third, Mr. Carpenter. For a group of Begonias, Mr. W. Green, Pen-y-lan, was first; second, Captain Matures; third, Mrs. Gunn, Cardiff.

#### TABLE DECORATIONS.

For a table 8 feet by 4 feet, laid for eight persons with dessert, &c., amongst five exhibitors Miss Jenkins, Cardiff, was deservedly placed first, using flowers of Gladiolus Mary Anderson and Sweet Peas with Adiantum Ferns and grasses; Mrs. Waldron was second, and Mrs. Brooks third. For a table 4 feet by 3 feet, Miss Ada Stanley was a good first amongst six competitors with a beautiful arrangement of Sweet Peas, Maiden-hair Fern, and grasses; second, Mrs. Jenner; third, Mrs. Jenkins.

#### BOUQUETS, &c.—OPEN.

These, as is always the case at Cardiff, were shown in perfect condition, Mr. W. Treseder securing first place with a bouquet of Roses and a bouquet for the hand. He was also first for a lady's spray, for a single basket of flowers, and for two baskets of flowers. Mr. Baggesen was first for a bridal bouquet.

#### VEGETABLES AND FRUIT.

These, together with plants, were splendidly staged by gardeners and cottagers, and there was a spirited contest amongst the Cardiff and county societies (affiliated district societies) for a challenge trophy (silver bowl, presented by Messrs. D. Duncan and Sons, *South Wales Daily News*), given for a combined group of cut flowers and vegetables covering a space of 18 feet 6 inches. The coveted prize was this year won by the Margam district, whose strong point was vegetables. The St. Fagan's district were a good second, and the Paterson Super-Ely district third.

#### NON-COMPETITIVE EXHIBITS.

These were shown in great variety, and made leading features. Silver-gilt medals were awarded to Mr. A. Perry, Winchmore Hill, for Water Lilies; to Mr. John Russell, Richmond Nurseries, for stove and greenhouse plants; and to Mr. Eids, Regent Street, London, for miniature Japanese trees in pots. Silver medals were awarded to Mr. Eckford, Wem, for Sweet Peas; to the King's Acme Nursery Company, for Roses; to Messrs. Dicksons, Chester, for miscellaneous plants; to Messrs. Wallace, Colchester, for herbaceous plants, &c.; and to Messrs. Blackmoor and Langdon, for Carnations and Begonias.

#### HUYTON AND ROBY.

If not the best this exhibition must at least rank as equal to any former display, the plants generally, although not large, were fresh, and gave evidence of good culture; and it is to be regretted that the space is so restricted that a larger marquee cannot be used; under the present conditions the plants cannot be seen to advantage. One other point in connexion with the plant classes that should be enforced by the committee, namely, the naming of exhibits; the exhibitor should remember that shows are not organised for

his benefit alone, and it is most desirable that the visitor should, if he wishes, be able to learn the name of the plants shown.

For the 9 feet circular group of plants A. McKenzie Smith, Esq. (gardener, Mr. W. Lyon) was first, and Thos. Henshaw, Esq. (gardener, Mr. J. George) second. Four stove or greenhouse plants, the same exhibitor won. For three stove or greenhouse Ferns: First, Mrs. Harding (gardener, Mr. J. B. Hardcastle), included being two fine specimen Tree Ferns. For two Palms or Cycads, Mr. J. B. Hardcastle won with good plants. For three Fuchsias and the single specimen, Mr. E. Bridge was first with profusely flowered plants. For four Gloxinias, Mr. W. Lyon won with good varieties, whilst he held his own for the single plant; this class was remarkable throughout for well-finished plants, and altogether made an imposing display.

The Roses were only moderate, Mr. J. Burrows winning for twelve and six blooms, and for six (three dark and three light). For six varieties stove or greenhouse cut flowers, J. Beecham, Esq. (gardener, Mr. W. Oldham) had the best, and for the best twelve bunches of herbaceous cut flowers Mr. J. George scored with a capital lot.

For four distinct varieties of fruit, Mr. W. Oldham won with fine Black Hamburgh Grapes, Royal George Peaches, Melons, &c.; Mr. T. Eaton was second. The same exhibitor won for two bunches of black Grapes with Black Hamburgh. For two bunches white with large bunches of Buckland Sweetwater. For three dishes of hardy fruit Mr. T. Eaton was first.

Mr. H. Middlehurst staged an excellent collection of Sweet Peas, and Messrs. Candwell showed hardy flowers, Roses and Sweet Peas. Mr. H. Middlehurst ably accomplished the secretarial duties.

#### THE NATIONAL CHRYSANTHEMUM SOCIETY.

THE annual outing of the above society took place on the 23rd ult., and by the kindness of Sir W. Wetman Dickinson Pearson, Bart., M.P., some 110 members and their friends visited Paddockhurst, Worth. The party travelled by the Brighton Railway to Three Bridges Station, from whence they were conveyed to Paddockhurst along some of the pleasantest leafy highways it would be possible to find in the county of Sussex. On arriving at their destination a short walk was enjoyed and then dinner was served in a spacious wagon shed, which Mr. A. B. Wadds had gaily decorated, and which was much preferable to a close tent. The chair was taken by Mr. Thomas Bevan, the chairman of the executive committee, who was supported by Mr. J. H. Witty, vice-chairman, Mr. J. W. Moorman, treasurer, the Mayor of West Ham, and several of the councillors of that borough. After dinner the usual loyal toasts were given, and then the healths of Sir W. D. and Lady Pearson, with hearty thanks for permission to visit the grounds of Paddockhurst. Mr. Wadds, the gardener at Paddockhurst, was also toasted, he having rendered most valuable assistance in making the outing a success. Dinner over, a visit was made to the glass structures and also the kitchen and flower gardens, notice being taken of the excellent condition of everything under culture and the admirable care observed on every hand, and great praise was bestowed upon the terrace gardens with its beds of various types of Pelargoniums mixed with Violas. A goodly number of the visitors were, by the permission of Lady Pearson, shown through the mansion, while others betook themselves to the cricket ground near the mansion, where a match was played between the Paddockhurst Club and a scratch eleven made up among the visitors, in which the Mayor of West Ham, playing for the latter, distinguished himself in a most creditable manner, making the highest score for the visitors' side. After the match tea was served, and at half-past seven a return was made to the station, and on departure hearty cheers were given for Sir W. Wetman and Lady Pearson and also for Mr. Wadds. London was reached shortly before ten o'clock, and the fact that the weather was gloriously fine added greatly to the enjoyment of one of the pleasantest outings the society has undertaken.

#### A SWEET PEA INSPECTION AT KELVEDON.

On the invitation of Messrs. Hurst and Son, 152, Houndsditch, a large party, which included personal friends of Mr. N. Sherwood, representatives of the leading London and provincial seed houses, and the chairman, officers, and committee of the National Sweet Pea Society, journeyed from Liverpool Street by the Great Eastern Railway to Kelvedon to inspect the large and representative collection of Sweet Peas on the seed trial grounds of the firm at Feering, near Kelvedon. Reaching Kelvedon at noon, the party was conveyed in coaches to Feering, where they were met by Mr. N. Sherwood, in greatly improved health, and his sons, Mr. William and Mr. Edward Sherwood, and a number of personal friends. Luncheon was served in a cool and commodious barn, Mr. N. Sherwood presiding, supported by his sons, Dr. Campbell (his son-in-law), Mr. Wm. Marshall (the chairman of the floral committee of the Royal Horticultural Society), Dr. Salter, Messrs. James Scruby, W. A. Bilney, J. Smith, J. W. Moss, Whitpaine Nutting, W. A. Garraway, &c. Justice having been done to an admirably-served repast, the usual loyal and complimentary toasts were duly honoured, and in rising to respond to the toast of his health, Mr. N.

Sherwood received a most hearty and sympathetic reception, as also did his son, Mr. Edward Sherwood, who had organised the outing. The trial of Sweet Peas was then inspected. The collection, which included all the recent novelties, consisted of nearly 500 samples, all in full bloom, and there was also a representative collection of the varieties of the Cupid type, carrying excellent heads of bloom, and showing little or nothing of that tendency to drop their buds prematurely, which has been noticed in previous years. A portion of the company inspected a remarkable and representative trial of culinary Peas, of which nearly one thousand samples had been sown. One leading feature was the fine character and purity of the various stocks. Others inspected interesting trials of Beans, Beets, Lettuces, Onions, Carrots, &c., and, not least in interest for many, a complete collection of aromatic and culinary herbs. The whole of the trials reflected the greatest credit upon Mr. T. A. Newby, who has charge of this important branch of an extensive business. Tea and light refreshments were subsequently served on the grounds, and the visitors departed for town with hearty good wishes for complete restoration to health of Mr. Sherwood, who is residing at Feering with his family and deriving great benefit from the rest he is enjoying. Hearty cheers were given for Mr. Sherwood and his sons on leaving, and the company reached London at a comparatively early hour, having been favoured with glorious weather throughout the day.

#### BOOKS.

**My New Zealand Garden**, by a Suffolk lady, tells the story of some of the pleasures as well as the pains of amateur gardening in that far-off colony, and is a record of personal experience that may be helpful in encouraging other New Zealand settlers to make the most of their opportunities. The ease with which South African plants, Nerine, Gerbera, Protea, and the like can be grown in the open air, and the kindliness with which the hardier vegetation of more northern climates accommodates itself to new conditions at the antipodes, disclose possibilities almost unlimited, which cannot but make the English gardener envious, to say nothing of the beautiful Ferns and indigenous flora of which some details are given. The lack of careful revision is to be regretted.

#### EVERGREENS, FLOWERING SHRUBS, AND FORESTRY.

An interesting lecture was delivered on Saturday, 12th ult., at the Delgany Nurseries, Greystones, County Wicklow, by Mr. A. D. Richardson, late of the Royal Botanic Gardens, Edinburgh, on "Evergreens, Flowering Shrubs, and Forestry." Through the courtesy of Messrs. Pennick and Co., proprietors of Delgany Nurseries, a large number of visitors from Dublin and surrounding country were privileged to attend. They were conducted through the grounds and shown the selection of trees and shrubs of all kinds. Mr. Hume Bland, of Kilquade, presided.

Mr. A. D. Richardson, who was cordially greeted, in the course of his lecture on "Evergreens, Flowering Shrubs, and Forestry," said that they would all agree with him that however interesting the subject of "Evergreens and Flowering Shrubs" was, "Forestry" was of far greater importance to this country. The soil and the climate of Ireland were suitable for forestry. In fact, he could not name a species of tree or shrub or anything hardy that would not flourish in Ireland. They had in Ireland a somewhat humid climate compared with that on the coast of England or Scotland. The climate of Ireland was eminently suited to the growth of Spruce. When properly grown this was a tree which gave the greatest volume of wood per acre. There was a great deal of waste land in Ireland which would be better under timber, as they sent enormous sums of money annually out of the country for timber which could be grown at home. They were a long way behind Continental countries in the matter, and it was only now that the question was becoming acute. A sum of £26,000,000 a year went to the Colonies and other countries for timber. Of that sum £12,000,000 went to Sweden, Norway, and Russia for Pine wood. They could easily grow as good timber as Continental countries if they put their woods under a more rational system. On the Continent the soil which was too damp for one species of tree was planted with trees suitable for the ground. The tree was adapted to the soil, and not the soil to the tree, as was often attempted in draining. As for ornamental trees and shrubs, he expressed surprise to find growing in that nursery specimens of such enormous size, and exceeding any which he had ever seen before. He mentioned several plants which he had found growing in the

open in the nursery, which could not in most parts of England or Scotland be grown except under glass. As for the Rhododendrons, they were the finest specimens he had ever seen. In connexion with the planting of trees in towns in Ireland, he did not know if the same conditions obtained in this country as in cities like London, Manchester, or Leeds, where the atmosphere was polluted with impurities. When electric light was introduced, and gas pipes, which were under the ground, done away with, the trees would have a better chance of living, as they would not be ruined by the escape of gas. The most suitable species of tree for town planting was London Plane. That species of tree had the peculiar property of shedding both leaves and bark yearly. It was therefore well adapted for poisonous atmospheres such as those of London and thickly populated cities. Having given an interesting description of plants grown in the nursery, and which he submitted, the lecturer concluded.

Mr. Lambert Jones proposed a vote of thanks to the lecturer. Ireland was, he said, eminently fitted for producing resinous trees. The very bogs of Ireland were reservoirs of health, and by lowering the drainage of the Barrow and Shannon we would heighten the advantages derivable from the Bog of Allan. These bogs should grow the Spruce and Pine tribe admirably, also the life-giving Laurel and Rhododendron. Lands which in other European countries, and even in England, were marshy, were in Ireland redolent with health. The effect of plantations on the rainfall of our western counties should be tried, as the question is not decisively ascertained at present. In any case the hardy conifers should enhance Ireland's salubrity anywhere, and make West Cork, Kerry, and Clare, the sanitorium of Europe. One result is certain, the shelter produced must create admirable locales for Potato and other early vegetables for British markets. Mr. Richardson had spoken of the needless importation of timber. This importation could be reduced by one procedure only, viz., by such plantation as would correct branching or stem shoots. If trees are allowed to grow knotted we cannot have good timber; the stem or trunk timber is depreciated sixty per cent. for joinery uses. He suggests close or shady plantation.

Colonel Hewitson seconded the motion, which passed with acclamation.

## ANSWERS TO CORRESPONDENTS.

### RULES FOR CORRESPONDENTS.

**Questions and Answers.**—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

**Names of plants.**—F. N. R.—1, Kalmia latifolia; 2, Kalmia latifolia angustifolia; 3, the Laurustinus.—*Azara*.—The Lily is *Lilium testaceum*, sometimes called *L. excelsum*. The large piece of Fir is probably *Pinus excelsa* (the Himalayan Fir), and the smaller *Pinus austriaca* (the Austrian Fir); but it is impossible to name such tiny pieces with any confidence. The single leaf, silvery underneath, is *Potentilla nivea*.—G. M. Littledate.—1, *Lilium croceum*; 2, *L. umbellatum*; 3, *L. excelsum*.—Mrs. Wedgwood.—1, *Erigeron philadelphicus*; 2, *E. speciosus*; 3, *E. Villarsi*. The Pink is *Cycllops*. Shrub No. 1 is an *Acer*; No. 2 a *Philadelphus*, but we cannot say which without flowers or fruit.—W. D. R. D.—*Allium maritimum*.

**Cabbage Lettuce failing** (G. W., Kent).—Some varieties of Cabbage Lettuce are very susceptible to turning black in the centre, as you describe, especially the wrinkly leaved varieties. Continuity is very subject to it. The cause is generally attributed to the foliage getting scorched and damaged when young through watering overhead or heavy showers followed by sudden bursts of sunshine. The damaged parts are folded in as the plant grows. They go on decaying and render the Lettuce worthless.

**Plants for chalk soil** (F. T.).—Of annuals and biennials any of the following families or genera: *Dianthus*, *Mignonette*, *Iberis*, *Poppy*, *Antirrhinum*, *Lupinus*, *Phacelia*, *Lunaria*, *Gedelia*, *Foxglove*, *Eschscholtzia*, *Virginia* and other Stocks, *Asters*, *Centranthus*, *Agrostemina*, *Sweet Peas*, *Scabious*, *Saponaria*, &c.; of perennials: *Dianthus*, *Iberis*, *Poppy*, *Lavender*, *Narcissus*, *Pentstemons*, *Achillea*, *Aconitum*, *Gaillardia*, shrubby *Veronicas* generally; *Pyrethrum*, *Lupinus*, *Lathyrus* or *Perennial Pea*, *Tritomas*, *Asters*, *Day Lilies*, *Poppy*, *Lenent Roses* (in shade), *Sedum spectabile*, *Megeseas*, *Scabious*, *Rudbeckia*, *Prunella*, *Pulmonaria*, and many more.

**Staking Peas** (J. C. D.).—We fear you have not done well in the staking of your Peas to press the stakes so close to each other at the top, as the inevitable tendency of such a course is to force the Pea stems or growths outside of the sticks and thus render them liable to be blown about for lack of support. To furnish that there should have been a space of fully 6 inches between the two lines of sticks all the way up, especially if your Peas (Duke of Albany) are growing strong, as is most likely the case. Not to stake such Peas is a grave mistake, so it is for varieties that grow but 3 feet in height, as the produce of plants that are well staked is usually one-third, and often one half, more than

is the produce of laid or unstaked rows. It would not now be wise for you to attempt to open or widen the sticks, but you had better get more tall ones and fix those in some 18 inches apart along each side so as to give the outgrowth the support that is needed.

**Camellias out of doors** (H. D. P.).—The ground mentioned should be well drained previous to planting. A layer of brick rubble 9 inches deep should be placed in each hole over agricultural drains. A depth of 2 feet of compost composed of two parts of good loam to one part of Briornos peat should be given. To each six parts of compost one part of rough sandy gravel should be added, well mixing the whole before using. If the soil around the roots is hard when planted they should be well soaked before being turned out, and the soil must be well rammed about them. Great care will be necessary to prevent their becoming dry until the roots begin to penetrate into the new soil. A mulching of well-rotted manure will be advantageous after planting.

**Recipe for fruit tree pests** (B. A.).—The recipe quoted would be an excellent one for the winter dressing of fruit or other trees for the eradication of aphides whilst growth was dormant, but for summer application on tender foliage we would recommend that the mixture be first tried at half its strength on a limited scale, and if found effective without injury to the foliage well and good. If not, the strength of the mixture could be increased until sufficiently strong to destroy the aphides without injury to growth. The two ingredients mentioned in the recipe are largely incorporated in ordinary soft soap, and for a good and safe summer wash for the eradication of aphides on fruit or other trees the following can be safely relied on: Mix together in hot water to the consistency of paint a wine-glassful of soft soap and the same of paraffin; to this add three gallons of rain or soft water, with which well syringe the affected parts.

**Vines sickly** (J. A. P.).—Your Vines are suffering from general debility. This is evident from the weakly growth of the shoots and from the thinness and want of substance in the leaves. Until you can infuse more strength and vigour of growth into your Vines we fear that complete immunity from such troubles as you complain of will be difficult to attain. To this end the step you took in renewing the inside border of your early viney is in the right direction. Without the Vines have abundance of healthy roots in a sweet and well-drained border it is hopeless to expect good results. We would treat the outside border in the same way as early in the autumn as you can, say the end of September (be careful in the use of artificial manures), and as soon as you can find time and the means serve your other Vines in the same way, and the result in due time will be strong, healthy, and disease-resisting Vines, with abundance of fruit. The parasite attacking the leaves and stems of your Vines is a fungus commonly called Vine rust. The best remedy for its extirpation is flowers of sulphur, applied thickly to the affected parts, and left on for twenty-four hours, partly shading the house during the time. Afterwards the sulphur may be blown off with a pair of bellows. We notice that some of the leaves have been sun-burnt, and traces of red spider are to be seen on others.

**Mealy bug on Vines** (Mrs. ROXHILL).—When mealy bug have secured a firm lodgment on the Vines it is a tedious and difficult matter to get rid of it. One of the best ways of doing so is the following, presuming that the work is to be taken in hand at once: Cut away from the Vines all superfluous lateral growth, taking care that every leaf and branch cut off is carefully collected and burnt. Syringe the Vines copiously with the following mixture, taking care that every particle of the foliage, both under and overleaf, is well saturated. A claret-glassful of paraffin, the same of soft soap, both mixed together with hot water until reduced to the consistency of paint, adding afterwards three gallons of rain or soft water. With this mixture carefully syringe the Vines two or three days in succession, at the same time syringing the walls and roof of the viney with the same solution. This application will kill every bug it will come in contact with, at the same time it will be necessary to closely inspect the Vines once or twice a week whilst the foliage remains on them for the further appearance of the enemy, and wherever seen should be shot at with this mixture. In winter, as soon as the Vines have been pruned, the rough outside bark should be rubbed off, and every particle of the stem well washed with the mixture. After this, the surface soil of the border should be removed at least to the depth of 1 in., and suitable mould added as a top-dressing to the same depth. As soon as growth is on the move in spring a keen look out must be kept for the reappearance of the bug, and wherever seen the mixture applied to it with a small brush. This look out must be kept throughout the season and the remedy applied. On the effective discharge of this duty hangs the success of the remedy. Should your Vines be bearing a crop of fruit the mixture cannot be applied until the Grapes have been cut.

**Origin of Crimson Rambler Rose (Rosa sinica Anemone).**—In your interesting account of British-raised Roses you refer to the Crimson Rambler as raised by Mr. Turner. As there are so many stories as to the origin of this Rose, such as to its having been brought from Japan by a Scotch engineer, &c., I venture to think many of your readers would be glad to have the question set at rest either by you or by Mr. Turner, who must know more about its origin than anyone else. Did Mr. Turner raise it or did he only put it on the market? The true history of this most remarkable Rose would be of great interest. There is another Rose I should like to ask some questions about. At the Rose show at the Temple on July 2 a beautiful bunch of *Rosa sinica Anemone* was shown; I forget by whom, I regret to say. It was a wonderful sight. I should like to know whether this Rose can be flowered in the open air; also, is the name *R. sinica* a synonym of *R. levigata* (the Cherokee Rose)? If so, why is a Rose from China called after a tribe of North American Indians? I should be most grateful if you would answer these questions.—F. N. A. GARRY. [In the bottom paragraph of the last column, on page 5, in our issue of July 5,

you will see it stated that Crimson Rambler is of Japanese origin, but was of English introduction. We believe no authentic account has ever been published regarding the origin of this Rose, but we believe it is a native of Korea. It was brought to England by the engineer of a trading vessel. This vessel brought from time to time a consignment of plants from Japan to Mr. Jenner of Edinburgh, and in one of these lots it was found. The gardener of this said gentleman was also accorded the privilege of disposing of it in England, which he did, we believe, for a very modest sum. The Rose was also exhibited at the Drill Hall on July 8, 1890, under the name of "Engineer," and received an award of merit, the exhibitor being Mr. J. Gilbert, Dyke Bourne, Lincoln. The lovely and most valuable single Rose (*R. sinica Anemone*) can be freely flowered in the open. It is far superior in this respect to the type *R. sinica*. Germany has the credit of its production, the variety having been obtained by cross-fertilisation by Herr Schmidt and introduced in 1896. The native habitat of *R. sinica* is China, but it has been naturalised in many parts of the globe. The Americans very soon invent a name for a Rose, and doubtless it is owing to its establishment in the States that the title of "Cherokee" has become associated with this Rose, but why this is so would, we think, be difficult to ascertain.—ED.]

**Ivy on trees** (G. W., Kent).—Unquestionably the growth of Ivy on trees is fatal to their proper development, and should never be allowed on valuable specimens, as it means ruin sooner or later.

**Scarlet Runners and Dwarf Beans** (G. W., Kent).—No doubt the cause of your failure is through soaking the seeds too long in paraffin, for unless they are thoroughly ripened and matured—as in a great many cases they were not last year—the paraffin would have a serious effect upon them, as, indeed, it does on all seeds when allowed to remain for any length of time in it. If necessary at all to use this for Runner and Dwarf Beans, it is far better to sprinkle a little along the drills after the seed is sown. Dwarf Beans are frequently sown at too great a depth, and many cases of failure may be attributed to this. Your method of manuring and treating the soil is excellent, provided, of course, the patent manures are used with discrimination, as no doubt they are in your case.

**Persimmon** (A. CHAPMAN).—You ought to find no difficulty in raising plants from your seeds of *Diospyros kaki*. They would, however, not produce fruit of good quality. There is a large number of named varieties which produce first-rate fruit, and fruit from a seedling would be about the same compared with them as a first-rate Apple compared with a Crab. There should be no difficulty experienced in fruiting the Persimmon in a sunny greenhouse; it fruits annually at Kew in a sunny house, and in Canon Ellacombe's garden in Gloucestershire it bears a fine crop of fruit every year on a wall out of doors. It likes fairly rich, loamy soil, and may be treated as Peaches or other orchard trees in pots, or may be planted out.

**Removing bulbous plants** (JUNORAMUS).—Such things as Narcissi, Tulips, and the like may be lifted after the leaves have died down, roots and foliage intact, and laid in by the roots in any spare border to more fully mature. This can hardly be done without some check resulting, but at the same time the check is less than would be the case were the bulbs not heeled in at all. Any time after the middle of July the bulbs may be again lifted and sorted into sizes for rep'anting in the border or in woodland or grassy places. No special treatment is required, and there is no reason, if given the usual treatment, why good blooms should not result another year. The least satisfactory of bulbous plants so treated is the Hyacinth, yet even this is not necessarily a failure if grown in good sandy loam. Indeed, we have now some bulbs in the garden that were forced into bloom a dozen years ago so early as January, and each year they carry good spikes of flowers. We do not say the increase is great, but in conjunction with the ordinary treatment accorded it is as much as could be expected. In this respect in private gardens has there been much waste in the past, for any flowers are welcome in border or woodland in spring time. Usually the bulbs we have referred to have been lifted every second year, and depending on their kind it is well that rest be given occasionally, though more especially in a continuously cold and wet season like the present one. The usual deep digging, manuring, and sand about the bulbs when grown in the border should not be lost sight of in the original planting. Each time the bulbs are lifted and replanted a fresh position in the border should be assigned them. Elladouno Lilies may remain undisturbed for an indefinite period if mulched annually, and we would certainly refrain from moving any that flowered well, except for creating fresh plantations. At such times the planting may be done quite early in July, and dry bulbs even to September. Delay in planting such things is not beneficial, however, German Iris and Day Lilies (*hemerocallis*) may be replanted now and then when the clumps become too crowded. This is an item that cannot be arranged by rule of thumb, however, and success largely depends on locality, depth of soil, &c. In light soils, such as the Thames Valley, the finest flowers of the Flag Iris are obtained only by biennial or triennial planting. Where ample soil exists, however, and ample room is given the plants, we know instances in a more holding soil where patches have formed 4 feet across and yearly produce several dozen spikes each. To remove such grand examples would be folly. We therefore advise you to be guided by your own results in your own special circumstances. Flowers may be sent for naming. See our rules and regulations. Good flowering specimens should be sent to obtain accuracy in naming.

\* \* Several answers are left over until next week.

### GARDENING APPOINTMENT.

MR. TOM GUILE, of Ascott Gardens, Leighton Buzzard, has been appointed gardener to A. J. Waley, Esq., Sone House, Reigate.

# THE GARDEN

No. 1603.—VOL. LXII.]

[AUGUST 9, 1902]

## IMPROVEMENT OF FLOWER EXHIBITIONS.

**W**E have lately had reason to praise a beautiful way of showing Roses, not the so-called garden varieties, but exhibition blooms, which tradition says shall be thrust into narrow tubes inserted in a green painted box. The ardent exhibitor will probably reply that because one or two classes are provided for flowers shown in this dainty way it does not follow the whole exhibition can be so treated. We have no desire to see the Rose exhibition completely altered in complexion, but there is no reason whatever why more classes of the nature of those provided at the Temple Rose show should not be instituted in the future.

But the whole method of staging flowers is wrong. As we have pointed out before, exhibitors persist in making a nursery garden of the exhibition, and pack in as many things as possible in a set space, without the slightest regard for the rarity or otherwise of the individual flower. A common garden flower, known to every intelligent country child, is thrust against an interesting rare kind some visitor would like to examine and probably purchase.

It is against the interests of the trade to put the matter on no higher level, so to exhibit flowers that all natural grace is gone. Of course there are exceptions, and a few nurserymen make displays that are at once delightful and instructive; but their example is not followed, and we stick to the ways of our forefathers with painful persistency.

We have lately heard complaints that flower shows this year have not in many cases received their usual support. This may be attributed to various causes no doubt; but it is not unlikely that flower exhibitions are ceasing to interest the general public because of the wearying monotony of the average display.

Last year we had reason to draw attention to the coloured grounds on which flowers are shown. The usual material is a hard raw green baize, which destroys the natural colouring, not only of flowers, but of foliage. The secretary of an important northern show asked us for assistance in choosing a suitable pattern of colouring for flowers and foliage, and we did so, selecting a certain tint of neutral grey-green, of a nature that is warm rather than cold, of course impossible to describe accurately in words, but such a colour as may be matched

in nature in many a piece of tree bark or half-dried moss. It is a colour that suits everything in the way of flower and leaf, so nearly neutral, and, though not dark, so low in tone that it does not come into competition with the most colourless foliage, such as is often seen, for instance, in Orchids.

As this matter of making flower shows more beautiful and interesting has been again taken up, we hope the following words we wrote last year about the supports for the flowers themselves will not be forgotten: "It is open to question whether the system of rough benches covered with baize could not in itself be considerably improved upon. We think that if a little careful thought were given to the matter that it would be easy to design very simple benches with upper ranges of staging, made in such sections as could be placed or easily fitted together in any of the forms of combination that might be required. If these were simply and strongly made, and painted a suitable colour, and given a fresh coat of paint every year before the spring shows, or a washing one year and a painting the next, the most difficult of the drapery part of it would be abolished, and the stages would be neater and more uniform. The drapery might be retained on the front of the bench down to the floor level, as it is obviously convenient for exhibitors to be able to put away their baskets and other matters under the bench."

## NOTES OF THE WEEK.

### FORTHCOMING EVENTS.

August 12.—Clay Cross Flower Show.

August 13.—Salisbury Horticultural Show.

August 13 and 14.—Hastings, St. Leonards and District Horticultural Society's First Summer Flower Show, Public Hall, Hastings.

August 14.—Taunton Dean, Rock Ferry, and Sheffield Horticultural Shows.

August 16.—Meeting of the Birmingham Amateur Gardeners' Association.

August 18.—Warkworth Floral and Horticultural Show.

August 19.—Royal Horticultural Society's Committees meet.

August 20.—Oxford Horticultural Show; Shrewsbury Floral Fête (two days).

August 21.—Jersey Agricultural and Horticultural Society's Show.

August 26.—Harpden Horticultural Show.

August 27.—Bath Floral Fête.

August 28.—Sandy Horticultural Show; Stirling Horticultural Exhibition.

August 29.—Bradford Horticultural Show (two days).

September 2.—National Dahlia Society's Show and Royal Horticultural Society's Meeting, Drill Hall, Westminster.

September 3.—Glasgow and Preston Shows (each two days), and York Florists' Exhibition.

September 4.—Paisley Horticultural Show (two days).

September 6.—Thornton Heath Dahlia Show.

September 10.—Royal Caledonian Horticultural Show at Edinburgh (two days).

September 16.—Dahlia Show, Royal Aquarium (three days).

September 18.—Great Fruit Show, Crystal Palace (three days).

**The proposed vegetable exhibition.**—The council of the Royal Horticultural Society, on Tuesday last, considered a further communication from me relating to the proposed vegetable exhibition next year at the Drill Hall, and finding that a big show was not asked for, but only a good representation of the best vegetables in season, have consented to the same being held subject to certain conditions with regard to prizes and classes, which would have to be arranged satisfactorily.—A. DEAN.

**Crossandra undulæfolia.**—Introduced from the East Indies in 1881 this handsome erect flowering stove plant has certainly not received the attention which its merits entitle it to. Not only are the leaves attractive, but the flowers, borne on erect spikes, are of such a rich shade of salmon-orange as to be almost unique as regards colour. Grown in  $5\frac{1}{2}$ -inch pots and interspersed with other stove plants, they present quite a fascinating appearance. Propagation is effected by taking side shoots moderately firm and inserting them in  $2\frac{1}{2}$ -inch pots in a light sandy soil and treating as for ordinary stove plants. Pot on as required in two parts loam, one of peat, and some sharp silver sand. Syringe during the growing season, but not when in flower; the colour is so delicate that the blooms would soon become spotted.

**A peculiar grafted Laburnum.**—On page 57 of THE GARDEN Mr. Owen Thomas gives a very interesting account of what is doubtless Laburnum (*Cytisus*) *Adami*, as growing in the Botanical Gardens at Birmingham. According to Nicholson, *Laburnum Adami* was raised or originated in 1825, by Jean Louis Adam, by shield-grafting or budding *C. purpureus* on to a stock of the common *Laburnum vulgare*. As Nicholson further observes: "A most extraordinary thing in connexion with it (*i.e.*, *L. Adami*) is the complete reversion of some parts of the same tree to one or the other of the parents." It may also be added that intermediates appear with buff or reddish flowers, and now and then tufts or Witches' Broom-like masses of what is practically *C. purpureus* appear on the same branch as the intermediate phases and the typical yellow *Laburnum*. Dr. Masters recently exhibited a branch showing these variations before the scientific committee of the Royal Horticultural Society, and every year specimens are sent for name or explanation to the editors of gardening papers and others, often accompanied by the remark that the tree on which they grew "has never been grafted." The point of special interest, however, in Mr. Thomas's note is that the particular tree at Birmingham would appear, from the wording of his remarks, to have been made over again in the Botanical Gardens there about thirty years ago by grafting *C. purpureus* on to the *Laburnum* stock. If this is so we have, as I believe, the only known instance

of Adam's original experiment and its results having been corroborated. I understood some few years ago that Messrs. Veitch, acting, I believe, on a suggestion of the scientific committee of the Royal Horticultural Society, undertook to experiment by grafting or budding *C. purpureus* on to the Laburnum, but I never heard if they actually did so or if any results were obtained. That variegation can be communicated to green-leaved stocks by budding or grafting variegated scions upon them is pretty well established; but so far the possibilities of graft hybridisation are, in the main, supported by Adam's *Cytisus* or Laburnum. I may say that I have repeatedly budded *C. purpureus* on to the common Laburnum without obtaining any results, but I should be the last to argue from my own failures that others may not have succeeded, as in the case at Birmingham. The original graft in the last-named case apparently died, notwithstanding which the stock had become "inoculated" as it were by the scion, an experience analogous to that in the case of variegated Abutilon, Pyrus, &c., as grafted on green-leaved stocks, the actual scions dying after they had communicated their characteristic vitality to the stock. It is, of course, well known that in the case of garden varieties of Apples, Pears, Grapes, &c., the stock often influences the scion in a marked degree, and that the converse is less often observable, perhaps, due to the fact that, as a rule, any growth produced by the stock is suppressed or removed as soon as it appears. There is a difficulty also in deciding the precise variation due to grafting varieties as against that produced by other factors, such as soil, climate, &c. The case of pure species being varied by grafting is less open to sources of error or misapprehension, but even here again there is room for further experiment and caution in preparing records of results. I hope, however, Mr. Latham will kindly tell us the history of the Birmingham grafted or budded Laburnum, and that this very interesting subject will also be kept in view by all horticulturists interested in the mysteries and vagaries of vegetable physiology.—F. W. BURRIDGE.

**The Prairie Rose.**—Where *Rosa setigera* can be got to flower freely it should be given a prominent position, for when smothered with flowers in August it makes a very pretty object. It is a native of North America and is of a particularly wild, rambling nature, shoots 15 feet or more long being made in a single season. The flowers are in large corymbs and are rose-coloured, changing with age to white; they are about 2 inches across, and continue in good condition rather longer than the majority of single-flowered Roses. When planting it a fence or cluster of good strong, rough branches should be provided for it to ramble over. If grown in this way the flowers are seen to advantage. At Kew it is flowering more freely than usual in the Rose garden, where it is very effective.—W. DALLIMORE.

**Achimenes Dazzle.**—Achimenes are so easily cultivated and lend themselves to such a variety of purposes that one would prefer to see them more frequently at our shows. The variety under notice has been grown for very many years, and still holds its position against all new comers. The small dark green foliage, brilliant scarlet flowers, and dwarf habit make it most useful for the front of the greenhouse stage. For grouping it is one of the most charming plants, the colour being so striking that it can be arranged instead of scarlet Pelargoniums, and it will impart a rich tone that the latter often fail to do.—R. P.

**Trellis Gooseberries.**—This manner of cultivating Gooseberries is rapidly growing in favour, and having practised it for the last twenty years I can testify as to the excellent results in regard to size and quality of the fruit thus obtained as well as to the ease with which it is gathered and netted. Another point in its favour not so generally known is the extra protection afforded against spring frosts. In a season like the present, when the bush fruit is nearly all on the ground, that on the trellis is very little affected, a state of things to be explained by the fact that the perpendicular style of training enables the foliage to shelter the fruit much more

effectually. As very close pruning (sometimes associated with a very brief life for the trees) is an essential feature in trellis system, I should like to note that the majority of our trees have been in their present quarters for twenty years, and that failures are due to an error in the selection of varieties.

There are some sorts that do not take kindly to this treatment.—E. BURRELL.

**Ceropegia Woodii.**—This is a very elegant habited plant from South Africa, introduced some years ago by the late Mr. Wm. Bull of Chelsea. As a basket plant in a warm plant house or stove it is very graceful and distinct. Its pendent shoots are very

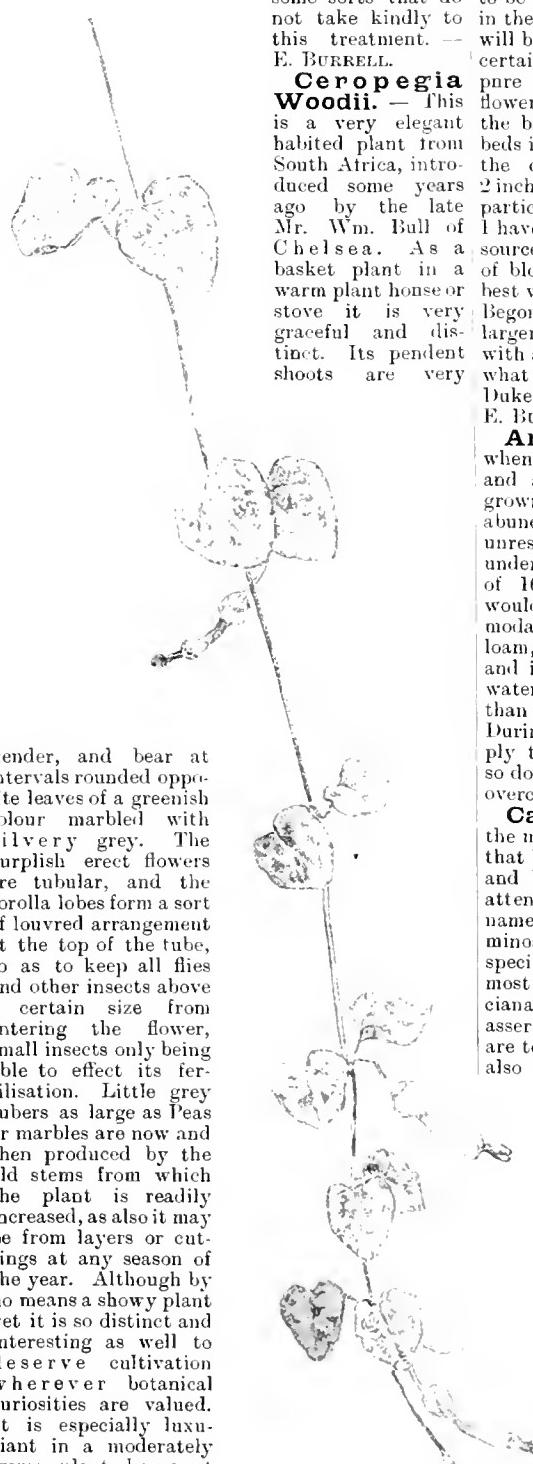

but for perennial interest and quaint attractiveness none of the many known species surpasses *C. Woodii*, which is herewith illustrated.—F. W. BURBIDGE.

**Fibrous-rooted Begonias.**—This race of Begonias, although not so showy as the tuberous section, make charming beds, and are by no means to be despised as pot plants. It is probable that in the course of a few years the size of the flowers will be considerably increased; at present they are certainly small, but are remarkable for the clear pure shades in scarlet, pink, and white, and the flowers are produced in great profusion. One of the best things to associate with them in small beds is the very dwarf Ageratum, that variety with the dark blue flowers that only grows some 2 inches high. I am under the impression that this particular form of Ageratum is very rare, at least I have received so-called dwarf forms from different sources nothing like so good, either in habit or size of bloom; the form we have is far and away the best very dwarf blue bedder in cultivation. If the Begonias in their different shades are required for larger beds it is advisable to plant in large clumps, with an occasional taller plant to relieve the somewhat flat appearance. Fuchsias Annette and Duke of Edinburgh are useful for the purpose.—E. BURRELL.

**Angiopteris evecta.**—This giant Fern, when well cultivated, is one of the most noble and at the same time one of the most easily grown. But it will only appeal to those having abundance of room, where its development will be unrestricted, and its huge spreading fronds—which under good conditions attain a length of upwards of 16 feet—may be seen to advantage. We would strongly advise those who can accommodate it to plant it in a mixture of sound loam, peat, broken red sandstone, and coarse sand, and if possible in close proximity to a pond of water, where the roots derive more nourishment than could be given from surface waterings. During summer shade from strong sunshine and ply the syringe diligently to the fronds, as by so doing thrip, which is so destructive, is entirely overcome.—R. P.

**Cæsalpinia japonica.**—This is one of the most distinct of the innumerable hardy shrubs that have been sent to this country from Japan, and being just now in flower it at once arrests attention. The genus Cæsalpinia has given the name to a sub-division of the extensive order Leguminosæ. With the exception of the above-named species, all the Cæsalpinias are tender, and so are most of their immediate allies—the Browneas, Poincianas, Jonesias, &c. Exception may be taken to the assertion that all the Cæsalpinias except this one are tender, on the ground that *C. Gilliesii*, known also as *Poinciana Gilliesii*, is not so, but even in the south of England this needs the protection of a wall. In returning (after this dissertation) to *C. japonica*, it may be described as a free-growing subject, of a loose spreading habit, almost Bramble like. The stems are armed with solid curved prickles, and clothed with elegant bipinnate leaves of a pleasing shade of light green. The flowers, which are borne in partially erect racemes, are about an inch in diameter, and of a bright yellow colour, while the glowing red of the anthers in the centre causes them to stand out markedly from the rest of the blossom. This Cæsalpinia was introduced from Japan by Messrs. Veitch, and first flowered at Coombe Wood fifteen years ago; but it is even now quite an uncommon plant. Though sometimes injured by particularly severe winters, it, in the south of England at least, soon recovers.—T.

**Genista æthnensis.**—In gardens where summer-flowering shrubs are required, this ought certainly to have a place, as throughout July and the early part of August its graceful pendulous branches are wreathed with golden flowers. At Kew a number of fine groups may be seen. Like many other really good shrubs, it is a very old

CEROPEGIA WOODII.

introduction and one that has been sadly neglected, really fine plants being very scarce. It is a native of Sicily, and grows from 15 feet to 20 feet high. The branches are long, pendulous, and Rush-like, the flowers small, borne from the nodes of the terminal half of the current year's growth, and golden in colour. The leaves are very small but sparingly produced, and fall early in summer. Their loss is, however, made up for by the bright green branches. It is best to raise the plants from seeds. The young plants should be frequently stopped during the first three years of their existence to promote a bushy habit. At seven years old specimens can be had 6 feet high and 5 feet through. Like other Genistas, this should be placed in the position it is to occupy permanently when not more than two or three years old, as large plants move badly. —W. DALLINORE.

### EDITOR'S TABLE.

#### CEROPEGIA WOODII AND CALCEOLARIA BURBIDGEI.

Mr. Greenwood Pim sends from Easton Lodge, Monkstown, County Dublin, sprays of the pretty Ceropegia and Calceolaria Burbidgei with this note: "I enclose for your table some sprays of Ceropegia Woodii, which grows, as you see, extremely well here in a temperate house in which Adiantums and many other Ferns also do well, also Gloxinias, Bougainvilles, and a good many cool Orchids, &c. You will also find a bit of Calceolaria Burbidgei. This is growing in a cool greenhouse with Pelargoniums, Begonias, herbaceous Calceolarias, Azaleas, &c. It is planted out and it is now through the top ventilators. It has never been out of flower since Christmas, and is now blooming more profusely than ever."

[Both interesting plants. The Calceolaria is a very handsome greenhouse flower, and is one of those good things seldom seen outside a botanic garden.]

#### GALEGA BICOLOR.

Mr. W. B. Hartland, Patrick Street, Cork, sends flowers of this pretty Galega, which originated at Ard Cairn. It has a wealth of flowers of blue and white colouring. It is apparently as free as the white Galega officinalis, and is probably between the two, viz., the type and alba. There is a brightness about this bicolor form that should commend it to those who rejoice in groups of easily grown hardy plants.

#### LONICERA HILDEBRANDTIANA.

Messrs. R. Veitch and Sons, Exeter, send flowers of this beautiful Honeysuckle, which we hope soon to illustrate. We shall describe it more fully then. The tube of the bloom of this great Honeysuckle is 4 inches in length, and the spread of the open end was almost 2 inches. The bright green shining leaves are solid and leathery and are 4 inches long by 2 inches broad. It is a remarkable plant.

#### OTHER INTERESTING PLANTS FROM EXETER.

*Symphyandra Hofmanni*.—A very rare plant of pretty colouring. We should much like to know where Messrs. Veitch grow this. A note about its culture and requirements would interest many readers.

*Alstroemerias*.—A delightful gathering of mixed forms of *A. chilensis* and *A. aurantiaca*, the latter very rich in colour.

*Solanum crispum*.—Its blue colouring is most welcome. Quite happy in southern counties.

*Scabiosa caucasica magnifica*.—A very large and beautiful variety of a good garden plant.

*Cytisus nigricans*.—Shrubs in flower become fewer as the summer days pass away. We think too little of the glorious family of Brooms, and in the present instance this kind at this time is covered with bright yellow flowers, which are borne in erect racemes. The lower flowers open first, and thus a succession is gained, the plant remaining long in bloom. *C. nigricans* was introduced from South-East Europe about the year 1730, and is readily raised from seed, which is freely

produced. The word *nigricans* refers to the black colour that specimens become when prepared for the herbarium.

*Notospartium Carmichaelie*.—Another southern county plant, with a wealth of pink flowers.

Many other flowers were sent, some of which we hope to illustrate.

### WANDERERS OF THE GARDEN.

"The Orchis takes  
Its annual step across the earth."

IDEAS, like epidemics, are in the air. Among others that have occupied the attention of the gardening world of late has been the provoking conduct of the Vanishing Bull, the Creeping Crocus, and the Disappearing Seed. These wanderers of the garden are difficult to understand and puzzle us every year anew. All the long winter the plants have had it their own way; then spring comes round again and we want to have our finger in the pie, but we find the plants will not let us. Bulbs vanish, Crocuses creep, seeds disappear, and we have to confess the garden folk are livelier and more independent of us than we knew.

So we have been studying our wanderers a little and find there are a good many kinds of them—some whose movements are easy to follow, because they run about above ground, before our very eyes; others most inscrutable in their methods, for they are burrowers, and creep about in places where we cannot see them.

The above-ground wanderers are simple creatures; we are all familiar with them, and know how merrily they run, and crawl, and climb, and trail to seek new pastures. We may watch the wild Strawberry racing about to choose some favoured spot, seizing on it with dainty toes or fingers, there to root, or the Periwinkle throwing out yards of green wire, that will presently hook on somewhere and start fresh shootlets and rootlets, or later in the year we may admire the motherly little Ivy-leaf Toad-flax as she feels her way about the wall to find a comfortable cranny for her seeds, or the naughty Dodder—though he will be outside the garden fence—as he buttonholes his hapless host so fatally. All these wanderers we may notice with amusement, and can more or less control them, but it is a different thing with the underground travellers; these work in the dark, and their movements are wrapped in mystery.

There is variety among them; some have bulbs and some have tubers, and equally surprising things are done by both. One of the cleverest is the intelligent Tulip. We can find out how intelligent he is by planting him in a shady part of the shrubbery, where he will not be comfortable; he will not stay there, he will walk out, but we shall not see him doing it. He will go, if not by a twopenny tube, by something very like it, any way it will be a subterranean one. He will send out a long white shoot horizontally running underground, and make himself a new bulb at the end of it, using up the old stuff which comes by way of the tube. Then next year we shall see how far our Tulip has marched, and if he does not think he has gone far enough into the fresh air and sunshine to enjoy himself as a Tulip knows he should, he will repeat the process every season till he is satisfied and we shall be wondering, "Now, who has been interfering with that Tulip? He has been moved by somebody." So he has, but that somebody is himself.

The creeping Crocus in its way is just as clever as the Tulip. We often find him in unexpected places. How does he get there?

Sometimes he makes even his enemies help him. Maybe a hungry slug will get hold of him unawares and affectionately eat him up, all but one "eye." The Crocus, undismayed—even if left high and dry on the top of the mould—will set to work at once to make the best of a bad job. He is as good at working from one eye as a Potato, and will send down a diving-tube straight into the earth, where he will develop a new Crocus, and again we shall be puzzled to death to think "where that Crocus sprang from."

It is wonderful what Crocuses (must we say Croci?) can do if put to it. This year with our own eyes we have seen them performing wonders in the depths of earth. A handful or two had been buried too deeply and forgotten by a gardener. Long after the time for blooming had come and gone, these luckless Croci pushed to the top to look out, like Rip Van Winkles, at a world which had come to a point they could not comprehend. Digging down to them was like digging down to the relief of miners. There they were as busy as bees, manufacturing baby bulbs out of raw material, and sending upwards long yellow-white stems, much telescoped, but trying to form buds. They had been in the furnace of affliction, and could only wander up, not round-about, but even to do that was something, and it saved their lives. Tubers are very walkative, none more so than the common early purple Orchis.

The author of "Plants that Walk" has reckoned that this Orchis, by means of his tubers—first one and then the other dying off and a fresh one coming in front of it—will pace, one tuber's length at a time, across a meadow 6 inches in a dozen years. This is slow going, I fancy, judging by the rate at which my own early purples romp about the fernery where they live, but never forget to take that annual step across the earth, made famous by the poet.

The wanderings of some garden Lilies are surprising. When it comes to the roll-call in the herbaceous border we see what they have been doing when we were not looking. Quarters are shifted, there has been a rearrangement decided on by the plants themselves, and we have to acquiesce, for we must be ruled by them as a household is ruled by a delicate child. *Lilium auratum*, that lovely lady of scent and sweetness, is very fidgetty, and manages to get about much as the Tulip does. If we put her in a pot, carefully placing her in the middle of it, she will make a point of taking her own way—she knows best what she likes, and will move off to the very edge. There is, indeed, no end to the original things done by the plants, which, to use an expression that once amused me from a coolie gardener, "Have an Onion to them."

Mice and moles (might we add the gardener's spade?) do also, undoubtedly, assist our wanderers; in no other way can we account for the sudden leaps they take, over a house and garden, for instance, planting themselves where none of the kind have heretofore been seen. Some Lilies of the Valley have just performed this feat before my very eyes, at least I see the Lilies where they are; as to the trick of how they got there I was not quick enough to find it out.

But it is a good garden rule to let our wanderers, whenever possible, remain where they have wandered to; they have worked and should earn their reward, and their migrations always do them good. Change of air, change of scene, change of food is as great a tonic to plants as it is to people. Like us, they are invariably the better for a little wandering.

F. A. B.

### AN AMATEUR'S GARDEN.

IT is rare to find in a private garden of not unlimited space so large a collection of rare and interesting plants as in that of the Old Parsonage, St. John's, Ryde. It was a pleasure to go round those borders once again, albeit a sad one, for the loss of the master, always so genial and enthusiastic, could not fail to be fresh in memory, but, even so, it is good to believe that there is every prospect and hope of the garden being kept up on the old lines, and that it may still remain the treasure-store that it is.

Masses of Irises of all the best forms of the Germanica and bearded type were in flower at the end of May, as well as many others of rarer stamp, for Mr. Ewbank was a great lover of every kind of Iris, though of later years his chief interest has been centred in conquering the difficulties which surround the culture of the less-known Oncocyclus breed. A very fine clump in full flower in the open border, demanding no particular attention, of a hybrid Oncocyclus—*I. lupina* × *I. Ciengialti*—testified to the superior robustness of the mixed race; but, as Sir Michael Foster tells us, the hybrids partake less of the Oncocyclus character than of that of the other parent. Several other interesting Irises were in flower. A patch of the pretty little Hungarian Sand Iris (*I. arenaria*) not often found in English gardens, though easy enough to raise from seed, was bright with its yellow flowers. Bulbous Irises were represented for the moment by *I. Sisyrinchium*, whose fragile but exquisite pale blue blossoms were closed when we came to look for them in the evening; while the Californian *I. macrosiphon*, with cream-coloured flowers beautifully veined, would probably have excited endless discussion on the score of identity had any expert in that particular section been present. Camassias of all the best species, including the fine and still uncommon *C. Engelmanni* in strong clumps, were amongst the most prominent ornaments of the bulb borders, and against the stone-blue of their spikes the vivid glow of a fine head of the orange-scarlet *Habranthus pratensis* shone out very conspicuously. Tall *Eremurus* were beginning to flower, one very good clump of *E. Bungei* having no less than ten spikes; and Asphodels were just at their best. The keen pleasure which such a garden gives to a true lover of plants is well illustrated here, for each succeeding morning of the year is greeted by the opening of some fresh and very often rare flower. Over the pathway a Judas Tree (*Cercis Siliquastrum*), old enough for its brittle trunk to be split in two after the not infrequent manner of its kind on reaching mature age, was rosy red with crowded flower-buds.

The rockery was bright with masses of *Aubrieta* and *Saxifrage* in all their best forms, and *Ramondias*, *Gentians*, *Morisia hypogaea*, alpine *Crowfoots*, *Edrianthus serpyllifolium*, and many another mountain plant in full flower showed that the conditions of the island garden, situated only a little above the sea level, came not amiss to them. The New Zealand Forget-me-not (*Myosotidium nobile*), so capricious in most places, was flourishing exceedingly with strong heads of bright blue flowers, and *Omphalodes Luciliae*, which many of us would also fain domicile in our gardens, has apparently no reluctance here to display its delicate beauty of flower and leaf. It may be well to remind growers of these two somewhat fastidious but most beautiful plants, that an addition of lime to the soil in which they were growing proved to be the great factor in their

well doing. Never has it been my privilege to see so magnificent a clump of *Cheiranthus mutabilis* as on this rockery. Tender species as it is, and often disappointing and short-lived, a specimen such as this would make any one wish to possess it, and to try it again and again if it failed, yet it is not often to be seen even in Devon and Cornish gardens, where it might thrive without difficulty. By its side it was delightful to find the charming old double yellow *C. Harpur Crewe* full of flower and fragrance—a Wall-flower which puts forward no obstacle of constitution or culture to hinder its growing in any garden, yet is not to be found in one out of a hundred.

*Cypripedium spectabile* was sending up strong growths, but *C. Calceolus*, a most interesting species from the fact of being one of the rarities of our own British flora, was showing many of its quaint yellow and brown slippers. It would be impossible to tell of a tenth part of the plants which are at home in this overflowing garden, or to speak of the wealth of the flowering shrubs it contains. Many readers of THE GARDEN are familiar enough by hearsay, even if they have not seen, the enormous bush of *Pojociana Gilliesii* against the house and the *Mandevillea suaveolens* which clammers up to the eaves—the *Lonicera hildebrandtiana*, with its sentry-box for winter shelter, which so delighted the heart of its owner by the uniqueness of its flowering in the open air, and the huge trees of the lovely lilac *Abutilon vitifolium* and its white variety. But it would be well, I think, to draw attention to a Rose—*R. sinica* var. *Anemone*—which, alas! he never saw in bloom, but which is flowering this season for the first time against the wall of the house, and is one of the most beautiful of single Roses. It is a hybrid of *R. laevigata*, a much-named and widely-distributed species, of which *R. sinica* is one of the synonyms. The typical form is familiar to many under the name of the Cherokee Rose, which has large white solitary flowers. In the variety *R. s. Anemone*, the flowers are bright rose-pink, almost shell-like in their cupped form, with petals of good substance and about 4 inches across. The effect of the whole plant is heightened by the vigorous glossy leaves, mostly trifoliate, which clearly indicate its descent, and altogether it is remarkable enough when in bloom to arrest the steps of any passer-by. This Rose was referred to by Mr. Woodall in his interesting "Riviera Notes" (THE GARDEN, May 11, 1901) with much appreciation, but that it is not as yet well known in England is certain, and we must hope that it will not prove too tender for ordinary gardens. At any rate, it should be noted for the southern counties, for a more beautiful Rose of its kind it would be hard to find. A large breadth of the crimson-spotted yellow *Rosa berberifolia*, though none of its flowers were then open, was pretty in its glaucous Barberry-like foliage and evidently happy where it could run riot as it liked. Another golden-flowered Rose (*R. Eae*) seldom met with was growing against a wall as strongly as its slender character would ever permit, and not far off was a charming deep pink single China Rose, the name of which could not be ascertained. It is very evident that the climate of the Isle of Wight suits these rare and somewhat exacting species of Rose.

An idea seems somehow to have gone abroad that the collection of plants in this interesting garden was about to be dispersed, but this is far from being the case. Associations so tender and so hallowed cannot easily be broken, and, happily, there is no stern necessity here, as

with so many clerical homes, to bid farewell to the scene of life-long joys and sorrows. May the garden, therefore, under the fostering care of those who loved its master-spirit abide long and prosper.

K. L. D.

### THE FLOWER GARDEN.

#### A NOTE ON SWEET PEAS.

**G**ROWERS of Sweet Peas had cause to complain during the greater part of June, owing to the cold and wet weather. Although sowings were made much earlier than usual, we failed to obtain anything like a free display until the first week in July. As a rule, from a later sowing than that observed in this instance we have gathered flowers quite freely during the second week in June. However, at the present time our Sweet Peas are developing blooms of superb quality. In high and dry situations such as ours the plants in late July have deteriorated considerably, and to maintain a good display copious waterings and incessant attention have been absolutely necessary. Our plants at the present time average about 7 feet high, and their growths are wonderfully strong, stronger in fact than they have ever been seen here. Our practice is to raise the plants in a genial temperature in early February, placing five or six seeds in a 5-inch pot, and subsequently carefully to harden them off and plant outdoors in April. We plant them in clumps, first taking out the soil to the depth of about 2 feet, filling in the hole with about half a barrowful of manure, and making this firm. The holes are made some 3 feet or rather more apart, this space enabling the grower to overlook and control his plants with ease. In hot and dry weather watering is regularly carried out. Each clump of plants is first watered with half a gallon of clear water, and an hour subsequently they are again treated to half a gallon of manure water. We prefer to use Ichthemic guano, and first dissolve this in boiling water. By these means the manure is more readily made a plant food, and is quickly assimilated. In a short time this generous treatment of the plants is seen in the healthy and vigorous character of their growth, and, what is of importance, the flowers are exceptionally large, brilliantly coloured, and of good form. Rarely are the flower stalks less than 12 inches long, and often more than this. For decorative uses one can appreciate to the full a good length of foot-stalk, as this enables the decorative artist to adjust each spray to advantage, so that its beauty and elegance are taken full advantage of. It is impossible to gain the same advantage with flowers having a short length of foot-stalk, and for this reason flowers of high quality should always be used for the best decorative effects.

Some varieties stand out conspicuously for their beauty and also good quality, and one of the best is Prince of Wales, a beautiful rose-pink variety. Often as many as four flowers are produced on each spray, and they are very fine. Miss Willmott is without doubt the finest of the orange-pink flowers. Lovely is still one of the best, its pale rose-pink flowers being charming. Sadie Burpee is a superb white, and stands pre-eminent above the other whites here. Salopian, the brilliant mulberry-red variety, is still valued for its fine colour and its free display, and in Mars has a serious rival for brightness and richness of colour. Prima Donna is rightly highly esteemed, both on account of the large truss and refined soft pink colour. In Duke of Westminster we have a very distinct and handsome flower, its rosy maroon and violet colouring being very good. Black Knight and Stanley are two excellent bronzy chocolate varieties, and there is little to choose between them in quality. The primrose-coloured or rather rich cream sorts are best represented by the Hon. Mrs. Kenyon and Queen Victoria. In our collection none of the others equal these two sorts. Their flowers are large and of good form, and their stalks wonderfully long and erect. A

charming sort is Hon. F. Bouvierie, with coral-pink standards and wings of a lighter shade of the same colour. In bluish lavender sorts, Lady Grisel Hamilton stands well, and in a deeper shade of the same colour Emily Eckford is most distinct. A superb flower is Prince Edward of York, having bright rosy cerise standards and wings of the deepest shade of rose. A good flaked variety is Mrs. Joseph Chamberlain, being white, flaked heavily with bright rose.

Highgate, N.

#### SMALL ROCK GARDEN AT EXETER.

THE accompanying illustration, from a photograph by Mr. F. W. Meyer, gives an excellent example of what can be done in the way of rock garden, making within a short time. The picture represents a portion of the grounds of H. A. Willey, Esq., Pennsylvania Park, Exeter, which have been recently laid out by Messrs. Robert Veitch and Son, of the Royal Nurseries, Exeter. Little more than twelve months ago this ground was practically a piece of waste, consisting principally of mounds of bare clay, of which the greater portion had to be removed before operations of rock building could be commenced. The stone used is an oolitic limestone of a pleasing light brown or yellowish colour, and freely perforated with large and small holes, some of which form excellent pockets. A very similar kind of stone may be seen in the Botanic Gardens at Bath. As this stone belongs to the sedimentary or stratified rocks, the rock building in this garden has been done on the principle of Nature—that is to say, each group of rocks distinctly shows its stratified character, but, as in Nature, even the most regular strata are sometimes rent asunder by upheavals and convulsions, which scatter the rocks in various directions, so have these artificial rocks been composed to represent a very broken and rugged surface.

In the centre of the picture may be seen a small cave filled with Ferns, &c., and forming the background of a kind of open grotto with seats. In this part some of the rocks have almost perpendicular fissures, which were planted sideways with *Saxifraga longifolia*, *Androsace chumbiensis*, *A. lanuginosa*, *A. sarmentosa*, and many kinds of *Sempervivums*, *Sedums*, &c.

A suitable background is formed with various conifers and flowering shrubs, and between these and the rocks are masses of perennials, *Tree Lupins*, *Cistus*, &c., while still further back carpets of *Lysimachia Nummularia*, *Sedum album*, and *Cerastium* cover the ground, intermixed with *Aubrietas*, *Arabis*, *Phlox setacea*, *Lithospermum prostratum*, and other bright flowers.

The foreground of the picture shows a small pond, in which Marliac's Water Lilies are just making a good start, the banks being studded with Japanese and German Iris and other plants loving the waterside. Two prominent rocks between the pond and the

ROCK GARDEN AT PENNSYLVANIA PARK, EXETER (THE RESIDENCE OF H. A. WILLEY, ESQ.).

aforementioned open grotto are planted with *Spiraea Thunbergii*, *Hieracium villosum*, *Chrysogonum virginicum*, various *Linarias*, *Antirrhinum*, &c., but the parts near the main path are adorned with choicer kinds of the more minute type, such as *Edelweiss*, *Gentiana verna*, *Dianthus alpinus*, and other gems.

The pond is fed by a streamlet forming two small waterfalls. The rocks, of course, are not continuous, but are broken here and there by grassy banks or groups of suitable plants. As may be judged from the picture reproduced the charm of the work consists in the light and natural arrangement resembling a broken up and even a somewhat scattered appearance without detriment to harmony or without losing sight of the picturesque effect of the whole. The work was designed by Mr. F. W. Meyer.

VISITOR.

#### NOTES ON HARDY PLANTS

##### NARCISSUS TRIANDRUS ALBUS.

**R**EERENCE to *N. triandrus albus* is made by "S. T." in your issue of May 31, page 351. In my research after Daffodils in Spain I found *N. triandrus albus* in all positions. One locality occurs to mind where I found it growing amongst Pine needles, shaded by the overhanging Pines, the soil very poor, and the flowers exceedingly small, and as the ground sloped down to a stream I followed the slope, the plants becoming stronger and the flowers and bulbs larger. But the largest bulbs, the strongest plants, and the finest and largest flowers were those in the water. On an island in the Bay of

Vigo in sand I found the flowers as large as those of *N. triandrus calathinus* when strong and well cultivated. In the neighbourhood of Oporto, in the fissures of granite rocks, in full sun and the bulb fully exposed and wedged into the fissures, I have seen plants with very fine flowers. The self-yellow and the two-coloured *N. triandrus* I found growing on the roadsides, and at other times amongst trees. I am of opinion pounded granite would give good results. The bulb on all occasions was but slightly covered. This elegant Daffodil should succeed well in rockwork with 2 inches or 3 inches of pounded granite in the pockets. *N. cyclamineus* is semi-aquatic, and should do well at the bottom of rockwork, and *Corbularias*, from Spain, should succeed under the same conditions. Both the yellow and citron-coloured forms, the small yellow *Corbularias* in Spain and Portugal are usually found in dry sand. I recall to mind a habitat I visited on a little island, where Pines grew in dry sand, I found a miniature yellow *Corbularia* with leaves as fine as the hairs from a horse's mane, and flowers exceedingly small, while the land around the island, covered in winter with sufficient depth of water that sportsmen punted their boats in search of snipe, the flowers there as the water receded were as large as *Corbularia* conspicuous. The home of this last-named species has not yet been found. *N. juncifolius* from the Pyrenees and *N. minimus* from Spain should be valuable rock plants and useful on sloping banks.

Cape Town.

PETER BARR, V.M.H.

#### CAMPANULA STANSFIELDI'S HYBRID.

AMONGST several dwarf hybrid Campanulas which have come under my notice during the last three or four years the best for perennial cultivation on alpine rockeries is one sent me three years ago without name or parentage by Mr. Stansfield of Southport. Both in leaf and habit and flower it might be described as a magnified *C. waldsteiniana*. The flower, however, is 1 inch long and fully 1 inch across the mouth when spread out. The

colour is rich purple, and the plant begins to flower about the middle of June, when 3 inches high, and continues to produce flowers in abundance for three months, never becoming shabby or more than 6 inches high. The habit is very close, and a three year old plant from a cutting is 8 inches or 10 inches across measured at the base, and bears nearly 200 flowers open at once, fresh buds coming continually in the axils of the leaves. It seems barren, the same being my experience of all true hybrids in the genus *Campanula*, though the so-called species in the *C. rotundifolia* group cross with one another freely and their progeny continues fertile, so that it is hardly possible to keep the varieties distinct. The specimen sent is the full height from the ground.

On page 60 it is stated that *C. waldsteiniana* and *C. tommasiniana*, though botanists have made them one species, are to gardeners quite distinct. So they are if you take the extremes, but I can make them meet as series. I enclose a stalk and flower of each, between which you will see very little difference. In the specimen of *C. waldsteiniana*, which I send for comparison, it will be seen that this dwarf species has the leaves closer together in proportion and longer leaf stalks. It has also the flowers wider compared with their length, but it is a species which varies much in this particular, the flowers sometimes being so long and narrow as to approach in form those of *C. tommasiniana*, which the elder De Candolle considered a variety of *C. waldsteiniana*.

C. WOLLEY-DOD.

*Edge Hall, Matlock, Cheshire.*

P.S.—Since writing the above I have heard from Mr. Stansfield that he believes the parents of the hybrid to be *C. tommasiniana* and *C. carpatica*. This is probable from the characters.—C. W.-D.

[The specimens sent bear out what Mr. Wolley-Dod has written.—ED.]

### LILIUM GRAYI.

THIS fine *Lilium* was to be seen in capital condition in front of the range of houses in the Royal Botanic Gardens, Edinburgh, the other day. One plant in particular was very handsome with its fine stalk from 4 feet to 5 feet high, and bearing a large number of its beautiful flowers. It is a Lily which is little cultivated in Scotland, but only wants to be better known to be more appreciated and to find its way into many northern gardens. The handsome bell-shaped flowers are of a dark rich red, prettily spotted with purple. Although reputedly one of the peat and moisture-loving Lilies, the position it occupied at Edinburgh would indicate that it is not absolutely necessary that it should have much moisture to succeed. It has been introduced for a considerable time now, and an interesting notice of it appeared in THE GARDEN of July 1, 1893.

S. ARNOTT.

### HEUCHERA ZABELIANA.

MR. MALLETT's note on this hybrid *Heuchera* will, one hopes, draw attention to this pretty plant, which quite merits what he has said about it. It is a good grower and a free bloomer here, where it has flowered for two seasons. Two promising new *Heucheras* raised by M. Lemoine are *La Perle* and *Flambeau*, although the former is not so pure in colour as one would like. The latter is brighter than *H. zabeliana*, and approaches in hue the fine *H. sanguinea*, which one so seldom sees well grown. *H. zabeliana* has, however, larger and more open flowers.

S. A.

*Carsethorn, by Dumfries, N.B.*

### MUSCARI COMOSUM MONSTROSUM (THE FEATHER HYACINTH).

IN going through the interesting old garden of Sir Mark J. M'T. Stewart, Bart., M.P., at Southwick, Kirkcudbrightshire, the other day, I was pleased to come across the old Feather Hyacinth in quantity. It is not too often that one meets with this remarkable form of the Tufted Grape Hyacinth, and one is always pleased to see it, especially in old gardens where it must have been grown for many years. The flowers, unlike those of the

typical *M. comosum*, are all barren, and the whole inflorescence is divided into a feather-like mass of bluish violet tufts. It is a very old plant, often spoken of in the old books as "the fair curled haired Jacinth," and Rea tells us that "this is a beautiful and strange fashioned flower, and hath been of great esteem, but now grown something common." One can hardly call it common now, though it is far from plentiful. I find that it likes a more open position than the typical *M. comosum*, as if crowded up the blooms do not always open in dull and wet weather.

S. ARNOTT.

### CAMASSIAS.

THE value of Camassias for grouping in the border, shrubbery, and in woodland, or in any situation where it is desirable that the plants should be able to take care of themselves and thrive, is slowly but surely gaining recognition, despite the drawbacks of a singularly confused nomenclature and the dearth of authoritative information about them. The genus contains five well-marked species and ten distinct plants, all being well worth growing, whilst the varieties of *C. Leichtlinii* rank among the finest and most showy bulbous plants we have. These forms of *C. Leichtlinii* and the forms of *C. esculenta* (the "Quamash" of the North-American Indians, who use the roots as food) are invariably confused in all but the most carefully-assorted stocks of Camassias, insomuch that planters are not likely to be certain of getting the right kind of plants. The forms of *C. Leichtlinii* are far better than *C. esculenta* at its best; in fact, the two specific types are wide apart in decorative value, whilst the *C. esculenta* of Dutch growers, probably the old-time type that has not varied in size or colour under cultivation is, in its turn, far inferior to the major strains of *C. esculenta*, mostly fixed geographical forms and variations, now collected wild in California and sent over to this country after a year's selection and test by collector-growers. Californian bulbous plants, by the way, do not sport colour forms and variations under cultivation at the same rate as do plants from other countries, the great wealth of varieties being due mainly to the diversity of climate, for the rule of "one district, one type" prevails to a marked degree. All Camassias are hardy, nevertheless.

*C. Cusickii* (S. Watson), a strong-growing plant, with an inflorescence like that of *Eremurus*, and broad glaucous leafage of bold outline, is universally admired. The spikes attain a height of 4 feet, and are densely clothed for some 2 feet of their length with upwards of 100 sky-blue or lavender self-coloured flowers closely packed together, *Eremurus* fashion, the bristling yellow anthers being very conspicuous. The individual flowers are starlike, an inch across, and regular, the petals being equidistant and similar in length and breadth. The leafage is very glaucous, above an inch wide, more often two, and fully 2 feet in length. It is the earliest to flower, and it is on this account desirable to plant this species in a warm situation, or late frosts will spoil any flowers that may be in an advanced state. In ordinary seasons the inflorescence is not injured, but seasons like that of 1902, which have so far proved destructive to many floral displays, may again be experienced. The leafage is more frequently cut somewhat by frosty winds, but that does not harm the plant or spoil its beauty to any appreciable extent.

*C. esculenta* (Lindl.) is a low-growing plant 18 inches high as a maximum. It has thin linear leaves, and from twenty to thirty flowers coloured blue or purplish blue, each an inch across, the upper five petals ascending and slightly fulcate, aggregating together so as to isolate the lower petal, which is boat-shaped and slightly incurved, showing in this respect a marked resemblance to many exotic Amaryllids. The petals as they wither droop independently, leaving the capsule free of any covering. Several recently collected forms of this plant, as yet without distinctive names, are real improvements worthy of a place in any garden. The type plant, though effective in the mass, falls short of many of the good features of other species, and one has become

accustomed to regard it as too poor for border planting, but excellent for the wild garden and for planting in stretches of grass land by the thousand. It is cheap enough to admit of extensive planting for a reasonable outlay, and it proves satisfactory in all but poor soils. *Alba*, a charming variety and a rarity, should find a place in the choice bulb border. Mr. Carl Purdy, in a valuable letter sent to Messrs. Wallace, of Colchester, cites five geographical forms, varying in height and colour, together with the following information: "*C. esculenta* has petals of unequal size, and five of the segments are on one side and one on the other. When the flower wilts the segments fall down irregularly below the capsule. The size of the plants and number of flowers is of no value in separating the species; there are low-growing few-flowered forms of *C. Leichtlinii* and very tall *C. esculenta*. The largest *C. esculenta*, however, never equal the largest *C. Leichtlinii*, while *C. Leichtlinii* is a fuller and larger flower. *C. Leichtlinii* has broad petals, and the flower is nearly regular in shape; when the petals wilt and fade they twist above the capsule like bon-bons."

*C. Leichtlinii* (S. Watson) is a variable but very beautiful plant of great garden value. Its distinctive characters are readily apparent when grown side by side with *C. esculenta*, but a difficulty arises as to which of the five forms comprised in the species should be accepted as the type. Watson's *C. Leichtlinii*, according to Mr. Purdy, was blue-flowered, but the *C. Leichtlinii* of horticulture, the original plants sent to Europe, of which I have quantities under cultivation, are cream-coloured. This type is now generally known as *C. Leichtlinii*, and it appears desirable to regard it as the typical plant, despite the fact that, according to Mr. Purdy, "no cream-coloured *C. Leichtlinii* have been found in British Columbia since Jeffries' time (1850). It has leaves 1 foot long, and strong, bold spikes 3 feet to 4 feet high, bearing from 50 to 100 cream-coloured flowers 1 inch to 2 inches across, with lanceolate petals regularly disposed and equidistant, a median line of olive running down the centre of each. The flowers are not so crowded as in *C. Cusickii*, but are evenly distributed on fully 2 feet of the spike in a light, graceful array. The styles and stamens project at several angles from the flowers, adding greatly to the fine effect they give. The petals as they fade roll themselves neatly over and beyond the capsule, so that the flower spikes have a much more tidy appearance than is the case with *C. esculenta*, which always looks ragged below owing to the ragged parts of the flower hanging about it. *Alba*, a pure white-flowered form with porcelain-tinted filaments, is a magnificent plant, the flowers glistening as though frosted. *Atrocerulea*, a dark blue-coloured form, with broad petalled star-like flowers of fine size and much substance, is in many respects the finest of all Camassias; it is stouter and taller than the type, and the flowers average nearly 2 inches across. These three forms are the best of all *C. Leichtlinii* as yet discovered; they are highly effective garden plants of unusual merit. Those interested in plant phenomena will find study in timing the flowers as they open; it will be found that each day's quota of flowers open at 3.40 p.m., conditions of weather making but little difference to them.

*C. montanum* (Hort.), a bright blue-flowered species midway between *C. Leichtlinii* and *C. esculenta*, produces dense *Eremurus*-like spikes bearing forty to sixty flowers an inch across, the petals of which are bluntly lanceolate, falcate, and slightly involute, five of which ascend as in *esculenta*, but the withered petals roll together, enclosing the capsule as in *C. Leichtlinii*. The anthers are very large, coloured a bright yellow, the filaments being of a porcelain-blue. It is a very pretty species of compact habit, a much neater, bigger, and better plant than *C. esculenta*, but it lacks the tall commanding grace of *C. Leichtlinii*. It is the latest of all to flower.

*C. Frazeri* (Torr.)—The only remaining species known to me is a comparatively slender plant 18 inches high, bearing pale porcelain-blue flowers

under an inch across, and closely arranged on the stem, resembling *montanum* in many respects, but fewer flowered and a much more slender grower.

Cultivation, independently of propagation, scarcely needs consideration with *Camassias*; they will grow well anywhere in soils of good tilth. The main feature is to select a place where they will appear to the best advantage. It is necessary to plant the tall-growing species in colonies of several; a single *Camassia* looks as odd as a single Lily, whilst the smaller species may be employed for naturalising in quantity, a use for which they are particularly fitted, as we have no kindred plants suitable for this purpose flowering in May and June, save a very few. *Camassias* do not produce offsets very freely, but they may be raised by the thousand from seeds, seedlings attaining maturity in the fourth and fifth year; a few, however, may flower earlier, especially if sown in boxes as soon as ripe and introduced to heat, thereby gaining a whole season.

GEORGE B. MALLETT.

## TREES AND SHRUBS.

### TENDER SHRUBS AND TREES IN THE SOUTH-WEST.

(Continued from page 81.)

**C**ORYNOCARPUS L. EVIGATA.—New Zealand. An evergreen tree bearing panicles of white flowers, followed by Plum-like fruit. A healthy young plant is at Ludgvan Rectory.

*Crinodendron Hookeri* (*Tricuspidaria hexapetala*).—Chili. A particularly handsome shrub growing to a height of 5 feet, bearing large, drooping, cherry-red, urn-shaped flowers on long peduncles, the petals being very firm in texture. In many gardens.

*Cytisus racemosus*.—Peak of Teneriffe. One of the commonest and most popular greenhouse plants. It grows to 8 feet or 10 feet in height in the south-west and often flowers until Christmas.

*Daphne indica*.—India. Both the white and purple-red form of this fragrant plant are common in the open in Devon and Cornwall, and in mild seasons commence to bloom in January. Some old plants have formed large bushes in front of walls.

*Daphniphyllum glaucescens*.—China. Evergreen. This is probably hardy, but is uncommon. The largest specimen I know is at Trewidden, and is 12 feet in height and 20 feet in spread. It has long shining leaves, the young shoots being red in colour; these, early in April, were surrounded by closely-clustered maroon-red flower-buds.

*Datura sanguinea*.—Peru. This grows to a large size in the south-west, often forming a tree 12 feet or more in height, and in mild winters blooming until February. *D. suareolens* (Mexico) is probably more tender, as such large specimens are rarely seen.

*Dendromeccon rigidus*.—California. A handsome shrub with glaucous leaves, the branchlets terminated by bright yellow Poppy-like flowers. It succeeds best in poor soil that does not induce vigorous growth. Enys.

*Desfontainea spinosa*.—Chili. A most distinct evergreen shrub, with leaves resembling those of a Holly. It bears tubular flowers 3 inches in length, of a bright vermilion, tipped with yellow, and is a very handsome object when in full flower. It commences to bloom in the summer, and often holds many of its flowers until November. The largest specimen I have met with was about 8 feet in height, and was in the neighbourhood of Teignmouth. The Desfontainea is to be found in most gardens.

*Diosma ericoides*.—South Africa. A Heath-like evergreen shrub, bearing

single white flowers not unlike those of a Myrtle. Its leaves are fragrant when bruised. A healthy plant, about 4 feet by 4 feet, trained against a wall was coming into bloom at Tregothnan at the end of March.

*Diospyros Kaki*.—The Persimmon. China. This is hardy, but rarely fruits except in the south-west. A tree at Bishop's Teign顿 produced fruit, which ripened well in 1890. In autumn the colouring of its foliage is very attractive.

*Drimys (Tasmannia) aromatica*.—Tasmania. An evergreen shrub or small tree bearing tiny white flowers in spring. Its leaves if bitten are very pungent, stinging the palate like pepper. The finest specimen I know is one 15 feet in height at Menabilly. *D. Winteri*. South America. A handsome flowering shrub bearing ivory-yellow, fragrant flowers an inch across. At Bishop's Teign顿 there is a good example over 12 feet in height. Both species are fairly well distributed in gardens.

*Dryobalanops aromatica*.—Sumatra. The Camphor Tree. There is at Penjerrick a good specimen 20 feet in height.

*Edwardsia grandiflora* syn. *Sophora tetraptera* (the New Zealand Laburnum).—This and its variety *E. microphylla* bear racemes of yellow flowers, the individual blooms being 2 inches long in the first case and about half that length in the second in the spring. Examples 10 feet or so in height are to be found in some gardens.

*Embothrium coccineum*.—South America. The Fire Bush. The most brilliant of all flowering trees capable of outdoor culture in this country. In May every twig is laden with clusters of long flowers of glowing scarlet, the trees presenting a most gorgeous spectacle. Every good garden in Cornwall, and most in South Devon, possess specimens, some containing a dozen or more. The finest are probably at Trewidden and Penjerrick, where they are 30 feet in height and as much in spread.

*Eriostemon buxifolius*.—Australia. A small evergreen shrub, bearing pink flowers in the spring. Tresco.

*Escallonia illinita*.—Chili. Bears white flowers in July. There is one 15 feet high at Menabilly. *E. revoluta*.—Chili. Bears white flowers three-quarters of an inch long in August, 20 feet high, Menabilly. *E. organensis*.—Organ Mountains. Bears rose-coloured flowers. Fine specimens in more than one garden. *E. floribunda*.—Monte Video. Bears fragrant white flowers in August. Common in the south-west.

*Eucalypti*.—Australia. Some thirty or forty species are grown, of which perhaps the best known are *E. Globulus*, which has attained a height of 50 feet; *E. Gunnii*, 40 feet; *E. citriodora*, 20 feet, against the house at Tregothnan; *E. amygdalina*, *E. cordata*, &c. Many flower freely and bear fertile seed.

*Eucryphia pinnatifolia*.—Chili. A beautiful deciduous flowering shrub, bearing large white flowers like a St. John's Wort, with bright yellow anthers. A specimen at Trewidden is 8 feet in height.

S. W. FITZHERBERT.

(To be continued.)

### TWO GOOD SHRUBS.

#### GENISTA HISPANICA.

WHEN well grown this is one of the best and most ornamental of the dwarf Genistas, and it is a plant which should be found a place in every garden. It has been known under a variety of names, and is still occasionally met with as *Ulex* or *Spartium hispanicum*. In general appearance it differs from most of the other Genistas by its dense rounded habit, isolated plants growing naturally into compact rounded bushes 1½ feet to 2 feet high and 3 feet or more in diameter.

The popular names Spanish Genista or Dwarf Spanish Broom suggest its native country, it being fairly plentiful through Spain, and from there to the south of France. It appears to have been introduced in the first instance in 1759, but it does not seem to have been cultivated to a very great extent. The branches are thin, covered with rigid, branched spines, and sparingly clothed with small, lanceolate leaves. The flowers are golden yellow, borne in terminal, flattened racemes, and completely cover the plants about the latter end of June and early part of July. With regard to soil it is not fastidious, that of a fairly light, loamy character being most suitable. When planting plenty of room should be left between the plants so that when mature each plant stands clear of its neighbour. This is a point worth attention, as in beds where the plants have grown into one thick mass the plants in the centre of the bed are often injured in winter by insufficient air being able to get

THE DWARF SPANISH BROOM (GENISTA HISPANICA) IN A SURREY GARDEN.

to them. Propagation may be effected by means of cuttings inserted in sandy soil in a close cold frame in August.

W. D.

#### OLEARIA MACRODONTA.

This is one of the most handsome of all shrubs, but is happiest in the southern counties of England and in Ireland, at least this is my experience. It is beautiful both in leaf and in flower. In New Zealand it is used as a hedge plant. I remember a note about it in THE GARDEN of August 17, 1900, page 119, where it is mentioned by Mr. C. H. Treadwell that it makes "an excellent hedge, admired by most of the visitors to my garden. The flowers are similar to those of *O. Cunninghamii*, though not so bright or showy. My hedge is about 4 feet high, and though individual plants have flowered, I have not seen it in bloom at one time. When this happens it will be a beautiful sight."

#### TREES AND SHRUBS FOR ENGLISH GARDENS.

(Continued from page 44.)

##### CONIFERS.

ALTHOUGH a few conifers are deciduous, such as the Maidenhair Tree (*Ginkgo biloba*), *Taxodium distichum*, the Golden Larch (*Pseudolarix Kämpferi*), and the true Larches, the great bulk of the family consists of evergreens. It is to the conifers, indeed, that belong the only hardy evergreen trees which in stature and size rival the large deciduous trees of cool temperate latitudes. Although our only native conifers are the Yew, the Scotch Pine, and the Juniper, there is a sufficient variety of soil and climate within the limits of the British Isles to provide suitable conditions for nearly the whole of the family. It is only a few subtropical species that cannot be accommodated. This does not imply that the whole of the hardy conifers can be grown satisfactorily in any one place. In even the best conifer localities there are some species that will not reach perfection, and in the general run of gardens there is a considerable proportion of species about which the same has to be said. This fact, however, has often been overlooked. The extreme popularity of conifers, which was at its height from forty to fifty years ago, undoubtedly led to the enriching of the parks and gardens of this country with what are now, in many instances, magnificent specimens. To realise how great that enrichment was, one has only to mention such places as Dropmore, Murthly Castle, Ochertyre. But conifer planting, from both artistic and merely cultural points of view, was overdone. Conifers began to fill an undue proportion of space in gardens, and displaced to a large extent the beautiful flower-bearing deciduous vegetation whose seasonal variations give such charm and interest. With all their symmetry and richness of hue, the popular species of *Abies* and *Picea* often have a heavy, even sombre aspect. Heavy masses of Pine, Spruce, and Fir can never give that changing aspect in the

landscape that comes with deciduous vegetation. The tender tints of spring, the flowers, the gold and purple of autumn, it is to these that the seasons of our northern latitudes owe their greatest delights.

Perhaps the worst of all the uses to which conifers have been put is that of forming long avenues across parks. It is difficult to understand the frame of mind that would prefer rows of *Araucaria*, *Abies nobilis*, or other similar things—however well grown and pyramidal they might be—to a noble vista of Chestnut, Oak, or Lime, with its canopy of branch and foliage overhead. Conifers can,

trees is more stately and picturesque than the Cedar of Lebanon. How much do we of the present day owe to those who a century or more ago planted this tree so abundantly in this country!

Before planting conifers largely in any garden where they are to be grown for their purely ornamental qualities, a study should be made of the species planted in other gardens where the conditions as to soil, moisture, and altitude are similar. On the peaty formations in Surrey and Hampshire where Rhododendrons succeed so well, many conifers thrive exceedingly well also. The common Spruce and its allies are nearly all failures on light dry soil, especially where the subsoil is gravel. In places, however, where the Spruces fail, the common Larch and the Lawson Cypress succeed well. In chalk districts many conifers refuse to grow, but the following are among those that thrive: *Abies magnifica*, *nobilis*, *nordmanniana*, and *Pinsapo*, the Cedars, *Cupressus lawsoniana*, *macrocarpa*, and *nootkatensis*, the Maidenhair Tree, the Junipers, the Thuyas, the Yews, and the following Pines: *Pinus Laricio* and *austriaca*, the Scotch Pine, *P. excelsa*, and *P. Pinaster*. Most of the Pines, too, are happy on gravelly or stony ground.

Near the sea, that is, in positions exposed to the direct force of salt-laden winds, there is not a large number of conifers to select from, but the following have been found to succeed best: *Pinus insignis*, *P. muricata*, *P. sylvestris*, *P. Laricio*, *P. austriaca*, *P. inops*, *P. contorta*, and *P. montana*, *Juniperus communis*, and *Cupressus macrocarpa*. In damp or boggy places the deciduous Cypress (*Taxodium distichum*) is a most valuable tree. Its soft feathery verdure is most beautiful in summer, and in autumn it dies off into lovely shades of orange and red-brown.

The conifer family is especially noteworthy for the way many of its species vary. Not only is this propensity evidenced in such characters as the colour of the leaf and the differences in habit; it shows itself more remarkably sometimes in the form and texture of the leaf and mode of branching. So great is the difference between some forms of certain species of conifers that they have been placed in

OLEARIA MACRODONTA IN MESSRS. GAUNTLETT AND CO.'S NURSERY AT REDRUTH.

however, be used very effectively for forming short avenues within the garden itself, especially in the more trimly-kept parts.

The practice that is frequently adopted of forming a pinetum and bringing together the members of this family in one part of the grounds is a very good one. It is far better than sprinkling them thickly but indiscriminately over the whole garden. At the same time, where sufficient space is not available for the formation of a pinetum they may be used in their proper proportion with other evergreens in various parts of the garden. Single fine specimens on lawns of *Abies*, *Picea*, and of many other genera are always effective, and nothing in the whole range of native or foreign

different genera. What are generally known as *Retinosporas*, for instance, are really nothing more than forms, "states" the botanists term them, assumed by various species of *Thuya* and *Cupressus*. Strictly speaking, *Retinospora* has no separate existence as a genus. This, however, is a botanical phase of the matter. Horticulturally we are more concerned with such variations as adapt the plants to various garden purposes. Many quaint and dainty forms of large trees are very suitable for the rockery in association with alpine plants. The common Spruce, for instance, has given birth to many pigmy forms. The Yew, the Scotch Pine, and various others have "spotted" in a similar way. But no hardy tree varies so

PEDICULARIS FOLIOSA

(LIFE SIZE).

much, perhaps, as the Lawson Cypress when raised from seed. The species has assumed almost every shade of colour that conifers do assume, and every form of growth. Beautiful golden, variegated, pendulous and erect varieties have been raised, and not only from the Lawson Cypress, but from many other conifers also. The golden Yews, the yellow form of the Monterey Cypress, and the golden variety of the Scotch Pine, may be recommended to those who require this colour, although in the Pine it only shows itself in winter. The blue-white or glaucous hue that is more or less present in most conifers, shows itself most conspicuously in the Blue Spruce (*Picea pungens glauca*), in *Cedrus atlantica glauca*, in the new Cork Fir from Arizona (*Abies lasiocarpa* var. *arizonica*), and in *Abies concolor violacea*.

W. J. BEAN.

(To be continued.)

**MOUNTAIN FLOWERS.—II.**

At an altitude of 6,000 feet one is in the region of true alpine vegetation. Here, at the Rochers de Naye, at that height above sea-level, and just over the north-eastern end of the Lake of Geneva, a good proportion of the vegetation proper to the elevation may be studied and enjoyed. Close to the terminus of the local branch of the little alpine railway are two great slopes facing respectively approximately north and south. It is strange to see how absolutely different is the vegetation on the two exposures. The northward slope, grassy towards the valley bottom but rocky above, is crowned with massive heights of limestone standing up whitened and weather-worn and looking at a distance, except for the uneven spaces of their actual tops, as if they were bare of all vegetation. But at the foot of these crags, among the piles of broken rock, and in the steep slopes of

rock and grass close by, is a happy wandering ground for anyone who has a little knowledge of, and a great love for, mountain plants, while the rifts and fissures of the giant upper rocks are like the most perfectly planted alpine garden. Visible everywhere from its bright white flowers, with their pretty centres of yellow anthers and neat glossy foliage, is *Ranunculus alpestris*, sometimes in the grass, but most striking in narrow, upright rifts of the calcareous rock, whose stratification is here absolutely perpendicular. A little dark humus gathers in the damp rift, from which moisture seems always to ooze, then comes a pad of short moss and then the pretty little *Ranunculus*, so that the whole fissure for some feet in height is studded and starred with its charming bloom. Two dainty Ferns, *Cystopteris fragilis* and *Cystopteris alpina*, nestle in deep enshirms of moss among the chaos of broken rocks, and in one slightly overhanging rift is the oddest looking row of the greasy feeling stars of *Pinguicula*, not in flower. Neat cushions of *Silene acaulis*, with roots thrust deep into the rocky cleft, spread happily over the stony surface and show us what to do in our rock gardens. Indeed, this whole region is a precious lesson in good rock gardening. Where a rocky mass has little rounded pits, there the soil gathers and makes the home of some neat little silvery *Saxifrage* or of a tuft of *S. oppositifolia*, here excessively minute in size. A thousand feet lower the same plant is of normal size.

The heads of the great rock masses, in most cases inaccessible, have a hoary growth of the dwarf *Juniperus nanus* and short grasses, but a note of bright colour is given by the pink-bloomed tufts of *Melandrium rubrum*, having at a distance something the effect of tufts of Thrift of a brighter and better tone of pink. The accessible slopes have the same Juniper and *Rhododendron ferrugineum* and brilliant jewels of *Gentiana verna* and boldly pictorial masses of the foliage of *Laserpitium Siler*, with occasional plants of *Daphne Mezereon* and *Thalictrum aquilegifolium*.

Everywhere upon the northern facing slopes is *Anemone alpina* with its large bloom and feathery foliage, and with it *A. narcissiflora*. It is good to see the white flowers of *Anemone alpina* in sunlight against the cold grey of the limestone rock in shade. Neither this nor its constant companion *A. narcissiflora* are pure white in colour; both have a slight creamy tinge. In *A. narcissiflora* the clustered buds

have a rosy stain that makes them look something like a little bunch of fruits nestling in a ring of bracts, but in *alpina* the buds of the solitary blooms are of a wonderful bluish colour, like faintly blued steel with a greenish tinge.

*Dryas octopetala* is very frequent and, with the two prostrate dwarf willows, *Salix herbacea* and *S. reticulata*, forms a large part of the covering of the smaller rocks on the steep slope. It likes to be seated on the top of a rock, with its woody stems thrust deep down into a rift and to spread out its sheets of neat glossy foliage, and to send them hanging down the rock face sometimes as much as a yard. Lifting up such a mass of living drapery, one finds a thickish pad of living and dead moss and humus, through which little rootlets of the *Dryas* pass to lick the cool moist surface of the rock below.

Coming to another pile of great rocks there are again other plants that we treasure in our gardens, and that here we can learn how best to grow—two *Campanulas*, *C. caespitosa* and *C. pusilla*, both tightly rooted into rock clefts, with *Primula Auricula* and *Veronica saxatilis* in exactly the same positions.

Besides the two white *Anemones* in the broken ground just below the larger rock masses the most frequent plants are the *Globe flowers*, *Alchemilla alpina* and *Horminum alpinum*, whose small yet handsome rounded leaves of firm texture always seem to promise a better flower than the disappointing one that accompanies them.

Though it is well on in July the snow still lies in the hollows of the northward slopes, in places as much as 9 feet deep, and even in

VIOLA CALCARATA (LIFE SIZE).

some hollows that face the south. Each pool or drift of snow is edged with a space of brown turf where the grass has not yet recovered, and through this brown turf, and even through the edge of the snow itself come the flowers of the brave little *Soldanella*, so difficult to bloom in England. The pretty little nodding flowers of a bluish lilac colour, with their reddish stems and fringe-edged petals, are in such quantities that one cannot help treading them under foot. There is one other plant of the upper part of the northward slope that takes the lead of all others where it occurs in fairly plentiful patches. I had never before seen it at home and just in perfection, but as it grows on these heights, *Primula elatior* is a plant of distinguished beauty. The yellow of its petals is of a tender and luminous quality; it is not the greenish yellow of our English Primrose nor yet the colour of the Cowslip, and is not quite so bright as *P. sikkimensis*, though reminding one a little of the colour effect of that beautiful himalayan, but it has a tender purity of its own that is infinitely charming and that is most becomingly accompanied by the pale green of its boldly wrinkled leaves. The wild Oxlip that we sometimes find at home, and that is a natural hybrid of Primrose and Cowslip, is a very poor thing compared to this beautiful species of the Alps, though I believe it goes by the same name and is commonly confounded with it in gardens.

The steep grassy slope that faces the south is thickly studded with the bright deep purple bloom of the scentless *Viola calcarata*. It has something in common with *Viola cornuta*, as it has the long spur that is one of the characters of the latter, but this is a plant of the Pyrenees. In this handsome alpine Violet the colour sometimes varies to a bright red-purple such as one sees in some of the varieties of English Iris, but, as a rule, there is very little variation to the paler shades. The foliage is small and mostly hidden in the grass. *Hedysarum obscurum* makes handsome masses of bright magenta-crimson bloom, and the same colour, of a rather better quality, is taken up by a showy crimson *Pedicularis*. Where a fair depth of soil has collected *P. foliosa* also is a remarkably handsome plant, with its closely-flowered heads 3 inches to 4 inches long of pure pale lemon-coloured bloom with deeper coloured lip. *Centaurea montana* is also at home here, the flower looking a little thin from one's eye being accustomed to the fuller garden kinds.

*Anthyllis Vulneraria* is everywhere. Though it is also a wild English plant, it is so bright, with its round heads of cheerful yellow bloom, that one thinks it should be used in the rougher parts of pleasure grounds or wherever there may be bare banks of chalky soil.

*Geranium sylvaticum* is a handsome thing in these mountains, densely flowered and brilliantly coloured with its own fine purple. *Myosotis sylvestris* is everywhere, of a rather deeper colour than is usual in gardens, but it seems to do itself an injustice from its habit of growing in isolated plants, giving only one or two sprays of bloom. Probably from the

recollection of its use in beds or groups in gardens one expects to see it in more thickly flowered masses.

The pale clear lemon colour of the rather pretty crucifer, *Biscutella laevigata*, is conspicuous at the top of the sunny slope, where grass gives place to rocky backbone that ends in a jagged edge with sheer descent of bare mountain side to the north. The extreme edge is tempting, though dangerous; small, well-bloomed tufts of the mountain flowers are just out of reach over the edge, all the more flowery and tufted because they root into the cracks of the bare limestone and are not made proud of growth by the deeper soil of the grassy slope. But, though these are tempting to look at, their counterparts may be found in safer places a couple of yards further back. Here is *Phaca astragalina*, a neat white-flowered leguminous plant, and the pretty dwarf white-flowered *Polygonum viviparum* and quantities of the neat little *Globularia cordifolia*.

The little Orchid *Nigritella angustifolia* sends up its modest spike here and there in the grass and *Phyteuma orbiculare* is fairly common.

The flowers are so engrossing that for a time one forgets the glorious landscape, the range upon range to east and south, and the many snow-capped giants; the eastward half of the immense lake lying like a map below; the glory of wondrous colour as cloud masses throw their shadows over summit and hollow; the wonder of the pure air that feels like inhaling new life; all this one almost forgets in the delight of searching for and gladly greeting the jewels of flower beauty that lie at one's feet.

## CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

### LILIES IN PAILS.

[TO THE EDITOR OF "THE GARDEN."]

**S**IR,—The failure of Lilies in the open ground, which appears to be somewhat general this year, and to which reference was made in *THE GARDEN*, July 19, page 37, recalls an example of Lily growing in pails lately brought to my notice in South Devon. Being greatly interested in the strong, healthy growth and numerous flower-buds of these particular Lilies—principally *L. longiflorum* and *L. speciosum*, it is true—their owner, who is a zealous gardener, explained that the bulbs had been grown for several seasons, without replanting, in the same wooden pails in which I saw them, which were, in fact, nothing more nor less than lard tubs, bought at a grocer's for fourpence each, painted at home, and furnished with a strong but simple handle at each side.

The pails were well-drained and the bulbs carefully planted in suitable compost to begin with, and afterwards had not been disturbed further than by making room for a good top-dressing of rich soil every spring. The pails were standing, when I saw them, in partial shade on a broad terrace walk in front of an old-fashioned country house, and could not fail to arrest the attention of the most casual observer by their unusual vigour. I was told that when flowering was over they were removed to the kitchen garden to complete their growth, and when the leaves and stems had died off the pails were

wintered without further ado under the stage of a cold greenhouse, or sometimes in a convenient room used as an amateur workshop. Practical hints of this kind are sometimes useful, and the

RANUNCULUS ALPESTRIS IN A VERTICAL LIMESTONE FISSURE (TWO-THIRDS LIFE SIZE).

ease with which they can be moved and stacked gives these pails an advantage over large pots, or the paraffin tubs, sawn in half, which are also invaluable for many garden purposes. The conditions of culture being under more ready control

is probably the secret of the remarkable well-doing of the Lilies in question, but the fact that Lilies of all garden kinds are not so happy as usual this season in many South Devon gardens made them more noteworthy.

K. L. D.

### APPLE TREES ON THEIR OWN ROOTS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I am anxious to find out if Apple trees can be kept dwarf or reasonably small on their own roots by proper pruning, and if it would be a profitable undertaking to cultivate them thus. In *THE GARDEN* (page 427) there is a short notice of Apple Bramley's Seedling, by Mr. J. Ward, where he hints that early fruiting trees may be profitably grown on their own stocks, as he condemns the Paradise and speaks favourably of the seedling stock, which I suppose means Apple stock. Should you be in a position to state in a few words if it is feasible and practicable to grow fruit trees on their own stocks for market fruits, I shall be very thankful. I have a small orchard of 500 Peach trees, near Boston, kept dwarf by pruning, that are first-rate. I now desire to put out some twenty or thirty acres of Apples and Pears if I can keep them dwarf on their own stocks. If this is not profitable to do I must not do it.

*Philadelphia.*

ELI E. JOSSELYN.

[All Apples and Pears in England are grafted or budded on one stock or another. None are grown from seeds as permanent trees for fruiting on their own roots, and this no doubt was the reason of this subject not being mentioned in the book you named. Apples grown on own-root trees from seed without budding or grafting would produce fruiting trees perhaps as quickly as those grafted on other stocks, but no dependence could be placed on the variety coming true. The chances are that instead of the variety sown reproducing itself, a mixed and medley progeny would be the result. Moreover, not more than half the young seedlings could be utilised for planting; only the strong and clean-stemmed ones. The uncertainty of the varieties coming true by this manner of propagation is of itself a sufficient reason to place the practice entirely out of court.

The stocks used for grafting the Apple are the following: The Crab, the Apple, and the English Paradise. The best of the seedlings will be fit for grafting the third year after sowing. For the planting of trees in orchards, or in any position where it is intended for them to develop into large trees, the Crab stock, as being strong and deep-rooting, is considered the best. The Apple stock is recommended for those grown as bushes, and which in this country are usually planted at from 10 feet to 12 feet apart each way, and especially for such free-fruited varieties as Lane's Prince Albert, Stirling Castle, Lord Suffield, Lord Derby, and Cox's Orange Pippin; in fact, all the free-fruited varieties. The English—not French—Paradise stock is used as a stock for those varieties which are a long time in bearing fruit after planting, such as Blenheim Orange, Bramley's Seedling, Newton Wonder (one of the largest, most handsome, and best of late Apples), or any variety it is specially desired to bring into early fertility. A planter contemplating the planting of twenty acres would be well advised to plant maiden trees (one year after grafting) of approved sorts on free, healthy stocks than to attempt to grow trees on their own roots. The price for those worked trees when bought by the thousand is exceedingly low.

As regards the possibility of keeping Apple trees dwarf by pruning, whether on their own roots or on other stocks, no doubt this is quite possible, and especially so when the trees are grown on the surface-rooting Paradise stock; indeed, it is possible by intelligent and effective pruning on whichever stock it may be planted. The objective of the scientific culture of fruit trees is a speedy return of good crops of best quality fruit that will command the best price in the market. In attaining this objective pruning plays a very

important part. We must bear in mind, in the first place, that the well ripening of the wood and the fruit-bearing buds of the tree is essential before success can be hoped for, and in order that this may be effectively accomplished the branches of the trees must be disposed sufficiently wide apart to allow the sun and air to exercise their influence in developing and ripening growth, therefore overcrowding of branches must be guarded against by timely and judicious pruning. If the thinning out of the branches is neglected and growth allowed to become so thick in the tree that light and air are excluded, then a soft, immature, and fruitless growth is the result, and no amount of pruning can keep such trees within reasonable bounds.

When a tree has been brought to a constant and heavy fruit-bearing condition by ample and judicious winter and summer pruning, then fertility is secured, and this condition as long as it continues will effectually maintain the frame of the tree within moderate limits for many years, and only moderate or very little pruning will be necessary.

—ED.]

### SEASIDE PLANTING.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—In one list of trees I see Silver Fir recommended as suitable for seaside planting. Does this mean all the kinds of Silver Firs that are generally listed as *Piceas*, and would it include the two Spruces, *Abies parryana glauca* (or Colorado Blue Spruce) and *Abies parryana Engelmanni*? I should very much like to know of a few of the best varieties of such trees that would do three-quarters of a mile from the sea, 100 feet above it, exposed position near Deal, soil about 2 feet light loam on chalk.

*Folkestone.*

WM. B. WELCH.

[None of the Silver Firs (*Abies*) or Spruces (*Picea*) are good trees for planting at the seaside, unless there is sufficient shelter to break the force of the wind, and even then there are very few that will succeed. The species most suitable for planting where there is a thick outer belt are *Abies nobilis*, *A. lasiocarpa*, *A. nordmanniana*, and *A. pectinata*, the common Silver Fir. Of the Spruces *Picea nigra* and *alba*, the North American Spruces, succeed better than the Norway Spruce, *P. excelsa*, but these, like the Silver Firs, must have the shelter of a good wind break; *Picea parryana*, *pungens* and *Engelmanni* will not succeed in exposed places, even in inland localities, and fail entirely by the sea. The conifers that will thrive by the sea are very few, and probably not more than half a dozen kinds are reliable. The finest of all is undoubtedly *Pinus Pinaster*, which is essentially a seacoast Pine, revelling in storms and sprays. *P. maritima*, closely allied, is equally suitable. Then, for warmer parts, is the Aleppo Pine (*P. halepensis*), but which cannot be relied on, except on southern and warm coasts. *P. insignis* is somewhat hardier, and stands the sea gales fairly well, and *P. austriaca*, and its relative, *P. Laricio*, are both reliable, and specially for making the first barrier against the winds. The hardy Scotch Pine (*P. sylvestris*), if planted in large masses, grows well but does not luxuriate close to the sea, and is especially liable to be browned in foliage by the salt spray.

Besides the Pines the finest of all conifers is the Monterey Cypress (*Cupressus macrocarpa*), which one sees hardy everywhere on the coast in these islands, and which grows finer than it does in its home on the Pacific coast. It makes a fine front barrier against the wind, especially when mixed with the foregoing Pines. The variety *C. lambertiana* is equally reliable. There are two other conifers which, though not much planted by the sea coast, will, I believe, prove reliable: these are *Cedrus atlantica* and *Thuja gigantea* (sometimes called *T. Lobbii*). I should plant these without hesitation, knowing, as I do, their hardy natures. A third conifer that I have seen doing well by the sea is *Abies Pinsapo*, and I recommend your correspondent to plant it on his chalky soil at Deal, but he must provide a temporary shelter for

it in its small state. This subject of seaside planting—the most difficult in a tree planter's practice—is such an important one, especially in its details, that it cannot be dealt with in a note, but what I have stated may be of service.—W. G. Kew.]

### GRAFTING TREE PÆONIES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Referring to Mr. Arnold's remarks on "Tree Pæonies," page 292, May 3, I saw while in Japan a garden of Tree Pæonies, said to be at least 100 years old, and they had a very rugged look. To have layered from such would have been a rather difficult operation. At Osaka, I was fortunate in my visit to see what Mr. Unger describes as the finest collection of these plants in Japan. None of the plants were large, and I presumed these were the plants for the sale of 1899, after being divested of every scrap of wood that could be used for grafting, leaving the regulation three flower buds. These growers are not paid very much for their plants, at least so one would judge from dress and general appearance of the men, and if they can get saleable plants in two years by grafting instead of four or five years by layering it is a consideration. I see, however, no reason why the graft should not be as low as possible on the stock. I shall have occasion to write to some of the leading exporters, and will put the subject before them of grafting as low as possible. I see no reason, if the graft is buried, why the plant should not root above the graft. It should also be borne in mind that the source of supply is an important factor as regards quality. There are careless growers in Japan as elsewhere, and the careful man who does an export trade, has only dealings with careful growers, who are generally also raisers of new varieties. Anyone visiting Japan when the Tree Pæonies are in bloom are welcomed by the owners, who put up a notice of invitation when any special flower is at its best. In the case of Iris, tea houses are erected in commanding spots, and these places are much frequented, the visitors drinking tea or hot saki, a drink resembling sherry, which is made from rice. It affects the legs before it affects the head. The great distilleries are at Osaka, where the best Tree Pæonies are grown.

*Cape Town.*

PETER BARR, V.M.H.

### THE FRUIT GARDEN. PROPAGATION OF THE PINE-APPLE.

**P**ROPAGATION of the Pine-apple may be effected in four ways, either by rooting the crown of the fruit, the suckers, by cutting off the stem and rooting the shoots that will arise from it, or by seed. Undoubtedly the best of all the methods is that of rooting the suckers, and it is the one generally practised in this country. The suckers should not be removed from the parent plant until they are fully 18 inches high; it is profitable often to leave them even longer. The Queen variety of the Pine bears suckers unusually freely; one plant will often produce five or six. Most of these will appear in the spring, and they should, so soon as they can be conveniently handled, be reduced to one or two. The result will be that the remaining suckers develop into far more vigorous plants than would be the case if several were left upon the parent plant. The successful culture of the Pine depends largely upon the early treatment of the sucker; if this is not neglected there is a much greater chance of its developing into a vigorous fruit-bearing plant.

By the middle of the month of May the suckers will be large enough to handle, and all surplus ones should then be removed. This work needs performing with some care, for injury, both to the plant and to the sucker, is very easily caused. The best way is to press the sucker low down away from the stem and give it a twist, when it

A BANK OF TEA AND HYBRID TEA ROSES.  
(From a photograph by Miss Willmott.)

may easily be detached without harm being done. The few suckers left will now grow rapidly as the plant develops, and towards the end of August should have made strong sturdy plants from 18 inches to 2 feet high. This is the time to remove them for the purpose of potting, but with this subject we have not at present to deal.

The next method of propagation is by the crown of the fruit, and its practice necessitates a much longer time before a plant capable of bearing fruit can be produced than does the way we have just detailed. It is usually resorted to only in the case of varieties which are shy in giving off suckers, making these, of course, scarce and of greater value. The only preparation necessary before inserting the crown of the fruit in the pot is to take off a few of the bottom leaves, leaving about half an inch of the base bare; from that portion roots will be emitted, when it is potted firmly into a medium-sized pot and this plunged into a bottom heat of 70°.

The third method referred to, namely, by means of the stem, is accomplished by laying the hard part of the stem, after stripping off the leaves, in shallow pans or boxes filled with light loamy soil, covering them to the depth of half an inch, and plunging the boxes in a bottom heat of the same temperature as before mentioned. This is a most useful practice to adopt when it is desired to increase the stock of choice and scarce varieties. It will be at least two years before Pines propagated in this way will give any return in fruit, and probably longer; but as one stem will often produce from five to six plants it is a useful method of increasing the stock.

We now come to the fourth and last-mentioned manner of propagating the Pine. When Pine culture was so highly thought of and so generally practised in this country, between thirty and

forty years ago, many attempts were made to raise new varieties by cross-fertilising the older ones. A few sorts were raised in this way, and for some years were in commerce. They were, however, no improvement upon existing varieties, and for this reason soon suffered extinction. Propagation by seed in the case of the Pine is only resorted to when it is desired to raise an improved new variety.

I am afraid there is no great field for improvement in the varieties of the Pine, those we already possess being so excellent. The principal ones are The Queen, Smooth Cayenne, Charlotte Rothschild, and Black Jamaica. Others that used to be grown, but now are almost forgotten, are Providence, a huge variety, the fruits, though of poor quality, often weighing as much as 16lb. each; Sugarloaf, a handsome, conical fruit of an intense crimson colour; Prince Albert, much like Sugarloaf, but a larger fruit and not quite so conical; and Lady Beatrice Lambton. This variety was raised at Lambton Castle in 1860 by Mr. Stevens, at that time gardener there; it is a useful and handsome fruit of excellent flavour, and very distinct. Lord

Carrington is a variety that was introduced by Mr. Miles (Lord Carrington's gardener) many years ago. This was popular for a time, especially as a winter-fruited Pine. For all practical purposes, however, the varieties now grown in England may be said to be the following: The Queen, Charlotte Rothschild, and Smooth Cayenne. There are three recognised varieties of The Queen Pine—the Moscow, the Ripley, and the Thornby. The Ripley is the most handsome, of the best quality, and most commonly grown. There are two varieties grown under the name of Charlotte Rothschild. The genuine one has large, dark, broad leaves; the spurious one has long, narrow ones. Of the Smooth Cayenne there are also two varieties; the true one has dark, broad, leathery foliage, with a few prickles, while the inferior one has much narrower and smoother leaves. A. P. H.

## THE ROSE GARDEN.

### TEA ROSES ON BANKS.

MANY an otherwise good garden is disfigured by a wearisome repetition of dull grass banks. They are not only uninteresting, but are difficult to keep in order, and if they face the sun the grass burns and is unsightly all the summer. The illustration shows such a bank not grassed, but made beautiful by a bold grouping of Tea and Hybrid Tea Roses, with a front planting of that grand pink Verbena Ellen Willmott and Funkia. This lower planting will, of course, leave this part of the bank bare in

winter, but the place in question is not a winter residence. It might in other circumstances be planted with Heaths or Cotoneaster, or with dwarf Cistuses and dwarf Lavender, or some of the well-clothing plants of good winter grey, such as Lavender Cotton.

### ROSES FOR PERGOLAS, FENCES, AND ARCHES.

We have been asked by many readers of THE GARDEN to give a selection of the most easily-grown and beautiful Roses for pergolas, fences, and arches, and hope the following carefully compiled list will be helpful.

We have many Roses that almost anyone can grow, supposing always that the soil is fairly good and that it is deeply dug before planting and enriched with animal manure. Light, shallow soils should be deepened by removing the gravel below, giving the plant at least 2 feet of good soil with a layer 3 inches or 4 inches thick of cow manure on the gravel, and thus render it more retentive. Heavy, clayey soils should have gritty material incorporated. Road scrapings, washed seasand, or burnt refuse make good material for the purpose. Where I think the beginner makes a great mistake is in attempting too much. He plants Roses, fruit trees, flowering shrubs, herbaceous and bulbous plants, &c., all in one little plot, with the result that nothing is done well and all are overgrown. Give the Roses as open and sunny a spot as possible, prepare the ground by trenching some weeks before planting, avoid falsely stimulating artificial manures, and only use good farmyard manure, well decayed. Plant in the autumn if possible, although early spring planting is not to be condemned. Where the garden is bounded by a close-fitting fence some lovely Roses may be planted against it. Roses in pillar form are also beautiful when well done and isolated in a way to exhibit their individual beauty. Arches of Roses present a glorious picture if covered with suitable kinds. These may span the walks or run parallel to them. Should this latter plan be adopted, clumps of dwarf Roses in front of the arches would be most appropriate. If a pergola or covered Rose walk be possible, a feature of considerable interest is added to the garden, but pergolas seem out of place in small gardens.

As to pruning Roses, those grown on the fences should have some of the flowering wood cut away in summer immediately after flowering, and in spring just the shortening of the laterals suffices, the long rods being left untouched. Similar treatment is accorded pillar Roses, but arch and pergola Roses should be allowed to grow as they like, excepting that when crowded one or two of the oldest shoots are removed quite to the ground. It is important to dwellers near large towns that the foliage of the Rose plants be cleansed of various deposits at least every other day, selecting the evening as the more suitable time. If this be well done, the green fly and other pests will be less troublesome. I cannot too forcibly impress upon the beginner the importance of frequent hoeings, not merely to kill weeds, but also to aerate and sweeten the soil. The varieties named below are all selected for their freedom in blossoming, usefulness for buttonholes and sprays, and also by their sturdy vigour providing the grower with some free-growing Roses that with ordinary care the merest tyro can easily cultivate. The following twelve kinds are well adapted for fences, and are placed in order of merit:

#### FOR FENCES.

*Marie Van Houtte* (Tea-scented).—A general favourite, of palest cream colour. The petals are usually edged with rosy pink, which colour in autumn is much intensified. A splendid grower, constantly blooming, yielding quantities of lovely buds.

*Wm. Allen Richardson* (Noisette).—A west fence would probably suit this best. It is a Rose of remarkable colouring, rich orange-yellow, also notorious for the way in which some of its blossoms appear nearly white. To avoid the latter give it good feeding; for instance, a couple of gallons,

each week after buds are seen, of weak liquid manure made from cow manure and soot. Thin out the old wood after flowering in autumn, and in spring shorten laterals only. Spread well out on the fence.

*Mme. Abel Chatenay* (H.T.)—Always a favourite. The colour is fawn-pink shaded salmon, the centre of the flower intense in colour, paling to the outer edge. A vigorous grower, good as standard on wall or fence or as bush. May be cut with fine long stems. If used as a bush tie over some of the long growths, securing them to pegs fastened in the ground, and thus induce a more abundant blossoming.

*Mme. Lombard* (Tea), salmon-pink, buds often red. A most reliable grower and one easy to cultivate, yielding quantities of its pretty buds.

*Mme. Hoste* (Tea).—Certainly one of the best; rather thin when expanded but superb in its half-open stage and in the buds. Colour bright clear yellow. A grand Rose of free growth and very floriferous.

*Anna Ollivier* (Tea).—Similar to the last-named in growth, with buds of most lovely colour, rosy flesh, with brownish crimson base on the outside petals. When well grown the colour of this variety is most unique.

*Caroline Testout* (H.T.).—A magnificent Rose of the La France type, though not so sweet. Buds very lovely, also expanded flowers. Grand to cut for table decoration, and for this purpose several plants should be grown. Trained on a fence it needs but little pruning.

*Safrano* (Tea).—A bright apricot-coloured bud. Pays for good cultivation, as then the buds are much elongated. This variety is grown in immense numbers on the Riviera, and quantities of its pretty buds are imported in March and April.

*Marie d'Orleans* (Tea).—As hardy as old Homer, but far more useful, for it yields the most beautiful of buds of a brilliant rose colour.

*Gustave Regis* (H.T.).—Perhaps the longest bud Rose we have. Canary-yellow in colour. A strong grower, should be sparingly pruned, but like all strong growers it flourishes best on the young wood. As a bush it is good, also standard. A west aspect would be best if used on a fence.

*Dupuy Jamain* (H.P.).—One of the best late flowering red Roses we have, and a most useful all round variety, cherry red in colour, and of strong growth.

#### PILLAR ROSES.

To make really effective pyramidal pillars three plants should be planted in a group, the supporting stakes being formed in the manner of a tripod. They should be in any conspicuous place. The kinds named are selected for their pretty buds rather than the extra strong growths.

*Climbing Belle Siebrecht* or *Mrs. W. J. Grant* (H.T.).—The dwarf form of this is well known, and is one of the most beautiful bud Roses. I should prefer to grow the climbing variety as a pillar. From pillars three years or four years old fifty to sixty blossoms appear towards the end of June, and one is assured of another blossoming later. The most shapely buds and flowers with fine long stems can be had from this Rose, and the brilliant pink colour is in much request for table work.

*Celine Forestier* (Noisette).—Rich sulphur-yellow. A well known kind of vigorous growth. The growths must be left long when pruning. If room cannot be found for it as a pillar it makes a splendid standard.

*Bouquet d'Or* (Tea).—A perfected *Gloire de Dijon*. Not so vigorous, but it gives buds of the greatest beauty, and richer in colour than *Gloire de Dijon*.

*Grüss an Teplitz* (H.T.) is a very brilliant colour, useful for cutting, especially late in autumn. Then it forms the prettiest of scarlet buds. The fine clusters and beautiful foliage are very conspicuous at all times.

*Mme. Berard* (Tea).—A splendid vigorous

Rose for a tall pillar or arch. The lovely apricot-coloured buds make elegant buttonholes.

*Billiard et Barri* (H.T.).—Buds rich golden yellow. One of the best Roses of its colour. Growth semi-climbing. Plant it against a 6-foot stake and train any long growths it makes spirally, which will induce a freer blossoming.

*Ulrich Brunner* (H.P.).—A good all-round red Rose, not particularly handsome in bud, but so vigorous and good that one can recommend the variety with every confidence.

*Clio* (H.P.).—A grand white Rose with flesh pink shading. It produces its blossoms in immense bunches and must be severely thinned, then every bud is a perfect buttonhole. A very strong grower, not, however, very free in autumn.

*Dr. Rouges* (Tea).—An attractive red bud with coppery yellow shading. Rather better than *L'ideal* as a pillar, but not so distinct in colour.

#### FOR ARCHES OR PERGOLAS.

It is most important to plant such Roses on the above that may be depended upon to clothe them rapidly, and as they are planted for garden effect one would not cut the flowers for the house. I, however, name some kinds that will yield pretty buds, and also certain kinds that produce handsome trusses of blossoms for vase or table if required. Taking them in order of merit that grand old Tea

*Gloire de Dijon* must stand first. This must not be left out of any garden. If no arches, then have a pillar, a standard, or a spreading bush of it, for it will accommodate itself to any mode of culture and training. Its long canes bent over to form a handle similar to that upon a basket will be studded all over with buds.

*Blairii No. 2* (Boursault).—A good double Rose of pink colouring, vigorous and free. (See illustration.)

*Reine Marie Henriette* (Tea) is sometimes called Red *Gloire*, but why no one knows. If left unpruned it will, in two or three years, make a glorious arch, and its cherry-red flowers are showy, if not especially handsome. Rather liable to mildew, therefore should not be watered artificially. Good doses of liquid manure in winter would help such Roses immensely.

*Electra* is grand; one of the best of these free rambling Roses. It flowers rather earlier than *Crimson Rambler*, and is of a yellowish-white colour with tiny canary-yellow buds.

#### AN OLD ROSE GROWER.

(To be continued.)

## GARDENING OF THE WEEK.

### INDOOR GARDEN.

#### CHRYSANTHEMUMS.

No definite date can be stated as to the time for selecting buds. Very much depends on the season, varieties, and the locality in which the cultivator resides. As a general rule from the middle to the end of August is the best time. Great care is necessary in removing the surplus buds and shoots; this work is best done in early morning or late evening. If practised during the middle of the day the growths are tough and the selected bud is likely to get damaged. Watch minutely and search the points of the shoots for earwigs; there is no better trap for these than short lengths of Broad Bean stalks placed plentifully amongst the plants. To prevent or destroy green-fly, dust the points of the shoots with tobacco powder. A good syringing in the morning will cleanse the shoots from both fly and powder. Should thrip make its appearance syringe the shoots well with soft soap and water. Tie growths to make them perfectly secure against the wind. The plants will much benefit by a good top-dressing; the surface soil should be slightly stirred with a pointed stick, care being taken not to damage the roots. A suitable compost is one of rough turf loam and dried horse manure in equal parts, with a sprinkling of bone-meal. Where dwarf plants are required the shoots may be made into cuttings from 4 inches to 6 inches long when the bloom buds are formed. Insert singly in 2½-inch pots in sandy soil, pressing the compost round the cutting; place them in a propagating frame with a good bottom heat; water and shade from sun. Five or six cuttings of the single varieties should be inserted in 4½-inch pots. These may all be flowered in their cutting pots, and are useful plants for conservatory and house decoration.

#### MALMAISON CARNATIONS.

The earliest layered batches will now be growing freely, and should be potted up as soon as rooted. Prepare a compost of two parts loam, one part leaf soil or peat, and the remaining part made up equally of crushed charcoal, silver sand, and dried horse manure. In mixing, add a dusting of soot, and should the loam be light then add a sprinkling of bone-meal. The layers should be taken up with

ROSE BLAIRJI NO. 2 ON A PERGOLA.

a good amount of soil adhering and placed in 3-inch or 4-inch pots. Use clean and dry flower-pots, and drain them thoroughly. Pot firmly but with great care, as the roots are easily injured. The plants will need staking, and care is necessary in giving water until roots have been freely made. It is well to shade them for a few days, after which give plenty of air and keep the plants near the glass. The later batches should now be layered as the plants pass out of flower. Large specimens should be potted on, using a rather rougher compost, and firmer potting is essential. Three good winter flowering varieties are Sir Charles Freemantle (deep rose pink), Princess May (deep rose), and Marchioness of Londonderry (scarlet); one-year old plants potted on are the best for that purpose.

JOHN FLEMING.

*Wexham Park Gardens, Slough.*

## THE KITCHEN GARDEN.

### CELERY.

THE whole of this crop ought now to be growing freely; it is absolutely necessary, however, to have it in perfection, that the plants be kept well drenched with water, both overhead and at the roots; in dry weather, indeed, it is hardly possible to give too much, and at every third watering either farmyard liquid or house sewage should be given. Remove all side growths, split and deformed leaves, hand pick the maggot-infested leaves and consign them to the fire where badly attacked. I fear that in some districts, especially farther north, it is very prevalent this year. Continue to earth up the Celery plantings at short intervals, this being the proper method to blanch Celery. Also dust over the foliage with soot in early morning while wet with dew.

Celeriac, or Turnip-rooted Celery, which was planted as advised, should, like Celery, receive liberal treatment by way of thoroughly watering and keeping the surface soil constantly stirred with the hoe, as the larger the bulbs the better will be their quality.

### BRUSSELS SPROUTS.

This is a most important crop in many gardens during the whole of the winter months. The earliest batch will now be in full vigour, and it is a capital plan to stake the whole of these to keep them in an upright position, as rough wind often turns them on one side, and the buttons become splashed and gritty and the yield is not so good. Any rough stakes will answer the purpose, and it does not take up much time. Apply a little artificial manure to each plant in showery weather, and the later plantations should be frequently hoed with the draw hoe.

### WINTER GREENS

of all kinds that were planted between rows of early Peas, which have afforded them the necessary shade during the past trying weather, will now be well established. The Peas should be removed, then apply a little patent vegetable manure, fill up any vacancies from the seed bed, lift them carefully with a fork, and thoroughly water them in. The whole of the ground between them should be pointed and broken up finely.

### GLOBE ARTICHOKEs

will be much benefited by giving them good drenchings of farmyard liquid, when they will continue to bear till quite late in the autumn. Should the heads come on faster than they are wanted for use, cut them before they commence to open, place the ends in water and stand them in a cool place, when they will keep fresh and fit for use for many days.

### POTATOES.

Lose no time in lifting the tubers as they become ready; far better to err on the side of taking them up early and storing than leaving them in the ground, as in all probability after a spell of continuous wet weather many will become afflicted with the disease which otherwise might, by early lifting, have been saved. Should the skins become

slightly rubbed they will quickly form another, and be none the worse; burn all the haulm and rubbish on the ground.

### WINTER ONIONS.

The ground having been previously prepared, the first sowing should at once be made in shallow drills, after the ground has been thoroughly raked down and made quite firm in dry weather. The drills, after sowing, should be well watered with a rose watering-can to assist germination of the seed. White Emperor, White Leviathan, and Giant Blood Red Rocca are all excellent for the first sowing.

### CARDOONS.

These should be kept well watered and blanched as they become large enough, this taking fully ten weeks to do properly.

E. BECKETT.

*Aldenham House Gardens, Elstree, Herts.*

## THE FRUIT GARDEN.

### POTTING STRAWBERRIES.

THE preparation of plants for forcing is best commenced by layering runners as soon as they can be secured, and they should when ready be placed in their fruiting pots without delay. They then have ample time to form good crowns and fill the pots with roots, but under these conditions it is not advisable to employ pots so small as is sometimes recommended, especially for strong growing varieties. For early forcing pots  $5\frac{1}{2}$  inches and for late use those  $6\frac{1}{2}$  inches in diameter are none too large. These must be efficiently drained with clean potsherds, lightly covered with dry moss, coated with dry soot, so that the plants do not become waterlogged, which would be fatal to success. The compost should consist of a good rooting medium, not over rich. A moderately heavy loam, finely broken up, with dry horse manure mixed, answers well, and in potting it should be rammed rather firmly. When potted the plants should be placed upon a firm bed of ashes, in position fully exposed to the sun, and be allowed sufficient space to develop their foliage without being crowded.

### PINE-APPLE SUCKERS.

Plants of Queen Pines that are relieved of their fruit should have their roots well supplied with tepid manure water, and be regularly syringed over head and between the plants in the morning and evening of fine days. This treatment, accompanied by a circulation of warm air and a night temperature of from  $65^{\circ}$  to  $70^{\circ}$ , will induce the suckers to make sturdy growth and be fit for potting at the beginning of September. In preparing suckers for potting, remove their bottom leaves and cleanly cut off their jagged ends. In potting, place them firmly in well-drained 7-inch pots, and weaker ones in a size smaller, using light fibrous loam, mixed with dry soot as a compost, and if the loam is poor add a little bone-meal or a similar manure. Plunge the pots in a low house or pit in a bottom heat of about  $85^{\circ}$ , and give them sufficient tepid water to moisten the soil through, but afterwards, until the plants are rooting freely, water must be very carefully administered. Maintain a rather close and moist atmosphere, and keep them shaded from bright sunshine until they are rooted, when more air, accompanied by less shading, should be given. Should the suckers be affected with scale or mealy bug thoroughly clean them before they are potted.

### SUCCESSIONAL PLANTS.

It is at all times desirable to examine plants individually and not collectively, for injudicious watering is a great evil. Encourage the plants to make robust sturdy growth by ventilating the structure early on warm days, and closing sufficiently early for the temperature, from solar warmth, to reach  $95^{\circ}$ . A night temperature of  $70^{\circ}$  is desirable, and if it can be upheld without assistance of artificial means all the better.

TUOS. COOMBER.

*The Hyndre Gardens, Monmouth.*

## MISCELLANEOUS.

### GRAFTING THE CACTUS.

OME of the Cacti, which make most desirable specimens when of good size, are so very slow in growth on their own roots that a collector would get tired of waiting for them. This is one of the principal reasons for grafting Cacti, although it is also done for other reasons. Better effects are obtained by having a trailing or drooping part grafted on a tall stout stem of Cereus, as thus a specimen can be set on a table without having to hang over the sides. Then other curious effects are obtained by putting a globular part on a Cereus stock, when in a very short time the scion is full grown and blooming freely. To improve the bloom and get it sooner is another object in grafting. The process is not at all hard, and any one who has some good strong rooted cuttings of Cereus nycticalus, grandiflorus, or colubrinus, and has some slow grower like the Epiphyllums, can do as well at producing these curiosities as an old hand at the business. First, be sure that both the scion and stock are in a good healthy, growing condition, preferably in the spring. For instance, if it is desired to use a stock of C. colubrinus, and put a top on it of C. flagelliformis or rat-tail Cactus, select a stock about 2 feet high, and take two nice pieces of new growth of the rat-tail, about 3 inches in length: cut the top off the stock square and split it down the centre about an inch; then with a sharp knife cut the scions to a wedge shape, and insert in the split top of the stock. To hold them in place you only require to run a long Cactus spine through both stock and scion, and tie a string firmly around the stock to keep the cut edges together. For a few days set in a partially shady place, and do not wet the graft when watering. Growth will very quickly commence, and you will be surprised at how fast a large head will form on the tall stock. The Crab Cactus is grafted in the same way, but the best stock to use is the Pereskia, which forces a fast growth, and is better when old than a Cereus stock. The globular sorts can be put on in any way that seems to suit best, either set flat on top of the stock, care being taken to have the cut edges about the same size, or by wedging either the stock or scion, and inserting into the other, always fastening the two together as firmly as possible with spines, and by tying strong around to hold the edges together till they unite. The small specimen shown in the engraving is only one season's growth of Echinocereus coespitosus or Lace Cactus on C. colubrinus. The scion, when put on, was only about the size of a Walnut, but grew so fast it looked as though the skin must burst. A specimen of C. flagelliformis cristatus or Opuntia tesselata cristata, makes a very odd plant when grafted, and assumes all sorts of fantastic forms in Cock's-comb style.—J. H. CALLANDER in *The Canadian Horticulturist*.

### A GROWL FROM ITALY.

I WISH to call attention in the columns of THE GARDEN to one or two practices on the part of nurserymen, both English and foreign, which appear to me to be very reprehensible and much on the increase.

The chief of these is the extreme carelessness in sending bulbs not true to name. Last autumn I had an opportunity of getting out a few bulbs from England by private hand. (Neither plants nor bulbs are allowed to be imported from England into Italy.) I wrote to a well-known nursery for a dozen Iris tingitana which I desired to add to my little collection of Iris. The price of these was 3s. per dozen, but only ten bulbs were sent for the dozen. These were carefully planted and their flowers watched for with some anxiety. When they appeared they were found to be neither more nor less than a common yellow Spanish Iris! I sent a sample of the flowers to the nursery in question and received, not a word of apology or regret, but a post-card with a curt

remark that there had evidently been a mistake, but that they would rectify it this autumn.

But at any rate this was polite in comparison with the behaviour of a Dutch firm who, on being informed that out of fifty of the Spanish Iris Thunderbolt, ordered last autumn for a bed where a particular touch of colour was desired, only four were true to name, and the remaining forty-six had been sent in mistake, wrote me a dissertation on "rogue" effects of bulbs, and offered to make good half the number this autumn! Now Spanish Iris are not a very expensive thing, but to have a particular effect of colour spoilt is very annoying, and I hear complaints of this sort of thing on all sides among my gardening friends in Italy.

Another very annoying trick of bulb growers is the sending out of bulbs so immature that one has to wait for some years for their flowering. A friend of mine showed me this spring some very lovely Narcissus flowers, and on my enquiring from whom he had them, he named a first class Dutch firm, adding that he had them *four years* ago, and this was their first flowering! Now it appears to me that the catalogue price of bulbs is generally high enough to justify the expectation of receiving bulbs sufficiently matured to flower the first season.

Yet a third bad habit remains to be noted, and that is when a cheque is sent in payment of an account the latter is frequently *not* returned, but a post-card acknowledgment is sent in lieu of the account properly received. I find this custom prevails to such a degree that I never now do return the account, which forms my invoice of plants received, if I can possibly help it. But this spring I received the bill for a little consignment of Chrysanthemums and Cannas from a Lyons firm so carelessly made out that only half of the items figured in the debit column, the remainder being ignored, though mentioned on the invoice sheet. I filled in the amounts owing to the best of my ability, and as it was the first time I had dealt with this firm I thought it better to return the account itself along with the cheque that they might verify my figures. After waiting ten days for an acknowledgment of my letter I wrote to enquire if it had been received, and there came a post-card reply, thanking me for cheque, soliciting further custom, &c. I had the trouble of again writing to request the return of the account itself. Of course I had a copy, but with an Italian gardener one cannot be too careful to be clear as to what has been ordered, and an original list is never a thing to be thrown away.

Now just consider the time, trouble, eyesight, and postage involved in this system of book-keeping. And this is by no means an isolated instance. I hardly ever receive an order that does not involve some correspondence, and the arrogance of some of the Dutch firms and their total inability to acknowledge the possibility of any mistake would be amusing if it were not so provoking, when facts to the contrary have been put clearly before them. It would be a great matter if these remarks were laid to heart.

Florence.

TUSCAN.

#### PLEACHED ALLEYS.

In the old days the pleached alley was as familiar in English gardens as the pergola of the present age. Both are interesting and useful features in the pleasure grounds, since both provide grateful shadowed walks in the sultry heat of summer. The pergola is the more pictorial, for on either side flowering plants may be grown in narrow borders between the supports, but this is not possible in the dense shade of the pleached alley. In forming either one or the other its site should be thoughtfully chosen. Many pergolas appear to have no reason for their existence, and to have been dropped casually in the garden, leading from nowhere to nowhere.

These covered ways should always be constructed to lead from one point of definite interest to another; and where this is done the garden views revealed on emerging from their shade gain an increased interest and beauty. The subjects most generally used in the fashioning of pleached alleys

were the Hornbeam and Lime, both native trees; but green alleys have been made of Yew, of Cotoneaster microphylla, Holly, and other evergreens. Since, however, the alley-way is not needed in the winter season deciduous trees are more suitable than those that retain their leaves. In spring the deciduous tree may be watched putting forth its buds and gradually making a leafy canopy above the path.

Other good trees for alleys are the weeping varieties of the Ash and Elm. The use of trees of naturally weeping growth is not absolutely necessary, as is proved by the preference shown in former days for Hornbeam, Lime, and Beech, but the drooping branches fall more easily into position than those of upright growth.

The alley requires attention. In winter the oldest of the wood must be cut out to make room for the young growth, and when this is lengthening vigorously it must be carefully laid in.

Flowering trees have not yet been alluded to with the exception of the Lime, with its flood of sweetly-scented pale green flowers during the hot July days, but many may be used with the happiest results for the pleached way. Laburnum is one of these, and in spring the alley is clouded with golden tassels. Wistaria is used with beautiful effect in Japan for covering overhead trellises and draping archways, and the long, scented, lavender flower trails are never more charming than when seen hanging from an arching covered way. Where Wistaria is made use of the alley should be at least 9 feet or 10 feet in height at the centre, especially if the Wistaria known as multijuga is employed, which is almost invariably grown in Japan, as the racemes are 3 feet or more in length. The commoner Wistaria sinensis is generally planted in English gardens, but W. multijuga is very beautiful and does well in many places. The Wistaria is often of slow growth in its early stages, but when once well established makes long and vigorous shoots annually. If the alley has an iron framework, which for the Wistaria is necessary, this may be clothed during the first few years, until the Wistaria is growing strongly, with annual climbers, such as Cobaea scandens, Lophospermum, Mina lobata, and even with varieties of the large-flowered Clematis, these naturally being removed when the Wistaria covers the alley. Very pretty alleys are sometimes formed of fruit trees—Pear, Apple, Cherry, and Plum making charming spring pictures, and being almost as decorative when in their fruit-bearing stage. Where fruits and flowers are required care should be taken that every shoot is exposed to the sun and air, since if they are densely shaded by other growth they will fail to ripen, and will consequently flower badly or not at all. The Prunus family contains not a few ornamental pendulous varieties that are well adapted for the pleached alley.

#### THE KITCHEN GARDEN.

#### VEGETABLES AT THE DRILL HALL.

VERY recently a memorial, signed by some sixty persons—Fellows of the Royal Horticultural Society, members of the vegetable committee, and others interested in vegetable culture, the promoters of the memorial being Messrs. E. Beckett and A. Dean—was presented to the council. It pointed out that, whilst all descriptions of plants, flowers, &c., were well and continuously favoured at the Drill Hall meetings, and a special show for fruit was held at the Crystal Palace, no special encouragement was given to vegetables, although these constitute subjects of the very first importance in horticulture. The council were, therefore, invited to arrange that at least one Drill Hall meeting annually, either in July or October, be set apart specially as a vegetable show, and that some small sum be voted each year as prizes to one or more classes. The object of the memorialists was to secure representation in London of the very

best descriptions of vegetables such as are seen at some of the great provincial shows—not in unlimited collections, which too often include much inferior material, but in restricted collections of first-class excellence. That the seed trade would join heartily in offering prizes for such an exhibition there can be no doubt, and the Royal Horticultural Society might thus provide the finest display of vegetables to be seen in the kingdom at trifling cost. So far few chances to see high-class vegetables are offered in London. There have been, and will be again this autumn, competitions for them at the Westminster Aquarium, but that place will disappear early next year and will no longer be available for exhibitions, hence in 1903 there may not be any good class vegetable shows in the metropolis. When it is remembered that London is the headquarters of the Royal Horticultural Society, the fact presents a grave reflection on that body when, in being applied to to fill the void, it seems perhaps somewhat diplomatically to decline to do so. The reason alone given in the following reply to the memorial referred to seems to be so very inadequate, seeing that no one would think of issuing a schedule of vegetable classes exceeding the space the Drill Hall can spare to fill. Through the Rev. W. Wilks, M.A. (secretary), the council has replied: "The council have had your memorial as to vegetables before them at two sittings, and have very carefully considered it. They have concluded that to have really representative collections of different grades would require more room than can be given in the Drill Hall, and for this reason, and 'other' reasons, they desire to postpone the further consideration of the matter until a larger hall is provided." What the "other" reasons may be are not stated, but I fear dislike of vegetables is one.

A. DEAN.

#### SOCIETIES.

##### HANDSWORTH FLOWER SHOW.

THE eighteenth annual exhibition and floral fête of the Handsworth and District Horticultural Society was held in the Victoria Park on July 25 and 26.

Group of plants arranged for effect, 30 feet by 15 feet, winner of first prize to receive silver challenge cup.—First, Messrs. Cypher and Son, Cheltenham; second, Mr. Hancox, West Bromwich.

Twelve stove or greenhouse plants, distinct, not less than six in bloom.—First, Messrs. J. Cypher and Son, Cheltenham; second, Mr. W. Vause, Leamington.

Collection of fruit, not less than ten varieties, Pines excluded, winner of first prize to receive silver challenge cup.—First, Mr. Goodacre (gardener to the Earl of Harrington); second, Earl of Carnarvon.

Best six bunches of Grapes (three black, three white), winner of first prize to receive silver challenge cup.—First, Earl of Carnarvon (gardener, Mr. J. Read); second, Mr. Goodacre.

Twenty-four Roses, distinct.—First, Messrs. Perkins and Son, Coventry; second, Messrs. D. Prior, Colchester; third, Messrs. J. Townsend and Sons, Worcester.

Twelve bunches garden Roses, distinct.—First, Mr. J. Mattock, Oxford; second, Messrs. J. Townsend and Son.

Twelve Tea Roses, not less than six varieties.—First, Messrs. D. Prior; second, Messrs. Townsend and Son; third, Mr. J. Mattock.

Twelve yellow-ground or self Carnations or Picotees, distinct.—First and second, Mr. R. S. Cartwright (gardener, Mr. R. J. Rudd).

##### GENTLEMEN'S GARDENERS AND AMATEURS.

Group of plants arranged for effect.—First, Mr. C. A. Palmer (gardener, Mr. W. C. Thomas); second, Mr. George Tangye (gardener, Mr. Tomkins); third, Mrs. J. H. Pearson (gardener, Mr. T. Faulkner).

Group of plants arranged for effect, not to exceed 6 feet.—First, Colonel Howard Wilkinson (gardener, Mr. J. J. Canning); second, Mr. W. H. Floyd (gardener, Mr. C. Brown); third, Mr. A. Heaton (gardener, Mr. F. Biddle).

Nine stove or greenhouse plants, distinct, not less than four in bloom.—First, Mr. E. J. Abbott (gardener, Mr. S. Coster); second, Mr. C. A. Palmer.

Six stove or greenhouse plants, distinct.—First, Mr. C. A. Palmer; second, Mr. E. J. Abbott.

Six exotic Ferns, distinct.—First, Mr. C. A. Palmer; second, Mr. V. Vaughan (gardener, Mr. C. Perkins); third, Mr. W. H. Floyd.

##### CUT FLOWERS.

Twelve bunches of cut flowers, from stove or greenhouse plants, not less than six varieties.—First, Mr. F. Baker; second, Mr. C. A. Palmer; third, Mr. E. J. Abbott.

Twelve bunches of hardy border flowers, not less than nine varieties.—First, Mr. E. J. Abbott; second, Colonel Howard Wilkinson; third, Mr. A. J. Rabone.

Twelve Roses, not less than six varieties.—First, Mr. F. Dennison; second, Mrs. Goode; third, Mr. E. J. Abbott.

## PRESCOT.

This summer exhibition was held in glorious weather in the delightful park of Knowsley, by the kind permission of the Right Hon. the Earl of Derby, K.G. The number of entries exceeded those of last year by over 100. The fruit was excellent, whilst the vegetables showed a considerable advance; Mr. B. Ashton, gardener to the Earl of Lathom, beating that able veteran Mr. Rainford with a superb collection. The committee, Mr. F. H. Taylor, treasurer, and Mr. W. Case, secretary, are to be congratulated upon the success of what promises to be the leading summer show of the district. A suggestion as to the more rigid interpretation of Rule XI, might be noted so that pressure could be brought to bear upon the exhibitors to name their exhibits, especially those in the plant classes, in which the names are conspicuous by their absence. The following were the awards in the more important classes:

Collection of plants arranged for effect: The first prize, presented by the Hon. Arthur Stanley, M.P., was won by A. McKenzie Smith, Esq. (gardener, Mr. W. Lyon), with a tastefully arranged display, in which Palms, Crotons, Caladiums, Cattleyas, Francoas, &c., were used to advantage; H. Ogden, Esq., was second, and Thomas Henshaw, Esq. (gardener, Mr. J. George) third.

Six stove and greenhouse plants, three in bloom: Dr. Cook (gardener, Mr. G. Osborne) was first; J. C. Gamble, Esq. (gardener, Mr. W. S. Barnes) was second.

Four Caladiums and a single specimen, J. Parrington, Esq. (gardener, Mr. Thomas Eaton) was first in each class.

Four stove and greenhouse Ferns: Mr. W. S. Barnes led with good Adiantum cuneatum, Pteris longifolium, &c.

For eighteen, twelve, and six cut Roses, Mr. P. Green won in each class with fair blooms considering the late season.

For six light coloured blooms, Mr. E. Baché won with the variety Mrs. Shriman Crawford. For twelve Carnations, Mr. J. George was easily first. For six bunches Sweet Peas, Mr. P. Green was first, in which the staging was faulty. For twelve varieties of herbaceous cut flowers, Mr. P. Green won with a fine lot of Alstroemerias, Coreopsis, Gladioli, Delphiniums, &c.

Four dishes of fruit: Mr. T. Eaton was a good first, showing Black Hamburg Grapes, Hero of Lockinge Melon, Elrige Nectarine, and Royal George Peaches. The Right Hon. the Earl of Lathom (gardener, Mr. B. Ashton) was second, and J. Beecham, Esq. (gardener, Mr. Oldham) third. Two bunches Black Hamburg, Mr. W. Oldham won with large bunches.

Two Muscat of Alexandria: Mr. W. Gaunt won with highly coloured examples. Two bunches black Grapes: H. Cunningham, Esq. (gardener, Mr. W. Wilson) was first with splendid Madras Court. For two bunches of white Grapes, W. Leeming, Esq. (gardener, Mr. J. Ashcroft) won with well coloured Buckland Sweetwater. For the Melon, Mr. T. Eaton won with very good Lord Derby. Six Peaches, Mr. W. Gaunt was first with Barrington, and for the same number of Nectarines, Mr. T. Eaton won with Elrige, and held the same position for a dish of Cherries.

For twelve varieties of vegetables, Mr. B. Ashton won with a superb lot; Mr. J. Rainford was second.

Amongst the exhibits not for competition Messrs. A. Dickson and Co., Newtowndale, had a grand lot of cut Roses; Mr. H. Middlehurst, Sweet Peas; Messrs. Candwell and Sons, Sweet Peas, Roses, and herbaceous cut flowers; Messrs. Thomas Davies and Co., well flowered Lilium longiflorum, Tomatoes, &c.; Mr. Charles Young sent beautiful Sweet Peas; Mr. Charles Kinns, Sweet Peas and sundries.

## NEWPORT AND COUNTY.

THERE was a marked increase in the entries this year, and the quality of the exhibits was generally decidedly good. Cut flowers and stove and greenhouse plants, &c., were shown in capital condition. Mr. Cypher's group of miscellaneous plants attracted much attention, as did also the smaller groups of plants, particularly those of Begonias. Vegetables were of good quality and were largely shown, the collections staged for special prizes offered by Messrs. Sutton and Sons, Wheeler and Sons, and Gerraway and Co. being of considerable merit. The leading exhibits of fruit were generally good, but there was room for improvement in some cases. Trade exhibits were numerous, and greatly contributed towards filling the several large tents.

For six distinct stove and greenhouse plants, Mr. Cypher, Cheltenham, was an easy first with large finely flowered specimens; second, W. J. Buckley, Esq., Llanelli (gardener, Mr. Carpenter). Mr. Cypher also took the first prize for six ornamental foliage plants with big Palms and Codiaeums in variety; Mrs. Williams, Rynglas (gardener, Mr. J. Tuft), being second, and Mr. C. H. Farley third.

In a class for six exotic Ferns, Colonel Wallace, Chesterholm (gardener, Mr. Powell), was placed first with well-grown specimens; H. J. Davies, Esq., coming second.

## ANATEURS AND GENTLEMEN'S GARDENERS.

Four stove and greenhouse plants, the society's silver medal to be awarded to the best specimen in this class. Here Mr. Lockyer (gardener to C. Hanbury, Esq., Pontypool Park) was first with splendid plants, a plant of Stephanotis floribunda gaining the medal; second, Colonel Wallace, with a very creditable set, closely followed by Mr. Harris (gardener to G. F. Colborne, Esq.). Four ornamental foliage plants: First, Mr. Harris; second, Mrs. Pickford; third, Dr. Garrod Thomas. The Coleus made a good display.

## GROUPS.

Miscellaneous plants arranged in a space of 11 feet in diameter. There were two entries in the open class, and the leading exhibit came from Mr. Cypher, and contained the choicest plants usually employed for the purpose. Mr. Carpenter was the other exhibitor, and arranged a nice group.

Plants in a space of 50 square feet. Six exhibits set up groups in this class, and Colonel Wallace, C. H. Bailey, Esq., and W. J. Buckley, Esq., were placed in the order named.

Group of Begonias in a space of 25 square feet. Four staged in this class, R. P. Williams, Esq. (gardener, Mr. Jones), securing the lead, closely followed by E. Davies, Esq.

## CUT FLOWERS.

Roses, twenty-four Hybrid Perpetuals. Four good lots were staged.—First, King's Acre Co., Hereford, with very good blooms; second, Messrs. J. Townsend and Son, Worcester.

Tees, twelve distinct—First, Messrs. Townsend and Son second, Messrs. S. Treseider, Cardiff.

Carnations, twelve blooms.—First, Messrs. Blackmore and Langdon, Bath; second, Messrs. Taplin and Sons, Newton Abbot.

Mr. Lockyer was first for twelve bunches of stove and greenhouse flowers. Messrs. House and Sons, Bristol, and Mr. W. Treseider, Cardiff, first and second in the order named for twelve bunches of herbaceous flowers.

Messrs. House and Sons, and Mr. Basham, Bassaleg, were first and second for twelve bunches of Sweet Peas, and were placed in the same order for an arrangement of Sweet Peas in a space 9 feet by 3 feet.

Mr. W. Treseider, Cardiff, was first for twenty-four Cactus Dahlia in fine condition. He was also first for a shower bouquet.

## NON-COMPETITIVE EXHIBITS.

Silver medals were awarded to Messrs. Blackmore and Langdon, Bath, for cut blooms of Begonias in about 100 varieties, and to Messrs. Pattison, Shrewsbury, for Pansies and Violas. Bronze medals were also awarded to Mr. Basham for a collection of Sweet Peas; to Messrs. Taplin and Sons for Carnations; and to the King's Acre Nursery Co. for Roses, Gooseberries, &c.

## ROYAL HORTICULTURAL SOCIETY.

The meeting held at the Drill Hall on Tuesday last was by far the smallest that has been held this year. Hardy flowers were fairly well represented, and there was one extensive display of fruit, that sent by Miss Adamson from Regent's Park; but there was, generally speaking, a poor display.

## ORCHID COMMITTEE.

Present: Messrs. Harry J. Veitch (chairman), James O'Brien, J. G. Fowler, de B. Crawshay, H. M. Pollett, E. Hill, H. T. Pitt, F. W. Ashton, G. F. Moore, J. W. Odell, W. H. Young, J. Charlesworth, H. A. Tracy, H. Little, Jeremiah Colman, and James Douglas.

Messrs. Charlesworth and Co., Heaton, Bradford, exhibited several choice and interesting Orchids, which included Cattleya hardiana, L.-C. Adolphus superba, Cypridium adonis (C. rothschildianum × C. Curtisii), C. Chapmannii magnificum (C. bellatulum × C. Curtisii), Cattleya Leander Hyades (C. bicolor × C. speciosissima), Lecidea cattleya purpurata schilleriana (L. purpurata × C. schilleriana), and others.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, exhibited a small collection of Cattleyas, for instance, C. superba splendens, C. Eldorado Wallisii, C. Eldorado, C. gigas, and Cycnoches chlorochilon, the curious green-flowered Swan Orchid was also shown. Silver Flora medal.

Captain Holford, C.I.E., Tetbury, exhibited a small group of Orchids that contained a splendid plant of Vanda cornuta (cultural commendation), Cattleya Patrocini, L.-C. elegans (Westonbirt variety), Epidendrum fragrans, L.-C. C. G. Rubbing, and several good Cypridiums. Silver Flora medal.

Mr. James Douglas, Great Bookham, Surrey, sent L.C. Juno (Edenside variety).

Messrs. William Bull and Sons, Chelsea, showed Cypridium C. (Charlesworthii × C. supercilie).

Cypripedium × Sophie (C. gowerianum × C. niveum) was sent by F. A. Rehder, Esq., Gipsy Hill (gardener, Mr. R. Norris).

Flowers of Cattleya gigas (Little's variety) were shown by H. Little, Esq., The Earons, East Twickenham (gardener, Mr. A. Howard).

Odontoglossum harryanum was exhibited by J. F. Alcock, Esq., Great Berkhamsted.

Lecho-Cattleya Adolphus superba—Lelia cinnabarinum and Cattleya Aclandiae are the parents of this new and beautiful hybrid.

The spreading petals and sepals are a rich buff-yellow, lightly spotted with chocolate-red. The lip is a velvety crimson-red with a central band of yellow. A distinct and attractive novelty. Exhibited by Messrs. Charlesworth and Co., Heaton, Bradford. First-class certificate.

## FRUIT COMMITTEE.

Present: Messrs. H. Balderson, James Cheal, W. Bates, S. Mortimer, Alexander Dean, Wm. Pope, Horace J. Wright, George Kelf, J. Jaques, J. Willard, and A. H. Pearson.

A gold medal was given to Miss Adamson, South Villa, Regent's Park, N.W. (gardener, Mr. G. Kelf), for a splendid display of fruit. At the back of the group were Plum trees in pots, excellent specimens, bearing heavy crops of fruit, and along the front were Black Hamburg and Buckland Sweetwater Grapes, dishes of Peaches, Plums, Cherries, Gooseberries, Raspberries, and Melons, all of first-rate quality. When one considers that all the fruit was grown within two miles of Charing Cross, Mr. Kelf's exhibit is most creditable.

Messrs. Paxton Brothers, Bedford, exhibited a box of splendid fruits of their new Strawberry Trafalgar, grown in the north.

Mr. Beale, gardener to E. A. Hambray, Esq., Hayes Place Gardens, Hayes, Kent, was awarded a silver-gilt Knightian medal for some splendid bunches of Black Hamburg Grapes cut from a vine 100 years old. They were excellent fruit, and the bunches very large.

Messrs. Harrison and Sons, Leicester, exhibited an extensive collection of Peas (enquiry). Very many varieties were represented, seventy-seven in all. Silver Banksian medal.

## FLORAL COMMITTEE.

Present: Messrs. W. Marshall (chairman), H. B. May, George Nicholson, J. Jennings, J. Walker, R. F. McLeod, G. Reuthe, C. R. Fielder, Charles Dixon, J. W. Barr, W. P. Thompson, C. E. Shea, E. H. Jenkins, W. J. James, J. H. Pitt, H. Turner, W. Howe, and the Rev. F. Page Roberts.

Mr. Maurice Prichard, Christchurch, Hants, exhibited an extensive display of hardy flowers, the Phloxes, Eryngiums, Veronicas, Carnations, Liatris, Tritomas, Helianthus rigidus, Galega officinalis, and Gladioli in variety were well represented. Silver Flora medal.

Messrs. Feed and Son, West Norwood, S.E., exhibited a group of Achimenes in considerable variety.

Hardy herbaceous flowers were largely shown by Messrs. T. S. Ware, Limited, Feltham, Phloxes, Campanulas, and Lilliums being largely represented. Silver Banksian medal.

M. V. Charrington, Esq., The Warren, Edenbridge, exhibited a small group of Carnations, wherein were noted several good and distinct varieties. Silver Banksian medal.

Messrs. Phillips and Taylor, Bracknell, Berks, showed Sweet Peas and Carnations in numerous varieties.

Hobbies, Limited, Dereham, arranged a group of zonal Pelargoniums, each variety being set up in a semi-circular mound. Grandville (red), Mrs. Ashworth (white), Double Life (splashed red and pink), Aquarelle (rich pink and white), and Double Jacoby (very deep red) were the best. Silver Banksian medal.

Messrs. William Bull and Sons, King's Road, Chelsea, exhibited several splendidly grown and highly-coloured Crotons, of which C. Reidii, C. Thompsonii, Flamingo, and Beauty were of the best.

Mr. Charles Turner, Royal Nurseries, Slough, exhibited blooms of Carnations arranged on exhibition boards. Some of the varieties were splendidly represented: for instance, Duke of Alva, Galileo, Duke of Albany, Goldilocks, Cecilia, Falcon, Agnes Sorrel, &c. Silver Banksian medal.

Mr. E. Potten, Camden Nursery, Cranbrook, Kent, exhibited a pretty lot of hardy herbaceous flowers, such as Gaillardias, Spireas, Gypsophila, Eryngium, &c. Phlox Drummondii, nana, about 6 inches high, was noticeable.

Messrs. J. Cheal and Sons, Crawley, exhibited hardy flowers and cut shrubs in great variety. Sweet Peas and some Dahlias were included in Messrs. Cheal's display.

Messrs. Barr and Sons, King Street, Covent Garden, showed Lathyrus latifolius var. Apple Blossom, L. l. var. Brilliant, Reseda alba (with tall erect spikes), Hamatulus Nelsoni, Satyrium coriifolium, Rudbeckia hirta Sulphur King, and other interesting plants.

Splendid flowers of the new Roses Ben Cant and Mrs. B. R. Cant were shown by Messrs. B. R. Cant and Sons, Colchester.

Dr. Bonavia, Westwood, Richmond Road, Worthing, exhibited a buff-coloured variety of Oleander odorum. This came from Hyères. It is very floriferous and sweet scented, and thrives well if planted out in a greenhouse.

Mr. A. Campbell, gardener to Lady Ardilaun, Dublin, exhibited several seedling self-coloured Carnations—St. Anne's, heliotrope; Louis Botha, white, &c.

Eichornia crassipes in flower was exhibited by Mr. Dixon, gardener to the Earl of Ilchester, Holland House, Kensington.

A. Van Meerbeek and Co., Hillegom, near Haarlem, Holland, sent several Calla elliotiana seedlings.

Carnation King Edward VII, a scarlet self, was shown by Mr. F. M. Bradley, Church Street, Peterboro'.

Hibiscus sinensis brilliantissimus was sent by the Earl of Ilchester.

H. Balderson, Esq., Hemel Hempstead, showed border Carnations Gladys Taylor and Mary Francis, the former a deep flesh-coloured self.

Lilium pulchellum, newly introduced from China, bearing small orange-scarlet flowers, was shown by Messrs. James Veitch and Sons, Limited, Chelsea.

Mr. M. Prichard, Christchurch, Hants, showed Astilbe New Rose, a pretty pink-coloured variety.

Mr. James Douglas, Edenside, Great Bookham, Surrey, exhibited a collection of Carnations that comprised numerous excellent varieties, such as The Naiad, yellow self; Mrs. Prinses, golden-yellow; Professor Cooper, heliotrope and salmon; Horsa, in the way of Dr. Nigel, but streaked, &c.

## NEW PLANTS.

First-class certificates were awarded to

*Lobocladus macroleps*.—A distinct and well marked species from China. The branches are freely disposed and form an effective plant, in which the glaucous colouring and tender brown of stem show to advantage. Only quite a small example was shown, but this, we believe, is the largest at present in this country. This new conifer promises to be a really good acquisition. Exhibited by Messrs. James Veitch and Sons, Limited, Chelsea.

*Astilbe chinensis var. Davidii*.—A handsome perennial, some 5 feet or more high, with the leafage of the ordinary type of *Astilbe chinensis*, and bearing a dozen or fourteen pyramidal spikes of rosy purple, a shade of colour in some respects resembling the purple loosestrife. As an addition to first-class perennials the present plant is most notable and a decided acquisition. Doubtless when established in the garden it will form one of the most pronounced and effective of modern introductions. Exhibited by Messrs. James Veitch and Sons, Limited, Chelsea.

Awards of merit were given to

*Carnation Louis Botha*.—A nearly pure white, border kind, very full and showy. The outer petals are large and well formed; the centre petals are faintly lined with white. Shown by Lady Ardilaun, Clontarf, Dublin (gardener, Mr. A. Campbell).

*Carnation Cedric*.—A fine yellow ground, heavily flamed and edged with brick red. This is the largest and most distinct of this class we have seen. Shown by Mr. James Douglas, Great Bookham, Surrey.

*Carnation Bookham White Clove*.—A pure white flower, of medium size, and delightfully fragrant. Shown by Mr. James Douglas, Great Bookham, Surrey.

## EVILS OF GRAFTING.

### THE PROPAGATION OF CONIFERS.

**W**E have received the following useful article from a well-known amateur, touching upon a subject important to all interested in trees and shrubs:

Many mistakes have been made in propagating the Coniferae, and, to make matters still worse, the old erroneous doctrines are still preached and practised. The unpopularity of certain species of *Abies*, *Picea*, and *Pinus* is due to a great extent to the practice of grafting them on entirely unsuitable stocks. For instance, the species of *Abies* are worked on *A. pectinata*, of *Picea* on *P. excelsa*, and of *Pinus* on *P. sylvestris* or *P. Laricio*. In addition to this, such methods and stocks are still spoken of as the correct ones to use; though, to take one genus alone, what kind of a specimen *Abies bracteata*, *A. nobilis*, or *A. concolor* would make in twenty years' time if worked on *A. pectinata* I should not like to say—certainly very poor, even if they lived, which is doubtful. It may be laid down as a law that species of Coniferae should never be grafted but raised from seed, which can always be obtained through English firms. With varietal forms of Coniferae that will not come true from seed or that cannot be struck as cuttings, grafting must be resorted to, and if young plants of the type species are used as stocks the results will be fairly satisfactory. In the case of some of the more highly variegated Cupressus, &c., grafting is really the best method of propagation, as these forms are mostly of weak constitution and are not satisfactory from cuttings. In the following list the best methods of propagation are given with each genus, together with special mention of those forms which are of indifferent growth though not difficult to propagate.

**JUNIPERUS.**—The Junipers should be raised from seeds, though some of them do fairly well if propagated by cuttings. The green and glaucous varieties of *J. chinensis*, *J. excelsa*, *J. virginiana*, and *J. communis* root easily from cuttings, or can be layered with success. The variegated forms are best grafted on stocks of the species they belong to, and *J. Sabina* (The Savin) and its varieties are easily raised from cuttings or layers, the latter being a very easy way of propagating them.

**CUPRESSUS.**—This genus is divided into two sections, viz., the true Cypresses, represented by *C. macrocarpa*, *C. sempervirens*, &c., and Chamaecyparis, of which *Cupressus lawsoniana* is the best known species. With the former section seeds are the best means of reproducing the species, while the few varieties should be grafted on stocks of the parent species. The handsome *C. macrocarpa* var. *lutea* especially should be worked on the type, as it is practically a failure from cuttings, and if grafted on *C.*

*lawsoniana*, as is sometimes done, it makes a short, stumpy bush instead of a typically tall columnar tree. In the Chamaecyparis section *Cupressus lawsoniana*, *C. nutkatensis*, *C. obtusa*, *C. pisifera*, and *C. thyoides* are the only species, though there are a host of varieties attached to them, the forms of the three latter species, in fact, including all the various plants more commonly known under the generic title of *Retinospora*. The species should be raised from seed, which is easily obtainable and germinates readily, or in default they will root from cuttings. The varieties, with a few exceptions, are quickly propagated by cuttings, those that require to be grafted being *C. lawsoniana* var. *lutea*, the variegated forms of *C. nutkatensis*, and *C. obtusa* vars. *nana*, *nana aurea*, and *filifera aurea*. The forms of *C. thyoides* also do well when raised from layers.

**THUYA.**—These are propagated in much the same way as the *Cupressus*, viz., the species by seeds, and the varieties by cuttings or by grafting in the case of the one or two highly variegated forms. Some of the green or glaucous varieties of both *Cupressus* and *Thuya* will come fairly true from seed, from 40 per cent. to 70 per cent. being the usual quantity of seedlings true to name. Variegated forms from seed either come green or a mongrel mixture of green and variegated.

**LIBOCEDRUS.**—This should be raised from seed, as when grafted on *Thuya orientalis*—a too common method of propagation—it makes a miserable specimen. The middle pair of scales in the cone of *Libocedrus* alone contain fertile seeds.

**SCIADOPITYS AND TAXODIUM.**—These can only be propagated by seeds, and the young plants should have a fairly moist position with plenty of leaf-mould or peat to grow in afterwards.

**SEQUOIA.**—The two species of *Sequoia* should be raised from seed, and the three or four varieties be grafted on the type species.

**CRYPTOMERIA.**—This only contains one species, viz., *C. japonica*, which can be obtained from seed or by cuttings; and the varieties root readily as cuttings, though one or two of the weaker ones do better if grafted on *C. japonica*.

**ARAUCARIA.**—Propagate by seeds, which, though sometimes difficult to obtain, germinate freely and quickly.

**TSUGA.**—The Hemlock Spruces are easily and quickly obtained from seeds, and one or two will strike from cuttings; the varieties do best when grafted on the species they belong to, though *T. pattoniana* var. *glaucia*, more commonly known as *Abies hookeriana*, will come fairly true from seed, about 75 per cent. being the usual quantity if the seed is obtained from good plants.

**PICEA.**—This genus has been mentioned before as being commonly grafted on *P. excelsa* (the common Spruce), which is an easy way of obtaining young plants, which, however, cannot

be recommended to form good specimens in after years. The species of *Picea* should all be raised from seed, and the many named varieties of *P. excelsa* should be grafted on the parent species. At least one-half the plants of *P. Engelmanni* var. *glaucia* and *P. pungens* var. *glaucia* (the Californian Blue Spruce) will be found true to name when raised from seeds, while their superiority afterwards over grafted plants is unquestioned.

**CEDRUS, LARIX, AND PSEUDOLARIX.**—It should always be remembered that these three are quite distinct genera, and for purposes of propagation should never be used in conjunction with each other, the first being evergreen, and the two latter deciduous. The species of all three should be raised from seed; the varieties of *Cedrus* should be grafted on that genus, the forms of *Larix* on the Larch, though the geographical forms of the common Larch, such as var. *rossica* and var. *sibirica*, usually come true from seed. *Pseudolarix Kampferi*, the only representative of the genus, must be raised from seed, as if grafted on the Larch they will not thrive for long.

**ABIES.**—In this genus some of the most handsome Conifers are found, and also some of the most difficult to grow. All the *Abies* should be propagated by seeds, but if seed of the varieties cannot be obtained then they must be grafted on the parent species.

**PSEUDOTSUGA.**—This genus only contains one species, viz., *P. Douglasii* (the Douglas Fir), which is propagated readily by seed, the seedlings being of rapid growth and soon form good plants. The few varieties are grafted on the type, though the majority will come fairly true from seed, which, however, is not always to be obtained.

**PINUS.**—Perhaps no Conifer adds so much to the beauty of the landscape in winter as the Pine. All the species should be raised from seeds, and any green or glaucous varieties can also be propagated in the same way if seeds can be obtained. The golden, dwarf, and variegated Pines must be grafted on the species they are varieties of.

**TAXACEAE** is usually associated with Coniferae, from which it differs chiefly by the seed being nearly or quite enclosed in a fleshy envelope instead of in a cone, the fruit of some resembling a small Plum, but a typical fruit is seen in that of the common Yew. The hardy genera are *Ginkgo biloba* (the Maiden-hair Tree), which is propagated from seed—the plant is deciduous and slow growing; *Cephalotaxus* and *Torreya* are propagated by seeds, cuttings, or layers.

**TAXUS** (the Yew).—There are only three or four species of *Taxus*, but there are a great many varieties of the common Yew, many being very handsome. The species are easily raised from seeds, layers, or cuttings. The first two methods are the best, cuttings being very slow in growth, but as seed is very plentiful in most years this is the quickest and best means of propagation. Some of the

varieties will come true from seed; the Irish Yew, however, must be struck from cuttings, as seedlings never come true. The more highly variegated Yews grow quickest when grafted on the common Yew, and as they always keep good in after years this method can for once be recommended. Propagate Prunnoptys and Saxegothaea by seeds, cuttings, or layers.

## EDITOR'S TABLE.

### BUDDELIA VARIABILIS.

Mr. Notcutt sends from his interesting nursery at Woodbridge, in Suffolk, flowers of this beautiful Buddleia. It is delightful when planted in small groups, either in the shrubbery or in the wild garden. The lilac-coloured flowers are produced in tapering terminal panicles upon long side shoots which are numerous and slender; the whole plant is very graceful.

### A GOOD SEEDLING DIANTHUS.

Messrs. James Grieve and Sons, Redbraes Nursery, Edinburgh, send us a bunch of a splendid new Pink they cultivate. It is an excellent seedling form of *Dianthus chinensis*, so far as we know unnamed. Messrs. Grieve mention that plants of this were planted out in October last, and passed unharmed through the past severe winter and spring.

### HAEENARIA CONOPSEA.

Mr. Alfred Pickard, High Street, Wolsingham, R.S.O., Durham, writes: "I see you had *Orchis maculata* figured in THE GARDEN recently, so I send you a few spikes of *Habenaria conopsea*, just to let you see what we can grow up here in the cold north country. Some three or four years ago the North-Eastern Railway Company put an up-siding in the station here, and to do so they had to take some soil from the bank side, and since then *H. conopsea* has come up in hundreds. It is very fine this year. Do you think the seed will have been dormant, or will it have come from a small clump of the Orchid about 300 yards higher up the railway?"

[With Mr. Pickard's note were sent several beautiful spikes of this deliciously-scented British Orchid. Perhaps some reader can give an answer to Mr. Pickard's question.]

## NOTES OF THE WEEK.

### FORTHCOMING EVENTS.

August 18.—Warkworth Floral and Horticultural Show.

August 19.—Royal Horticultural Society's Committees meet, Drill Hall, Westminster.

August 20.—Oxford Horticultural Show; Shrewsbury Floral Fête (two days).

August 21.—Jersey Agricultural and Horticultural Society's Show.

August 26.—Harpenden Horticultural Show.

August 27.—Bath Floral Fête.

August 28.—Sandy Horticultural Show; Stirling Horticultural Exhibition.

August 29.—Bradford Horticultural Show (two days).

September 2.—National Dahlia Society's Show and Royal Horticultural Society's Meeting, Drill Hall, Westminster.

September 3.—Glasgow and Preston Shows (each two days), and York Florists' Exhibition.

September 4.—Paisley Horticultural Show (two days).

September 6.—Thornton Heath Dahlia Show.

September 10.—Royal Caledonian Horticultural Show at Edinburgh (two days).

September 16.—Dahlia Show, Royal Aquarium (three days).

September 18.—Great Fruit Show, Crystal Palace (three days).

**Lupines losing their buds.**—With reference to the notes by "J. McDonald" and "F. D. Horner," my experience is exactly similar to the former's, namely, that it is the first spikes of the white Lupines only that lose their buds, and the second spikes ripen them. Field mice are not the cause with me, as the buds are not bitten off, but seemed blighted and fell off when touched. These white Lupines are so beautiful that it seems a pity some cure cannot be found. —C. L. A.

**Royal Horticultural Society.**—The next fruit and flower show of the above society will be held on Tuesday next, in the Drill Hall, Buckingham Gate, Westminster, 1—5 p.m. A lecture on "Horticultural Education and Teaching in England" will be given by Mr. W. H. Patterson, F.R.H.S., at three o'clock. At a general meeting held on Tuesday, the 5th inst., eleven new Fellows were elected, making a total of 870 elected since the beginning of the present year. The society will hold a special exhibition of Dahlias on September 2 and 3, in conjunction with the National Dahlia Society in the Drill Hall, Buckingham Gate, S.W. At this meeting only Dahlias can be shown—with the exception of flowers, fruits, &c., for certificate. All Dahlias, including those shown for certificate, must be left on exhibition until 5 p.m. on the second day, but other plants may be removed as usual. For schedule of prizes see "Royal Horticultural Society's Book of Arrangements for 1902," pages 91 to 93, or separate schedules can be obtained on application to either Mr. J. F. Hudson, M.A., Gunnersbury House Gardens, Acton, or to Mr. C. E. Wilkins, 19, Lyndhurst Road, S.E., joint secretaries to the National Dahlia Society. Intending exhibitors at the Crystal Palace fruit show on September 18, 19, and 20 can obtain an official entry form, together with schedule, on application to the Secretary, Royal Horticultural Society, 117, Victoria Street, S.W. (a penny stamp should be enclosed). Entries for this show close on September 11.

**College of Agriculture, Downton, Salisbury.**—The twenty-second summer session of this college ended on Friday week with the usual distribution of certificates and prizes. Professor Wrightson presided, and in his address spoke of the connexion between Nature study and agriculture, especially as regards trees (forestry), grasses, animals, both useful and predatory, insect attacks, and weeds. He also commented on the attention of their American and Australian students. The Bles scholarship of £10, given to the best man who has completed one year, was won by F. G. Bateman, of Somerset Road, Ealing, W.

**Italian National Chrysanthemum Society.**—We have just received the schedule of the fifth annual Chrysanthemum show of the above society, to be held in Milan on November 8 to 12 next. The society, which is under the high patronage of their majesties the King and Queen of Italy, has already accomplished much useful work, and several other societies in that country are now holding exhibitions of the popular autumn flower. The schedule and prize list contains altogether about sixty classes, and of these the first forty are exclusively for Chrysanthemums in some form or other. The prizes are, as is usual on the continent, bronze, silver, and gold medals, and nearly all the classes are open.

**Sweet Peas as pillar plants.**—To Mr. John Burn, the curator of the Abbey and other Leicester parks, is due the credit of showing in a most pleasing and convincing way the value of Sweet Peas as pillar plants grown in tubs. The way they are grown and disposed on the lawns in the Abbey Park (the tubs mostly hidden by low hedges) was the subject of general and favourable comment on the occasion of the recent successful show held in the park. The tubs which contain them are evidently old paraffin casks sawn in half. The soil they are planted in and the treatment they have received have evidently well suited the plants, for these had formed pillars upwards of 7 feet high, from 2 feet to 3 feet through, and were clothed over with lovely flowers in all the shades of colour in which it is possible to have the Sweet Pea. One of the secrets of success in their

culture in this case was evidently the persistent and timely removal of the pods as soon as the flowers were over and before they had time to form seeds. Without assiduous attention to this item of culture success such as that above mentioned is impossible of attainment.—O. T.

**Veronica cupressoides.**—This pretty rock plant should find a home in every alpine garden, however small it may be. It is quite miniature, of prostrate growth, and the foliage a pleasing light green, bearing pretty violet-coloured flowers. The position it likes best is a sunny one—the top of a rock or stone—where its roots have a chance of striking down through fissures or openings in search of sustenance.—O. T.

**Libocedrus macrolepis.**—Apart from its own intrinsic merit this Libocedrus is of particular interest to the lover of conifers in being a native of the Chinese province of Yunnan, whereas all the other members of the genus are found solely in the western hemisphere. The only thoroughly hardy member of the genus is *Libocedrus decurrens*, a native of California, which here forms a stately columnar specimen with deep green foliage. The *Chiliea Libocedrus chilensis*, though very beautiful, is as a rule unsatisfactory in this country, being often injured by frosts, while the exceedingly rare *L. tetragona* from Southern Chili is even more tender. As a conservatory specimen *L. doniana*, from the north island of New Zealand, is very beautiful with its rich green frond-like branchlets, but it is too tender for outdoor cultivation in this country unless in especially favoured spots. It yet remains to be seen whether *L. macrolepis*, for which we are indebted to Messrs. James Veitch and Sons, Limited, Chelsea, will prove to be of permanent value as an outdoor tree. Whether this is the case or not its beauty in the young state, as shown at the Royal Horticultural Society's meeting on August 5, when a first-class certificate was awarded to it, cannot be disputed, and the interest in it is unquestionable.—H. P.

**An interesting publication.**—"Bulletin de la Société Française d'Horticulture de Londres."—There is always a peculiar pleasure to those who have watched the steady growth of this deservedly popular society in receiving the annual bulletin recording the past year's work. The issue for 1901 recently to hand forms no exception to the general rule, for we note that both numerically and financially the French Horticultural Society of London still continues its career of usefulness. Its aim and objects are now pretty widely known on both sides of the Channel, and the support it receives from English and continental horticulturists, both amateur and professional, is a sufficient proof of the high esteem in which it is held. The roll of membership is now 600, a great contrast to thirteen years ago, when there were but twelve. The work is well printed and got up in the usual style, several illustrations adorning the text. Briefly stated, the contents comprise the annual report, rules, lists of the various grades of members and corresponding societies; then follow short reports of the monthly meetings, together with a full account of the annual dinner, a function that is gradually assuming an important position among the various horticultural festivities of the year. The financial statement is highly satisfactory, for it must be borne in mind that the society has no show to help the funds. A useful and ever-increasing library, of which a catalogue appears in the present volume, forms an interesting feature in the society's operations. Then follows the text of the various papers contributed by the members, a few titles of which must suffice, such as "Culture of the Eucharis," "Flowers at the Funeral of Queen Victoria," "A Chat on Water Lilies," "Cacti," "Primula obconica," "Admission and Horticultural Instruction at Kew Gardens," "Bibliographie," &c. The frontispiece is an excellent portrait of the late Mr. Thomas Rochford, with a biographical notice of the deceased by Mr. George Schneider, the president of the society, under whose able guidance it has made so much progress, and been of great service to many young gardeners at home and abroad.

**Torenia Fournieri.**—Of the several kinds of Torenia, the above, I think, is the best. Unlike the others, it is of a shrubby habit, and only requires the protection of a cool house, where it will bloom continuously the greater part of the summer. It is now very ornamental in the conservatory, where its lovely flowers, which are of a bluish purple velvety colour, are greatly admired. It is best propagated from seed during March or April. The seeds are very small, and will require careful attention in sowing and until after germination. The pot or pan should be shaded to keep the soil uniformly moist or failure will probably ensue. It will be found to thrive well in a compost of loam and leaf soil in equal proportions, with a little sand added. The roots will have ample room in 3-inch pots.—E. H.

**Crystal Palace Fruit Show.**—We are reminded of the approach of this great annual exhibition, promoted by the Royal Horticultural Society, by the receipt of the schedule. September 18, 19, and 20 are the dates of the show, and all entries must reach the Secretary, 117, Victoria Street, S.W., not later than Thursday, September 11, but before if possible. There are altogether 142 classes. Practical demonstrations in the art of fruit bottling will be given each day, at 3 p.m., by Mr. Fowler.

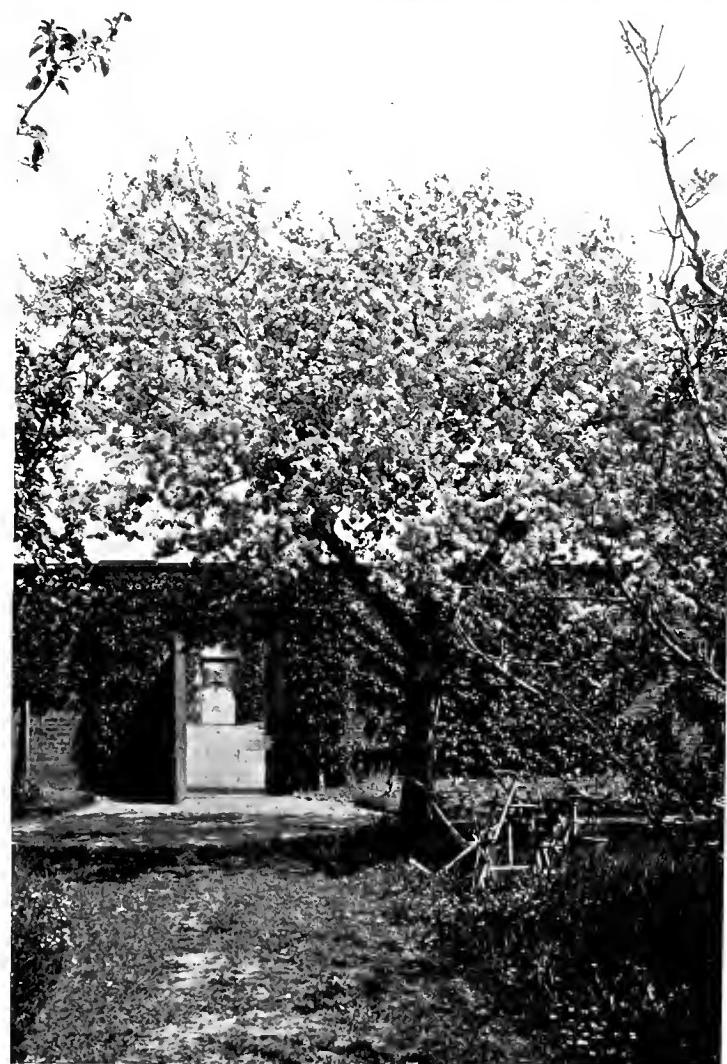

**Crimson Rambler Rose as a standard.**—Of the various ways in which this popular Rose is grown it pleases me best as a standard. For several years it has been grown here in this way and invariably flowers in the most satisfactory manner; its perfect hardiness fits it for this purpose. I have never seen a single branch injured by frost. When well grown it makes a widespread head, which when in flower gives the long flowing growth pendulous aspect, and in this way is seen to the best advantage. It should be worked on tall well-matured stocks, not less than 5 feet in height. It is a Rose which delights in liberal supplies of liquid manure, which should be given early in the spring and again directly the flowers are past. This will encourage a free vigorous growth, which is so necessary for the following year's display of flowers. A few specimens planted away from other things have a most charming effect, especially if associated with Golden Yews. I have found it a good plan to prune as soon as it has passed out of flower. I cut away as much as can well be spared of the old growth; this has the effect of concentrating its energies into the young growth, which will give the crop of flowers the following year. I am no lover of standard Roses, but this Rose behaves so well in this form that I feel justified in strongly recommending it. Unlike the majority of Roses worked on the standard Briar, the Briar will keep pace with the head if a healthy, well ripened stock is chosen for it. In every case has this been so here. This is so seldom the case with Hybrid Roses that I thought it worth mentioning. Some of the stems have developed to the size of spade handles. The least satisfactory way of growing this Rose is against a warm wall; in such a position it soon contracts mildew, aphis, and red spider, and becomes a very decrepit object. This season it has behaved a little better than usual, owing, no doubt, to the cold weather, absence of sun, and cold nights. Another way of growing this Rose is by pegging it down, when it will quickly root and send up long fat growths, which will flower most profusely, and will quickly fill a large bed or bank; it has a most telling effect.—A., Cirencester.

**Ficus stipulata (repens) variegata.**—The tiny-growing Ficus stipulata or repens is largely employed for clothing damp and shaded walls in the stove or the greenhouse, for hanging baskets, draping stages, and similar purposes, while its still tinier form minima is equally as valuable. Besides these a new variety (variegata) was recently shown at the Drill Hall, and when better known it will doubtless become a general favourite. This variety is in all respects a counterpart of the type, except that the small deep green leaves are mottled and freckled in an

irregular manner with white, some of the sprays being very prettily marked. The variegated variety of *Ficus radicans*, another climbing species, but more vigorous than *F. stipulata*, has since its distribution, some four or five years ago, made great headway in popular favour, being grown by thousands in some large trade establishments. Another creeping or climbing member of the Fig family is *Ficus falcata*, in which the exceedingly deep green leaves are about an inch long and of such a peculiar curved shape as to suggest the specific name of *falcata*. Though less vigorous than those previously mentioned it is equally desirable and available for the same purposes. All the above are among the easiest of plants to strike from cuttings.—H. P.

**The Wise Apple.**—Often in these pages has attention been called to the beauty of fruit trees when in flower, of which we have an excellent instance in the accompanying illustration. The Apple tree in full blossom is the variety Court Pendu Plat, commonly known as the Wise Apple, because it is said to flower after all danger from spring frost is past. It certainly does flower late in the spring, and the wealth of blossom it invariably produces usually provides quite a satisfactory crop of fruit. This Apple has been mentioned before under the heading of "Hardy Fruits in Season," but its merits, especially as a late dessert Apple for the amateur and cottager, entitle it to further notice and commendation. The tree is of moderate growth, the fruit of excellent quality and invaluable for late dessert, its distinct and attractive appearance rendering it valuable for market purposes. It has the further qualification of being a consistent bearer. The fruit is of medium size, round, and rather flat; the colour is yellow on the shaded side, covered over with russety dots, but on the sunny side it is a rich deep red. When grown on the Apple or Paradise stock it forms a compact bush of limited growth, and therefore trees may be planted fairly closely together—say, from 10 feet to 12 feet apart. On this stock it also succeeds well as an espalier or cordon, and grafted on the Crab it makes a fruitful and desirable tree for the orchard. The fruits are in season from Christmas to June.—OWEN THOMAS.

**Distinct Pelargoniums.**—There has been for the last year or two a decided revival in favour of the different zonal and Ivy-leaved Pelargoniums for pot culture; indeed, the members of these sections bid fair to be soon as popular as they were in the days of the Pelargonium Society twenty years or so ago. Of late many new varieties have been brought prominently forward, and from the amount of interest evinced in them at the various exhibitions they will doubtless be much sought after. Both at the Temple and Holland House they were well represented. I was particularly struck with the

THE WISE APPLE TREE IN FLOWER IN THE ROYAL GARDENS, WINDSOR.

following distinct forms, though they are now by no means novelties, some of them having been distributed for two or three years. Of double forms far and away the most striking is M. Alfred Erckener, the flowers of which, arranged in a large bold truss, are of a bright orange-vermilion, in fact of distinct yellowish shade. Other good notable forms are Carpeaux, blush dotted carmine; Champ de Neige, pure white; Charles Gounod, scarlet, white centre; double Henry Jacoby, crimson, like its single-flowered namesake; Eugene Delacroix, brilliant scarlet; Gustave Emich, vermilion, so valuable for winter blooming; Princess Victoria, white, with a narrow Picotee-like edge; and Roty, bright pink. The single varieties include Ada Negri, rosy carmine, white centre; Hilda, clear salmon; Hall Caine, cherry-red; Mark Twain, whitish freckled and flaked carmine; Paul Crampel, scarlet shot vermilion. The double-flowered Ivy-leaved section is now principally represented by varieties of more compact habit than was formerly the case, and which are therefore more fitted for pot culture than for vases, window-boxes, &c. Some of the forms are very beautiful, particularly Achievement, a cross between a zonal and an Ivy-leaf, with huge trusses of light cherry-pink blossoms; Beauty Supreme, pleasing soft rose; Colonel Baden Powell, blush lilac; Conden's Glory, scarlet; Mrs. W. H. Martin, manne; Mrs. Hawley, crimson shaded violet; Leopard, the most distinct of all, the flowers being of a clear lilac-pink, heavily blotched with crimson on the upper petals; The King, deep cerise; and The Queen, salmon-red.—T.

## FLOWER SHOW FANCIES.

"To feed on flowers and weeds of glorious feature."

IT is a curious thing about flower shows, even the very best of them—such as those of the Temple Gardens—that they teach us so many things by side-lights; we learn from them what is wrong as well as what is right, what not to do, as well as what to do. Returning once more to the seclusion of our own gardens, what is it that we feel? Certainly it is not envy. We come to the green parades we know by heart, more in love with them than ever, full of fresh plans and schemes for them no doubt, and with new ideas and ideals, but we have learned afresh two of the greatest secrets of good gardening—the terrible mistake of scrappiness and the beauty of the broad effect.

Among the flowers we have been looking at, it is the Roses that have left us the most lovely memories. This season, as usual, they bore away the palm, not only for beauty, but for breadth of treatment. Roses deserve the widest spaces and the best places, and had been given them. Nothing was lacking but the outdoor magic of swaying wind, cloud shadows, and the flitting of bee and butterfly, which under canvas are impossible. The absence of these lends even the loveliest flowers something of a wax-work look; but what a feast of colour, scent, and sweetness, and what a high-born dainty lady is every Rose! To be in full dress and stared at by everybody does not ruffle Roses, they are quite accustomed to it: admiring eyes are among the penalties of beauty as they are of being "queens." A poet has told us "who loves a garden, loves a greenhouse, too," but an afternoon among these flower show Roses sends us away more than ever devoted to the hardy gardening that belongs to the world of out-of-doors.

It is a long skip from these aristocrats to the little rock and alpine plants that now interest us so much and are so fascinating, that whenever we go, say, to Mr. Barr's nurseries, to look at his Daffodils and Tulips, it is impossible to do more than glance at them, because of not being able to tear ourselves away from the witcheries of the rock and water garden.

No class of plants suffers so much from being exhibited at a flower show (where there is never much room to spare) as the rock growers and alpines; most of them such small things, yet craving more than any others for generosity and room to romp about. Here comes an object-lesson. We are going to learn the evils of patchiness from these little sun-loving wildlings of rill and mountain. To see them set out, small bits and scraps of them, among a number of dry-as-dust geological specimens of rock or stone, who would imagine how lovely they are in nature, or in any place where they can be given a free hand? But the manner in which they are, and I suppose have to be, arranged at flower shows is only an exaggeration of the piecemeal fashion frequently observed in gardens, where the owners make the mistake of trying to grow too many sorts of things at once. A little piece of this, and a small bit of that, may have a museum-like interest, or the usefulness of a tailor's pattern-book, but never can give the charm that rests the eye and satisfies the heart.

The smaller flowers are the more it is necessary to grow them in profusion; then they bring into our gardens something of the joy of a Buttercup meadow, a wide heath ablaze with Furze or Heather, a field of Bluebells, or a glade that is yellow with Primroses. It is often marvellous to see the grand effects that come of common things. After visiting

a garden set out with any number of odds and ends—many of them worth their weight in gold (how very unpleasant it is to be told how much flowers cost), but looking lonely and alien—I have enjoyed, on my way home, the sight of a good stretch of White Nettle luxuriating in gipsy freedom over a roadside bank. This is how flowers of the rocky sort should grow in gardens.

The colour schemes at flower shows are often excellent, and the large handsome plants crowded with blossoms so beautifully grown, dazzle us with their perfection, but how about the little kitten-faced Pansies? Can we enjoy them so very much when they are poached like eggs, "sur le plat," each one on his own little round of cardboard? How meekly they look up at us, every little soft chin set as stiffly as if in stocks! What a contrast to these are the happy Daisies not far off, apparently quite at home in their cool green setting and in the company of kindred simple flowers. Dresden China Daisy, one of the smallest, if one of the newest things exhibited, was to be another of the pretty pictures taken home to find a place in the gallery that is never over-full.

That is the best of a good flower show, the pleasure of it lasts so long. It only begins while we are "taking in"; it is after we have left it and our lessons are learned that the truest enjoyment is felt, and to reckon up what we have been taught, and "what shall be done next?" because of it, are the prettiest compliments that can be paid to any flower show.

F. A. B.

## TREES AND SHRUBS.

### VERONICA TRAVERSII.

**V**ERONICA TRAVERSII is practically the only shrubby Veronica that can truthfully be called hardy, and it is doubtful if it will withstand a very severe winter, though it will pass through an ordinary English season without injury. During July it is a pretty sight, covered with its spikes of pure white flowers, which only appear white, however, when seen closely. At a distance they appear to have a pale lilac tint, which is due to the purple hue of the two comparatively large anthers found in each flower, the mingling of purple and white at a distance giving the tinge of lilac to the spikes of flower. The leaves are about half an inch long, and leathery in texture. In addition to its showiness when in flower, V. Traversii is a handsome evergreen, attaining a height of 4 feet or a little more and as much in diameter. It is easily propagated by cuttings, and the young plants should have their tops cut out in the spring for the first two or three years to keep them bushy; but this stopping should not be simultaneous with transplanting, or the two checks at once will seriously injure or even kill them. It is a native of New Zealand, as also is the dwarf V. cyprioides (V. salicinoides), a fairly hardy plant, with a bright golden tint in the foliage, and which makes an excellent plant for the rockery. It should be protected, however, if rabbits can get at it, as they will leave practically everything else in the winter to nibble it. The leaves are very minute, and closely appressed to the stems, which are furnished in July with short, terminal spikes of white flowers. It is a plant that might easily be mistaken for a dwarf golden Retinospora or Cupressus.

Bagshot, Surrey. J. CLARK.

### TENDER TREES AND SHRUBS IN THE SOUTH-WEST.

(Continued from page 95.)

**EUONYMUS FIMBRIATUS.**—Japan and India. This shrub is chiefly remarkable for the tint of its

young leafage, which is bright crimson, and gives a vivid, flower-like effect at a little distance in April. I have met with this at Tregothnan and Abbotsbury.

*Eupatorium wiciumannianum*.—South America. This soon grows into a rounded bush 10 feet or so in height and as much in diameter. It bears its flat heads of fragrant white flowers in the autumn and well into the winter, the flowers being succeeded by fluffy seed vessels. It is quite common.

*Eurya latifolia*.—Japan. Half-hardy. An evergreen shrub with leaves somewhat like those of a Camellia, bearing small white flowers. There is a variegated form that at one time was used for greenhouse decoration. Tresco.

*Fuliana imbricata*.—Chili. A very decorative, evergreen, Heath-like shrub, bearing a profusion of pure white tubular flowers clustered thickly around every shoot. A fine example 8 feet in height is at Trellissick, but it is a common plant in the south-west.

*Fagus cliffortioides* (the New Zealand Beech).—A tree with minute leaves, which have given it the name of Birch in its native land. In New Zealand it is evergreen, but in this country is deciduous. A good specimen is at Enys.

*Fremontia californica*.—An extremely handsome deciduous flowering shrub, bearing bright yellow cupped flowers 3 inches in diameter with orange stamens. It often remains in bloom for months. Large plants have, unfortunately, a way of dying off when apparently in good health, several fine specimens having succumbed in this manner. The finest I now know of is one growing in bush form about 8 feet in height at Newton Abbot, but the same garden contained at one time a larger example.

*Grevillea*.—Australia. *G. rosmarinifolia*, with carmine-red flowers, forms a vigorous shrub, growing to a height of 5 feet with a spread of 7 feet. It is to be found in many gardens. At Tregothnan, *G. Preissaei*, with pink and yellow flowers; *G. alpina*, red tipped yellow; and *G. sulphurea* are grown, and I have seen *G. robusta* which had been in the open for three years. All species are evergreen.

*Grevillea Arellana*.—Chili. A very ornamental evergreen tree, with large leaves of a deep glossy green, bearing white flowers followed by coral-red fruits the size of a Cherry. There is a fine specimen at Greenway, 20 feet in height, which has ripened fruit from which seedlings have been raised.

*Habrothamnus corymbosus*.—Mexico. This well-known red-flowered greenhouse shrub does admirably as a bush plant in the open, as does *H. elegans*, with purple-red flowers. They often carry bloom as late as November and are frequently met with.

*Hakea laurina*.—Australia. An evergreen shrub bearing clusters of rosy-lilac flowers. Menabilly. I am not aware if it has flowered in this country.

*Helicocarpus cyanus*.—Tropical America. A small evergreen tree bearing blue flowers. Tresco.

*Hoheria populnea*.—New Zealand. The Houhere of the natives. Ribbon-wood, with pure white flowers and handsome foliage. Enys and other gardens.

*Ilicium anisatum*.—Japan. A half-hardy evergreen shrub, bearing clusters of ivory-white flowers. Held sacred by the Japanese, who burn the bark before the shrines of their deities. Tresco. *I. floridanum*, Southern States of America, bearing maroon flowers. Not uncommon.

*Indigofera gerardiana*.—India. A low, branching, evergreen shrub with finely divided foliage and bearing racemes 5 inches in length of rose-purple, Pea-like flowers. Common. There is a white variety which is rarely seen.

*Jacaranda mimosifolia*.—Brazil. A very graceful evergreen tree with Acacia-like leaves a foot in length bearing panicles of drooping violet-blue flowers. I saw a fine young plant at Rosehill, Falmouth.

*Lagerstroemia indica*.—China. A handsome deciduous shrub bearing large bright pink flowers.

*Leptospermum*.—Australia. *L. baccatum* and *L. scoparium* are the most generally met with. Both bear small white flowers and are evergreen. I have seen the former 12 feet and the latter 20 feet in height. Other species are also grown.

*Libonia floribunda*.—Brazil. The favourite greenhouse flowering shrub, bearing drooping scarlet and yellow blossoms. Tresco and one mainland garden.

*Litsrea geniculata*.—Southern United States. A deciduous shrub or tree bearing white flowers in May. The largest in England is probably one at Menabilly. Twenty-five feet in height.

*Melaleuca hypericifolia*.—Australia. An evergreen shrub bearing scarlet bottle-brush flowers. Tresco.

*Melia Azedarach*.—Tropical Asia. The Bead Tree, so-called from the seeds being used for rosaries, bearing much branched panicles of fragrant lilac flowers. Leaves bipinnate and deeply serrated. Rosehill. Evergreen.

*Melianthus major*.—Cape of Good Hope. A well-known plant in sub-tropical gardening. At Rosehill it has reached a height of 12 feet.

*Metrosideros robusta*.—New Zealand. An evergreen tree bearing clusters of brilliant crimson flowers at the extremities of the shoots, in which it differs from *Callistemon*, whose flowers encircle the branchlets some distance below the extremities. Tresco. Thirty feet in height.

*Mitraria coccinea*.—Chili. An evergreen shrub, bearing bright scarlet flowers. This is to be found 6 feet in height in some gardens.

*Myoporum laetum*.—Australia. Native name Guaió. An evergreen tree bearing small white flowers and having lanceolate leaves dotted with countless transparent spots. Two mainland gardens.

*Nerium Oleander*.—Mediterranean. The Oleander. This is established and flowers in sheltered nooks on the mainland.

*Ozothamnus rosmarinifolius*.—Australia. An evergreen shrub, bearing countless minute, white flowers. Sprays if cut when the flowers are fully expanded will retain their decorative qualities for a year. It is common in the south-west, and at Trewidden there are bushes 8 feet in height.

*Paulownia imperialis*.—Japan. A hardy deciduous flowering tree, bearing erect panicles of large lilac Gloxinia-like flowers. Owing to the spring frosts it rarely perfects these, except in sheltered sites in mild springs, but when in good bloom it is marvellously beautiful.

*Pentstemon cordifolius*.—California. A tall-growing species, bearing bright scarlet flowers in the summer. With the shelter of a wall it grows to a height of 5 feet or more. Trewidden.

*Philesia huixifolia*.—Chili. A dwarf evergreen shrub, rarely exceeding 2 feet in height, bearing drooping, pink, Lapageria-like blossoms. To be found in many gardens.

*Photinia japonica*.—Japan. The Loquat. This hardy ornamental-foliated tree is practically hardy, and at Enys flowers annually. I believe, however, that it has not fruited. The finest specimen I know of, 15 feet in height with a head 12 feet through, is at Salttram.

*Pieris formosa*.—Himalayas. This so-called Andromeda is widely met with. The finest example is at Pentillie Castle, and is 20 feet in height with a spread of 30 feet. When this is white with its clustering flower sprays it is a lovely sight.

*Pimelia decussata*.—Australia. An evergreen shrub, bearing rose-red, globular flower-heads at the extremities of the branches. Tresco.

*Pinus Montezumae*.—Mexico. A noble and distinct Pine, good specimens of which are at Tregothnan and Menabilly, where it has fruited.

*Piptanthus nepalensis*.—Nepaul. An evergreen shrub, bearing numbers of bright yellow Laburnum-like flowers. It seems indifferent to soil, and may be seen flourishing under adverse circumstances. Common.

*Plagianthus betulinus*.—New Zealand. Ribbon Tree. Bears small white flowers in clusters. A splendid example 50 feet in height exists at Abbotsbury.

*Pittosporum*.—New Zealand. Evergreen shrubs. *P. Mayi* at Tregothnan is about 30 feet in height, while I have seen *P. bicolor* over 20 feet, and many fine examples of *P. undulatum*, *P. tenuifolium*, of which last a hedge has been made at Falmouth, and other species. All bear their little flowers in profusion in the south-west. The Japanese *P. Tobira* is a hardy shrub, bearing spreading flower-heads of fragrant white blossoms.

*Podocarpus andinus*.—Chili. A handsome evergreen tree to be found in most gardens. At Penjerrick there is a specimen 40 feet in height.

*Poinciana (Casuarina) Gilliesi*.—South America. An evergreen shrub with Acacia-like foliage, bearing clusters of large yellow flowers with bright red stamens. The finest specimen I have seen was in the late Rev. H. Ewbank's garden at Ryde, but I know of smaller ones in the south-west.

*Polygala grandifolia*, syns. *grandis*, *hilairiana*. Bahia. An evergreen flowering shrub, the finest of its race, bearing large rose and white flowers. Tregothnan.

*Pseudopanax crassifolium*.—New Zealand. An evergreen shrub with dark green thick leaves 2 feet in length with orange midribs. Ludgvan Rectory.

*Rhipidophorus cyanocarpus*.—Chili. An evergreen tree, bearing pale blue flowers, followed by violet-blue berries. A fine specimen 20 feet in height is at Menabilly.

*Rubus australis*.—A Bramble, the only form of which is worth growing, and that merely as a curiosity, is a practically leafless one. The leaves are indeed there, but they consist merely of three midribs armed with curved spines and terminated by leaflets less than an inch in length and an eighth of an inch in breadth. A large plant at Bishop's Teignnton has smothered an Euonymus bush and climbed into an adjacent Fir.

*Senecio*.—Many of the newer evergreen exotic species, such as *S. Greyi*, *S. Forsteri*, *S. Heritieri*, and others are grown, while in Rosehill Garden is a fifty year old plant of the Mexican *S. Petasites*, 8 feet in height.

*Solanum crispum*.—Chili. An evergreen flowering shrub, bearing lavender yellow-centred flowers in profusion, often reaching a height of 8 feet. Quite common.

*Spartanina africana*.—Cape of Good Hope. African Hemp. An evergreen shrub, bearing masses of white flowers with ruby-tipped anthers, a well-known greenhouse plant. At Tresco both

the single and double forms are grown and attain a height of 10 feet. The single form is also met with in mainland gardens, where it is often in flower in February.

*Veronica hulkeana*.—New Zealand. An evergreen shrub, bearing branching panicles of pale lilac flowers, doing best with the support and protection of a wall. To be found in many gardens.

*Westringia triphylla*.—Australia. Evergreen shrub, bearing blue flowers in summer. Tregothnan. S. W. F.

### BEECH HEDGES.

THOUGH they differ considerably in impenetrability many of our hardy trees and shrubs, both evergreen and deciduous, are available for hedges, and of them the finest and most generally employed among evergreens are the Holly and Yew, while the Whitethorn or Quick stands first of the deciduous kinds. Next to this comes the Beech and Hornbeam, and concerning the first-named of the two much may be said in its favour. The Beech will succeed in dry shallow soils, even if they are of a calcareous nature, and it soon attains an effective size, while, though its rigidity may not be equal to the Whitethorn, it nevertheless forms a dense hedge, and, regarded solely from the shelter standpoint, the fact that many of the leaves often shrivel on the branches instead of dropping, serves to increase its effectiveness in this respect.

These Beech hedges, some of them of considerable height, may be occasionally seen in old-fashioned gardens, where they serve not only to keep out intruders, but also to act as a break to rough winds, for it is well known that a hedge if of sufficient density is a more effective screen than even a wall, as the rough blasts are broken up when hurled against the masses of twigs and leaves. The Beech hedges so prominent in Messrs. Cannell's nursery at Swanley, in thus acting as a wind break, are of great value from an utilitarian point of view, while they also form a decided boundary line and serve to shut out any unsightly objects. In planting a Beech hedge good well-rooted plants that have been transplanted should be

THE GREAT BEECH HEDGE AT MICKLEOUR, N.B.

A HEDGE OF AYRSHIRE ROSES.

selected for the purpose, and the planting must be thoroughly carried out, as much depends upon this. When the hedge is once formed an annual clipping is all that is needed, and this is best done before the young growth gets too woody, as the action of clipping is thereby rendered much easier. Mixed hedges are sometimes recommended, but as a rule the most satisfactory way is to employ only one kind. Of the Beech it may be said that for high hedges it has no equal in quickness of growth, while its beauty is well shown in the accompanying illustration.—T.

## THE ROSE GARDEN. NEW ROSES AT WALTHAM CROSS.

**I**N the Waltham Cross nursery of Messrs. William Paul and Son the following Roses were very beautiful a few days ago:—

*Rose Sulphurea* (Tea).—This splendid garden Rose is likely to be much heard of in the future. The beautiful sulphur-yellow buds are produced on such erect stems that the effect on the plant is just what we have been looking for in a Rose of its colour. It will make a fine bedding kind, far better than the now little grown Isabella Sprout. The expanded flower, only then semi-double, changes almost to white, yet there is a yellow shade when seen in the mass. Not the least charm of the variety is the foliage, which is nearly as rich in colour as the Copper Beech. Messrs. William Paul and Son are to be congratulated in giving us this fine novelty, which must rank as a garden Rose in the same degree as their Medea does among the show Teas. Florists, or all who grow Roses in midwinter for cutting, will find Sulphurea a useful Rose, the petals being so firm. This enables the buds to remain in the bud stage much longer than many Teas having semi-double flowers.

*New Climbing Rose Field Marshal*.—This wall Rose we have long wanted. The flowers are brilliant blood-red in colour, with a blossom of almost exhibition size and fulness. In colour it reminds one of Cramoisie Supérieure, and also in the recurved petals; the form, however, is high-centred and the flower perfectly double. It is described by the raisers as a Climbing Monthly or

China Rose, which description was fully borne out by the long growths displayed. Field Marshal will not only be a splendid wall Rose for outdoors, but it must prove just the colour wanted for conservatory or greenhouse roofs and walls, as we have no really brilliant climbers for this purpose that combine quality of blossom with vigorous growth.

*A beautiful new single Rambler Rose*.—At the Drill Hall recently this firm exhibited a quantity of cut branches of their new single Rambler Rose named Waltham Rambler. Its large flower-clusters are of a beautiful bright pink colour, which is well maintained until the whole corymb is developed, and the numerous golden stamens supply a charming contrast to the fresh colour of the flowers. A fine plant exhibited, dug up from the ground, gave a good idea of the extraordinary vigour of the Rose, and flowering, as it does, simultaneously with Crimson Rambler, it cannot but prove a most useful addition to a popular group. The peculiar and valuable trait of the multiflora Roses is the persistency with which their blossoms remain on the plant, even until the whole cluster is developed, a fact worth remembering to all who desire a fairly lasting effect from such ramblers. Many of the early-flowering single Roses are far too fleeting to be effective, although nothing can prevent them being beautiful for the short time they are with us.

*Franz Karl Drusckii*.—The snowy purity of this splendid novelty is no less remarkable than its form. We seem to have obtained the ideal white Hybrid Perpetual in this Rose, although it may be wanting a little in fulness to please some exhibitors. But the extremely long buds and the splendid high-centred, half-open flowers of almost a dead white colour are found in no other variety. It reminds us somewhat of Beauté Lyonnaise, but is a great advance upon it in growth. It is not quite so vigorous as Margaret Dickson, but nearly so. Those individuals who show, and also those who use a quantity of forced flowers, would do well to secure a stock of this most excellent Rose. It is almost scentless, which is a pity. However, one cannot have every good quality in all Roses.

## ROSES FOR PERGOLAS, FENCES, AND ARCHES.

(Continued from page 101.)

*CRIMSON RAMBLER* is so showy that a garden would not be complete without an arch or pillar

of it. This Rose pays for liberal culture, which ensures highly coloured and large trusses. It is not necessarily an arch or pillar Rose, for it does capitally as a standard, or if a bush then bend over its growths and numerous trusses of blossom will be had in this way.

*Felicité Perpetue* is the best companion and contrast to the latter. Its huge bunches of white rosettes and pink buds are well known, and it is a splendid grower.

*Flora* cannot well be omitted. It is a splendid grower, and its flowers quite a good size, of a lively shell-pink colour.

*Mme. Alfred Carrive*, flowering early and late, is one of the most valuable climbing Roses we possess. Its sweetly fragrant, showy blossoms of flesh-white colour are not so abundantly produced as the climbers of the Rambler section, but individually they are better and more useful for cutting.

*Waltham Climber No. 1* is a Rose which always will yield a handsome bud of a bright crimson colour, and it is one of the best of our red climbers that are perpetual flowering.

### BUSH AND STANDARD ROSES.

The following Roses are all so good that an effort should be made to grow them somehow; even as isolated bushes or standards they would not fail to charm.

*Mrs. John Lainy* (H.P.).—One of the best Roses yet raised, hardy, free, and beautiful in colour.

*General Jacqueminot* (H.P.) is still a grand red Rose, a variety that could safely be planted by the thousand for market, only I should advise procuring it upon its own roots.

*La France* (H.T.) has been particularly good this year, but I cannot say it is always so. It is a Rose that does not require strong stimulants. If a wall space be available try one on it and prune very moderately, but spread out the growths. In fragrance La France has yet to be beaten.

*Fisher Holmes* (H.P.) still holds a high place in the affections of Rose growers. No Rose gives a prettier bud, and it is certainly one of the best dark red kinds we possess.

*Killarney* (H.T.) is getting very popular. Even among our almost countless number of pink Roses there is yet room for a delightful Rose like this. Long budded, clear coloured, and altogether a handsome, free growing variety.

*Mme. Pernet Ducher* (H.T.).—I had never noticed the lasting powers of this Rose so much until this year. Its flowers even when expanded, the petals moving with every breeze, do not drop but hold on for some considerable time after. The handsome trusses when all are expanded make glorious decorations in glasses. The canary-yellow buds, too, are very pretty and useful.

*Corallina* (Tea).—One need never be without a red buttonhole if some plants of this splendid acquisition are procured. It is as strong and free as the old monthly, and a Rose of greater usefulness than Papa Gontier and others of that character.

*Mrs. Sharman Crawford* (H.P.).—A Rose of wonderfully fresh pink hue. It makes fine buds and expanded blossoms, the latter being in much request for table decoration by reason of the stiff stems. The last one to name is

*Souvenir de Malmaison* (Bourbon), which has stood the test now of many years, and time does not destroy any of its charms. Its blush pink buds are as handsome as any Tea Rose.

AN OLD ROSE GROWER.

### THE MASSING OF ROSES.

One of the ways in which the Rose is best displayed, in my opinion, is by planting it in masses of one colour either in beds on the lawn or in borders.

I was much impressed and interested some few years ago when visiting the beautiful gardens of Miss

Alice de Rothschild, at Eythrope, by a successful exhibition of this manner of planting Roses. In this instance it was a long border running parallel with one of the garden walks that was planted (many hundreds of plants must have been used), and the variety made use of was Captain Christy. The plants were planted thickly, not more than a foot apart, in soil evidently well prepared and enriched by constituents well suited to the Roses' requirements, resulting in such a wealth of bloom and rich colour effect that would be difficult, if not impossible, to attain with any other flower. Some years ago masses of Roses were planted in this way in the West Terrace Gardens at Chatsworth, in large elevated beds (enriched by handsomely worked stone walls). This was decided upon in a great measure to reduce the number of ordinary tender bedding plants previously made use of. The varieties chiefly planted there were China Roses; the habit of these, the length of their shoots, drooping over the sides of the beds, and rising to a good height in the centre, together with the well-known floriferous character of these varieties, and their almost perpetual blooming, fit them well for the occupation of such beds, certainly in this case the substitution of the Rose for the common and prosaic bedding plants proved a success in every way, and I doubt not that there are beds in many gardens now occupied by a number of expensive, fleeting, and common-place bedding plants that could be made infinitely more interesting and beautiful by the substitution of the Rose, as in the case above mentioned. In another notable garden, not far from London, in which I had the pleasure of spending a day last summer, had been adopted this manner of planting Roses, with a decidedly striking and beautiful effect. In this case circular beds were planted on the margin of the lawn, between coniferous and other ornamental trees, and to my mind the association was most effective and beautiful. To be successful in this manner of growing Roses it is essential to guard against planting Roses of poor constitution or of feeble growth. These are of no use whatever for this system of Rose growing. It is also essential to have a deep, rich, and well-drained soil, in which a considerable amount of lime should be present; a mulch of short, well decayed manure should be placed on the surface, and a liberal application of water given in hot dry weather. Objection may be taken by some to the surface manure as being offensive to the eye, but planted closely as the Roses must be, when they are in foliage and

bloom every particle of the border will be hidden from view. The best time to plant Hybrid Perpetuals (and these and Hybrid Teas are the best for massing) is undoubtedly in the autumn (the end of October), although they may be planted with varying success from that time to the end of March. As to the distance apart they should be planted this must be governed by the size and strength of the plants and also the variety, but none should be planted at wider distances than a foot. To produce the finest blooms disbudding must have timely attention. The following are amongst the best for this system of planting:—

*Crimson.*

Marie Baumann  
Fisher Holmes  
Captain Hayward  
Duke of Edinburgh

*Pink.*

Mrs. J. Laing  
Mrs. W. J. Grant  
Mrs. R. G. Sharman Crawford  
Mme. Gabriel Luizet  
Caroline Testout

*Red.*

Ulrich Brunner  
Suzanne M. Rodocanachi  
Francois Michelon  
Marquise Litta

*White or Flesh Colour.*

Merveille de Lyon  
Margaret Dickson  
Kaiserin Augusta Victoria  
Captain Christy  
Bessie Brown  
Mildred Grant

*O. T.*

## NATURAL GARDENING IN SURREY WILDS.

### TROPAEOLUM SPECIOSUM.—FACTS AND INFERENCES.

TEN or twelve years ago I planted a few healthy roots of this lovely creeper in some very light soil in which several large specimens of Nephrodium Filix mas had been growing for more than twenty years. The situation was at the foot of a wall covered with Ivy, which had grown very freely and extended a couple of feet from the wall.

The soil in which the Tropaeolum grows has not been dug or otherwise disturbed for many years, and was not in any way prepared by me for any plants or Ferns. The aspect is north-east, and, except in early summer, in the morning for two or three hours, is in complete shade. The young shoots of the Tropaeolum are naturally well protected by the Ferns in spring and summer, and about the middle of June are seen to appear amongst the undergrowth, and then a very moderate amount of water is given in dry warm weather, but I do not think the roots of the Tropaeolum or the

Ferns amongst which they grow can ever get really wet.

Each year the twining stems of the Tropaeolum have increased in length, strength, and in the number of flowers they bear, and several of the blue berries formed last year ripened. The less the delicate shoots of the plant are touched the better. Any attempt at training usually fails, and the plant naturally makes such beautiful and graceful wreaths of its own accord that it is a pity to interfere at all. The plant is in perfect health, and evidently growing in a situation and under conditions that suit it perfectly. If it continues to improve for another year or two it may extend over a space 20 feet long by 8 feet high. No manure has been given, and it is growing in a very light sandy soil, which has not been forked up or disturbed for the last twenty years, but of course much vegetable matter from decayed leaves and "Fir pins" has accumulated from year to year. Many of the Fir trees in the copse hard by are 80 feet high with bare trunks, and the *débris* from them must be very considerable in every part of this garden. The ground in which the Tropaeolum grows during the greater part of the year must in fact be dry. The flower buds are now appearing.

I have been much surprised at the really magnificent growth made by the Ferns, American and native, in the thin layer of very light soil which overlies many feet of very dry gravel. Even the Osmundas, the Struthiopteris, the Onoclea sensibilis, and many others grow very large, and some are on *sandy banks*, hardly receiving any water during many months. In short, a garden which in fact is but a piece of reclaimed ordinary common, and in part Fir copse, seems to suit a very large number of the most beautiful and interesting plants which can be grown in our climate, and all ordinary bulbs, as well as Primulas, Polyanthus, &c., not only flourish, but increase by division and self-sown seed without trouble or interference.

July 28, 1902.

F. R. S.

## WATER GARDENING.

### THE BEST NYMPHEAS AND HOW TO GROW THEM.

FEW phases of gardening have made more rapid progress during recent years than has water gardening, and much of the popularity of this is undoubtedly due to the increased interest taken in Nymphaeas and their culture. Many varieties of these Water Lilies have of late years been introduced to our gardens from France and America—varieties that are remarkable for their extreme beauty, hardiness, and vigorous growth.

The delights of water gardening appear forcibly to appeal to Mr. Leopold de Rothschild, for in the lake in the picturesque grounds of Gunnersbury House one may see what is perhaps the most representative collection of Nymphaeas in English gardens, and the margins of the water are clothed with many handsome moisture-loving plants. Mr. Hudson has altogether transformed the aspect of the lake at Gunnersbury by his successful cultivation of the Water Lilies, of whose vigour and arrangement the accompanying illustration gives some idea. The clumps of the numerous varieties are arranged informally over the surface of the lake, more particularly towards either side, and the distinctive characteristics that each variety possesses, in the mode and vigour of growth, disposal of flowers, &c., add to the charming irregularity and natural beauty of the effect.

The cultural requirements of the hardy

IN A SURREY WILD.

Nymphaeas are simple and easily supplied. Messrs. James Veitch and Sons, whose experience with these plants is unusually extensive, say that any pool of water or pond of moderate dimensions, and from  $1\frac{1}{2}$  feet to 2 feet deep, will suit them admirably.

The best months for planting Nymphaeas are June, July, and August. They should first be planted in baskets, previously filled with good loam, taking care to make them firm. The baskets are then lowered into the water in places where the Lilies are desired to grow. The baskets will not decay for several years, and by that time the Nymphaeas will have become well established.

Some of the stronger growing sorts, the marliacea hybrids for instance, if not planted fairly deep, say 3 feet, will in a year or two push their leaves out of the water, making quite a massive clump, and thereby losing somewhat in beauty. Mr. Hudson remarked that he knew of Nymphaeas succeeding even when planted 6 feet deep or more. Of course with the less vigorous growing ones shallow planting is quite satisfactory, for

the long slender petioles spread out and the leaves float gracefully. A list of some of the best Nymphaeas is appended.

White.—*Alba candidissima*, with large pure white flowers, an early and continuous bloomer; *alba plenissima*, pure white, more double than the former; *caroliniana nivea*, sweet scented; *marliacea albida*, fragrant, pearly white flowers; *odorata*, the North American Water Lily, which produces its cup-shaped flowers very freely; *pygmaea*, the smallest of Nymphaeas, fragrant.

Yellow.—*Chrysanthia*, yellowish red, with bright orange stamens; *fulva*, light yellow, tinted with red; *flava*, citron-yellow; *marliacea chromatella*, a beautiful straw colour with yellow stamens; *odorata sulphurea* and the variety *grandiflora*, sulphur-yellow, fragrant; *pygmaea helvola*, flowers slightly larger than *pygmaea*, sulphur-yellow; *Seignouretti*, light yellow, tinted with carmine.

Dark.—*Atropurpurea*, dark crimson, large flowers; *gloriosa*, rich purple, one of the most beautiful; *Laydekeri fulgens*, rich crimson and orange; *marliacea ignea*, one of the most

richly coloured, crimson; *odorata exquisita*, deep rose-carmine; *William Falconer*, the deepest coloured hardy Nymphaea yet raised.

Pink.—*Caroliniana*, clear rose-pink; *Laydekeri rosea*, delicate rose-pink; *marliacea carnea*, blush; *marliacea rosea*, bright pink; *odorata rubra*, rose-pink; *odorata suavissima*, a beautiful pink; *tuberosa rosea*, delicate pink.

Other good Nymphaeas.—*Ellisiana*, brilliant carmine-purple; *Freebelli*, bright carmine-red; *odorata luciana*, a deep and rich rose-pink; *robinsoniana*, red toned with yellow.

## THE MOUNTAIN PRIMULAS.

(Continued from page 82.)

### SPECIES REQUIRING SILICA OR SPECIAL CULTURE.

*P. CAPITATA* (Hook.) syn. *P. globifera* (Griffith).—From Sikkim and Bhutan, between 12,000 feet and 15,000 feet. The most beautiful of all the Primulas; its deep blue-purple, globular

WATER LILY GROUPS ON THE LAKE AT GUNNERSBURY HOUSE, ACTON, NEAR LONDON.

head of flowers with silvery calyces is of distinguished elegance. Unfortunately, it is not common in cultivation, what is generally sold for it being the common *P. denticulata* or its varieties. *P. capitata* has narrow, elliptical leaves, finely serrated, covered on both sides, but especially beneath, with silvery white powder; the flower-stalk, 6 inches to 8 inches high, is also freely powdered with the silvery farina; flowers numerous in a globular head of a very deep blue-purple, covered outside with white powder; lobes of the corolla elegantly cut; calyx also covered with silvery powder. The flower-head, in consequence of the large number of flowers that compose it, remains long in beauty; we have even known them to last for several months. It flowers at all times of the year, according to the age of the seedlings. We have often had them lasting from August to November, though they usually flower in spring. This plant must have an absolutely non-calcareous soil, such as peat; it does extremely well in sphagnum. It has been killed at Geneva in the winter, but not at La Linnea, where, at an altitude of 5,360 feet, it has a winter covering of snow, a condition that it probably enjoys in its native place in the Himalayas, where it grows at about 15,000 feet. I do not think that it is killed by the cold, but more likely by the stagnant and persistent damp. Moreover, we must consider it to be a plant that is neither exactly a biennial nor monocarpous, but that has a short lifetime. But it yields a quantity of seed that is easily raised if sown in very sandy, non-calcareous soil.

*P. erosa* (Wall.) (Bot. Mag., t. 6916 A.).—Mountainous and lower regions of the Himalayas from Kumaun to Bhutan, between 4,500 feet and 10,000 feet. This plant, sometimes considered a variety of *denticulata*, is, in fact, quite distinct from it, having a rhizome without fleshy scales, and also by its obovate-lanceolate, obtuse leaves, which are not mealy and are more deeply and regularly toothed, by its silvery-powdered calyx, and by its flowers of a light lavender colour. I grew this plant for many years in peat, but have lost it of late, and when I have asked for it have received *P. denticulata*, though I believe the true *P. erosa* is in cultivation in England.

*P. Forbesii* (Franchet).—A native of Yunnan. A small biennial (?) plant, very floriferous. Franchet, the botanist, gave me some seed ten years ago, when he gave it also to some botanical gardens. It is a notable acquisition in horticulture. Unfortunately, it is not hardy with us, and, if I include it in the present treatise, it is because, from its prolonged season of flowering, it is a valuable plant for the decoration of the rock garden. The leaves are small, ovate-lanceolate, pubescent, boldly toothed, and with a more or less long stalk;

flowers of a fine rose colour, in groups of five to eight, in three to five superimposed ranges of whorls, which flower one after another. This plant likes peat and sun, but also needs a moist atmosphere.

*P. megaseifolia* (Boiss.).—From the mountainous regions of the Lazistan, near Rhizé, between 900 feet and 1,000 feet, and from the mountains of Persia. I have already described this species—new to horticulture—in THE GARDEN.\* It is peculiar in that it belongs to a group of which all the other types are

and that we may well be glad of its introduction. It is very easy to grow, but cannot endure severe winters. In consequence of its rarity and that we have had it so much asked for I have not as yet been able to use a single plant experimentally, but hope to do so next winter as we have been able to propagate a considerable quantity. It is difficult to grow from seed, as it germinates very slowly.

*P. mollis* (Hook.), Bot. Mag. t. 4798.—From Bhutan in the Himalayas. An inconspicuous and yet pretty plant; leaves with long petioles, cordate, downy on both sides; petiole covered with outspread white hairs; flowers deep crimson with red tube, in two or three superimposed but irregular whorls of fifteen to twenty. May to July. This plant requires a porous soil and a half-shaded place; it dislikes lime and prefers peat. H. CORREVON.

(To be continued.)

## AN ARTIST'S NOTE-BOOK.

### PRIMULA SIKKIMENSIS.

ONE of the most graceful and beautiful of all hardy Primulas is the "Sikkim Cowslip," yet so far as its general cultivation is concerned it is a neglected plant—neglected in the sense that so few care to make it the feature it should be in any garden where it is grown. The plant is well known to all hardy plant lovers, yet how many of the latter can ever say they grew a bed of even fifty plants of it in such a way as

to display its garden value and decorative character, much less the grace and charm that render it unique among the plants of higher altitudes. Not a few of the Primulas of the high mountain ranges are of difficult cultivation in British lowland gardens, but this fine Sikkim Primula is among the most easy to grow that we know. There are, however, one or two points, and in truth they are essential details in its cultivation,

that must not be disregarded if the plant is to yield its full value.

The points referred to are, briefly, that the species must be regarded as only of biennial duration; and, secondly, that it be given a wet boggy place to grow in. Given these this fine plant in its year of flowering will produce a stem 2 feet high, surmounted by a number of flowers, pale yellow in colour and drooping, and varying from three dozen to five dozen in a single head. All that is required from the first is to grow the seedlings quickly, and plant them early in the positions in which it is intended they shall flower. For example, with the seed sown in January or February the young plants may be transplanted into 4-inch pots in early May, and after six weeks in the pots plant them without more ado in their boggy bed. Where the seed is to be had in the later summer months, by sowing it at once an earlier germination should ensue. In this case the young plants may be planted out as early as April, the chief object of so doing

PRIMULA SIKKIMENSIS.

(From a drawing by

H. G. Moon.)

Chinese, while this one, isolated far away and extremely rare, appears on the borders of the Black Sea, where Balansa found it in 1866. Boissier described it in "Flora Orientalis,"<sup>†</sup> but it was only in 1900 that Mr. Carl Sprenger, of Naples, brought it into cultivation. It is a very handsome species, with the leaves oval-oblong, rounded or cordate at the base, leathery, of dark green colour and smooth surface, often red-brown above and strongly ribbed; flowers large, of a more or less dark rose-lilac colour, with the tube of the corolla of a bright orange colour, arranged five to fifteen and sometimes more in a wide panicle at the top of a thick stem that is downy below and has a height of 8 inches to 16 inches. Boissier says that it blooms in May, but in the Jardin alpin d'acclimatation it is in bloom all the winter, and this season it has been in full flower from the end of November till the end of March. I consider that it is a plant with a great future,

\* THE GARDEN, April 13, 1901, page 270.

† "Flora Orientalis," Vol. IV., t. 26.

being to obtain as prolonged a season as possible, for upon growth in the first year will largely depend the good flowering to follow the next year. Treated in this way the plant is one of the finest of the Primrose family, and commencing to flower at the end of May lasts many weeks in good condition.

In those instances where an entire bed cannot be devoted to it, colonies should be planted near such wet-loving subjects as the Dentarias, Trilliums, Cypripedium spectabile, and others; or small groups may be planted in prepared soil about the margin of the lake or pond. Indeed, in any position where the root fibres get in touch with moisture there will this plant be more or less happy and effective. In its native habitat, where the plant is said to cover acres of ground, it is ever found in wet and boggy places and at great altitudes, often 15,000 feet or 16,000 feet. In this country, when it is required to obtain seeds, if possible the plants should be in full sun, with the roots near to constant moisture: this, coupled with artificial fertilisation, is the best plan to adopt. In my experience the plant is most vigorous in a soil consisting chiefly of loam; a good depth of this, with a little old manure, sand, and leaf-soil added, serving quite well.

E. JENKINS.

## NOTES ON HARDY PLANTS

### RAYLESS YELLOW TUFTED PANSIES.

**I**N recent years there has been more advance in yellow tufted Pansies (*Violas*) than in those of any other colour. Since the rayless varieties were first distributed this advance may be traced, and now the names of really beautiful sorts are, if anything, too many. Of course, there is room for improvement, but the advance should be made in the habit of the plant, the substance of the flowers, and also in yellows of distinct shades of colour. In *Pensée d'Or*, one of the finest *Violas* raised by the late Dr. Stuart, we have a charming plant, with medium-sized rayless deep yellow flowers. This plant may be regarded as an ideal one for the border, as its habit is very tufted and its free-flowering propensity most pronounced. What is wanted now is a series of good things in other shades of yellow. There is room for those of a pale yellow colour, others of primrose or slightly deeper colour, and others still of the brightest yellow. Last season I made a selection of a few seed pods from the new rich bright yellow, Mrs. E. A. Cade, and the batch of seedlings from that handsome sort has given me a most interesting progeny. There are many really first-rate flowers, and these are developing on plants of very good habit. There are several quite selfs, and the blossoms are neatly cut and of good form. Already it has been possible to make a selection of the best, and their propagation will be proceeded with without delay. That the yellow rayless sorts will be added to from this batch of seedlings I feel quite confident, and another season should see them represented, the only satisfactory one of illustrating their true value as bedding plants. Interesting crosses have been made this season, and of these naturally one has great expectations.

D. B. CRANE.

### A NOTE FROM KIRKCONNELL, NEW ABBEY, N.B.

#### CAMPANULA LACTIFLORA.

THIS showy *Campanula* does well in the rather peaty soil in the Kirkconnell gardens, and the plants show a vigour and attain proportions seldom seen. The shades, from dark purple-blue to a creamy white were all pleasing, and the large pyramids of bloom given by the plants were very attractive.

#### XEROPHYLLUM ASPHODELOIDES.

This is another plant which seems to luxuriate at Kirkconnell, and one plant in particular had sent up several strong spikes of the creamy flowers of this distinct and little-cultivated Turkey's Beard.

#### DELPHINIUMS.

Some of Kelway's best *Delphiniums* adorn the back of the long borders devoted to hardy flowers, but this season they are showing signs of requiring lifting, manuring, and replanting, the flowers being smaller and the spikes less effective than usual. This is to be taken in hand in early autumn, and next year these noble Larkspurs will be probably as fine as usual. In some soils they seldom need replanting, but at Kirkconnell they are evidently the better of more frequent renewal of the soil than in many places.

#### MARTAGON LILIES.

There is a fine stock of the Martagon Lily in these gardens, some apparently dating back for many years. One seldom sees so many plants of the double Martagon, of which there are many clumps. The white forms are in quantity as well, and there can be no question as to the superiority of that one which seems to be free from the habit of fasciation, which destroys the beauty of the white Martagon wherever it occurs. The better variety grows taller and the flowers look whiter and prettier. The common single Martagon is also plentiful, and *L. Martagon dalmaticum* grows tall and flowers freely, though it does not increase so rapidly at the root as some of the others.

#### THE OLD ROSES.

I have before spoken in THE GARDEN of the old Roses in this garden, and they were practically all in bloom at the time of my visit. The dull season has not been so favourable for some of the centifolia type, but the others were giving a profusion of bloom. At my request some flowers were sent last year to Mr. R. P. Brotherton, who makes a study of these old Roses, and I was glad to learn from him that some were unknown to him before. There are great bushes of the majority at Kirkconnell, one of my favourites being a pink one, known there as Swiss Boy, which has been grown there for very many years.

#### HELIANTHUS TOMENTOSUS.

This Sunflower, although not yet in bloom, promises to do remarkably well at Kirkconnell, and the vigorous plants gave a promise of flowers equal to the ones which delighted those who made the acquaintance of this Sunflower at the shows last year when shown by Mr. Perry as *H. mollis*.

#### PLATYCODONS.

These have been grown rather largely for some years, and they are again showing plenty of flower, and are strong and vigorous.

#### ORCHIS MACULATA SUPERBA.

As may be expected from the peaty character of the soil and the low and rather damp position of the garden, hardy Orchids, of which several are grown, do remarkably well. *O. maculata superba*, known as the Kilmarnock or Miss Hope's Orchid, is, however, by far the finest of those cultivated, and it was a pleasure to see so many fine spikes. It was a pet plant of the former gardener, the late Mr. John Harper, and his successor, Mr. J. M'Gill, seems to take an equal pride in its cultivation. There were many other interesting things to be seen in Mrs. Maxwell-Withani's fine old garden, but space will not permit of further details.

S. ARNOTT.

## RECENT PLANT PORTRAITS.

The Botanical Magazine for August contains portraits of

*Echium Wildpretii*, a native of the Canary Islands.—This is a fine tall growing species with bunches of bright rose-coloured flowers arranged all round the upper portion of the tall stem surrounded by numerous narrow hairy leaves.

*Decaisnea Fargesii*, native of China.—This is a

plant of merely botanical interest, with pendulous green flowers.

*Heterotoma lobelioides*, native of Mexico and Guatemala. — This is also known under the synonyms of *Myopsis mexicana* and *Lobelia calcarata*. This is a most curiously formed but bright and ornamental flower of blood-red and yellow colouring.

*Fritillaria Ashkabadiensis*, native of Central Asia.

— This is a Crown Imperial with green flowers of no beauty and merely botanical interest. It was collected by Mr. Sintenis, and first flowered at Warley Place Garden by Miss Willmott, V.M.H.

*Gelsemium sempervirens*, native of the Southern United States. — This handsome greenhouse climber is also known under the synonyms of *G. lucidum*, *G. nitidum*, *Jeffersonia sempervirens*, *Bignonia sempervirens*, *Syringa volubilis virginiana*, *Anonymos sempervirens*, and *Carolina Jasmine*. The large tubular flowers are of pure white inside, shaded with pale yellow outside, and are produced in pairs at the axil of every leaf at the ends of the branches. Although introduced so far back as 1640, and figured by Parkinson in his "Theatrum Botanicum" in 1641, it has never been since figured in any English horticultural work.

The first part of the *Revue Horticole* for August has a portrait of *Laelia-Cattleya* Mme. Marguerite Fournier, a lovely hybrid resulting from the fertilising of a *Cattleya labiata* by pollen from *Laelia digbyana*. The seed was sown in March, 1897, and the first flower opened on February 1, 1902, in M. Fournier's garden at Marseilles.

The *Revue de l'Horticulture Belge* for August contains portraits of *Celsia Arcturus*, a beautiful yellow-flowered old greenhouse plant, and of *Eriostemon myoporoideus*, a very pretty and well-known greenhouse shrub. W. E. GUMBLETON.

## ORCHIDS.

### NOTES FROM THE WOODLANDS.

**N**OW in flower at the Woodlands are two beautiful new hybrid Orchids, or rather new varieties.

#### LELIA GRAVESIÆ VARIETY.

A handsome form, probably the finest yet known. It was raised from the same specific parents, viz., *Laelia dayana* and *Laelia crispa*, but different varieties to those used with the original. The flowers are of medium size, but of ideal shape and colouring. The sepals project slightly forward, their bases overlapped by the petals. Both are of a blush shade of magenta-rose, slightly darker in the centre. The lip has a compressed and rather narrow tube, which, if anything, serves to emphasise the bold curves and comparatively large size of the lamina. The rich depth of colour, madder-crimson, deepened with Tyrian purple, is exactly that which would be anticipated from the two parents, both of which have very dark labellums, a darkness further accentuated in this hybrid by dusky lines, which replace the keels of the *Laelia dayana* parent.

#### CATTLEYA MISS MEASURES.

The original hybrid named in compliment to Miss Measures was raised from *Cattleya lueddemanniana* and *C. velutina*, the first-named having carried the seed vessel. In the present form the parents are the same, but their functions were reversed. The result is even more pleasing. The flowers approach in size those of the pollen parent, and present a novel combination in colour. The sepals and petals are of a similar tint to the Barbary Dove, plus a delicate tinge of rose, just enough to give warmth to them. The labellum is almost flat, the reflexed form of *C. velutina* being counteracted by the influence of *C. lueddemanniana*. The lamina is of a deep purplish red, shot with crimson and flecked, rather than reticulated, with white. From the base, radiating into the throat, are rich old gold lines of varying widths. There is every promise of this variety proving of

exceptional beauty as the plant gains strength. Near this hybrid stood a fine example of one of Mr. Measures' very old favourites, viz., Lælio-Cattleya Exoniensis, the deep purple of the fluted lip contrasting well with the rose sepals and petals. It is interesting, as being one of the oldest of hybrid Orchids, yet still retains a premier position owing to its fascinating beauty.

#### LÆLIO-CATTLEYA ELEGANS.

Just at present this princely collection presents a grand sight. Scores of varieties are now in flower. Many of the plants are veritable specimens, and each bears several spikes. A new variety, L.-C. elegans var. Hilda, was noticeable and indeed striking—a grand form. Individually the flowers are  $\frac{7}{8}$  inches across, the petals of which, with the sepals, are a bright shade of pure purple, with deeper veins. The sepals bear a few spots, minute in size, but conspicuous from their deep colour, a character derived from the Cattleya parent. As in the majority of the varieties of Lælio-Cattleya elegans, the lip is wonderfully vivid, the whole of the front lobe being an intense purple-crimson, radiated with slightly raised ridge-like veins, the colour extending to the very foot of the column in a clearly defined wedge-like stripe. The side lobes are white, almost entirely so on the inner surfaces, but slightly suffused with rose on the outer. The apical angles are of the same brilliant colour as the major portion of the lip, and gradually fade to white.

LÆLIO-CATTLEYA ELEGANS IMPERATRICE is also a splendid variety, in every way worthy of its name. The flower is equal in size to that of the preceding, but with the anterior lobe of the lip of even greater width. The sepals are of that peculiar but pleasing shade of fawn or tawny-fawn seen in some varieties of elegans, in this instance tenderly touched with rose. Equally characteristic is the wonderful labellum of deep rich velvet-like crimson, darkened with purple-crimson, and slightly dashed with magenta at the edges. The almost triangular apices of the side lobes are of the same colour, shading to cream-white on the inner surface of the tube excepting that immediately beneath the column in a broad band of plum-red. Externally the tube is soft rose, flushed and dashed with crimson beneath.

#### CYPRIOPEDIUM MARTIONESS OF SALISBURY.

In one of Mr. Measures' Cypripedium houses a very beautiful hybrid, of the barbato - bellatum group, attracted attention. It was obtained from bellatum, fertilised with the pollen of barbatum superbum, Sander's var. The dorsal sepal is a soft rosy peach colour, shaded with rose madder, marked and spotted with crimson; the petals have a similar ground colour, but are thickly spotted with maroon. The delicately shaped shell-like lip is suffused with carmine-rose. The plant was given a first-class certificate by the Royal Horticultural Society on November 12, 1895, but has greatly improved since then.

Quite a contrast to it, yet equally attractive, though in a different way, was a well flowered plant of Cypripedium Frau Ida Brandt, a hybrid between lo grande and youngianum. It will be noticed that both the parents of this hybrid are themselves hybrids, hence it has a rather complex parentage. None the less it is very beautiful, one of the finest of all Cypripedium hybrids. The tall scape bore four flowers, each very large. The dorsal sepal is soft white, shaded with green at the base, tinted with rose, and spotted with chocolate, arranged in lines. The long, broad, drooping petals are exquisitely shaded with pink-magenta, spotted with dark purple-maroon, shaded with

green, and near the upper margins are a few prominent polished purple warts. The pouch is a warm red-brown, flushed with magenta. This variety throws Cypripedium Morganie entirely in the shade.

ARGUTUS.

## THE INDOOR GARDEN.

### CARNATIONS AT TRENT PARK.

**R**ESULTS obtained by Mr. Parr, head gardener on the above estate, conclusively prove that he thoroughly understands the cultural requirements in every respect of Carnations. It is doubtful if better all-round plants could be shown, and as very fine Malmaisons and their culture are of general interest Mr. Parr was approached in

carefully seen to, and as small a pot as possible used at this stage. The compost at this and all succeeding shifts is firmly pressed in, particular attention being given to this point when the layers are finally moved into the flowering pots.

Throughout the winter the plants are kept in a cool airy house, as near the glass as they can be, the points considered absolutely essential being the reduction of air only when really necessary and strict care in watering. Each plant must be dry before water is administered, and then a thorough soaking is given. Attention to watering and ventilation is considered of vital importance.

During the winter the syringe is entirely withheld, but as the sun gains power slight dampings are made on the stages and floors, and an occasional "dew over" is given to the plants about midday or a little later—always however, with discretion.

With the exception of a few quarter inch and

A HOUSE OF MALMAISON CARNATIONS AT TRENT PARK, NEW BARNET.  
(The residence of Mr. F. A. Bevan.)

the hopes that should he use any special treatment the information might be given to readers of THE GARDEN.

Mr. Parr, however, emphatically disclaims any secrets connected with them. Briefly, he describes his success with them to doing the right thing at the right moment and avoiding any tendency to force the plants.

He is by no means an advocate of hurrying where Carnations are concerned. Each layer is carefully selected, preference being given to a medium-sized shoot with healthy foliage than to one in any way coarse or fleshy. Healthy foliage is absolutely essential; pipings are also taken, but never when sufficient layers can be obtained. These are potted as soon as rooted, the compost used being a good loam of medium texture, obtained from sweet pasture land and stacked for twelve months, coarse sand, and a little leaf-mould; drainage is

half inch crushed bones, placed in the bases of the pots, and a little bone-meal and wood ashes incorporated with the compost when the plants are given their final potting, no artificial manures are used, and to this, the free admission of air, care in watering, and selection of young plants Mr. Parr considers is due the absence of disease.

Fire-heat is always ready to be applied, but only used when it cannot be dispensed with or in very damp and foggy weather—enough to prevent the atmosphere becoming surcharged with moisture.

Green-fly, the chief enemy, is kept at bay by gentle fumigations with XL All vaporiser, a moderate dose being quite sufficient if applied before the insect has time to obtain a strong footing.

The aim at Trent Park is to obtain blooms in quantity with quality. Where cut flowers

are required in abundance the first-named point must be considered, hence disbudding is not practised to nearly the same extent as would be the case were exhibition blooms alone required, nor, judging from the plants in bloom now, is severe disbudding really required. As the bloom buds appear, manure water—the liquid form obtained from the stables—is given, the applications becoming more frequent and gaining in strength as the flowers approach maturity. This forms the only manurial aid the plants receive, with the exception of that given in the compost, and occasional waterings during their growth of clear soot water, very weak.

Plants which are grown for specimens receive identical treatment, except that liquid manure is given in slightly stronger doses. To summarise: Success is obtained by studying the plants, by great care in watering and ventilating, by firm potting, fresh air, and judicious feeding.

J. G.

### USES OF BRITISH PLANTS.

V.—ROSACEÆ.

(Continued from page 64.)

**AVENS** (*Geum urbanum*).—This was much used in the Middle Ages in drugs for wounds: and also for drinks on account of the aromatic flavour of the roots or rhizomes. They were used in parts of England to flavour beer and wine. It is also called Herb-Bennet.

**Strawberry** (*Fragaria vesca*).—The Wild Strawberry, so common in woods, is a familiar plant. A variety of species is cultivated as the "Hautboy," i.e., Haut Bois, whence it came, or the "High Woods" of Bohemia. The Strawberry has been long cultivated in England, as well as the Alpine form (*F. collina*). It is a curious fact that this is the only one which can be grown with satisfactory results in Malta, as the ordinary large fruited garden sorts of American origin fail to ripen. It was called streowberige in the tenth century. The syllable streow means "straw" and refers to its runners resembling straws (Skeat). The stalks, probably the runners, were used in medicine in the fourteenth century and called "Strebowyses." It was first cultivated in the reign of Edward I.

**Marsh Cinque-Poil** (*Potentilla Comarum*) is a herb growing to 1 foot or 2 feet high in bogs and ditches, having dull purple flowers, being commoner in Ireland than England. It has a strongly astringent root or rhizome, formerly used in tanning. It also yields a yellow dye. It has been stated that the Irish used to stain their milk pails with it.

**Tormentil** (*Potentilla Tormentilla*) is a small plant abounding on heaths, recognisable by the flowers having four yellow petals. The thick root-stock is very woody and extremely astringent, 1lb. equalling 7lb. of Oak bark in this respect. The root-stock also yields a red colour which has been imparted to leather and wood in Lapland, &c. It is still retained in the Pharmacopœia for its valuable astringent properties.

**Lady's Mauθ** (*Alchemilla vulgaris*) is allied to the Burnets, and, like them, is astringent. The leaves are eaten by cattle, especially where it grows in abundance in meadows, as about Buxton and other hilly regions.

**Agrimony** (*Agrimonia Eupatoria*).—Like the preceding, this is an astringent plant and much used formerly as a tonic. Gerarde (1597) even says it was called "Philanthropos" because of the great esteem in which it was held. The plant can yield a good yellow, pale or deep in colour. In the fourteenth century it was called Egrimoine (Chaucer) and used for clearing the eyes, and also with mugwort and vinegar for a "bad back" and "alle woundes."

**Salal Burnet** (*Poterium Sanguisorba*) is a common plant, with globular purplish heads and pinnate leaves, being frequent upon chalky soil. It is very nutritious, so that sheep delight in it, and was formerly cultivated. The generic name *Poterium*, "a goblet," refers to the use of putting it in a tankard; while "salad" of course implies another use. In the fourteenth century it was one of the ingredients for wounds in "save," mentioned by Chancer. This plant is also very astringent. It was called *P. hortensis*, Garden Burnet, in Gerard's time.

**Dog Rose** (*Rosa canina*).—As a conserve the hips of this Rose have been long used in pharmacy. They also formed a common dessert dish in the sixteenth century, for Gerarde says they "maketh the most pleasant meats and banqueting dishes, and tarts and such like."

**Wild Pear** (*Pyrus communis*).—This is doubtfully indigenous, and when found wild in hedges, &c., it may have been a descendant of trees grown in old Monkish gardens. It is the origin of all cultivated varieties, as several kinds were known to the Romans. The "Warden" was first grown in the grounds of Warden in Edward I.'s reign (thirteenth century), and was borne on the arms of the Cistercian Convent in Bedfordshire, where it was first planted. Similarly the Pears are in the armorial bearings of the City of Worcester, as this fruit was cultivated in that county for perry. The wood of the Pear tree being very hard has been used for the coarser kinds of wood engraving.

**Crab Apple** (*Pyrus Malus*).—Like the Pear, the wild Apple trees are often degenerated forms from cultivation. The fruit is very austere and acid.

The juice known as "verjuice" is used for bruises and sprains in the country. It is sometimes

lotion of the Latin, *Montana Fraxinus*, of the ancients. The scarlet fruit abounds in malic acid, and a small amount of prussic acid, which might prove harmful to children. Many superstitions are attached to this tree. It was a preservative against witchcraft, a twig being carried about the person in Scotland for this purpose. The berries are largely eaten by thrushes and other birds, but are austere to the taste unless made into a conserve with sugar.

GEORGE HENSLAW.

### MISCELLANEOUS.

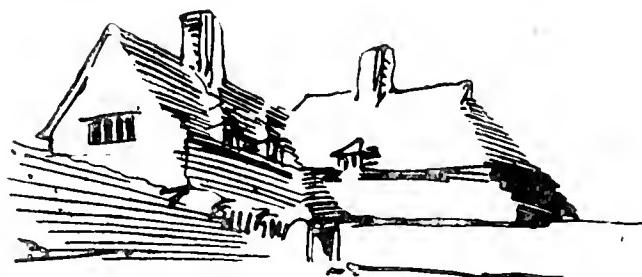

#### A WELL-DESIGNED BOTHY.

**A**S a fitting conclusion to the discussion on the bothy that appeared lately in THE GARDEN, we give an illustration of a plan of such a structure by Mr. E. L. Lutyens, such as might be built at one of the angles of a kitchen garden wall.

In the fine old vegetable gardens of 300 years ago such angle buildings were frequent. It is a treatment that gives great dignity, and that redeems the plain quadrangle from the dulness, that is its usual character. Moreover, as many small buildings are of the greatest use about a garden, their erection as a part of the main garden wall saves a great deal of other walling.

The building shown gives excellent accommodation for six men, with a roomy workshop, or for five if room No. 1 were reserved for cases of illness. The partitions between 2 and 3 and between 5 and 6 would be best not carried up to the ceiling but stopped at 7 feet high, thus giving both rooms the advantage of the ventilation given by the chimney of the one room in each pair.

Such a lodging for the young men, with the help of a good steady foreman, would be a benefit whose comfort and good influence could hardly be over-estimated; its erection would not be a matter of great expense, and owners of gardens who have the welfare of their employés at heart will it is hoped set an example.

BOTHY DESIGNED FOR CORNER OF KITCHEN GARDEN.

added to cider in Ireland to impart a roughness. All cultivated Apples are derived from this tree, and several varieties were well known to the ancients. The Pippins were so called because they were raised from seed, but grafting has been practised for ages. Professor Bailey says that the original Newtown Pippin when grafted on stocks growing in the different States of North America or in Australia soon assumes the prevailing character of the Apples in those regions respectively.

**Wild Service** (*Pyrus torminalis*).—This is a local tree occurring in woods and hedges. It bears small fruits, somewhat spotted and very acid. After a frost, however, it becomes mealy and agreeable, and is occasionally offered for sale.

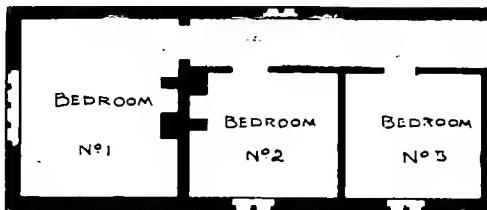

**Service** (*P. domestica*).—Really a native of South Europe, it was formerly much cultivated in this country, only a rare specimen here and there being now to be found wild, i.e., in the forest of Wyre, near Bewdley. It much resembles the Mountain Ash, but is more tomentose, and the fruit is larger and more pyriform. It appears to have been common in Gerarde's time. He figures it, observing: "It produces brownie berries, somewhat long, which are not good to be eaten vntill they have lien a while, and vntill they be soft like the Medlar; whereunto it is like in taste."

**Mountain Ash or Rowan** (*Pyrus Aucuparia*).—This resembles the last in foliage, but the fruit is different. Gerarde figures it under the names "Quicken tree," "Wilde Ashe," or "Wilde Service tree." The modern name is the trans-

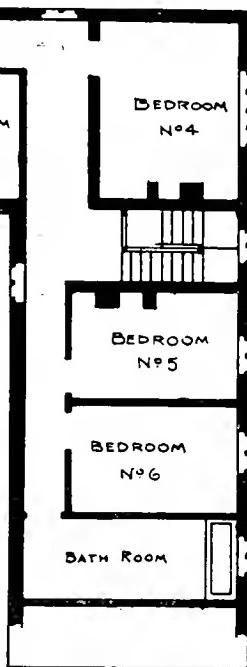

EXHIBITING CARNATIONS.

THERE seems to be very little hope that we shall see Carnations shown as grown, judging by what was seen so recently at the Drill Hall. The Carnation exhibitor holds that all his talent in growing flowers, and all that Nature does in the same direction, are insufficient. It has to be so with Roses, Chrysanthemums, Dahlias, and Sweet Peas for instance; but with Carnations the labours of the grower and of Nature when flowers are needed for competition are but half done. It is then found needful to invoke the aid of the dresser, and if that person be skilful and the flowers have in them enough stuff, then more than likely the gain in the competitions is due to his manipulation.

It seems little less than a scandal that under the auspices of the Royal Horticultural Society such things should be, but familiarity with wrong-doing breeds tolerance of the wrong. Yet did a rosarian but serve his blooms as Carnation florists do their flowers be would be expelled from his exhibition with ignominy. One of the results so bitterly complained of to me the other day at the Drill Hall was that ladies and gentlemen go there, see the manipulated blooms, their green sheaths frilled open, their weak petals extracted and their larger ones pulled out wide and flattened, think that such features are the natural ones of well-grown flowers, and are profoundly disappointed when they see

the blooms Nature, and the best of culture that can be given, produces. Is the dressing practice an honest one? Of course it is pleaded that "we all do it," which is true, but the flowers presented are very different indeed from those as grown. Is there any gain to Carnation culture resulting from this evil practice? When the Royal Horticultural Society disqualifies wiped or polished Apples, it seems inconsistent to sanction such abominations as Carnation dressing. Let us have flowers shown as grown, and on long stems. Nothing can well be more offensive to good taste than showing Carnations on paper collars, set as flat as pancakes in mathematically-made wood boxes. A. D.

PLAN OF UPPER STORY.

## GARDENING OF THE WEEK.

### INDOOR GARDEN.

#### LACHENALIAS.

**A**S the bulbs are now beginning to grow these should be shaken out. A suitable compost is one composed of three parts loam, one part leaf-mould, with plenty of sand and dried cow manure.

Place five or six bulbs in a 5-inch pot, covering them with about half an inch of the soil. Afford good drainage, as these plants require abundance of water when in active growth. Place the plants in a frame and do not give much water for some time after potting. For suspended baskets Lachenalias are invaluable. They also make fine specimens when grown in 10-inch or 12-inch pans.

#### FREESIAS.

These useful bulbs should be potted in successive batches throughout the autumn. Place five or six bulbs in a 5-inch pot, filled within 2 inches of the rim with a rich light sandy soil; then put in the bulbs and cover them about an inch deep. Place the pots in a darkened cold frame until the shoots are seen, when they should be fully exposed to the light. Freesias and Lachenalias dislike hard forcing.

#### ROMAN HYACINTHS.

These bulbs should now be potted according to requirements. Place three or four bulbs in a 5-inch pot, just covering them with soil, afterwards plunging them in cocoanut fibre out of doors. Where large quantities are forced they are better grown in boxes and potted just before coming into flower. Early Tulips should be treated somewhat similarly. It is necessary to place Narcissi deeper in the soil than is usual for the Tulip and Hyacinth. Do not press the soil too firmly in potting bulbs.

#### MIGNONETTE.

To ensure a succession of this another sowing should be made, following the method advised last month. Schizanthus should also be sown now to provide plants through the winter. For indoor decoration in spring intermediate stocks should be sown in 6-inch pots filled with a rich loamy compost, with plenty of wood ashes intermixed to keep the soil porous. Sow four or five seeds in each pot and place in a shaded cold frame. As soon as the seedlings appear thin to three plants in a pot. Plenty of light and air must be given during favourable weather. Water should be carefully applied during winter.

#### HERBACEOUS CALCEOLARIAS.

These should be examined, and any that are well rooted should be potted on, using a good rich loam with plenty of sand and dried cow manure intermixed. They should be fairly firmly potted.

Place them in a frame on a bed of ashes, amidst moist surroundings, and give plenty of air on suitable days.

Water carefully and shade from the sun. Keep a sharp look out for aphis, to which they are very liable.

J. FLEMING.

used as soon as they are ripe, and by gathering second early varieties, of which Williams' Bon Chrétien and Beurré d'Amanlis are types, at short intervals, a useful succession of ripe fruit may be kept up. These, like early Apples, must be protected.

#### CHERRIES.

Late Duke and other late varieties must be efficiently protected, that a late supply of fruit may be secured, while earlier kinds, whose crops are gathered, should have their nets removed and be thoroughly cleansed of any black aphid. The foliage should either be submerged in a powerful insecticide or be effectually dusted with tobacco powder.

#### FIGS.

As the fruits commence to ripen protect them from wasps with the aid of hexagon netting. The cold late spring has been unfavourable to Fig trees, and every inducement must now be given them to properly mature, otherwise the prospect of next year's crop will be marred. Thin out surplus growths, leaving a sufficient number of the strongest and best placed young shoots, which should be closely nailed to the wall.

T. COOMBER.

*The Hendre Gardens, Monmouth.*

## THE KITCHEN GARDEN.

### CAPSICUMS AND CHILLIES

which are in pots and being grown in cold frames should now be supported with green painted deal sticks, and where these are carrying heavy crops of fruit—as they should be at this date—give a good top-dressing of half-decayed cow manure and fibrous loam, and feed liberally with liquid manure at every alternate watering. Thoroughly syringe the foliage twice daily with tepid water to get rid of any insect pest. The above when well cultivated, as well as being useful for culinary purposes, make splendid decorative plants for autumn and winter use, in many cases rivalling the berried Solanums, especially the smaller fruited varieties.

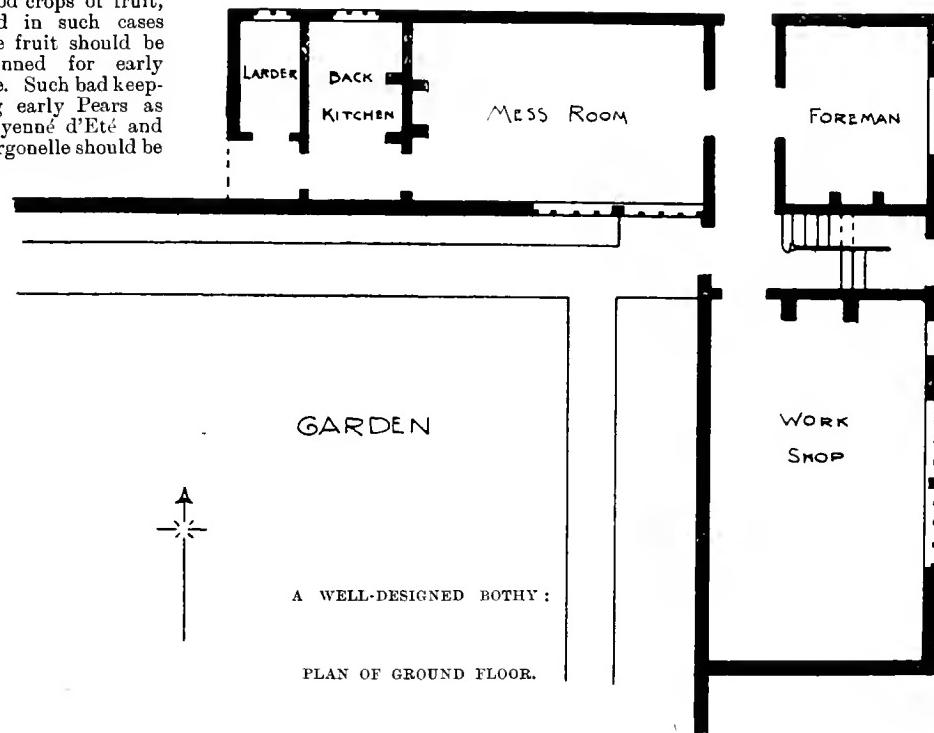

#### TOMATOES

planted in the open have made good progress during the past few weeks, and every encouragement should be given to the fruits which are set to swell away rapidly. Remove all surplus growth as fast as it is made, stop the leading shoots, and expose the fruits as much as possible to the sun and air. Give good soakings of manure water during dry weather, and any fruits which are

ing to the strength of the Vines and the means at disposal for nourishing them. Young Vines, or extending rods upon established ones, which have been stopped after making about 3 feet of growth, should have their laterals stopped at one leaf, except the leading ones, which should be secured to the wall or trellis, as the case may be. Attacks of mildew may be stopped by dusting the affected shoots with flowers of sulphur.

#### EARLY APPLES AND PEARS.

Early dessert Apples, such as Irish Peach, Beauty of Bath, &c., will require to be protected from birds, which are particularly troublesome in dry seasons. In order to have these early varieties in good condition they should be gathered when perfectly ripe and at once used, for their flavour quickly deteriorates. Lady Sudeley is a handsome early sort, but with us a shy bearer. Of early culinary kinds Lord Suffield and Lord Grosvenor are here carrying good crops of fruit, and in such cases the fruit should be thinned for early use. Such bad keeping early Pears as Doyenné d'Eté and Jargonelle should be

colouring should be cut and placed under glass to finish. Feed plants under glass which are in full bearing liberally, and guard against keeping too close and humid an atmosphere or in all probability disease will make its appearance. Pot on young plants as they require it, and maintain a sturdy growth. It is not yet too late to make another sowing for winter use, but it should be done at once. Select varieties which set freely. Winter Beauty is a capital kind and of excellent quality.

#### VEGETABLE MARROWS,

like many other things, are exceptionally late this season, except where the plants were raised early and brought on in frames, these having given good returns for some time. An excellent and prolific kind, which I have tried this year for the first time, is Sutton's Perfection, much resembling that splendid variety, Pen-y-byd, but sets its fruit more freely, and is a fine dark green. It makes a fine exhibition kind, and the quality is all one can wish for. Anyone who has not tried this should make a note of it for another season. Plants which are grown on manure heaps and rich soil will only need plenty of clean water both overhead and at the roots; but those on poor soil, which are being grown for covering unsightly corners, should be liberally fed with farmyard liquid, and watered overhead early in the afternoon.

#### GOURDS AND PUMPKINS.

Fruits on these should now be swelling, and when very large support them in some way. Those on plants on the level should be raised on boxes to ensure a high colour. Keep the plants well supplied with water, both at the roots and overhead; this is best done in the evening as the sun is leaving them.

#### HERBS.

Many kinds of these, such as Mint, Marjoram, Sage, &c., should be cut and properly dried in the sun, after which tie up in small bunches and hang up in an airy shed for winter use. Sweet Basil and Knotted Marjoram should be pulled up and treated likewise.

#### CARROTS.

Sow seed of Short Horn in cold frames, as young roots are generally more highly appreciated than larger ones, and with the aid of glass this sowing will prove very serviceable.

E. BECKETT.

## CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

## LILIES FOR ENGLISH GARDENS

[TO THE EDITOR OF "THE GARDEN."]

**S**I R.—In "Lilies for English Gardens" I was pleased to see that a strong point is made of the advantage an amateur enjoys in learning to distinguish the groups. Mr. Baker has divided the Lilies and Daffodils into; and, when mastered, how easy it is to find out if not the name of the variety or species, at least the way of having the correct name settled. Mr. Baker's divisions are so simple and so complete nothing more is left to desire, and I think will last for all times, although some think we have arrived at a point when a new monograph is needed; but I do not think so, and can only say to the advocates for a new monograph that they have not mastered the existing one. A certain writer abuses Haworth's monograph, but Mr. Baker takes a very different view of Haworth's work. Indeed, his only difference was in the names given to the three grand divisions, based on measurement. Mr. Baker has the greatest respect for the work of Haworth.

Mr. Elwes claims that *L. Kramerii* is the typical *L. japonicum*, being the first to have this name according to the St. Petersburg Herbarium. The next on the list is *L. Brownii*, and the third *L. odorum*. *L. Henryi*, Mr. Leichtlin and I agree, is

simply a geographical variety of *L. tigrinum*. I challenged the man who put this Lily into commerce for passing it on as a form of *L. speciosum*, and he replied it was a good selling description.

*Lilium Harrisii*, *Wilsoni*, and *eximium* I never could make out any difference between. The name *Harrisii* we know all about; the name *Wilsoni* must have been a misapprehension. The name *eximium* is of very old standing, and was lost till reintroduced from Japan. *Harrisii* is the best selling name. *L. robustum*, *grandiflorum*, and *Takesima* are three names for the same plant. *L. Takesima* is the oldest name, and *L. robustum* is the best selling name. I challenged the author of "Robustum" name, and he gave me the same answer as he did in the case of *L. Henryi*. *L. Harrisii* found its way to Bermuda as far as I can discover about the same time it did to Cape Town, and that might be from England from the early consignments from Japan. In the early days all Japanese Lilies went to London, and from thence to the Continent and America. In the very early days they went to Holland, to Siebold's garden, and from thence were distributed. The advantage Bermuda enjoys over Japan is that the bulbs mature earliest and are amenable to early forcing—just as Roman Hyacinths from Toulon—and are nearer to the British and American markets. The two centres do not clash. The Japanese thought they could cut out Bermuda, but at a terrible sacrifice, losing millions of bulbs in the effort. From shipping their produce early Bermuda gets first into the market, and so long as they can do so will hold the market for Christmas flowers, and Japan for the Easter market. The finest English *L. candidum* I ever saw were growing close to the wall of Stamford Church.

When in Japan I pointed out the finest form of *L. longiflorum* to cultivate, and was told it could be made to produce fifteen flowers, and as there was a good deal of mixture I recommended the name *L. longiflorum multiflorum*, and as the bulb was distinct from the other seven forms a start was made to select this one, and as they could distinguish it by the bulb at once they commenced the first season with 70,000. From this year's Japanese catalogues I see it is offered at the same price as the mixed lot. There were other forms I recommended that might please amateurs, but the decision was made. We shall throw all away except *L. longiflorum multiflorum* (*eximium*) and *L. longiflorum giganteum* (*grandiflorum*, *robustum*, and *Takesima*). If you keep to *multiflorum* and *giganteum* you will have the two best forms of *L. longiflorum*, and the trade would do well to adopt the names, get rid of all others, and so avoid confusion. I have been thus particular as there is sure to be confusion in names. Wallace in "Thompson's Gardeners' Assistant" adopts *grandiflorum*, my sons adopt *robustum*, and in Japan I see the name is *giganteum*.

*L. Kramerii* I found growing in Pine woods at Osaka, the bulbs amongst the Pine needles and the roots in the soil, the moist atmosphere and the shade of the woods being sufficient for the bulb. Professor Thomson when he returned from his voyage told me he found it in valleys much shaded. I next saw it in a temple garden in very robust health; the bed was raised, the soil was poor, and protected from the sun's rays by large overhanging trees on a high bank. The stem was almost black and the green of the leaves showed the most robust health. From the description I got of the place where *L. rubellum* grew on the foothills of Fasi-Yami, and seeing it growing under a deciduous shrub in Yokohama and flowering well I came to the conclusion that the two species needed the same treatment, and were more likely to suffer from humus in the soil than without it, and that perfect drainage such as might be got close up to the stem of deciduous trees and a dry poor stony soil would ensure success. Hence for pot culture I recommended a stony sandy soil with perfect drainage, and I see from THE GARDEN that a Mr. Fitzgerald (I think that is the name) took the hint and was successful. *L. Kramerii* at the temple and *L. rubellum* under the bush suggested the mode of culture to attain success and preserve the bulbs. *L. tigrinum Fortunei* was sent home by Fortune

when in Japan. I think he must have found it in some garden where it was cultivated as a vegetable, as I could not find it amongst the wild plants I saw, and possibly this was a selected one having superior claims. The one I saw wild answered to an old form, and the bulbs to be bought at the auction mart in London I have always found to be *Fortunei*. This variety I found was sold by the Japanese under the name *splendens* till I pointed it out as *Fortunei*, and in a Japanese catalogue I see the name is dropped out, and only *L. tigrinum* is offered in 1902, showing that not being sure they go on the safe side. *L. tigrinum splendens* (*leopoldianum*) was noticed by Mr. Leichtlin amongst a lot of Japanese freshly imported Lilies. The bulb was got and a stock grown, which was handed over to Van Houtte, so I take it we may consider it an accidental variety, as I could not find any knowledge of it in Japan. In "Lilies for English Gardens," China is given as its home, and most likely the old one we have in our gardens may have come from China, as it bears the name *L. t. sinensis*, but our two fine ones, *Fortunei* and *splendens*, are Japanese.

*L. auratum* I did not find growing either in Rice fields or near Rice fields. One field I found on the top of a hill overlooking Yokohama, and a second lot growing on flat ground some distance across the bay. The soil in both cases was loam. *L. longiflorum* is grown about Yokohama in the fields where Rice is grown. The difference in the case of this Lily is that the water is drained off, and in the case of Rice it is drained on to the land. In the early days of its exportation to Europe it was collected from the hills around Yokohama; now there are very few there. I have seen some, but not enough for collectors, who go further afield each year to get stock, which they size and plant. Some are ready the following year, and others not till the third year. *L. auratum* varieties are all selected from the type and not grown apart. *L. auratum platyphyllum* is not a garden variety, but found on an island off the coast of Idru; in fact none of the *L. auratum* are garden varieties; in other words, not raised in gardens, but collected as wild plants. In the neighbourhood of Tokio I saw a large quarter of *L. platyphyllum*. In no single instance did I see *L. auratum* cultivated otherwise than in the open without protection of any kind. From my experience of Lilies under trees, except in the case of *L. Kramerii* and *L. rubellum*, I failed to get saleable bulbs, and I dare say the Japanese know this. Amongst trees I have found *L. auratum* wild, but the plant was weak, lanky, and the bulb small, so I take it any shade beyond open glades cannot be good for Lilies as a whole. Trees as shelter may be good, but even this was not resorted to in Japan.

*Lilium speciosum* is wild on the mainland of Japan and on an island off the southern coast, but our supply is from cultivated stocks, collecting not being resorted to. *L. Kratzeri* is a white variety of *roseum*, and its proper name is *L. speciosum roseum album*. *Album novum* is a white variety of *L. punctatum*, and its name is *L. speciosum punctatum album*.

*L. croceum* and *L. bulbiferum* are wild plants. *L. umbellatum* is, I think, between *L. bulbiferum* and the Siberian form of *dauuricum* spectabile of Sweet's "English Flower Garden." It is not known where they originated, that is, *umbellatum*. Mr. Krelage said they came from England; in that case they must have been produced by Mr. Groom, of Clapham. Whether he raised all I cannot say, but he did raise some, and at the time there was a bit of a sensation, as he said he had been robbed of some of them. My study led me to put them under the species *L. dauuricum*, and I see my sons continue to do so.

*L. dauuricum* I found growing wild, deep in wet sand, on the northern island of Japan, when on my way to Yezo. It was a robust plant, and differed from *L. d. spectabile*. This Lily the Japanese I see now offer, I mean the one that grows on their island, not spectabile.

*L. Batemannii* has long been known in Europe under the name *L. venustum*. Some Japanese bulbs of this Lily came into Dr. Wallace's hands, and being more robust the first year (which is

always the case with imported bulbs) than *venustum*, he named it *Batemanniae*. Mrs. Bateman once asked me why her name was attached to the flower, and I told her it was *L. venustum*. The trade and amateur have nothing to complain of, as it made the bulb sell better under the new name than the old one.

Major Clarke said he had settled the parentage of *L. testaceum* by crossing *L. candidum* and *L. chalcedonicum*. I do not think *L. pomponianum* could have given the sturdy growth *L. testaceum* possesses.

My experience is unfavourable to *L. longiflorum* surviving our winters, not that the frost would kill the bulb, but in a mild season it—like *L. candidum*—commences throwing out leaves from the roots soon after flowering, and these get destroyed by our frost and the bulb suffers. The Dutch keep the roots out of the ground until late, and thus stop growth until spring. It is therefore not wise to depend on the bulb beyond the first year if left in the ground, and they are cheap enough to buy annually. I was glad to see in "Lilies for English Gardens" that the smaller-growing Lilies are recommended for rockwork, and at the bottom of the rockwork the bog-loving Lilies would do grandly, also the small growing Daffodils, *triandrus*, *juncifolius*, *Tennior*, *gracilis*, and *Corbularia tenuifolia*, also the large Spanish *Corbularia* and *cyclaminens*. On a hot rockwork in full sun *Corbularia alba*, and the different species from Spain and Eastern France which get burnt up in summer would do. We do not know the home of *Corbularia conspicua*, so are not sure whether it will take to water. The large Spanish yellow is annually under water, and you may see only the flower floating on the surface.

Cape Town, South Africa.

PETER BARR.

## SOCIETIES.

### COMMONS AND FOOTPATHS PRESERVATION SOCIETY.

#### THE ENCLOSURE OF STONEHENGE.

AT a meeting of the general committee, held at 25, Victoria Street, Westminster, an important communication, addressed by the Right Hon. G. J. Shaw-Lefevre to the Wiltshire County Council on behalf of the society with reference to the enclosure of Stonehenge, was approved. After pointing out that the recent enquiry held by a committee of three members of the County Council was not a judicial proceeding, Mr. Shaw-Lefevre stated:—

"The society, with a very large experience of cases affecting the rights of the public to roadways and footways, fortified by the advice of their solicitor and of an eminent King's Counsel of the Western Circuit, have arrived at a conviction that the Judges of the Supreme Court would hold that the public have a right to the use of the roads which lead to the monument, and which have been blocked by the fence as now erected."

"The society therefore cannot but hope that the Wiltshire County Council, without itself undertaking to decide the question at issue, will be of opinion that this is a case which ought to be submitted to the Courts of Law for a decision."

"The society would suggest that the County Council of Wiltshire, if unwilling itself through its own legal advisers to undertake legal proceedings in vindication of the rights of the public, should at least undertake to guarantee the costs of such proceedings on the part of the society to the extent of £600, for which the society will undertake that the case shall be adequately and fully presented in a Court of Law."

The Wiltshire County Council met on Tuesday last, when the communication from the society, together with a report from the roads and bridges committee of the County Council, was considered.

Mr. Edward North Buxton stated that the scheme for the purchase of the extensive open space at Lamourne and Grange Hill, Essex, was proceeding satisfactorily. Up to the present he had received promises amounting to about £5,000 from private contributors, while various local authorities in Essex had agreed to provide £13,000 altogether. Mr. Buxton announced that he had been able to secure the offer of an additional area of twelve acres of land at Grange Hill, adjoining the London County Council Asylum at Claybury, while the trustees of Earl Cowley had promised to dispose of their interests in the two Woodford Bridge Greens,  $\frac{4}{5}$  acres in extent, for £150, provided the whole scheme is carried out. The total area now embraced by the proposed open space will amount to no less than  $8\frac{1}{2}$  acres, offered to the public for the sum of £32,000. A hope was expressed by the society that the Corporation of the City of London would eventually make a grant of £10,000 towards the sum of £14,000 still needed to complete the purchase, on the understanding that the 800 acres of common and farm land at Lamourne are placed under the control of the City. It is also hoped that the London County Council will contribute to the purchase of the Grange Hill portion of the scheme, and that further subscriptions will be forthcoming from members of the public in order that the most com-

prehensive proposal for the extension of Metropolitan open spaces which has been before the public for upwards of twenty years may be carried out in its entirety.

#### BASINGSTOKE.

IN Golding's Park a very good exhibition was held by the Basingstoke Horticultural Society on the 4th inst. Plants were not numerous, but they were good in quality. Special prizes were offered for a group of miscellaneous plants arranged for effect. Mr. G. Best, gardener to F. R. Leyland, Esq., The Vine, Basingstoke, won the premier award by a very narrow margin, so good was the exhibit from Mr. C. Harvey, gardener to W. W. Portal, Esq., Sonnington. Mr. J. Wasley, gardener to J. B. Taylor, Esq., Sherfield Manor, Basingstoke, won the leading place for nine specimen stove or greenhouse plants with large, healthy Palms, Ixoras, and a handsome mass of *Lilium lancifolium* album. Mr. W. Hunt, gardener to J. Moss, Esq., Fern Hill, Blackwater, had the best *Gloxinias* and zonal *Geraniums*. Ferns, Fuchsias, and Coleus were all well shown.

Cot flowers were numerous and good. For twenty-four Roses, Mr. W. Neville, gardener to F. W. Flight, Esq., Twyford, was easily first with an even set of medium-sized fresh blooms; second, Mr. Wasley. For twelve ditto, Mr. Neville was first, closely followed by Mr. Hunt. Carnations were well shown by Mr. Neville, who secured the leading award with a dozen large, shapely blossoms.

Much encouragement is given here to hardy herbaceous cut flowers. In addition to the prizes offered by the society, Messrs. B. Ladham, Limited, Shirley, Southampton, offer prizes for a collection to occupy a certain space. The result was a fine display. In the latter class, and for twelve varieties, Mr. Hunt won easily, staging huge bunches of good things. Mr. Wasley was second in one class, and Mr. J. Tamplin, gardener to W. R. Mitchell, Esq., occupied a similar position in the other class.

Sweet Peas were feature. For six bunches, distinct, eleven competed, the best coming from Mr. S. Clifton, Winchester; Mr. Tamplin was a good second. A remarkably fine lot of zonal *Geraniums* in twelve trusses was staged by Mr. Hunt, who secured the leading award quite easily.

Several classes were set apart for ladies' exhibits. The tent in which they were arranged was made quite bright and interesting owing to the number and quality of the exhibits. For the best decorated table for six persons there were four entries. Miss Wadmore, Brook House, Basingstoke, secured the leading award with an arrangement possessing brightness and harmony of colouring. Miss Gosling, Basingstoke, was second.

Fruit was not numerous, but of good quality, Mr. W. Hunt winning for a collection of six varieties; Mr. Bowerman, gardener to Lord Bolton, Hackwood Park, Basingstoke, second. Mr. Hunt won the first place with Muscat Hamburg in the class for Muscats; Mr. Tamplin first for Black Hamburg; and for two bunches of any other black Mr. Wasley had Madresfield Court in superb condition.

Vegetables were numerous and good. Mr. Kneller, gardener to Sir Wyndham Portal, Malshanger Park, Basingstoke, won Messrs. Sutton's prize for six varieties with superb Onions, Potatoes, Tomatoes, and Peas; second, Mr. Bowerman. The latter won the society's prize for eight kinds, while Mr. Best did likewise in Messrs. Webb's class.

The trade was well represented by non-competitive exhibits, which added to the attractions of the show. Messrs. B. Ladham, Limited, Shirley, Southampton, had fine bunches of meritorious hardy cut flowers, such as the various forms of *Gaillardia*, *Coreopsis lanceolata* *Eldorado*, *Eryngiums*, &c.; Messrs. Wadmore had flowers, plants, and vegetables; and Mr. W. Breadmore, Winchester, Sweet Peas in quantity.

#### MIDLAND CARNATION AND PICOTEE SOCIETY.

THE exhibition of this society was held in the Edgbaston (Birmingham) Botanic Gardens on the 7th and 8th inst. The dates had been wisely altered from July 30 and 31, owing to the lateness of the season. Many of the classes were very keenly contested, and excellent blooms were shown. Unfortunately, the weather was bad, rain falling heavily the first day. At the luncheon given to the judges and others testimony was paid to the great help the society had received from Mr. Robert Sydenham during the years he had acted as honorary secretary. Mr. Sydenham remarked that much of the work had been done by his secretary, Mr. Herbert Smith. Mr. W. H. Parton, who now takes up the secretaryship, said he hoped all the good things said of Mr. Sydenham might some day be also worthily said of him.

#### SINGLE BLOOMS.

Twelve self Carnations: First, Mr. S. Gibbs, gardener to Robert Sydenham, Esq., Birmingham, with splendid blooms of Sapho, Queen of Scots, Exile, The Naiad, Boreas, &c.; second, Mr. H. G. Rudd, gardener to R. C. Cartwright, Esq., King's Norton, with flowers but little inferior; third, Mr. C. F. Thurstan, Penn Fields, Wolverhampton. There were numerous other entries.

Six self Carnations: First, Mr. A. W. Jones, Stechford, showing well Hildegard, Britannia, Lady Hermione, Much the Miller, &c.; second, the Rev. C. A. Gottwaltz, Hadsor, Droitwich; third, Mr. W. H. Parton, Yardley.

Twelve yellow ground Picotees: First, Messrs. Thomson and Co., the Nurseries, Sparkhill, with excellent blooms, Lady St. Oswald and Lady Bristol being the best; second, Mr. R. G. Rudd, with fairly good flowers; third, Messrs. Artindale and Son, Ranmoor, Sheffield.

Six yellow ground Picotees: First, Mr. A. W. Jones, Stechford, who showed moderately well; second, Messrs. Blackmore and Langdon; third, Mr. C. F. Thurstan.

Twelve fancy Carnations: First, Mr. R. G. Rudd, with some excellent blooms, notably of Voltaire, Argosy, and Hidalgo; second, Messrs. Thomson and Co., Sparkhill, with very pretty blooms; third, Mr. W. H. Parton, King's Heath, with good flowers also. There were numerous other entries in this class, which was, perhaps, the best in the show.

Six fancy Carnations: First, Mr. A. W. Jones, Stechford, with excellent flowers of Eldorado, Aglaia, Argosy, &c.; second, Mr. J. F. Smith, Sparkhill, with rather smaller blooms; third, Mr. C. F. Thurstan, Penn Fields, Wolverhampton, with good blooms.

Twelve white ground Picotees: First, Messrs. Thomson and Co., Sparkhill, who showed well Amy Robsart, Brunette, Mrs. Sharp, and others; Mr. A. R. Brown, Handsworth, was a good second; third, Messrs. W. Pemberton and Son, Walsall.

Six white ground Picotees: First, Mr. F. W. Goodfellow, Walsall, with good blooms, notably of Lavinia and Brunette; second, Mr. J. Keen, Southampton, with very good Amy Robsart, Mrs. Payne, and Little Phil; third, Mr. D. Walker, Kay Park, Kilmarnock.

Twelve flake or bizarre Carnations: First, Messrs. Thomson and Co., Sparkhill, showing splendid flowers; second, Messrs. W. Pemberton; third, Mr. S. Gibbs. This class brought out some excellent blooms.

Six flake or bizarre Carnations: First, Mr. D. Walker, Kilmarnock; second, Mr. F. W. Goodfellow, Walsall; third, Mr. J. Keen, Southampton.

#### AMATEUR CLASSES.

Six white ground Carnations or Picotees: First, Mr. C. J. White, Walsall, with pretty flowers; second, Mr. J. Williams, Smethwick, who also showed well; third, Mr. J. W. Smart, Moseley.

Six selfs, fancies, or yellow grounds: Mr. J. Williams, Smethwick, was first with excellent blooms of Lady Walsh, Hidalgo, Enchantress, &c.; second, Mr. W. Moore Binns, Mayfield, Worcester; third, Mr. C. J. White.

Six selfs, flowers undressed: First, Mr. T. Newton, King's Heath; second, Mr. J. Williams; third, Mr. W. Moore Binns.

#### BORDER FLOWERS.

Twelve selfs: First, Mr. R. G. Rudd, who had good blooms, but some dissatisfaction was expressed because the blooms were apparently dressed; second, Mr. W. H. Parton, King's Heath; third, Mr. S. Gibbs. There were four remaining prizes.

Six selfs, dissimilar: First, Mr. A. Chatwin, Edgbaston, who showed well; second, Mr. W. H. Twist, Yardley; third, Mr. E. Sergeusson, Formby, Liverpool, all exhibiting good blooms.

Twelve fancies or yellow grounds: First, Messrs. Artindale and Son, Ranmoor, Sheffield, with a good exhibit; second, Mr. R. G. Rudd; third, Mr. A. W. Jones, Stechford, both showing well.

Six fancies or yellow grounds: First, Mr. A. Chatwin, Edgbaston, with very good flowers; Mr. W. H. Twist, Yardley, a good second; third, Mr. C. F. Thurstan, Penn Fields, Wolverhampton.

#### BLOOMS STAGED IN THREES.

Twelve distinct selfs, yellow ground Picotees or fancies: First, Mr. W. H. Parton, King's Norton, who showed fine flowers, especially of Voltaire, Hesperia, and Golden Eagle; second, Mr. R. G. Rudd, King's Norton, with good blooms; third, Messrs. Artindale and Son. There were other good exhibits in this class.

Six self yellow ground Picotees or fancies: First, Mr. A. W. Jones, Stechford, who had beautiful blooms of Guinevere, Eldorado, Voltaire, and May Queen; second, Messrs. Blackmore and Langdon, Tiverton Nursery, Bath, who had very good Richness, Master F. Wall, &c.; third, Mr. A. Chatwin, Edgbaston.

One vase of white, blush, or pale pink self: First, Mr. J. F. Smith, Sparkhill, with the variety Mr. Eric Hambr; second, Mr. W. H. Twist, Yardley.

One vase of rose, salmon, or scarlet: First, Messrs. Artindale and Son, Sheffield, with the variety Mrs. A. Gilbert; second, Mr. A. R. Brown, Handsworth; third, Mr. Herbert Smith, King's Heath.

One vase of yellow, buff, or terra-cotta: First, Messrs. Artindale and Son, with the variety Pandelli Ralli; second, Mr. W. B. Latham; third, Messrs. Thomson and Co., Sparkhill.

One vase of any dark self Carnation: First, Mr. A. R. Brown, Handsworth, who showed the variety Comet; second, Messrs. Thomson and Co.; third, Mr. W. H. Twist, Yardley.

One vase of yellow ground Picotees: First, Messrs. Thomson and Co., with Mohican; second, Mr. A. R. Brown; third, Messrs. Artindale and Son.

One vase of yellow ground fancy Carnations: First, Mr. R. G. Rudd, with Eldorado; second, Mr. A. R. Brown; third, Messrs. Blackmore and Langdon, Bath.

#### SINGLE BLOOMS.—CARNATIONS.

Scarlet bizarres: First, Messrs. Pemberton and Sons; second, Messrs. Thomson and Co.; third, Mr. H. Boys.

Crimson bizarres: First, Messrs. Thomson and Co.; second and third, Mr. D. Walker.

Pink and purple bizarres: First, Messrs. Thomson and Co.; second and third, Messrs. Pemberton and Son.

Scarlet flakes: First, Mr. C. J. White; second, Mr. D. Walker; third, Messrs. Thomson and Co.

Rose flakes: First, Messrs. Thomson and Co.; second, Mr. G. F. Goodfellow; third, Messrs. Pemberton and Son.

Purple flakes: First and second, Messrs. Pemberton and Son; third, Messrs. Thomson and Co.

Picotees and fancies.—The principal prize-winners in the classes for single blooms of these were Messrs. C. F. Thurstan, C. F. Goodfellow, Thomson and Co., W. H. Twinst, Pemberton and Son, and R. G. Rudd.

#### SINGLE BLOOMS.—SELFs.

Messrs. W. H. Parton, A. W. Jones, Blackmore and Langdon, A. R. Brown, W. M. Biuns, J. H. D. May, Thomson and Co., G. Chaundy, and S. Gibbs were the chief prize-winners in these classes.

#### SWEET PEAS.

Twelve distinct varieties, prizes offered by Mr. Robert Sydenham, Tenby Street, Birmingham.—First prize, Mr.

F. J. Clark, Wistow Gardens, Leicester, with a beautiful display of *Coccinea*, Lady Grisel Hamilton, Navy Blue, Miss Willmott, &c.; Mr. V. B. Johnston, Tettenhall, Staffordshire, with good flowers and distinct varieties, was second; third, the Rev. F. Beincombe, Penylan Parsonage, Ruabon.

Floral arrangement of Sweet Peas.—First, Mrs. Simpson, Shipston-on-Stour, with good sprays loosely arranged; second, Mr. Herbert Hookham, Selly Hill, who used rose and white flowers; third, Mrs. A. L. Muston, Selly Park, with purple varieties.

Show Bouquet.—Messrs. Artindale were first with an arrangement of Malmais in Carnations; Messrs. Pope and Sons, King's Norton, second, with a prettier display; Mr. W. B. Latham, third, with a bouquet composed of dark red Carnations and Asparagus.

Spray of Carnations or Picotees.—First, Mr. A. M. Wilson, Spilsby, with a yellow variety; second, Mr. S. Gibbs, who used rose-coloured blooms; third, Mr. W. B. Latham.

#### NON-COMPETITIVE EXHIBITS.

Mr. S. Mortimer, Rowledge, Farnham, Surrey, displayed a beautiful lot of Cactus and double Dahlias for so early in the season. The blooms, especially several new seedlings, were of most attractive colours. John Burn, crimson; and Mrs. Horace J. Wright, cream, with vermilion centre, were remarkably good.

Messrs. Dicksons, Limited, Chester, showed hardy flowers in considerable variety. Notably fine were the Scabious, Gladioli, Heliotrope, Carnations, and Phloxes.

Mr. J. H. White, Worcester, showed a very attractive display of hardy flowers, in which we remarked several Eryngiums, Veratrum nigrum, Tigridias, about twenty-five varieties of Phlox, the white Agapanthus, Cactus Dahlias, and Water Lilies.

Messrs. Simpson and Sons, Birmingham, exhibited a collection of Sweet Peas in many beautiful sorts.

Tuberous Begonias were splendidly shown by Messrs. B. F. Davis and Sons, Yeovil. The blooms were remarkable for their fine colouring, good form, and immense size.

Messrs. Phillips and Taylor, Bracknell, Berks, showed Nymphaeas, Carnations, &c.

Messrs. Hewitt and Co., Solihull and Birmingham, exhibited an excellent display of hardy flowers in considerable variety, in which were especially noticed Liliacium, Coreopsis, Phlox, Statice, Eustoma, and Canterbury Bells.

Mr. William Sydenham, Tamworth, showed cut Roses nicely arranged in glasses and an excellent lot of Viola blanda in many rich and beautiful shades of colour.

Mr. Amos Perry, Winchmore Hill, London, N., exhibited a very attractive group of hardy flowers, the chief features of which consisted of a beautiful selection of Nymphaeas, no less than thirty sorts of these being shown. A new one worth noting is *N. Laydekeri* rosea proliifera, said to be the most free flowering of all. Other good things shown were Gladioli, Achillea graeca, Gaillardias, Tamarix ramosissima hispida, &c.

#### MEDALS.

Messrs. Thomson and Co., Birmingham, were awarded the champion medal, as they obtained the largest number of points in the large and single bloom classes.

Mr. David Walker, Kilmarnock, won a similar medal in the small and single bloom classes.

The silver medal offered to the most successful exhibitor in the single bloom classes was also won by Messrs. Thomson and Co.

#### AWARDS.

First-class certificates were given to:

*Metamorphosis*, rose flake, raised and exhibited by Messrs. Thomson and Co., Birmingham.

*Miss F. Sims*, a very dark crimson self, raised and exhibited by Messrs. Thomson and Co.

*John Pope*, a bright rose self, raised and exhibited by Rev. C. A. Gottwaltz, of Hadzor, near Droitwich.

#### PREMIER BLOOMS.

Dressed: Flake, Mrs. May, exhibited by Mr. David Walker; bizarre, R. Houlgrave, from Messrs. Pemberton and Son; heavy edge white ground Picotee, Brunette, from Mr. C. F. Thurstan; light edge ditto, Pride of Leyton, from Messrs. Thomson and Co.; heavy edge yellow ground Picotee, Gertrude, from Messrs. Thomson and Co.; light edge ditto, Childe Harold, from Messrs. Thomson and Co.; self, Miss F. Sims, from Messrs. Thomson and Co.; fancy, Eldorado, from Mr. A. W. Jones.

Undressed: Self, Hildegard, from Mr. S. Gibbs; fancy, Voltaire, from Mr. R. G. Rudd; yellow ground Picotee, Childe Harold, from Messrs. Artindale and Son.

## ANSWERS TO CORRESPONDENTS.

### RULES FOR CORRESPONDENTS.

**Questions and Answers.**—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

**Names of plants.**—J. F. A.—1, Campanula garganica; 2, C. rhomboidalis; 3, C. glomerata var. alba; 4, Eustoma sp.; 5, Sedum Alizoon variegatum; 6, Sedum album; 7, Alyssum incanum; 8, Veronica spicata; 9, Specimen insufficient for determination; 10, Asplenium Filix femina var.; 11, Asplenium Filix femina var.; 12, Sedum oppositi-

folium.—W. A. Watts.—Wild Chicory (*Cichorium Intybus*).—*Rosehill*.—The variety with the ruby-coloured foliage is known as *Rosa ferruginea* or *rufibfolia*, and the coral-coloured Tea Rose is *Corallina*.—W. D. F.—*Fagus sylvatica* var. *heterophylla* (the Cut-leaved Beech). *Polygonum cuspidatum*.—Arthur Swift.—The leaves you sent were, unfortunately, quite black and unrecognisable. In all cases good flowering examples are necessary for accurate naming.—C. Prentiss.—The *Callicepsis* (*Coreopsis*) is probably *C. bicolor nigra* or *C. b. purpurea*. There are several of these dark forms in general cultivation, and all come true from seeds, or nearly so.

**Oak tree decaying** (A. L. S.).—The Oak tree should be cut back in the winter when devoid of foliage, as if done now it would result in a considerable loss of sap. The cut should be sufficiently sloping to prevent any water setting thereon and thus causing decay. A coating of Stockholm tar will serve to protect from the weather and assist the wound to heal.

**Buds of Romneya Coulteri withering before opening** (J. A.).—This is a very common occurrence in *Romneya Coulteri*. It is usually the result of a check of some description, insufficient water, a very cold spell after hot weather, insect attacks, &c. From the leaves the plant appears to be perfectly healthy, and in this case the injury is probably due to the cold. You might give the plant a surface dressing of well rotted manure and decayed leaves.

#### Exhibiting hardy flowers (HAWICK AMATEUR).

Your question is a little vague, because whilst you use the term "hardy plants," your query as to vases leads to the inference that you mean hardy flowers in bunches set up in vases. We cannot tell you where you can obtain such vases as you need for the purpose, but you should enquire of some local dealer in glass or earthenware. Failing those, try some seedsmen or dealer in horticultural sundries. On a table 5 feet by 3 feet, from twenty-five to thirty bunches of flowers, not too large, and not crowded, but each one well displayed, should suffice; the taller behind, the dwarf in front, if the table is placed so as to have one front only. No foliage or dressing should be used other than the foliage of each variety. Of course you would show purely hardy things, such as will stand an ordinary winter out of doors. You might, no doubt, lay some foliage of a hardy kind about on the table between the vases.

**July-sown Carrots** (OXFORD).—It is a fact that Carrots raised from a sowing made now rarely if ever suffer from the Carrion fly or maggot. That is a special reason why a summer sowing should be made. Where ground has been well moved in digging early Potatoes it is only needful to level it, then to draw shallow drills 10 inches apart, and sow the seed fairly thin, as it is not held needful to thin out these winter Carrots later. Growth soon follows, and it continues up to the end of December at least. The advantage of having even but a small breadth of perhaps half a rod in area of these young Carrots to pull from during the winter is that they are so tender and pleasant to eat, far more so indeed than are the large Carrots which have been lifted and stored for the winter. Should very hard frosts ensue a portion of the bed may be covered up for the time with litter or Ferns. The Carrots should be pulled clean in the rows. The best varieties to sow now are the early winter or scarlet Champion.

**Rhododendron questions** (H. D. R.)—1, "Trees and Shrubs for British Gardens," a book which will soon be published; 2, October; 3, Anthony Waterer; 4, Leave them alone and they will bloom in time; 5, a, b, c, d, Impossible to answer these exactly without being in a nursery at blooming time. Miss Jekyll's own knowledge we think was about exhausted in what was written in "Wood and Garden," page 68 and onward. (a) *Album elegans* or *Album grandiflorum*, neither exactly white but lilac-white, extremely harmonious with *ponticum*; (b) Michael Waterer, John Waterer (crimson), Kate Waterer, James Bateman (rose), Mme. Carvalho, Sapho (white); (c) *Atrosanguineum*, Alexander Adie (scarlet or blood colour), Baron Schroder (flame colour)—the only other good deep colour we know is nigrescens, which is too early—perhaps Old Port would do for the second, and the only true pink we know is Bianchi, only grown by Maurice Young, Milford Nurseries, Godalming; (d) *everestianum* (light purple). No other purples we know go so well with this as selections made at blooming time of lighter and darker shades in the nursery. 6, Any of these colourings grouped as described would do equally badly against a brick wall, where whites only should be used.

**Peaches failing** (J. R. K.).—The cause of the failure in Dr. Hogg was evidently the early attack by aphides. Had this been prevented by timely attention in destroying the aphides, Dr. Hogg would have succeeded as well as Noblesse, as the variety is a good grower. Aphides often remain in embryo on the bark of the trees during winter, getting active at the same time as the growth, which they insidiously attack before their presence is suspected. In a case like this the tree should be washed over carefully a few weeks before growth begins in spring, with soft soap and water in the proportion of a wine-glassful to a gallon of water, when the larvae will be destroyed. At pruning time (the end of January) we should cut those affected shoots back to half their length, when we have no doubt that as many growths will spring from the base of the shoot as will be wanted for furnishing terminal and side shoots the following season, nothing can be done now. In the case of the Noblesse cut back as you suggest all lateral growth from the current year's shoots.

**Shading greenhouse** (CELIA).—Various causes operate to render the shading of greenhouses necessary in hot weather, the primary one being the excessive heat generated in glass houses, let even as much ventilation be given, when the sun plays upon the glass roof in full force. Then the inside temperature is often forced up many degrees above normal temperature, making it far too hot for the plants, and causing the soil in the pots rapidly to dry. It is at such times that shading of some description is useful as tempering the heat to suit the plants' requirements. Best of all is a thin roller blind of canvas or tiffany, because

that can be lowered or raised as may be needed. The best fixed shading is made of new milk and common washing blue, just to give the milk a pleasing tint. That should be painted on the glass, but it has to remain in all sorts of weather until the winter frost gets off. Shading should be used only in strong sunshine.

**Araucaria excelsa** (OSMUNDA).—This is a native of Norfolk Island off the coast of Australia, and like all plants from that region it needs the protection of a greenhouse, though it may be stood out of doors during the summer months. Care must be taken to remove it under glass before the autumn frosts appear, and it should not be placed outside in the spring till ordinary bedding plants can be safely trusted in the open ground. We fear that your Maple is past recovery; the reason of this we cannot say, as the removal to slightly cooler structure ought not to have affected it. Old stunted plants are, however, sometimes liable to go off without any apparent cause. As your plant is not quite dead you might keep it a little longer to see if it recovers, but, as stated above, we fear there is not much hope.

**Fairy Rings on lawns** (ENQUIRER).—Occasional dressings of a mixture of basic slag, sulphate of potash, and nitrate of soda applied to those so-called fairy rings on a lawn usually helps to their removal. Failing these particular manures, which can be obtained from any merchant, use a good guano mixture, applying at once 3lb. per rod, and again a month later. Top-dress the whole of the ring area. These rings are caused by a fungus, the roots or mycelium of which spread outwards into fresh soil yearly, and they render it poor. But the mycelium of the previous year dying or decaying becomes for the time a manure on which the grass feeds, and causes the strong green growth called Fairy Rings. The application of manure dressings as advised causes the soil to become alike rich, and good results follow. Probably the reason why Clover seed sown on a lawn comes up only in patches is because the seed fails to find soil enough properly to cover it. Where seed is so sown the lawn should have a liberal soil dressing.

**Rose American Beauty** (H. L. BROWN).—The correct name of the variety known in the United States under the above name is Mme. Ferdinand Jamain. It was raised by a French grower named Ledechaux, and introduced in 1875. The Americans claimed that the Rose originated in the garden of the Hon. George Bancroft at Baltimore, but it has long been recognised that the two Roses are identical. Although without a doubt the variety is of French origin, our American friends should be given the credit for the manner in which they have developed it. The astounding growth it will make in that country when grown upon its own roots and planted on benches under glass is simply marvellous, but we doubt whether the variety could be so grown here owing to our almost sunless winter season compared to that on the other side of the Atlantic. That Mme. Ferdinand Jamain is a Hybrid Tea seems perfectly evident from its very perpetual flowering habit and also judging from the wood and foliage. The deep rose colour is a shade not much admired in England, but under forced conditions and in midwinter even Roses of this colour appear beautiful, and there is this to be said in its favour, the Rose is deliciously fragrant.

**Moles in herbaceous border** (WORRIED).—It is very difficult to know what to advise in this case, as the soil being so light the moles can take a fresh turn at the least obstruction or the approach of danger. Cannot you trace them from the superficial runs down to the more permanent runs on the sand or gravel subsoil? It is quite useless we know by experience trying to get the upper hand by dealing only with the surface runs, but if by diligent search you find access to one of the main arteries or tunnels you may either trap them there or endeavour to oust them by burning sulphur in the low runs, and nothing is more penetrating than this. Have you no knowledge of their headquarters, or is there no hedge near by in whose bottom these things make their home? We have been most successful with the trap—which we always handle with gloved hands—by fixing upon a spot where of necessity the moles have to cross a path or roadway. In such case the runs are deep but not numerous, and many may be taken at a single point. Failing this we would certainly try to force the fumes of sulphur into their runs, and if necessary from two or more points simultaneously.

#### QUESTION.

"Peter's Wreath."—Can anyone tell me the botanical name of the shrub called in America "Peter's Wreath"?—M. P. FORSTER.

#### CORONATION AND THE CHILDREN.

THOUSANDS of poor East London children were not able to participate in the Coronation celebration. We are proposing therefore to give a Coronation Day in the country to as many as possible. For every £50 we can take out 1,000 poor children at the rate of one shilling per head. Will your readers kindly help us to brighten these young lives by giving them a day of gladness which will linger in their memory in years to come as the Coronation celebration of their Gracious King? Every gift, great or small, will be promptly acknowledged on behalf of our East London committee by (Rev.) JOHN W. ATKINSON, Claremont, Cawley Road, London, E.

**Visit to Messrs. Cannell and Sons.**—Sir J. Liege Hulett, Speaker of the Legislative Assembly of Natal, and Lady Hulett paid a lengthy visit to Messrs. H. Cannell and Sons' Swanley Nursery last Monday, and were much interested with what they saw. They propose having a day's visit to the firm's Eynsford Nursery later on, and making an exhaustive examination before leaving for South Africa.

No. 1605.—VOL. LXII.]

[AUGUST 23, 1902]

## MUSINGS ON PLANT NAMES.

**W**E print an article from Mr. Arthur Goodwin upon an interesting and important subject :

"Readers of THE GARDEN were no doubt amused at the enquiry made in Parliament recently as to whether the First Commissioner of Works would issue instructions that the practice of labelling flowers, shrubs, and trees in Latin in Kew Gardens shall be discontinued and English substituted. Perhaps no more foolish question could be conceived, yet at the time I noticed that a certain section of the daily Press, with that ineptitude born of ignorance, pronounced in favour of the suggestion, while a provincial journal, slightly more irresponsible than the rest, denounced what it described as 'botanical pedantry.' Most of us can picture to ourselves the able director of our lovely national garden smiling to himself at such narrow-minded pettifogging cackle. Nevertheless, Sir W. T. Thiselton - Dyer has to a certain extent responded to popular clamour, as may be seen by referring to the new 'Hand List of Herbaceous Plants.' This recently-published list consists of 1,235 pages, and is more than double the size of the old one, part of this increase in size being accounted for by the inclusion of English names 'where they exist.' This last proviso is of course important. One can hardly expect the Kew authorities to take upon themselves the responsibility of inventing popular names for plants of recent introduction. For my own part I fail to see the use of English names in cases where two plants, belonging not only to a different order but to a distinct species, have identically the same name applied to them.

"As an instance, in the 'Kew Hand List' *Astilbe rivularis* and *Spirea Aruncus* are both termed 'Goat's Beard,' yet as garden plants they are quite distinct, although both enjoy the same position, while from a botanical point of view the *Astilbe* belongs to the natural order *Saxifragaceæ* and the *Spirea* to the *Rosaceæ*. Canon Ellacombe, in his charming book, entitled 'In My Vicarage Garden and Elsewhere,' devotes a chapter to 'Plant Names,' which is most helpful and full of interest. I cannot do better than quote the following passage : 'During the last few years attempts have been made largely to increase the number of English names for exotic plants, and even to insist that none but English names should be used by English botanists. I have no wish to enter into the discussion of this vexed question ; I will only say that I think the attempt is both unwise and mischievous, and if adopted by other nations would lead to a woeful confusion, and, instead of knowing our plants by the one accepted scientific name, which would be good in every civilised nation,

we should have to learn the different names adopted in each separate country.'

Turning to the subject of hardy plant nomenclature, there still exist many puzzles which, unaided, we amateurs can hardly expect to solve. True, we owe considerable thanks to THE GARDEN for giving us a helping hand by means of such instructive articles as M. Correvon's, but there are still many families of hardy plants which would stand the searchlight of investigation thrown upon them. Take for instance what I must call for want of a better term the Sunflower family. By this I mean *Helianthus*, *Heliopsis*, *Helianthella*, and *Wyethia*. Even in many of our best gardens these Sunflowers appear to be misunderstood, and this can hardly be wondered at considering the appalling tangle of synonyms which seems to overshadow them. Last autumn I had the pleasure of seeing a large collection of these plants which had been gathered from many sources—but in this case a considerable number of them proved to be identical, although their labels would have led one to believe otherwise. In fact, Sunflower names seem to have been coined in a most reckless manner, and the "Kew Hand List" deals with twenty-two synonyms under the heading of *Helianthus*! Here, then, Mr. Editor, is a suggestion for a subject which might well be included in THE GARDEN, and one which I venture to say would, if adopted, prove of interest and value to your large circle of readers.

I feel bound to say that I appreciate a visit to a garden where plants and trees are correctly yet inconspicuously named, although I am well aware that in many good gardens labels are strictly vetoed. I cannot close without relating a rather amusing story which lately reached me afloat this subject. A certain proprietor residing in a well-known Midland town, where horticulture has many devotees, purchased a charming and picturesque estate in an adjacent suburb. One of the chief attractions of the place was a fine collection of well-grown trees and shrubs, and it occurred to their owner to have them all labelled after true botanic garden fashion for the edification of his friends and frail humanity generally. Accordingly, his own knowledge of botany being nil, an expert was called in and a list drawn up of the labels which would be required. Their preparation was entrusted to a house painter, who at least did his best. On a deep black background the names stood out in white of such prodigious size that the most astute advertising contractor would have been satisfied. The day arrived which saw the work completed, and the labels were duly affixed to their appointed positions. One tree only escaped, this being a magnificent Lime tree. However, it was soon espied by the lord of the manor, who thereupon himself hunted up its botanical name in a dictionary, and forwarded it to the decorator to be inscribed like the rest. This was accomplished and the label placed in position. Strange to

say no one seems to have noticed anything wrong with it until one day a botanist of some repute came to see the place and was shown round by its owner. Judge of the visitor's astonishment when, asked to admire a stately Lime tree, he read upon its trunk the following inscription : "Citrus communis."

## THE WALL GARDEN IN AUGUST.

It is only during recent years that wall gardening (*i.e.*, the covering of walls with ornamental plants) has received proper attention. Wall gardens as well as rock gardens generally look brightest in spring or early summer, but the plants given in the following notes are now in flower at Exeter, so that the wall garden in August need not be much less interesting than in the spring if suitable plants are used.

Where the top of a retaining wall can be covered with soil to the depth of 9 inches or more a surprising number of good showy plants can be grown there with excellent effect. *Linaria dalmatica*, which is still in bloom, is a suitable plant for this purpose, its yellow and orange flowers stand out boldly, and the plant will often shed its seeds and spring up in other places. Equally suitable are many *Dianthus*; of those still in bloom may be named *Dianthus rupestris nanus*, with white deeply fringed flowers; *D. versicolor*, deep crimson flowers, with darker centre; and *D. integer*, with white fringed flowers. There are many other suitable kinds, but most of these would now be out of bloom. Another most suitable plant is *Corydalis ochroleuca*, which has creamy white flowers, which now are fully open, while its relative, the yellow *Fumitory* (*Corydalis lutea*), has passed out of bloom more than a month ago. Attractive, too, is *Erigeron mucronatus*, or, as it is sometimes called, *Vittadenia triloba*, whose Daisy-like flowers are produced in great profusion, and which, if planted on the top of a wall, will quickly spread downwards, covering the wall with a veil of pretty flowers. A fine contrast is formed with this plant and Iceland Poppies in orange or yellow colours, which as a rule will last till August, and sometimes self-sown plants will flower much later. Other good plants which like a sunny position are the bright yellow *Achillea tomentosa* and the purple *Statice elata* and *Pyrethrum Zadaskyi*, which has large flowers of a pale pink colour and grows about 10 inches high. *Arenaria montana* and other species are now out of bloom, but *Arenaria grandiflora* with its white flowers is still quite fresh.

### PLANTS SUITABLE FOR CREVICES OF A WALL.

An excellent plant for the above-named purpose is *Linaria anticaria*; its flowers are white, tipped with blackish maroon, and very striking. It grows about 10 inches to 12 inches high, and is supposed to be only biennial, but I have known plants to occupy the same spot for several years in succession ; it easily sows itself. Other suitable *Linarias* which do not object to the narrowest chink or fissure are the well-known *Linaria Cymbalaria* and the somewhat larger *L. pallida*. Thymes are mostly out of bloom, but the purplish blue *Thymus lanceolatus* and the somewhat paler *T. micans* are still at their best. Here and there,

too, *Thymus Serpyllum* has not quite passed out of bloom. Very suitable as wall plants also are the various kinds of *Mesembryanthemums*. In Cornwall *Mesembryanthemum edule* covers walls and banks rapidly. Unfortunately, it is not hardy except in sheltered positions near the sea. A much more hardy and reliable plant which is just now in full bloom is *M. uncinatum*, which has tough but slender, curiously jointed stems, and bears a profusion of pretty pink flowers. The dwarf alpine Thistle *Carlina acaulis* makes an excellent wall plant, and is only just opening its large whitish blooms, which are quite 4 inches or 5 inches across. Very slender and graceful but yet very hardy is *Tunica Saxifraga*, with its pendent flowers of a delicate blush white or pale pink. The blue *Campanula pomila* makes a good companion to the latter, and in most places has not yet finished blooming. In walls whose interior is filled with good soil *Campanula isophylla* and *C. isophylla alba* would do well in a warm sheltered situation, but perhaps the best of all wall plants for this month are the *Sedums*. Of this useful race of very hardy plants quite a number are now in full bloom, including the yellow *Sedum bridgeanum*, the pale pink *S. corsicum*, which with its red stems and thick fleshy leaves is particularly striking, the deep yellow *S. kamtschaticum* and its variegated variety, the pale pink *S. populifolium*, and the somewhat tall deep yellow *S. middeniorianum*, the bright crimson *S. sibiricum*, and the curiously formed yellow-flowering "Coxcomb" *Sedum* (*S. monstrosum*).

#### WORK IN THE WALL GARDEN.

During this month there is plenty of important work to be done in the wall garden. Now is a good time to divide plants which have finished blooming and to prick them off into crevices of the wall with a view of having them established before winter sets in. Seeds, too, of such varieties as are easily propagated by seeds may now be sown direct into the crevices. To do this successfully it will in most cases be necessary to insert into the crevices small wedge-shaped pieces of stone, driving them in with a mallet or hammer so as to form a foundation for soil in which to sow or plant. After sowing more soil and more wedge-shaped stones may be rammed into the crevices. Probably some of the seed so sown will not germinate till the spring. Plants in pots should not be planted into the wall garden till next month.

*Exeter.*

F. W. MEYER.

#### EDITOR'S TABLE.

##### BULBS OF NARCISSUS EMPEROR.

Messrs. J. R. Pearson and Sons, Chilwell Nurseries, Lowdham, Notts, send us a few bulbs of this grand Daffodil, as they say "Just to show you what our Lowdham soil can do." The bulbs received certainly are unusually fine ones, the largest one weighed half a pound. With such home-grown specimens as these before one, one has no reason to feel uncertain as to the bulb-producing capacity of British soil! They were splendid.

##### LILIUMS FROM COLCHESTER.

Messrs. Wallace and Co., Kilnfield Gardens, Colchester, have sent us specimens of two very interesting Lilies, the one *L. Alexandra* and the other *L. bakerianum*. The flowers of *L. Alexandra* are large, white, and sweetly scented, those of the Burmese *L. bakerianum* are smaller, cup-shaped, and heavily marked with dark crimson on the lower half of the petals. Some of the white star-shaped blooms of the Mexican *Milla biflora* were also sent.

##### SINGLE-FLOWERED TUBEROUS BEGONIAS.

Messrs. Storrie and Storrie, Dundee, write: "We have pleasure in forwarding you a box of sample blooms from our strain of giant single Begonias. These are cut from seedlings selected during the past few years, and are representative, while the colour range is very comprehensive, embracing many shades of white, pink, rose,

crimson, scarlet, salmon, and yellow. This strain, which is the result of six or seven years' careful selection, is remarkable for the robust, giant habit and erect growth of the plants."

[The flowers which accompanied Messrs. Storrie's notes were of excellent form, large, and of beautiful colouring.]

#### NOTES OF THE WEEK.

##### FORTHCOMING EVENTS.

August 26.—Harpenden Horticultural Show.

August 27.—Bath Floral Fête.

August 28.—Sandy Horticultural Show; Stirling Horticultural Exhibition.

August 29.—Bradford Horticultural Show (two days).

September 2.—National Dahlia Society's Show and Royal Horticultural Society's Meeting, Drill Hall, Westminster.

September 3.—Glasgow and Preston Shows (each two days), and York Florists' Exhibition.

September 4.—Paisley Horticultural Show (two days).

September 6.—Thornton Heath Dahlia Show.

September 10.—Royal Caledonian Horticultural Show at Edinburgh (two days).

September 16.—Dahlia Show, Royal Aquarium (three days).

September 18.—Great Fruit Show, Crystal Palace (three days).

**The Scarlet Lychnis.**—This noble herbaceous plant is a much finer thing in our Scottish gardens than it generally is in the south.

In suitable soil the stalks reach a height of about 6 feet, the double sort producing broad and deep trusses of its glowing flowers, which last in beauty for a long time. Though the plant is common it appears to have its likes and dislikes. For example, it must have room to grow and not be crowded by other plants, and on that account it does not prove suitable for borders planted rather for effect than for the beauty of the plants individually. It is generally propagated by division, but stock can be much more rapidly increased if some of the flowering stems are selected previous to the flowering stage being reached, and these cut into short pieces with eyes strike root readily in a cold frame. Rockets and many other plants may be propagated in the same manner. Though there are many varieties, single white, flesh colour, and red, and there used to be a double white form, none of these are of any value when compared with the double scarlet. The single, it may be noted, is readily increased by means of seeds. Few of our exotic flowers possess so many names as this. Among the oldest are The Nonsuch, Flower of

Bristow, and Flower of Constantinople. "Bridget in her Bravery," not so long ago in use in the south of England, has a flavour of bygone days. We also find it as Scarlet Cross and Knight's Cross, and Evelyn seems to refer to it under the name of "Chaledons." Among Scotch gardeners of an older generation it was invariably called Scarlet Lightness, and if I am not mistaken the more painstaking were accustomed to stake out each stem individually. It, moreover, has the honour of being the flower Parkinson holds in his hand in his portrait in the *Paradisus*.—R. B.

**Lobelia tenuior.**—For several recurring summers this Lobelia has formed a very notable feature in No. 4 greenhouse at Kew, and when its great beauty is taken into consideration one is surprised that it is not met with in most gardens. True, the charm (to many) of novelty cannot be claimed for it, for it was introduced from the Swan River district of Australia about the year 1838. It only needs to be taken in hand by one of our large market cultivators, such as Mr. Sweet of Whetstone, to have its merits appreciated everywhere, as the rich cobalt blue flowers, nearly an inch across, supply a colour that is but little represented among cultivated plants. This Lobelia reaches a height of a foot or more, and like its better known and popular relative, *Lobelia speciosa*, it will continue to flower throughout the summer months. There is a certain variability in colour among seedlings of *L. tenuior*, and doubtless with extended cultivation distinct varieties would arise.—H. P.

**Hardy Azaleas.**—In answer to your correspondent "Tuscan," page 57, the hardy

CEANOTHUS MARIE SIMON. (See page 131.)

Azalea known as the Old Yellow is the typical Azalea pontica, known now as Rhododendron flavum, a native of the Black Sea region, and was introduced into this country in 1793. The other old varieties such as Messrs. Osborn used to grow are now almost ousted from cultivation by the larger-flowered class, in the production of which Azalea sinensis or mollis has played a part, and consequently they are but little grown in nurseries and very difficult to obtain.—H. P.

**Asclepias curassavica.**—The genus Asclepias is an extensive one, containing as it does many hardy as well as tender kinds. The showiest and most popular of the hardy species is A. tuberosa, whose umbels of orange-scarlet flowers form a notable summer feature in the garden. Occupying a similar position (viz., the best) among the tender kinds is that at the head of this note—A. curassavica, a native of tropical America, from whence it was introduced as long ago as 1692. In most works it is referred to as a warm house or stove plant, but just now some plants of it, plunged in the turf out of doors at Kew, are particularly attractive, for they are freely bearing their umbels of orange-scarlet flowers, which thus exposed to the sunshine are of more vivid a tint than in a shaded structure. This Asclepias is a quick growing sub-shrub, whose upright shoots are clothed with Willow-like leaves. It succeeds best if kept fairly dry in the winter in the warmest part of the greenhouse, and cut back to good strong eyes before starting into growth in the spring. It is very easily raised from cuttings. The seeds of this are provided with a silky wing, by means of which they float considerable distances, hence in many parts of the tropics it is regarded as a troublesome weed.—T.

**The Royal Horticultural Society.**—A meeting of the fruit and vegetable committee was held at Chiswick on the 14th inst. to examine the earlier maturing of the Potatoes grown for trial this season. Present: Mr. A. Dean, in the chair, and Messrs. J. Smith, J. Willard, W. Bates, G. Wythes, H. Markham, G. Reynolds, S. Mortimer, H. J. Wright, W. Pope, and G. Woodward, thus constituting a quorum. The Potatoes had in many cases suffered from late frosts, materially checking their growth, whilst some late strong growers had spread tops some 4 feet in width. All these late ones were left for examination several weeks later. Of the large number lifted some ten were ordered for cooking, two being older varieties of esteemed merit whereabouts to test quality. Ultimately, after being cooked—work that is admirably done at Chiswick—it was agreed to give awards of merit to New Century (Dickson, of Chester), a short top, first early Kidney, a great cropper, and of high excellence; and to Northumbria (Wythes), a handsome even white round, raised by crossing Syon House Prolific with Sutton's Seedling. It is a capital cropper. Four very fine croppers—Alderman (Sharp), Crampton (Brydon), Earl Roberts (Bradley), and New Seedling Round—were found yet immature, and will be tested again later. It was resolved to ask the council, in addition to the customary Pea, Potato, or other trials, not necessarily large ones, to have thoroughly representative trials of climbing and dwarf Kidney Beans and Vegetable Marrows next year. It was also desired that a limitation should be put on the number of varieties sent by any one person or firm, as only the very best strains are desired. Some other products suggested for trial were unsuited for the very porous and readily exhausted soil of Chiswick. The Tomatoes are usually seen at this time, but they, in common with so many things, are late this season.

**Three flower beds.**—I describe three flower beds of small size filled with cheap and easily procured plants flowering from the time they are bedded out until they are pulled up in November. The first consists of light mauve Heliotropes and Gazania splendens. The orange and mauve flowers look well together, and bloom at and for the same length of time. Both plants grow best in a sunny spot. The second flower bed is filled with the heart-shaped leaved single white Campanula (perennial) and blue Lobelia.

These plants flower rather late in June and sometimes not until July, but they keep in flower until there is a frost if the dead flowers are picked off the Campanula. The third flower bed is composed of single white Petunias, rosy scarlet Geraniums, and dwarf Nasturtiums, either scarlet or rose-coloured, to harmonise with the Geraniums. These last plants, with the addition of three Marguerite plants in the background as a support for the Petunias, make an effective show in a window box. Some of the Petunia stems remain upright and some fall with the Nasturtiums in festoons over the edge of the box.—WINIFRED SPURLING.

**Bulbs for the Royal parks.**—Messrs. W. Cutbush and Son, nurserymen, Highgate, N., have received the following letter from His Majesty's Office of Works: "I am directed by the First Commissioner of His Majesty's Works, &c., to accept your tender of the 21st ult., for the supply of bulbs for bedding purposes in the coming season to the Royal parks and gardens in the charge of this department.—(Signed) W. J. TOWNER."

**Improvement of flower exhibitions.**—No one will, I think, gainsay the suggestions put forth in the leading article in THE GARDEN of the 9th inst. as to the improvements that might be effected in our flower shows. Among other matters there is a great tendency to stage the plants too high, hence it is impossible to see them to the best advantage. We may, however, see a change in this respect, for Messrs. Wallace's collection at the Holland House Rose show was grouped on the grass and attracted a good deal of attention, owing to its departure from the usual lines. Another and a very important matter which is particularly noticeable each year at the Temple show is the overcrowding of plants of especial interest by numbers of common subjects, so that one is apt to overlook the choicest gems. Just after the Temple show this year Mr. Elwes raised a protest against this in the *Gardeners' Chronicle*, and suggested a space be put aside for choice and interesting subjects, so that while the real plant lovers would be attracted there, those of the public fond of a showy display would find plenty to interest them elsewhere.—H. P.

**Outdoor Tomatoes.**—Although just the same careful treatment, attention, and culture has been bestowed on Tomato plants this year outdoors that was given in some preceding years, there is at present a very poor prospect of a crop of fruit being obtained. All the culture in the world cannot do for these warmth-loving plants what the sun can do, and whilst culture has been freely provided the sun's rays have been specially lacking. What is to be done? That is a question that myriads of Tomato growers are asking, and specially so are those who have put out thousands of plants in the ordinary way, and are even yet spending much time and labour in tying, pinching, and otherwise attending to them. Certainly it will be useless to allow the plants to set more than two or three trusses of fruit, pinching out the tops and any other trusses that may form. That seems to be all. Those who have but a few plants put out, and amateurs especially, may try to lift some and get them into pots, then into a greenhouse early in September to help them to ripen their fruits.—A. D.

**Figs at Chiswick.**—It is doubtful whether the Royal Horticultural Society has a more valuable horticultural asset than is the remarkably fine collection of Figs growing there in pots under glass, and which is probably the finest and most complete in the kingdom. Mr. S. T. Wright mentioned the other day that he had some eighty varieties. It will be a matter of surprise to many to learn that there is so large a number presumably distinct in commerce. The plants have become so large through the excellent culture and liberal feeding bestowed that, although all roots are much restricted necessarily in pots, they have entirely overflowed the large span house for some years given over to them, and now fill also one of the large lean-to's at the back of the flower garden leading to the old council chamber, and very soon yet another house must be utilised, as in the span house the plants

are far too crowded. This is just one of the things, perhaps a minor one, yet far from being a trivial one, which shows so forcibly the need there is for a new and larger garden and plenty of first-class glass houses, such as a Royal Horticultural Society might be proud to possess. It is interesting to learn that Figs as dessert fruits are very popular amongst the Fellows and are in great demand. That fact shows that there is a good opening for first-class Fig culture on the Chiswick lines if conducted for profit. It may be said that a great horticultural garden should be utilised for other purposes than in growing Figs or other fruits for the Fellows. But it should be remembered that to exhibit the highest examples of fruit culture and testing all the best kinds and varieties could not be conducted without producing fruit, and when it is so produced it is satisfactory to find that it has a ready market provided without trouble. Those who want a limited collection of the best varieties—for fruits differ greatly as to flavour and sweetness—should study the report on them in the society's journal, or write to the Chiswick superintendent for a select list, which will be readily supplied to Fellows.—A. D.

**The American Chrysanthemum exhibition.**—The date of the above exhibition, to be held under the joint auspices of the Chrysanthemum Society of America and the Horticultural Society of Chicago, at the Art Institute, Chicago, was first set for November 4 to November 8, but has now been changed to November 11 to November 15 inclusive. This is the first exhibition attempted by the national society, and the arrangements made for it by the local society are most satisfactory. The main exhibition hall is 60 feet wide by 220 feet long and 30 feet high, with an annexe 40 feet by 80 feet. The conference hall—a beautiful and commodious chamber—in the same building can be secured for meetings and discussions as may be found necessary. More delightful and appropriate surroundings for the great Chrysanthemum renaissance of America could hardly be imagined, and the building is located in the very best section of the city for the accommodation of visitors of every class and from every direction. The preliminary list of premiums has been out for some time, and copies of the same may be had by addressing Mr. Edwin Lonsdale, secretary, Chestnut Hill, Philadelphia, Pa., or Mr. E. A. Kanst, assistant secretary, 5700 Cottage-Grove Avenue, Chicago.

**The Royal Horticultural Society's committees at play.**—A report as to the prospects of the proposed friendly match at cricket between the fruit and floral committees was made to the members of the former committee, from whom the challenge emanated, at the meeting at Chiswick on the 14th inst. It is most pleasant to learn that Leopold de Rothschild, Esq., has kindly consented to allow the match to be played in Gunnersbury Park, the date being September 3 (Wednesday), the day after the first Drill Hall meeting of that month. Mr. G. Woodward will, in the unavoidable absence of Mr. W. Ponpart, captain the fruit committee team, and it is hoped that the floral team will, as with the other team, consist of recognised members of the floral committee solely. All arrangements as to lunch, tea, &c., were left in the hands of Messrs. S. T. Wright, J. Hudson, and G. Reynolds. Wickets to be pitched at 11.30 sharp.

**Mr. George Nicholson.**—Some time since it was decided by some of Mr. Nicholson's friends and colleagues to offer him, privately, on the occasion of his retirement from the Curatorship of the Royal Gardens, Kew, some tangible evidence of the high regard in which he is held. A committee consisting of Mr. W. Marshall (treasurer), Mr. F. W. Burbidge, and Dr. Maxwell Masters was formed to carry out the proposal. Numbers of contributors, rather than large amounts, were solicited. The result has been very satisfactory, and Mr. Nicholson has selected various articles, the daily use of which will remind him of his old friends. The salver bears this inscription: "Presented to George Nicholson, V.M.H., late Curator of the Royal Gardens, Kew, by his friends and colleagues, who, while admiring his

qualifications as a man of science and a gardener, have a warm appreciation of his worth as a friend. 1902."

**Tuberous-rooted Begonias at Totteridge Park.**—Tuberous-rooted Begonias are so rarely met with in superb condition, except in the collections of trade growers and specialists, that to meet with plants bearing large handsome blooms is a fact worth recording. Double-flowered tuberous-rooted Begonias are well grown at Totteridge Park, and this season Mr. J. Brooks, the gardener there, has excelled to a remarkable degree. One long lean-to house is principally devoted to these plants, and on the occasion of our visit, a day or two since, excellent specimen plants were carrying flowers of high quality. Contrary to the usual rule in most establishments, the plants here are in 5-inch and 6-inch pots, and there is no doubt whatever that they appreciate these less roomy pots for their fleshy roots. The colours of the flowers were very varied—crimson, red, pink, rose-pink, salmon, yellow, primrose, and white flowers were abundant, and there were, besides, many intermediate shades. The plants were branching, yet compact, and, contrary to what one generally expects when handling them, the large heavy blossoms showed no disposition to drop from their fleshy flower-stalks. In the collection are a few good seedlings, of which the raiser is justly proud.—D. B. C.

**Lilium giganteum failing.**—The editorial answer to "British Columbia" on this subject in THE GARDEN for August 9, more particularly the last half, deserves attention, for during the dormant season large bulbs of *Lilium giganteum* are often brought under one's notice, with the assurance that they will bear a fine spike of bloom. I have been tempted to try them several times, but the result is always the same, viz., a spike about 3 feet high, with two or three flowers partially developed, while the other buds drop without opening. They were grown in pots and intended for indoor decoration. On the other hand, some grown from suckers, potted on when necessary, and with good healthy roots flowered grandly, though they were given exactly the same treatment. I am fully convinced that these large fine-looking bulbs, without any roots and yet containing the flower spike in embryo, cannot be depended upon, however treated, to give satisfaction.—H. P.

**The Phlox as a lawn plant.**—During the spring and early summer we have such a wealth and abundance of bloom with our Rhododendrons, Azaleas, and other early flowering trees and shrubs that the most ardent lover of colour effect on our lawns cannot help but be satisfied. During the summer and autumn, however, a dearth of colour in this direction has generally been regretfully endured under the impression that the inevitable must be accepted. That this is not so was convincingly brought to my notice a few days ago on visiting the beautiful gardens of Mr. Harry J. Veitch at East Burnham Park, where a great number of early spring flowering trees and shrubs has been planted of late years. In the beds (especially those of Rhododendrons and Azaleas) many summer and autumn-flowering things have been planted, securing an uninterrupted succession of beautiful effects well into the autumn. The dominant feature now is the Phlox, planted in masses of self colours, chiefly brilliant crimson. Whether the season has specially suited the Phlox, or unusual care and attention have been given to its culture, the effect produced by these well-flowered plants was certainly very striking.—O. T.

**Olearia macrodonta** seems quite hardy here, having passed through the last two winters without any protection. *Olearia Haastii* is now a huge bush, having stood six winters. It is as yet only in bud.—M. P. FORSTER, Penrith.

**Carnation Alice Ayres.**—In Park Lane a few days ago I took occasion to notice the summer bedding arrangements in this famous part of Hyde Park Gardens and was disappointed at not finding them of the usual excellence, the adverse condition of the weather during the summer being no doubt responsible for the absence of free growth and floriferousness of the plants.

Among the most notable and useful of the plants employed was a Carnation bearing the above name. This is of strong and excellent growth, and as free flowering as a Pink; the colour is white, flaked with pink. The groundwork of the bed was planted with blue and mauve Violas, producing a novel and decidedly pleasing effect.—O.

#### **Violas Nellie Riding and Seagull.**

—Those in search of really good bedding Violas should not fail to obtain the varieties *Nellie Riding* (yellow) and *Seagull* (white). In colour *Seagull* is the purest white I know. The bloom is of good size and substance, and the plant is practically perpetual blooming. With me it has been a mass of flower since the end of April, and is likely to continue so to the end of the summer. *Nellie Riding* is one of the richest yellows we have. The flower is large and practically rayless, and as regards growth and constitution is equally as good as *Seagull*.—VIOLA.

#### **Sciadopitys verticillata.**

—This beautiful Japanese conifer, so oddly termed the "Umbrella Pine," is doing so well at Coombe Wood that it is a matter for surprise it should so seldom be seen doing well when planted in gardens. In the nursery it seems to thrive as though it were a common conifer, and the specimens which are transplanted every two years at least are literally green as grass. On enquiry as to the cause of failure in gardens I was told that it was largely due to the selection of sites that are too dry, whereas the plants seem to like a cool moist base, with some peat and a little quite short manure. That the Umbrella Pine in specimens of moderate dimensions is unusually handsome there can be no doubt.—A. D.

**Buddleia variabilis.**—A strong growing form or rather forms from China of this well known shrub, for, as the title implies, there are several varieties, has very robust wood growth, large lanceolate leafage, and carries at the points of the shoots long purplish or heliotrope-coloured inflorescences. The plants flower through August, hence have merit in that respect. They would do admirably planted in the semi-wild garden as they need ample room.

**Eucryphia pinnatifolia.**—This is one of the most beautiful of autumn or late-flowering shrub trees, for the Eucryphia partakes of both. The great specimen just now in beautiful bloom at the Coombe Wood Nursery is an object worth going a long distance to see. We have nothing like it amongst deciduous things blooming so finely at this time of the year. This specimen is some 15 feet in height and 8 feet through, has small Berberis-like leafage, and is covered with single cup-shaped flowers, something like those of St. John's Wort, in colour pure white. Half a century ago this plant, had it been known, would have been grown under glass.—A. D.

#### **Astilbe chinensis var. Davidi.**

—It was indeed a joy to see this superb new hardy plant at the last Drill Hall meeting, but it was a far greater pleasure to see it in the bright light of the open day as growing in the nursery at Coombe Wood, where I saw a small colony of it a few days since. Of several forms of *chinensis* this is by far the best; indeed, it is entitled to rank as the finest hardy herbaceous plant that has been introduced to Britain for many years. With us the variety has special merit, because it blooms after most of the other *Astilbes* are over. When in full strength its noble red inflorescence, most beautifully suffused with blue, reaches to a height of 6 feet; it should be a grand plant to intermix with the white-flowered *Nicotiana sylvestris*. The inflorescence is spiral and on strong stems, ranging from 16 inches to 20 inches in length.

Judging from the nature of the soil at Coombe Wood, it looks as if the new plant, like the Meadow Sweet, appreciated ample root moisture.—A. D.

### **TREATMENT OF GROUND BENEATH TREES.**

How frequently in gardens is the ground beneath the shade of trees an eyesore, even

where, with this exception, are fulfilled all the conditions of a well-ordered and well-cultivated garden. In some instances this may no doubt rightly be attributed to ignorance as to which plants will flourish in such a disadvantageous position, but more often we think the cause may be traced to a disinclination on the part of those responsible for the ordering of the garden to concern themselves in the matter. It is curious (the fact may be observed in many places) how assiduously and persistently some will labour in one certain part of the garden, sparing no pains whatever in its beautifying and maintenance, whilst another quarter, that under the shade of trees for instance, will practically remain unattended to, chiefly it may be supposed for the reason that no brilliant effects of colour can be there produced by means of flowering plants. This, however, is a poor excuse to offer for leaving in a bare and neglected condition a position that might at least be suitably and pleasingly covered with plants and shrubs of a variety and beauty of foliage by no means to be despised even in a more conspicuous and more favourable part of the garden.

Everyone knows how in almost every garden it is not difficult to find, under the spread of the branches of some lawn tree, ground that is absolutely without covering. The satisfactory clothing of this ground with suitable greenery may in some instances present a little difficulty, but we know from experience, and anyone may learn who will journey to the Royal Gardens, Kew, for there are several excellent object-lessons *apropos*, that such difficulties are not at all insurmountable. The ground beneath an old Yew tree will perhaps prove as difficult of successful treatment as any, for roots innumerable are near to the surface and make the ground extremely poor. Even the Yew, however, is not invincible in this respect, and when one has said this others individually need hardly be mentioned.

To say nothing of the improved appearance of the ground itself, the mass of greenery such as is furnished by some of the plants we shall mention is, in summer and winter alike, certain to be appreciated; in summer as a pleasing and restful relief from the flowers of many brilliant hues, in winter as a refreshing change from the monotony of bare and apparently unfilled beds and borders. Some little preparation is necessary in order that disappointment may not result. The surface soil should be dug over with a spade or fork, as circumstances permit, that is to say, as the roots of the overshadowing tree are many or few, deep down or near the surface, and the soil should be enriched also. This slight help, with careful and good planting, a suitable selection of plants, and timely periodical watering, should, and indeed will, quickly and completely transform what is more often than not an eyesore into at least a pleasing verdure.

Both major and minor Periwinkles are quite at home in hungry shaded ground; *Euonymus radicans variegatus*, a charming trailing plant, is equally so, and Ivy is of course entitled to rank with either. Others that one might mention are *Berberis Aquifolium*, *Aucubas*, *St. John's Wort*, *Gaultheria Shallon*, *Butcher's Broom*, *Snowberry*, *Cotoneaster microphylla*, and *Box*. Without pretending to give a complete list of plants suitable for present consideration, the right use of those mentioned will at least enable all who are so minded to remove what too frequently is altogether an unbeautiful spot, and at the same time to effect a permanent improvement.

A. P. H.

## THE FLOWER GARDEN.

## MIXED SWEET PEA SEED.

**W**E have never before had cause to grumble at the unsatisfactory distribution of Sweet Pea seeds, and as the present season is remarkable for carelessness in this respect there is good reason why notice should be taken of it. Last spring we, like many others, purchased from a well-known seed merchant some forty varieties, and in so far as the germination of the seed is concerned the results were entirely satisfactory. As a matter of fact the results were better than usual. We always raise our plants in pots, and after a process of hardening off they are planted out in April. All went well until the flowering season came round. One of the first clumps of plants to come into flower was the new Miss Willmott, certainly one of the finest of the salmon-pink kinds in cultivation. To our dismay of the three plants in this small clump one gave flowers somewhat similar to Emily Eckford; this from a new sort seems hard to believe, yet there it was and is still, and there is no denying it. A little farther along the row is a clump of what was sent out as Coccinea, but one of the five plants is none other than Prince of Wales. A clump of Lovely is another instance, and in this case Triumph is the stranger. We could give several other cases, but these will be sufficient to prove that the matter is a serious one. In one clump of a supposed distinct variety no less than three sorts are now flowering. We cannot be charged with carelessness at the time of sowing, as the packets of seeds were opened one at a time, and a second packet was not proceeded with until the first one had been disposed of. Every possible precaution is taken to prevent mixing of the seeds. This note is written to impress upon seed raisers and others the need there is for extreme care in the harvesting, and as the present period is generally regarded as the season for seed-saving we sincerely hope there may not be a recurrence of the present season's experience. Those responsible for the distribution of seeds cannot well be too careful in looking over their stock, no matter whether they grow it themselves or whether it is grown for them. They do much to make or mar the prospect of the flower's popularity, and now that the humblest cottage is taking to growing a selection of named sorts there is every reason why the utmost care should be observed in the seed harvesting. B.

## NEGLECTED ANNUALS.

To mention a few of the more uncommon and neglected annuals suitable for borders and beds in the garden, and which are in flower at the present moment, may be of interest to many readers of THE GARDEN.

There is the pretty little *Mesembryanthemum tricolor*, which I have seldom seen in gardens I have visited, and which here seems to attract considerable attention and admiration. It is a very dwarf hardy annual, and is undoubtedly the most showy of all the annual Mesembryanthemums. It bears white as well as crimson and rose flowers, each an inch or more in diameter. The plant itself, with its cylindrical oval foliage, only reaches a height of 3 inches or 4 inches, but spreads 6 inches or 7 inches. When grown in a warm sunny position it flowers profusely. Here it grows in the gravel walks at the foot of the terrace walls, fully exposed to the sun, and during the sunny hours of the day its Portulaca-like flowers are so fully open and so abundant that very little of the foliage is seen. It is also grown here in shallow ornamental boxes for placing upon the top of low walls, where it is equally effective. It does well if sown in sandy light soil in the open garden about the end of April, but is preferably raised from seed sown in boxes under glass during the month of March. Notwithstanding what is said to the contrary, I find it not at all difficult to transplant successfully.

Another delightful sun-loving flowering plant is the *Leptosiphon*, the larger flowering L. densiflorus and L. androsaceus, are very attractive, but not nearly so beautiful as hybrids of L. roseus and L. aureus. I prefer to grow most flowers in clumps or masses of one colour, but make an exception with these Leptosiphon hybrids, as I consider a bed of mixed colours of this charming flower is far more effective than a bed of, say, L. roseus, by itself. The best results are obtained by sowing in the open bed, where they are to flower, some time during April.

*Abronia umbellata*, though really a perennial, is a plant well adapted for treating as an annual, and if sown in a bed in the open in April or May soon covers a considerable surface by reason of its trailing habit. There are plants here that have stems fully 2 feet or 3 feet in length. These long succulent reddish stems that lie flat on the ground but sprout out in a pleasing manner are not the least of its attractions. The Verbena-like clusters of rosy purple flowers are very pretty and spring up all along the procumbent stem; they are also slightly fragrant.

There is a plant which is always catalogued as

*Calandrinia grandiflora*, with large showy blooms of a bright rose colour that are drooping in the bud, but on opening the flowers are upright. It has pale green fleshy leaves, and the flowers reach a height of 10 inches to 12 inches. It is particularly well adapted for sunny exposed positions where the soil gets dry and baked with the heat, and should be sown in the ground where it is intended the plants should remain. There is another annual Calandrinia which is also worth growing, C. speciosa. It is dwarfer than the other, and has flowers of a deep purple-crimson: it also likes a dry sunny situation. HUGH A. PETTIGREW.

St. Fagans Castle Gardens.

## LONICERA HILDEBRANDTI.

We are pleased to be able to illustrate this remarkable Lonicera, with L. flexuosa for comparison. This species has been written of on more than one occasion in THE GARDEN, and was one of the plants which much interested the late Mr. Ewbank, who flowered it outside at Ryde, and received a first-class certificate for it at one of the meetings of the Royal Horticultural Society. There

FLOWERING SHOOT OF LONICERA HILDEBRANDTI COMPARED WITH THAT OF LONICERA FLEXUOSA  
(ON THE RIGHT).

a half-hardy annual, and, so far as I have observed, has always been alluded to as an annual, but which I know from experience to be a true perennial. It is *Diascia Barbera*. It certainly requires a little protection through the winter, but if its roots are taken up and wintered in boxes in a frame and planted out in the spring earlier flowering plants are obtained than when treated as an annual. However, whether as annual or perennial, *Diascia Barbera* is an acquisition to any garden. Its pretty pink, coral-like flowers are in evidence throughout the summer, and as its habit is graceful it is always effective when in a bed by itself or at the front of a mixed border.

*Platystemon californicus* is a pretty dwarf annual that is not frequently met with, but is well worth a place in any border of hardy flowers. Its long cream-coloured petals with yellow blotches at the base remind one very much of a *Pinguicula*, while its unopened flowers have the appearance of upturned Snowdrop blooms. Its culture is the simplest, as it simply needs sowing where it is to flower, though it is essential that the seedlings be well thinned out. A very handsome annual is

is no question that this Honeysuckle is harder than many suppose; it is at all events quite happy in southern gardens, and the flowers are remarkable both for their deep yellow colouring and their size. We received a cluster recently from Messrs. Veitch and Sons, of Exeter, who kindly sent the photograph from which the accompanying illustration was prepared, and the individual flowers measured 4 inches in length and 2 inches across the open end, while another attraction is the bright green leathery leaves. The late Mr. Ewbank wrote of it in THE GARDEN of August 25, 1900, as follows: "I learn from a kind letter, which I have had from Mr. Watson, that Lonicera Hildebrandti was first flowered at Glasnevin in 1898, at Kew in 1899, and a few weeks later in Edinburgh. All these performances must have been under glass, but Mr. Watson tells me that it is likely to be hardy in my garden, as he knows of a plant which has stood several years in the open in south Cornwall. If it should be really so, I have got hold of an acquisition for the Isle of Wight, whose value can hardly be surpassed. It is a magnificent Honeysuckle of a bright yellow colour, and of a size which puts all

other Honeysuckles into the shade. The large leaves also befit it well and are of a fresh green colour. . . . I may as well say that *Lonicera Hildebrandtii* was planted against a wall with a full western exposure; it is the only wall which I have that is available for the purpose at all. Several fine Magnolias have come to grief here. What was esteemed by me the largest *Fremontia californica* in the country perished in the same way; it simply died of sun-stroke and nothing could save it at all." We should much like to know if this noble plant has succeeded in Midland gardens. At present our knowledge of it is scanty.

#### TENDER WALL PLANTS IN THE SOUTH-WEST.

THE notes on tender shrubs and trees grown in the open in the south-west are fittingly supplemented by a passing reference to plants used for covering walls, mostly of climbing habit, but a few of shrubby growth.

*Bignonia (Tecoma) radicans* is a hardy climber, and *B. capreolata* may also be considered so. Other members of the family grown in the open are *B. capensis* (Cape of Good Hope), orange; *B. Cherere* (Guiana), orange-scarlet; and *B. speciosa* (Uruguay), pink. Greenway, on the Dart.

*Berberidopsis corallina*.—Chili. Drooping crimson flowers, borne in racemes in the autumn. This evergreen plant does best in peat or leaf-mould in a partially shaded position. Common.

*Bougainvillea glabra*.—Brazil. This climber cannot be considered a success in the open, even in the south-west; but I know of two gardens where it has been grown and flowered, but in neither case has it exhibited a tithe of the freedom of growth displayed by it under glass.

*Bucklandia populnea*.—Himalayas. A handsome evergreen foliage plant, said to grow to a height of 100 feet in its native habitat. Its large, heart-shaped leaves are tinted with bronze and maroon. Tregothnan.

*Callicarpa purpurea*.—India. An evergreen shrub, bearing small inconspicuous flowers, followed by violet-coloured berries. Trewidden, Penzance.

*Cassia corymbosa*.—Buenos Ayres. A rambling shrub, almost invariably grown against a wall, though I have met with it planted against a wire fence and spreading out on either side. In August it is a mass of golden-yellow bloom, some of which it often retains until Christmas. With wall protection it reaches a height of 12 feet or more, and when in flower is a striking object in the garden. It is fairly common in the south-west.

*Chorizema*.—Australia. Well known evergreen greenhouse plant, bearing Pea-like flowers of orange and red. Masses 7 feet in height and more in breadth grow against the walls at Trewidden, and commence to flower in March. *C. cordatum* and *C. Lowii* are the species generally grown.

*Cissus discolor*.—Java. A climber, bearing greenish yellow blossoms.

*Clematis indivisa lobata*.—New Zealand. This beautiful white-flowered Clematis grows well in many gardens, and commences to bloom in March.

*Clinanthus puniceus*.—New Zealand. A brilliant-flowered evergreen climber, bearing large flowers, somewhat resembling lobster's claws, scarlet-crimson in hue. It sometimes commences to flower as early as Christmas, the number of its blossoms increasing until mid-May, when it is a glowing sheet of colour. The finest plant I know of is at Stoke Fleming, near Dartmouth, where it covers the side of a large house.

*Diplacus (Minutus) glutinosus*.—California. Another popular greenhouse plant bearing buff flowers, which succeeds admirably against walls in many gardens, growing some 5 feet in height.

*Eurocarpus cyaneus*.—Australia. An evergreen plant of shrubby growth, bearing whitish blue flowers. Greenway.

*Ercilla (Bridgesia) spicata*.—Chili. A self-clinging evergreen climber, bearing inconspicuous flowers. Fairly common, but scarcely attractive.

*Hibbertia dentata*.—Australia. An evergreen climber, with foliage of deep bronze, bearing single bright yellow flowers in April. Trewidden. H. Reidii, also yellow-flowered. Tregothnan.

*Hydrangea scandens*.—Japan. A rampant-growing climber bearing flat flower-heads composed of blooms, the minority of which are sterile. It clings naturally, and is displayed to best advantage when allowed to ascend a bare tree trunk. At Menabilly, Cornwall, a specimen planted twelve years ago has ascended the columnar trunk of a Turkey Oak to a height of almost 40 feet.

*Inga pulcherrima*.—Mexico. An evergreen shrub, bearing bright scarlet flowers in summer. A fine plant, covering a large expanse of wall, is at Greenway.

*Knema nigricans*.—Australia. An evergreen climber, bearing violet-purple flower racemes of small, Pea-like blossoms. Greenway. K. alba is also grown.

*Lapageria*.—Chili. This handsome evergreen climber, producing long, wax-like blossoms of white and rose, is well known under glass. In the south-west it does well in the open against a north wall in peaty compost, often bearing its flowers as late as Christmas.

*Lasiandra (Pleroma, Tibouchina) macrantha*.—Brazil. A beautiful evergreen shrub of climbing habit, bearing large violet flowers. It is usually cut down by frost, but breaks again strongly in the spring. Trewidden and other gardens.

*Manderilla suaveolens*.—Buenos Ayres. A lovely deciduous climber, bearing large white, deliciously fragrant flowers in August. It does well in several gardens in the south-west, in some of which it seeds freely.

*Michelia (Magnolia) fuscata*.—China. A deciduous shrub, bearing dull purple, sweetly scented flowers. Tregothnan.

*Phenomena prolifera*.—Cape of Good Hope. An evergreen shrub, bearing large, terminal, crimson flower-heads. Trewidden.

*Physianthus albens* (syn. Arauja albens).—Brazil. An evergreen climber, bearing a profusion of white flowers, which later assume a reddish tinge. Common in the south-west. The finest specimen I have seen grew against a cliff-face in the public gardens at Torquay. It spreads to a height and breadth of considerably over 20 feet, and one year bore over a dozen huge, corrugated seed-pods about the size of a cricket-ball, but oval in shape. This strain killed the plant, but a young one has now taken its place.

*Plumbago capensis*.—Cape of Good Hope. A climbing evergreen shrub, bearing large heads of pale blue flowers; a favourite conservatory plant. It is grown in several gardens, and flowers well in the open. A fine example, which has been unprotected for five winters, is growing in the same site as the Physianthus alluded to above.

*Pueraria thunbergiana*.—Khasia. An evergreen climber, with leaves 5 inches in diameter, bearing blue flowers. Fibre is obtained from the stems and starch from the roots of this plant. Tregothnan.

*Rhodochiton volubile*.—Mexico. A climber, bearing blood-red, drooping flowers. This plant, in common with *Lophospermum* and *Maurandya*, all three of which are perennials, is almost invariably killed by the winter, but is easily raised from seed. Rosehill, Falmouth.

*Rhynchospermum (Trachelospermum) jasminoides*.—Shanghai. An evergreen climber, hardy in the south-west, bearing countless starry white flowers, most delicately perfumed, in August. It is to be met with in the majority of gardens, and in one it has covered the house-porch.

*Ruscus aculeatus* (syn. Semele androgyna).—Canary Islands. An evergreen climber, valuable for its striking foliage. The leaves, or rather cladodes, are over a foot in length, and are furnished with from twelve to twenty pinnate sections of a glossy green. Penjerrick, Falmouth, where it has borne its inconspicuous, greenish white flowers.

*Solanum Wendlandii*.—Costa Rica. An evergreen climber, bearing clusters of large, lilac-blue flowers 2½ inches in diameter. The late Rev. H. Ewbank, in whose garden at Ryde the finest specimen I have seen was growing, considered it the best of all the tender climbers amenable to open-air culture in the south-west.

*Sollya heterophylla*.—Australia. Bluebell

Creeper. An evergreen climber, bearing drooping blue flowers. Tregothnan.

*Stauntonia (Holballia) latifolia*.—Himalayas. An evergreen climber, with oval, leathery leaves, bearing in April clusters of greenish white flowers delightfully odorous. A very common plant in the south-west.

*Streptosolen Jamesii*.—Columbia. A handsome evergreen shrub, in great request for clothing conservatory pillars, &c. It bears panicles of orange-red flowers, and when in full bloom has a brilliant effect. A plant about 7 feet in height is growing against the house at Trewidden.

*Syringa albiflora*.—Australia. An evergreen leguminous shrub, bearing white Pea-like flowers, well known in greenhouses. It is grown in several gardens, and, if cut down by sharp frosts, breaks strongly again in the spring.

*Tacsonia exoniensis*.—A hybrid between *T. Van Volxemi* and *T. mollissima*, bearing bright rosy pink flowers. Trewidden.

*T. mollissima*.—Quito. A vigorous species, bearing pink flowers, with tubes from 4 inches to 5 inches in length. Though Quito is on the Equator, its height above sea-level being 9,600 feet, the temperature is not unduly high. There is a large plant, which has had to be kept within bounds by periodical pruning, at Rosehill.

*T. quinensis*.—This is probably identical with the last-named. The foliage is similar, but I have not yet seen it in flower.

S. W. F.

#### THE ROSE GARDEN.

##### A TOWN OF ROSES.

ASTRANGER to the busy and thriving Berkshire capital of Reading, I was not prepared for the marvellous display of Roses, not only in the country gardens around but in well-nigh every little plot or front alike throughout the city. It seemed as if by general consent everyone had said, "This year is Coronation year, we will, therefore, give pride of place to our best and chiefest national flower," and accordingly plumped for the Rose with one universal accord. The writer had the privilege of visiting many gardens and grounds in and about the environs of Reading. One somewhat more extensive than her fellows had its Crimson Rambler in the fullest bloom, gracefully trailing over archways, and presented a perfect mass of gorgeous colour. Never do I remember the Rose so fine and vigorous or with larger and cleaner flowers than those around this neighbourhood this year. Their excellence in these parts, too, is the more remarkable seeing that the soil is not clay at all, but in very many cases an exceedingly thin layer of earth upon thick beds of gravel, which clearly proves how satisfactory a result can be produced with the Rose with suitable added substance and reasonable, perhaps I should say intelligent, attention. On the higher ground, in the sanctum of an old grower now retired on his laurels, some superb Teas were in evidence, several being maidens on budded Briars. I must mention a promising Carmine Pillar, its rarely brilliant bloom suggesting great possibilities in the future, while representing the pick of Roses in general I noticed A. K. Williams, Her Majesty, Marie Van Houtte, Merveille de Lyon, and The Bride, that exquisite almost pure white flower, a spot from Catherine Mermet. Here, too, the Crimson Rambler largely asserted itself, a very striking festoon towering in the exact centre of the garden and keeping watch as it were over its more lowly and humbler neighbours. Very beautiful, too, were the many varieties of the Penzance Seedling Briars, though the peculiar bronze-coloured Austrian kind had already shed its glories. All round this region the useful old-fashioned Cluster Rose (the Maiden's Blush) might be seen, of particularly robust and kindly growth. Good old "Glory to thee, John" had I suppose disposed of its first crop, for I somewhat missed our ancient acquaintance, as, too, the pretty

Homer Rose, which seems to have dropped out of the running somehow nowadays. Of various other gardens about the borough itself I had a passing glimpse, and even with the same impression, a uniform excellence appeared to have possessed the Rose, no matter how grown, whether dwarf, standard, or climbing.

Further afield, and though quite out of Reading, yet appertaining in a measure to its county town, I viewed a display hard to beat outside a nurseryman's grounds in any of the home counties. Grown extensively in regular rows and in distinct kinds was opened to our view the Rose in her most perfect form and culture. To give a list of the blooms seen here would be but to run through the very cream of a grower's catalogue. It must suffice, therefore, if I name but a very few of the many choice specimens here afforded. Very striking among climbers were Lucida Plena, L'Ideal (peculiarly charming when in bud), and Aimés Vibert. Somewhat unusual and of wonderful success were the budded Teas on high standards, a bold proceeding and one that had fully rewarded the grower. Prominent among such were a White Maman Cochet, the deepening yellow Princess of Wales, Jean Ducher, Rainbow, Hon. Edith Gifford, and Mme. de Watteville, a salmon-white Rose, with petals delicately edged with carmine. That delightful Rose Comtesse de Nadaillac, grown against a wall, was of superb beauty and possessed phenomenal wealth both of wood and size of bloom.

Among Hybrid Perpetuals on the Manetti we feasted our eyes upon rows of Mrs. J. Laing, S. M. Rodocanachi (a noble Rose but practically scentless), and Jeannie Dickson, while H.P.'s were grandly represented by Mrs. W. J. Grant, Kaiserin Augusta Victoria, the nankeen yellow Gustave Regis, and Viscountess Folkestone.

Lastly, I must record a short walk with an old judge and grower of Roses and a winner of innumerable trophies in his day. We were returning from a water excursion up the river, which proved somewhat of a fiasco owing to a midsummer deluge. Taking a cross cut on entering Reading from the further side we found a remarkable running panorama of Roses of great variety and beauty. The wandering suburban road was practically a new one, with houses but recently erected and all on one side only, being in a district but sparsely built over and in course of being opened up. My companion was eloquent in his

praise of the wonders of those little garden fronts, only a few feet square, yet each aglow with choice or showy specimens, just at their best and full of blooms.

Almost without exception house after house had its tiny pleasure ground tenanted by the Rose, whether dwarf or standard, trellised over an archway or trained against the wall; in many cases indeed all or most of these designs were combined. My recollection tells me of fine plants of Devonensis, Marie Baumann, Rev. Alan Cheales, La France, Mme. Carnot, Boule de Neige, and Sylph. Truly our walk, a desolate and disconsolate one enough under the first conditions, was rendered by this happy coalition of circumstances a both delectable and instructive one.

VIATOR.

## NOTES ON HARDY PLANTS

### ERINACEA PUNGENS.

**C**LOSELY related to, and somewhat resembling the dwarf-growing Genistas, is this extremely rare and pretty little shrub. It grows very slowly, and rarely attains a height of 9 inches, spreading out in a mat-like mass rather than growing in an upward direction. The branches are short, stiff, and spiny, and what few leaves there are are small and not very noticeable. The Pea-shaped blossoms are borne several together during May and June from the axils of short, spiny branches, and are of a blue colour. This plant is a native of Spain, and has been in cultivation for a great number of years, never, however, having become at all common. This is no doubt due to the great difficulty there is in propagating it. Seeds appear to be the only means of increase, and these are borne very sparingly even when the plant is growing under natural conditions. It has been said to be a tender plant, but it has withstood several winters out of doors at Kew without injury. Plants are to be seen there near the Temperate house, and they flower every year.

W. DALLIMORE.

### THE HOLLYHOCK.

THIS homely old plant, introduced from China upwards of 300 years ago, used to be relied on by our best flower gardeners years ago as one of the chief factors in producing an interesting and beautiful effect in our borders and shrubberies during late summer and autumn. What glorious effect masses of these planted together used to give few will ever forget who have seen them. It is not too much to say of this noble flowering plant that when planted in groups of, say, five plants, in self colours of scarlet, pink, yellow, white, and black, whether the position in which they are planted is the back of the herbaceous border, an avenue by the sides of a garden walk, or as isolated beds on the lawn amongst conifers, that we have no other plant of equal stateliness and beauty. For the subtropical garden, planted in association with the many handsome and bold foliage plants we possess, it is simply invaluable, yet it is not so often seen planted in this way as one could wish. This is to be regretted, more especially as the plant succeeds so well in the dingy and smoke-laden atmosphere of our towns.

As a florist's flower in years gone by few have had more ardent or sincere worshippers than has the Hollyhock, and I would hail the day with delight that brought many lovers back to its shrine. Considered in this respect, special culture and special varieties—with which this paper does not pretend to deal—are necessary. The great value of the plant, in my opinion, consists in its character as a decorative garden flower. Even the single strong growing ones, when planted in shrubberies, give a delightful brilliancy in the autumn to an aspect of the garden which is often dull and commonplace. The chief cause of the unpopularity of this plant of late years, as is well known, has been the Hollyhock fungus; so virulent, indeed, at one time as to make it impossible to grow the plant at all with any satisfaction. It is still liable to attack, but when grown from seed—the plan I recommend—it is far less subject to it than when propagated from cuttings. Once the plants are attacked by this disease cure is difficult, if not impossible. The best way is to take the precaution that no other plants of the mallow family, by which the disease is often communicated, are growing anywhere near the Hollyhock, and on first discovery carefully pluck every leaf which may show signs of being affected and burn them; afterwards give the plants a heavy dusting of flowers of sulphur.

The best way to propagate plants for garden planting is undoubtedly by seed. Our seed growers have attained to a perfection in the art of hybridisation and seed selection as was never dreamed of years ago, when to grow the Hollyhock from seed, excepting for the purpose of raising new sorts, would have been scouted as impracticable, propagation by cuttings and divisions being the only method of increase then in vogue. The seed should be sown in July, or early in August is not too late. A good position in which to sow it is a border with a west aspect. If the seed is fresh and good the young plants will soon come up, and towards the end of October they should be potted into small pots and wintered in a cold frame, or they could be planted out in the frame at a distance of 5 inches or 6 inches apart. The plant is quite hardy in the south, but whilst young a very severe frost will sometimes cripple the seedlings, therefore it is better to give them the protection of a cold frame in winter. Early in the month of April they should be planted out in the reserve garden 2 feet apart each way in ordinary soil, and covered over with inverted flower pots at night until danger of sharp frost has passed away. Towards the autumn many if not all the seedlings will flower.

This is the time to select the best varieties for future planting. To grow

ERINACEA PUNGENS ON THE ROCK GARDEN.

the plant successfully it must be borne in mind that it is impossible to do so unless the soil in which they are planted is deeply trenched, at least 2 feet, and liberally enriched with well-decayed manure. When it is said that the plant may occupy the same position with advantage for a matter of three years, with little further attention as regards the roots, the good work done in the first instance is well justified.

The best time for planting in permanent positions—as regards the southern counties at any rate—is the autumn (September and October). In colder localities better results are obtained by giving the plants the shelter of a cold frame for the second year, and to plant out in permanent positions in April. They will afterwards take care of themselves. The plants may be relied on to come true to colour, and certainly 75 per cent. will prove to be double from carefully-selected seeds.

OWEN THOMAS.

## TREES AND SHRUBS FOR ENGLISH GARDENS.

### THE HARDY HEATHS.

(Continued from page 44.)

**E**RICA ARBOREA.—In one respect this is the most remarkable of all the Heaths that are hardy in Britain, for it attains the dimensions of a small tree. In the Isle of Wight—perhaps elsewhere—it has been known to grow 20 feet high, with a trunk 29 inches in circumference. It occurs wild and in considerable abundance along the Mediterranean coast region between Genoa and Marseilles, the wood being used largely in the manufacture of the so-called "Briar" tobacco-pipes—"Briar" in this case being a corruption of the French word *bryuère*.

All the Heaths are noteworthy for the freedom with which they blossom, but they do not equal in this respect *Erica arborea* and its near ally, *E. lusitanica*. The flowers are almost globular and nearly white; they are quite small individually, but so abundantly are they borne that the plants are literally almost covered with them from March to June. My experience of this species is that it is hardier and thrives altogether better in the London district than *Erica lusitanica*. It ripens seed most years and can thus be readily increased by natural means. The young wood is densely covered with short dark hairs, and the leaves are closely packed in whorls of threes.

*E. lusitanica* (*E. eodonodes*).—To many people the name *lusitanica* as applied to this Heath will be, perhaps, unfamiliar. It is not so well known as *eodonodes*, but is really an older name. This Heath comes, as its name implies, from Portugal; it is also found in Spain. It is often confounded in gardens with *E. arborea*, which frequently does duty for it. *E. lusitanica* is the rarer plant. Briefly, they differ in the following respects: The flowers of *E. lusitanica* are longer and more bell-shaped than the globular ones of *E. arborea*, and they have a delightful Vanilla-like fragrance; the foliage of *E. lusitanica* is a rather paler green and has a more plumose aspect, the individual leaf being longer and more slender; the young wood, although downy, is not so markedly hairy as in *E. arborea*. The remarkable abundance of its blossom has already been alluded to under the previous species. I have not seen *E. lusitanica* more than 4 feet to 5 feet high, possibly it grows twice as high under favourable conditions. In parts of Dorset it thrives exceedingly well. Near London it succumbs during severe winters,

although frosts up to 20° do not seem to injure it. Messrs. Veitch, of Exeter, have a Heath—probably a hybrid—intermediate between this species and *E. arborea*.

*General Notes.*—On the whole it may be said that few groups of flowering shrubs of similar size have as great a charm in the garden as these hardy species of *Erica*. Their usually neat habit, their wealth of blossom, and the length of time they remain in flower (sometimes three or four months) combine to make them indispensable to gardens where they can be accommodated. There are not more than about a dozen real species that can be grown in the open, but with perhaps one exception they are all valuable. If the whole group be grown one or more species may be had in flower during every month of the year except sometimes November. The plant sold as *mediterranea hybrida*—possibly a cross between *carnea* and *mediterranea*—has come into prominence in recent years and has proved a most valuable acquisition. I have noticed flowers open in November in some seasons. Every year some are expanded before Christmas, and during January it is one of the brightest of all outdoor plants. Thus it may be said to commence the *Erica* season. Following it come *Erica carnea* and its variety *alba*: then, in a cluster, we have *arborea*, *lusitanica*, *australis*, *mediterranea*, and its several varieties, which fill up the months from March to June. From June onwards there are *ciliaris*, *mawiana*, *scoparia*, *cinerea*, and *Tetralix*; whilst *vagans*, and *multiflora* carry on the *Erica* season to October.

A peaty soil is undoubtedly the best for the Heaths taken as a whole. The great Heath nurseries are all on soil of that nature. But it is by no means essential. A loamy soil can, by the addition of leaf-soil, and, if necessary, sand, be made to suit all the Heaths. Some, including *stricta*, *carnea*, *cinerea*, and *mediterranea*, are quite at home on a calcareous soil. In all cases positions well exposed to the sun, with, if possible, cool moist bottoms should be selected for them.

The methods of planting and disposing these plants vary, of course, according to their size. The taller species, like *arborea* and *lusitanica*, are too tender to be planted promiscuously. They should be given a sheltered position and planted amongst or near other shrubs. In the south and western counties beautiful effects have been produced by planting them in irregular scattered groups, pretty much as one finds Gorse or Heather on a moor. *Erica mediterranea* and its varieties, a singularly beautiful group and considerably harder than the two just mentioned, have flowers of various shades of purple and white. They are capable of making some of the most charming effects when planted in large masses, and are especially valuable for planting on gentle slopes or rather elevated ground. Dwarfer sorts, like *E. carnea* and its white variety (*alba*), *cinerea*, &c., are useful as edgings to formal beds of ericaceous plants; they are delightful also to grow in patches on the rockery or in front of a hardy plant border.

The common Heather of our moors and mountains (*Calluna vulgaris*) is a very near ally of the *Ericas*. Under cultivation it has produced many varieties. It likes a peaty soil or a sandy one, and is longer lived and more profuse flowering under cultivation in soil that is poor rather than rich. It is very charming when grown in natural looking masses in the wilder parts of the garden, and its value is all the greater because it flowers when almost all other shrubs are out of bloom—from July to September. Numerous varieties are offered

by dealers, amongst which the following are most noteworthy, either for their beauty or their distinctness: *alba*, *alba Serlei*, *Alporti*, *aurea*, *Foxii*, *Hammondi*, *hypnoidea*, and *rubra*.

St. Dabeoc's Heath, as *Daboecia polifolia* is commonly called, is one of the most beautiful and valuable of this family. It commences to flower in June or July, and will continue till October or even November. It bears its flowers in erect terminal scapes, and they are of a lovely purple colour. There is a white-flowered variety (*alba*), and another called *versicolor*, which has flowers of both colours on the same plant and even individual flowers partly white and partly purple. This Heath is very abundant in Connemara. Naturally it acquires a straggling habit, but under cultivation this may be corrected by an annual shortening back of the shoots that have flowered. This operation, which is best performed early in the year before growth commences, can also be employed for the later-flowering *Ericas*, such as *ciliaris*, *Tetralix*, *vagans*, and *Calluna vulgaris*.

### THE BEST EVERGREENS.

I have prepared a representative list of the hundred species of evergreens which I consider most deserving of cultivation, and have roughly grouped them according to their size. Bamboos, which have been treated separately, and conifers are not included. There is, of course, a good deal of difference in the sizes to which evergreens attain, according to the climate in which they are growing. The grouping here is merely intended to give an approximate idea of their habit. Those marked with a dagger (†) are the more tender ones, and, although valuable plants in the southern and warmer parts of the country, had better be left out in the colder localities or given wall treatment.

Possibly I have overlooked some evergreens quite as good as those mentioned, and there are always some beautiful plants that do well in certain places but fail in the generality of gardens—such evergreens, for instance, as *Fremontia californica*, *Embothrium coccineum*, *Carpenteria californica*, and many other things like the New Zealand Veronicas, Himalayan Rhododendrons, Escallonia, &c. But, on the whole, these hundred evergreens, with the varieties that belong to them, represent very adequately the best of those that can be grown in the average climate of Great Britain and Ireland. A garden that contains them all is a well-stocked one.

<i>Hedera Helix</i> and vars.	" <i>minor</i>

## TREES AND SHRUBS IN WINTER.

Although the conifers and other evergreens introduced from other countries have added so greatly to the warmth and attractiveness of gardens in winter, deciduous vegetation too is full of beauty then. As has already been said, it is the large deciduous trees natural to our climate that should predominate in the garden landscape, and not, as occasionally happens, the sombre hues of Spruce and Fir. It is in winter that one can appreciate best the graceful beauty of the Birch and Willow, and contrast it with the gaunt, rugged strength of the Oak. Some trees, perhaps, are as beautiful then as when clothed with summer verdure. The common Elm, bereft of its foliage and with every branch and twig standing out against a winter sky, is one of the most beautiful objects in nature.

There is, of course, in winter a scarcity of bright colour in the garden compared with other seasons; but it is not entirely absent. Even in November and December there are trees and shrubs that brighten the garden with their coloured bark and fruits. Although not abundant, the members of this class are not used so extensively as they might be.

## ORNAMENTAL WILLOWS, &amp;c.

Among Willows, for instance, there are the golden and red-barked varieties of *Salix vitellina*. These, though scarcely ever seen, are capable, when properly treated, of producing bright, warm effects that are especially charming from November to February. When allowed to grow naturally this Willow — known popularly as the Golden Osier — forms a graceful tree of large size. Its twigs have a golden or red tinge, according to the variety, but on fully grown trees these twigs are not large, and as it is, of course, the bark of the preceding summer's growth only that is coloured no very marked colour effect is produced. To obtain a really bright patch of colour it is necessary to plant these Willows in goodly sized groups and to prune them hard back every spring. By treating them in this way a great cluster of long, wand-like growths is made every year, the bark over the whole of which becomes a bright yellow or red as winter approaches. An effective group is produced by mixing the red and yellow barked varieties.

Another striking Willow is *Salix*

*daphnooides*. The young bark of this species is covered with a thick glaucous or vivid blue-white "bloom." *S. acutifolia* is similarly distinguished, although not quite so distinctly. Different from any of these Willows, too, is the variety of *S. triandra*, with purplish brown bark. To bring out fully the ornamental qualities of these Willows they should be treated as advised for *Salix vitellina*. All these Willows are especially charming near the edge of water. Not only are their moisture-loving propensities satisfied, but their beauty is doubled by reflection in the water.

Somewhat similar to the Willows in the character of their bark, but useful in being adapted for drier situations, are the Cornels (*Cornus*). The best of the genus in this connexion are *Cornus alba* and its variety *sibirica*. They produce bark which for one or two seasons remains a bright red during the time the branches are leafless. A group of *Cornus alba*, with *Chionodoxa* *Luciliae* or Winter Aconite planted thickly beneath, gives a very pleasing bit of colour early in the year. A yellow-barked form of *Cornus stolonifera*, known as *flaviramea*, deserves mention.

Several shrubs are notable for the particularly bright green of their bark. The forms of *Kerria japonica* and *Neillia* are very bright during the winter on this account, but still more effective is a near ally — *Stephanandra Tanakae* — a comparatively new shrub, also from Japan, but of little value in any other respect. Finally, I may mention the Rubuses with white stems. As in *Salix daphnooides*, the bark is covered with the waxy secretion known as "bloom," and of a blue-tinted white. Some six or seven species of *Rubus* have this character. Of those obtainable from nurseries, *R. biflorus*, a Himalayan species often to be had from dealers under the erroneous name of *Rubus leucodermis*, is the best. Dr. A. Henry has introduced a Chinese species — *Rubus lasiostylus* — which is even better than *biflorus*: the bloom is more distinctly blue and the stems sturdier and more self-supporting. The species is, however, an extremely rare one in

cultivation. It is scarcely necessary to repeat how essential it is that these Brambles and Cornels should be planted in bold groups.

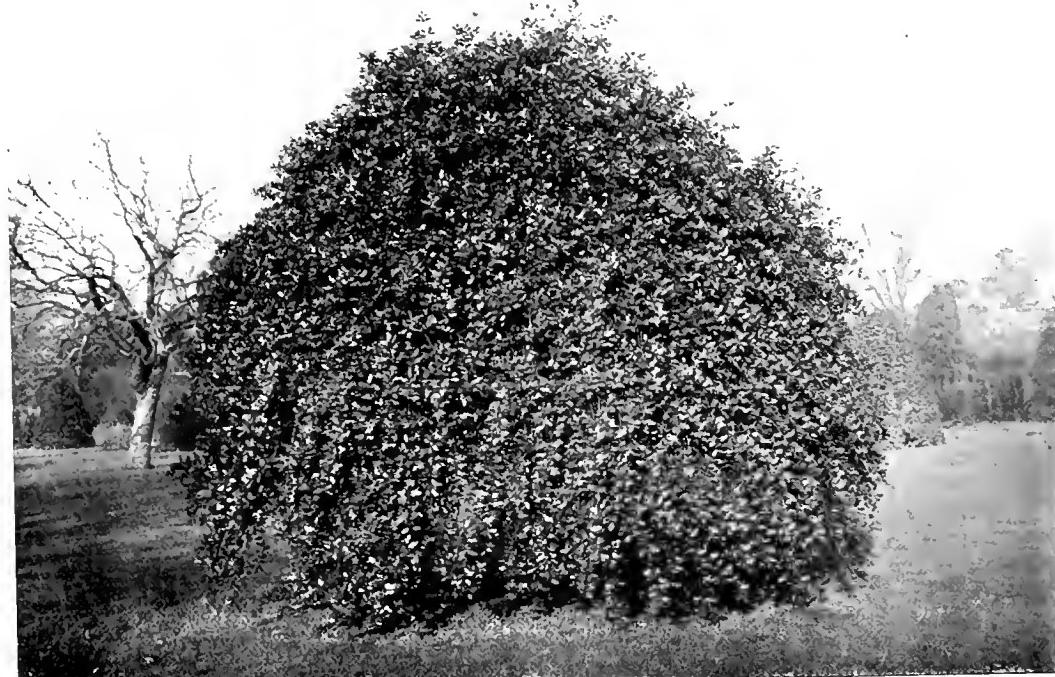

Among trees the most noteworthy as regards the colour of their bark are the Birches. The beauty of the common white Birch has not been overlooked by planters. A single specimen or a few grouped together make a bright winter picture when associated with evergreens. The Canoe Birch of North America (*Betula papyrifera*) has a bark of an even purer white than our native species. The Yellow Birch (*B. Intea*) shows warm orange-brown tints on the more recently exposed surfaces of its bark. The bark of the River Birch (*B. nigra*) is not brightly coloured, being of a dull dark brown, but it gives the tree a notably curious aspect owing to the way it stands out from the trunk and branches in great ragged-looking flakes.

W. J. BEAN.

(To be continued.)

## WEEPING HOLIES.

VARIOUS forms of the common Holly (*Ilex Aquifolium*) are amongst the most valuable evergreens for garden decoration, and few things are more highly prized, especially in winter, than large specimen plants. The numerous forms vary considerably in character, not only in size and shape of leaf, but in habit of growth. Some with little or no pruning develop into free growing, upright trees, or are of dense, sturdy habit, making dwarf bushes rather than trees, others again assume a pendulous form. Of the latter type large plants are decidedly ornamental when isolated upon a lawn. As a rule the pendulous varieties are budded on tall stems of the type, and trained out in an umbrella-like fashion, so forming a hollow mound of greenery. In some places, notably in the Necropolis Cemetery at Brookwood, pendulous varieties have been allowed to grow without any attempt at training, and in a number of instances the results are good. Stout stems 10 feet or 12 feet high are surmounted by irregular

A WEEPING HOLLY (*ILEX AQUIFOLIUM* VAR. *PENDULA*) IN THE ROYAL GARDENS, KEW.

heads, which droop down 6 feet or 7 feet, leaving several feet at the base of the stem bare. In the winter months these long pendulous branches smothered with bright red berries are very effective. The specimen illustrated is one of several growing in the Royal Gardens, Kew, and is named *I. Aquifolium* var. *pendula*. The leaves of this closely resemble those of the type, but there are other varieties available for persons who are fond of variegated leaves. Of this set *Argentea pendula* (Perry's Weeping) with silver variegated leaves, *aurea pendula* (Waterer's Weeping), with gold variegated leaves, and *pendula tricolor* are very distinct. To get height into these Weeping Hollies it is often necessary to tie up a few of the top shoots, otherwise they get out of shape by increasing more rapidly in width than height.

W. D.

### THE ROCK GARDEN IN AUGUST.

The love for rock gardens has certainly increased among those who strive to keep their gardens interesting all the year round. Flowers in beds or borders, where a certain amount of formality is indispensable, are well enough in spring and early summer, but, unfortunately, all too soon their glory vanishes, and the gap between the seasons is most severely felt when the summer is on the wane, i.e., during the month of August. It is then that we appreciate most highly the fact that our garden also contains, perhaps, irregular borders, a wall garden, a rock and water garden, or other places where formality is absent, and where we can so arrange our plants that they are at their best when, perhaps, in an adjoining part of the garden flowers have already begun to fade.

As the end of August and the month of September are very suitable for planting, it may not be amiss to review briefly such flowers as are now (the middle of August) in bloom in various rock gardens, chiefly in the West of England.

#### TRAILING PLANTS NOW IN FLOWER.

One of the prettiest things flowering this month is *Polygonum vacinifolium*. Its pendent shoots and pink flowers are particularly graceful when hanging over bold ledges or projecting rocks. Not being an evergreen it should be associated with evergreen plants if possible. More rampant in its growth is *Convolvulus althaeoides*, which is only just coming into bloom. The flowers are the size of a florin, of a beautiful bright rose colour, and the leaves are of a grey colour. This *Convolvulus* dies down in winter and comes up again in the spring; it should not be planted close to small alpines as it spreads very quickly, and is happiest when allowed to ramble over some shrub or other, which it will quickly cover.

The same might be said of *Lathyrus rotundifolius* and its white variety, which are suitable only for very bold rocks or for places where they can be allowed to run wild. Much neater are the prostrate *Gypsophila repens* and *Gypsophila prostrata*, whose tiny white flowers are produced in great abundance and are just now at their best.

#### SMALL ROCK PLANTS IN BLOOM.

Owing to the backward season the number of plants still in bloom is exceptionally large, and I will, therefore, only mention the principal ones. *Hypericum nummularifolium*, with its small round leaves and bright yellow flowers, grows only a few inches high and prefers a half shady nook, while the creamy white *Polemonium confertum mellitum*, which is still in flower at Exeter, prefers a hot and sunny position. *Anomatheca cruenta*, with red flowers the size of a sixpenny piece, is a bulbous plant, which when once planted will last for years. *Ethionema diostrophis*, with its heads of handsome purplish rose flowers, is past its best, but still carries several blossoms; it loves a sunny

prettiest of that genus; it has not yet finished blooming, and its peculiar spikes of bracts and bright purple flowers, as well as its somewhat glaucous ovate leaves, make it an interesting object in the rock garden. Its height here is about 9 inches. About the same height is *Enothera eximia*, a North American plant, known also as *Enothera cespitosa*. It has very large white flowers 3 inches or more across, shaded with pink.

Among other small kinds of rock plants now in bloom I may mention the beautiful *Androsace lanuginosa* and its variety *A. l. oculata*, the bright rose *Silene Schafta*, the yellow *Inula ensifolia*, *Hypericum olympicum*, *Scutellaria alpina*, with its white and purple flowers, *Campanula carpatica*, *C. c. alba*, *C. pumila*, *C. portenschlagiana*, *Acantholimon venustum*, and various *Opuntias*.

#### MEDIUM-SIZED PLANTS NOW FLOWERING.

Among newly-introduced plants of medium size, i.e., between 1 foot and 2 feet or so in height, few can rival *Dianthus Emilie Parée* (see illustration), which is now in full bloom; it is 18 inches high, very floriferous, and has flowers of a delicate pink, which are sweetly scented and last a very long time. A handsome companion to this, and flowering at the same time, is the fine new variety of *Scabiosa caucasica*, known as *S. c. magnifica*, with large, deep blue flowers, excellent for cutting. The fine pure white variety of *Scabiosa caucasica* is now also at its best. (*Enothera speciosa* (the white Evening Primrose) is very conspicuous, and perhaps more attractive still is its pink companion, known as *Enothera rosea*. *Teucrium purpureum*, with woolly leaves and bright purple flowers, forms a striking contrast to the deep yellow *Helenium pumilum* and the blue *Platycodon grandiflorum* and its paler and dwarfer varieties known as *P. grandiflorum album*, *P. Mariési*, and *P. Mariési album* go well with the beautiful yellow *Linums*, viz., *Linum flavum* and *Linum arboreum*, which are just unfolding their petals. Very showy still are the bright dazzling flowers of carmine *Dianthus Atkinsoni* and the deep yellow *Coreopsis senifolia* and *Coreopsis lanceolata*.

#### WATER AND WATERSIDE.

In most water gardens *Nymphaeas* will now be in all their glory, looking better, in fact, than during early summer, when the leaves and flowers would scarcely be developed; and, as among the latest introductions among choice Water Lilies we have much variety, there should be no excuse for lack of colour this month. I need not name the enormous number of varieties of Water Lilies here, since

DIANTHUS EMILIE PAREE (A GOOD PLANT FOR THE ROCK GARDEN, NOW IN FLOWER).

place. A little gem with prickly leaves and bright yellow flowers is *Erysimum kotschyanum*. It is only 3 inches high, and while most *Erysimums* flower early in spring this is only just now opening. A pretty Labiate is *Micromeria croatica*, which is only 6 inches high, and has bright purple flowers and small Thyme-like opposite sessile leaves. Of quite different type is *Erodium Reichardii*, with its pretty white flowers close to the ground, and owing to its spreading growth it forms an excellent carpeting plant for a half shady position. According to the botanical authorities this plant should now be called *Erodium chamædryoides*. *Origanum pulchellum*, which is supposed to be a form of *Origanum Tournefortii*, is by far the

several articles specially devoted to that subject have appeared in THE GARDEN quite recently. A pretty little aquatic with bright golden-yellow flowers is *Valisneria nymphaeoides*, and among other water plants now blooming the large yellow *Ranunculus Lingua* deserves to be mentioned. A good plant for carpeting shaded ground by the waterside is *Houstonia serpyllifolia*, the sky-blue flowers of which are still showy. Among taller plants by the waterside now blooming are the bright crimson *Lythrum roseum superbum*, the white *Lysimachia clethroides*, the blue Poppy, *Meconopsis Wallichii* (which, by the way, requires a moist and shady nook), the tall white *Gentiana thibetica*, the tall scarlet *Chelone*

PRIMULA EROSA (LIFE SIZE).

barbata, the white Spiraea Filipendula, and the glorious crimson Spiraea palmata.

#### TALL PERENNIALS FOR THE BACK OF THE ROCK GARDEN.

A plant little known except in the extreme West of England is Lobelia Cavanillesii (also wrongly called Tupa salicifolia). It grows freely when once established, but in a young state requires protection during very cold winters. The tubular flowers are scarlet and yellow, and very showy at this time of the year. Michauxia campanuloides grows  $4\frac{1}{2}$  feet high, and its large white blossoms are still showy. Unfortunately, it must be considered a biennial. A most peculiar plant ( $2\frac{1}{2}$  feet high) now blooming is Plagius grandiflora. It is a composite without ray florets, consisting, in fact, only of a huge semi-globular yellow disc 1 inch deep and 2 inches to  $2\frac{1}{2}$  inches across. Dianthus Pancici is also uncommon. It grows  $2\frac{1}{2}$  feet high, and bears numerous large heads of deep crimson flowers resembling those of Dianthus cruentus. Among other tall perennials are the purple Liatris spicata, the blue Aconitum japonicum, the pink Physostegia virginica and its white variety, the mauve Galega officinalis, the white Californian Tree Poppy (Romneya Coulteri), the blue Thistles (*Eryngium amethystinum* and *Echinope ruthenicus*), the white Achillea The Pearl, the yellow Heliopsis scabra, and the white and blue forms of Pentstemon ovatus.

#### ROCK SHRUBS NOW IN BLOOM.

As no rock garden is complete without some rock shrubs, I will name at least a few which have come under my notice. Many of the hardy Heaths are now at their best, and many are the different shades of colour to be obtained. Less well known are Ononis rotundifolia and O. fruticosa. The former is almost over; the latter has blossomed for nearly two months, and is still most attractive with its rosy flowers. Cytisus Weldenii is only just opening its bright golden yellow blossoms, and Cytisus nigricans, with its long yellow racemes, is still in full bloom, as are also the blue Ceanothus Gloire de Versailles and the pink form Ceanothus Marie Simon. Senecio Greyii, with yellow flowers and tomentose evergreen leaves, makes a capital rock shrub for a prominent position, and last, but not least, may be mentioned the following hardy Fuchsias, which are just opening: Fuchsia Riccartoni, F. exoniensis, F. corrallina, F. serratifolia multiflora, F. cordifolia, F. macrostemma, and F. globosa.

#### WORK IN THE ROCK GARDEN.

During this month this is limited practically to the gathering of seeds and cuttings of species it is desirable to propagate. Of watering there has been little need during the wet season we have just passed through. Seeds may be sown as soon as ripe, and cuttings under a hand-glass will, in most cases, root out of doors and become established before the cold weather sets in.

F. W. MEYER.  
Exeter, August 12.

#### THE MOUNTAIN PRIMULAS.

(Continued from page 113.)

**PRIMULA PURPUREA**  
(Royle), syn. *P. nivalis*  
var. *purpurea* (Regel),  
*Stuartii* var. *purpurea*  
(H o o k.),  
*macrophylla*  
(Don), *jaeschkeana*  
(Kern.). —  
From the alpine and subalpine regions of the Himalayas and of Afghanistan. A very characteristic species, which I am surprised to see is included in *nivalis* by Pax, and by "Inde x Kewensis," for it is quite dissimilar in cultivation.

THE GARDEN \* published a good coloured plate of it, which those who have it should con-

sult. It is a stout, strong-looking plant, with stiff upright leaves, slightly toothed—but often untoothed—dark green above and a bright white, generally yellowish below, long and narrow; flowers very dark purple, numerous, drooping because of the length of the pedicel, which, with the stem and the calyx, is entirely covered with white powder; corolla deeply cut; flower-stem stout, from 8 inches to 12 inches. This species is, unfortunately, difficult to grow, at any rate at Geneva. I have often received seed, collected in the Himalayas and coming direct; it germinated well and developed normally, but the seedlings decayed; one only survived and flowered, but we were unable to keep it.

**P. Reedii.**—From Kumaun in the Western Himalayas. It was found about twenty years ago by Dr. Duthie and described by him. This plant was distributed from the Botanic Garden of Saharanpur in 1886.† I saw it on August 17, 1893, at Mr. G. F. Wilson's at Weybridge, where it flowered for the first time in Europe, and was at once struck by its beauty and peculiarity. It is a low-growing plant, leaves ovate-lanceolate, with deeply-cut crenate lobes, narrowing to the petiole, covered all over with white silky hairs: scape erect and firm, 2 inches to 4 inches long; flowers two to three, fragrant, large, drooping; calyx broad, snowy white inside, teeth triangular, acute; corolla about 1 inch across, cream-coloured, quite white at the base. Miss Wilson made a drawing of it, and I believe an engraving was published later, either in THE GARDEN or the *Gardeners' Chronicle*, but of this I have no note. It has never been in my possession, and I know nothing of its culture. Mr. Wilson had it in a cold frame. I remember his joy when I told him, one Sunday morning, that it was my first sight of the new Primula in flower. Dear old friend! He sees now, I trust,

PRIMULA PURPUREA.

more beautiful flowers than even those he loved so well on earth !

*P. Suboddi* (Morr.), a Japanese garden plant syn. *P. cortusoides amara* (Lindl.), *cortusoides grandiflora* (Lem.).—A highly ornamental plant, very generally grown : leaves all radical, long-stalked, ovate, crenate-dentate, reticulated and softly downy ; flowers bright purplish-crimson in the type, large with ovate lobes deeply cut and often laciniated. Flower-stem from 8 inches to 12 inches high, bearing six to twelve flowers. There are a large number of varieties and forms, many of which are fixed and have received names. Although this beautiful plant has never been found wild, it is, without doubt, a true species, and is rightly given specific rank in the "Index Kewensis." Its cup-shaped calyx, deeply lobed and indented, distinguish it clearly from *P. cortusoides*. It was introduced from Japan in 1862, and Pax thinks it likely that its origin should be looked for, not in Japan, but in Southern China, a land that, as is well known, has still many secrets awaiting the explorer. It is not easy to grow, doing badly in all calcareous ground, where the leaves soon turn yellow. It likes half shade, and dislikes damp, and should be in well-drained porous soil. This is all I can say of it, for I know no more.

*P. Stuartii* (Wall.).—From the Himalayas, Nepaul, &c. Figured in *Bot. Mag.* t. 4356. A plant of tall habit and graceful form, somewhat recalling *P. purpurea*. Leaves smooth, 1 foot long, widely lanceolate, glabrous above, mealy beneath, edges crenulate, stem 12 inches to 20 inches high ; flowers a fine golden-yellow, in a many-flowered umbel, large, drooping, thick-limbed. It flowers from May to July. It must have a deep and porous soil, peaty if possible, in half sun, no stagnant moisture, and a place sheltered from northerly winds.

*P. sufruticosa* (A. Gray).—From the alpine regions of the Sierra Nevada in California. A small tufted plant with nearly woody stems, twisting about on the ground like a small shrub : leaves narrow, conneiform, spatulate, toothed at the end : flowers a fine purple-rose, arranged in umbels of three to seven, on a stalk 3 inches to 4 inches high. April and May. This species requires a well-sheltered place in rock work, a certain amount of sun, and a well-drained nook in firm stony soil.

*P. Wattii* (King).—From Chola-Natong in Sikkim. This species, sometimes known as *P. azurea* (though I doubt whether this name has been published), was described a few years ago.<sup>†</sup> I do not know it. I have just received some seed collected in the Himalayas and sent by a friend of our establishment ; I hope that it will germinate safely, and that this plant, of which we hear great things, will soon be available for gardens.

It is in this division of plants needing special culture that all the new species described by Franchet, that were found in Yunnan twelve to fifteen years ago, must be placed. It is unfortunate that, as I have already said, the seed of these species, too old when received to germinate properly, all failed, and I believe I am right in saying that, excepting *P. Forbesii* and *P. Poissonii*, none of these beautiful Chinese species are in cultivation. I should be glad to be corrected if in this I am in error, and should be grateful to any of my readers who will give me information. This province of Yunnan, like all Southern China, contains wonders of vegetation, of which, as yet, we know but little ; *Incurvillea Delavayi*, *Kohreuteria bipinnata*, and *Peonia lutea* are examples of its flora,

which holds many an unknown wonder and surprise in store. Now that China is open, it is for England, with her sea power and wide possessions, and her sons always pushing forward to explore and to civilise, to obtain for us these rich treasures, both for science and for our gardens.

Geneva.

H. CORREVON.

(To be continued.)

## THE FRUIT GARDEN.

### OUTDOOR FIGS.

AS an outdoor crop the Fig can be successfully cultivated in many parts of these islands, but its cultivation out of doors has not extended for certainly the past half century. Indeed, it is not too much to say that more practical and various efforts were made to cultivate it successfully in this way forty years ago than at the present time. The failures in its cultivation in this respect I believe are due to the want of knowledge as to the locality and position in which it will succeed than from any other cause. That it will succeed admirably even as a standard or an espalier on the coast of our southern counties is beyond a doubt, as witness the prolific Fig orchards of Worthing and other coastlands of Sussex, which have annually returned heavy and profitable crops for scores if not hundreds of years. The Fig is pre-eminently a fruit of the coastline, and it is useless to try and grow it any great distance inland, in consequence of the greater severity of the weather and the injury to the tree from frost, our occasional severe winters killing it to the ground. It is then to growers on our coastlands that we must look to for an increased growth of this fruit where the climate is mild and where immunity from severe frosts exists. That there are such positions in many parts of Great Britain besides Sussex goes without saying. I may instance the coast of North Wales, say from Flint to Bangor. I have on many occasions had the pleasure of visiting the beautiful gardens of Lord Penrhyn at Penrhyn Castle, Bangor, where every department of the garden is so successfully represented by the labours of his lordship's veteran and highly respected head gardener, Mr. Walter Speed, V.M.H. Among the many fruits under his care I may say for myself that there are none more appreciated than are the splendid crops of Figs which he annually secures from his Fig trees on the open walls. I remember also as a boy how well the Fig was fruited on outside walls at Bodorgan, Anglesey ; the position of the garden was less than a quarter of a mile from the sea shore. Let us hope that through the instrumentality and advocacy of THE GARDEN a new impetus may be given to the growth of this delicious fruit by the many able gardeners of our coastlands. There is no fruit more welcome on the dessert table than a well-grown ripe Fig, and few command a better price in the market.

Where grown against a wall a position facing south or south-west should be given. Ample drainage must be provided for the border, which should not be more than  $\frac{2}{3}$  feet deep, and which at first when the tree is planted should be of limited extent. The soil in which it is planted should not be over-rich, and should consist of sound friable loam three parts and one part made up of lime rubble, broken bricks, and road scrapings, with a bag of quarter-inch bones to a cartload of soil, as well as a good sprinkling of lime. It is a wise precaution to take to build a temporary wall (say 4 feet from the wall against which the tree is planted) as high as the border so as to confine the roots of the tree into this limited space for a few years in order to check luxuriance of growth and to promote early fruitfulness.

At the time of planting the border should be made as firm as possible, and in the course of four or five years' time this temporary wall may be removed and the roots given greater space to

enable the tree to further develop itself and to sustain the heavier crops of fruit which it will now carry. If the ordinary soil of the garden is good all it will be necessary to do in extending the border will be to trench the added part, adding at the same time a liberal sprinkling of quarter-inch bones and of the other ingredients recommended above. Taking it for granted that the drainage is effective, the object of the cultivator should be to secure short jointed, well-ripened growth during the summer, as on the success or failure in accomplishing this depends success or failure as regards securing a good crop the ensuing season. It is these shoots which produce the fruit. The current year's growth will also produce fruit, but too late to ripen out of doors in our climate.

Although rich soil is not recommended for the growth of the Fig, once a good crop is secured mulching of rich short manure should be placed over the roots, and in hot weather, whilst the fruit is swelling, liberal waterings of diluted manure water from the farmyard should be applied every ten days or a fortnight until the fruit approaches maturity, when it must be withheld until it is gathered. After this a good soaking of manure water should be given and little or no further watering will be needed during the remaining part of the season.

What pruning is necessary should be carried out at this time, and will consist in cutting out branches where they overlap or are too thick, leaving only enough to furnish the tree all over with bearing wood for next year's crop. By thinning out the shoots thus early advantage is secured of the sun's heat and light in consolidating the sappy growth and in plumping up the buds ready for a good crop the following season. When the leaves fall in the autumn many half-formed fruits will be found on the current season's growth ; these will come to nothing, and had better be taken off.

#### WINTER PRUNING AND PROTECTION.

If pruning has been carried out as recommended above there will be little or no winter pruning to do. Still, the trees must be looked over and the growths properly regulated and superfluous shoots cut away. This should be deferred until the end of March, as the tree being tender cut shoots are more subject to damage by frost. The fan form of training is the best.

Success or failure depends perhaps more on the way in which this item of work is carried out than on any other detail of culture. There are many different ways in which this can be done, some untiring the branches and roping them round with ropes of hay or straw. The objection to this plan is the length of time the branches are excluded from light and air, which must prejudicially affect the trees, and the same objection applies more or less to mats permanently fixed over them. The best way, in my opinion, is to bed the roots well down with a layer of Bracken Fern or dry leaves 1 foot deep and carrying them well up the stem of the tree and then to have wattled hurdles of straw or Bracken Fern strongly made long enough to reach from the border to the ridge of the wall, and wide enough for a man to be able to hand them about easily, say 4 feet. These can be made to fit tight together and be an effective protection against the most severe frost, but the great advantage in favour of these hurdles is the fact that they are portable. They can easily be removed and lapped over one another in warm and bright weather to the great advantage of the trees, exposing them to light and air and as easily returned into position on frosty nights.

OWEN THOMAS.

**HARDY FRUITS IN SEASON.**  
THE Strawberry crop was later than usual this year, but on the whole was good. We commenced gathering quite a fortnight later from plants grown for an early supply, and the last dish was taken on the 8th inst., the variety being Eleanor, which is our latest Strawberry. From the third week in June till the second in August is a fairly long season, but it should be added that our earliest bloom was protected in May, and we have plants

\* THE GARDEN, May 14, 1887.

† Report of the Saharanpur Botanic Garden, 1885-86.

‡ Journal of the Linn. Soc., XX., page 10, t. XIV. A.

on south, east, and north borders to extend the season as long as possible. The new variety Trafalgar is a splendid mid-season fruit, and those who need quantities will find it reliable. I never knew a worse season for

#### BLACK CURRANTS;

the crop was a very poor one. Red Currants were good; but Gooseberries thin owing to the spring frosts. More importance is attached to such crops as the early Peaches and Nectarines, and these like other fruits are much later. I have often gathered Early Rivers' Nectarine from a protected south wall the last week in July, but the fruits are quite three weeks later this year. I recently gave the new Cardinal Nectarine a trial on a wall facing south-west, but the result is not satisfactory. I know that when sent out this variety was recommended for forcing. It would be interesting to readers of THE GARDEN to know if this variety succeeds further south: here the tree grows freely, but there was no fruit.

#### PEACHES

are now useful and ripening freely. Our first dish from the open wall was gathered on the 2nd inst., the variety on a south wall being Amsden June. Waterloo succeeds Amsden June quickly, but we grow both, for should one fail the other often succeeds. It often happens that one may gather these varieties from walls in the open when the late kinds under glass are not ready. These early American varieties must have liberal culture and not be allowed to carry too much fruit. A Peach well worth room in all gardens to follow Hale's Early is Condor; with us it never fails to crop, and is a beautiful colour. I noticed last year and several previous seasons we had this variety ripe the third week in August; it is much later this year. Early York was not equal in quality or crop to Hale's Early, and Early Beatrice I consider small and poor compared to Amsden June and Waterloo. The

#### BEST EARLY PLUM

is Stint; it is one of the late Mr. Rivers' seedlings, and most valuable for early supplies. I do not like the name, but I am ignorant as to its meaning. Stint is a small reddish fruit, of very good quality, juicy, and the tree is a good grower. The fruit was ripe this season on the 2nd inst. from trees on a west wall. I formerly grew this variety as a cordon, but do not advise this method, as it fruits much better when grown more naturally. Early Prolific this year is very scarce; there was a good promise early in the season, but the crop was an almost total failure. I should add that Early Favourite is in the same condition. Our

#### EARLIEST APPLE

for dessert is Mr. Gladstone; this was ready for use on the 7th inst. Most of the early dessert Apples are very scarce this season. Irish Peach is good, whereas Beauty of Bath is almost barren of fruit. Lady Sudeley is cropping fairly well; this variety is nearly always productive. We find the small but good Doyenné d'Été Pear invaluable for dessert at this season; though small it is good and very pretty and most productive. We have, unfortunately, very few Williams' Bon Chrétien this season. Clapp's Favourite is more plentiful, but not of such good quality. A favourite early Pear is Marguerite Marillat; this is very fine early in September, and with us a better cropper than Souvenir du Congrès. I noticed in the northern part of the country that hardy fruit crops are much heavier, no doubt this was owing to their being in flower during better weather. The season as regards early fruits will, I fear, be poor in many places.

#### EARLY PEAR DOYENNE D'ETE.

THIS small, handsome Pear is of great value at this time of year, when so few others are ready for use. I have seen few early Pears bear better

than this variety. When grown as a cordon it rarely fails to crop, and grows rather larger, too. With us Doyenné d'Été is preferred to the newer St. Swithin; the latter is a little earlier, but lacks the flavour of the first-named. I am aware many object to the small size, but I think for dessert it should not be found fault with on this score. I have referred to its appearance, and it certainly is a very pretty fruit, its bright colour and perfect shape being much liked. With early fruits one does not expect the very best quality, and this Pear to do it justice should be gathered a few days before it is quite ripe. It is then of quite a refreshing flavour and really good quality. It does well grown in any form, and makes a compact pyramid; it also succeeds as a standard, cropping very freely, and rarely fails even in adverse seasons.

G. WYTHES.

#### THE EARLIEST STRAWBERRIES.

THE earliest dishes of Strawberries are always

THE REV. F. R. BURNSIDE.

welcome provided they are good, and to obtain them it is necessary to plant specially for that purpose. I would advise planting in July if possible.

I am aware it is not always practicable, but much is gained by early planting and securing a good growth before winter. It is useless to take layers from plants that have fruited, as the runners are so much later; far better reserve a few plants for supplying layers. This season the fruit from plants grown specially for first supplies from the open ground obtained double the price of forced fruits grown earlier under glass, the variety being Royal Sovereign. Even at this late season I would advise more attention to early planting in a rich root-run deeply dug, and each plant made firm. Plants treated thus will throw up very strong spikes of bloom, and these will produce fine fruit much earlier than from older plants. Do not leave the plants after the second season—the first year for size and earliness, the second for quantity.

S. M.

#### WORKERS AMONGST THE FLOWERS.

##### REV. F. R. BURNSIDE.

**T**O rosarians the world over the name of the Rev. F. R. Burnside, the rector of Great Stambridge, near Rochford, Essex, is familiar. His skill as an exhibitor of Tea Roses, and his earnest endeavours to encourage Rose growing wherever he has been placed, have done much to help beginners in the culture of the flower for show.

It was through his enthusiasm that the Southend Rose Show was started, and the first exhibition held there recently promises well for the future, and in his own parish he tries to interest his parishioners in gardening and make them love the flowers of garden and hedgerow about them. Those dwelling in parishes worked on these simple and beautiful lines have reason to thank their clergy, for in this way are homes made happy and prosperous. We cannot do better than publish the remarks of the Rev. H. D'ombraim about Mr. Burnside in the "Rosarian's Year Book" for 1901, in which a portrait appeared of this excellent rosarian.

"It was in the disastrous year of 1879 that I first made the acquaintance of this enthusiastic and genial rosarian. He was then living in the pleasant Kentish village of Farningham (his native village), a village dear to all anglers, for the river Darent on which it is situated was the favourite resort of many metropolitan piscatorial clubs. Mr. Burnside was not then in orders, and his garden was a small one, but he managed to grow some fine Roses; and to give an earnest of what might be expected of him, he got up an exhibition; but, alas! the day was a pouring wet one, and the place where the tent was fixed was a meadow with long grass. Under these circumstances it was not to be wondered at that the exhibition was a failure, and it said a good deal for the pluck and energy of Mr. Burnside that he determined to have a second one, but the wet weather continued, and one might readily have concluded that there would be an end to Rose exhibiting in Farningham; but no! the seed sown had borne fruit, and up to the present date annual exhibitions have been held there.

"My next intercourse with Mr. Burnside was at the quaint and pleasant Cotswold village, Chipping Campden, his first curacy. In 1888 he accepted the very small living of Much Birch, about six miles from Hereford, and here he was first enabled to show what he could do in the way of growing Tea Roses. The ground was high—about 400 feet above sea level—and here he grew such plants of Marie Van Houtte, Anna Olivier, Innocente de Pirola, Rubens, and other Roses as I have rarely seen equalled. Mr. Burnside has always maintained that Tea Roses do best at a considerable altitude above sea level, and many rosarians remember the delightful day they spent at the Hereford Rose Show, and afterwards sharing his hospitality at his very pleasant vicarage. Domestic circumstances, however, compelled him to resign Birch, and he went to a curacy near Derby, where he met with an unfortunate bicycle accident and was laid by for a long time. I did not see him at Derby, and was glad to find that after a short time he had come down to my

own county and had accepted the curacy in the beautifully-situated little village of St. Margaret-at-Cliffe, near Dover, overlooking the English Channel and exposed to every wind that blew. But here his undoubted skill as a grower of Tea Roses was brought to bear, and although his plants were few in number he ventured to enter at the Crystal Palace in 1900 for the Tea Challenge Trophy. Here he had as competitors Mr. Alexander Hill Gray, the Rev. A. Foster Melliar, Mr. O. G. Orpen, and Mr. Conway Jones. Mr. Alexander Hill Gray's large collection of Tea Roses at Beauclerc, Bath, was brought into competition with Mr. Burnside's small one at St. Margaret-at-Cliffe, where he grew only 290 Roses, most of them half-standards, and yet so close was the contest between him and Mr. Hill Gray that the judges were more than half an hour in deciding to whom the prize should be given. And here I may as well say that the establishment of the Challenge Trophy for Teas was due to Mr. Burnside's

very neat in the arrangement of his boxes. He and I have been friends for upwards of twenty years.'

## CORRESPONDENCE.

## GRAFTING TREE PÆONIES

[To THE EDITOR OF "THE GARDEN."]

SIR,—Various letters have appeared from time to time on the grafting of the Tree Paeony by the Japanese, and I note Mr. Barr's communication on the subject in THE GARDEN of the 9th inst. With regard to the nuisance caused by the suckers of grafted plants, it seems to me that Mr. Barr's suggested remedy (grafting low down) will not serve its purpose, as the stock employed is so vigorous and prolific of suckers that it is almost impossible to keep them in check. I have had a good deal to do with these Tree Paeonies from Japan, many of which are grafted as low as possible, but my experience is that even if the scions root the suckers are pushed up as freely as from the others, and it is almost impossible to eradicate them. Take a plant as imported with good roots, and you will find a score or more of latent buds thereon, which are only awaiting the return of spring to push forth vigorously. Cut these away, others will in due time make their appearance, and these cannot be properly removed unless the plant is dug up. The only remedy that I can see is to propagate by layers, which would, as Mr. Barr points out, be very awkward in the case of many plants, while the process of increase, being much slower, these Paeonies would be naturally dearer, and, though preferred by many, it is questionable if, from an £ s. d. point of view, they could compete with the grafted ones. Such being the case, it is more than probable that we shall go on grumbling, yet buying grafted plants of Paeonies, Rose Acacia, Prunus triloba, and many other things that would all be better on their own roots. T.

## FERN BALLS.

[To THE EDITOR OF "THE GARDEN."]

SIR.—I beg to send you herewith a photograph showing a Fern ball made of "Davallia bullata." These Fern balls have in later years been exported in large quantities to America, and I hear that the article has also been taken up in England.

It is without doubt a very beautiful ornament for the house, verandah, or any place in the garden where there is shade. The structure, so to speak, is made of sphagnum moss, upon which the Fern roots are closely tied. The string used for tying is made of Chamaecrops fibre, which has the advantage that it does not rot for a number of years. The culture is the easiest possible. In spring they are dipped in water and hung up anywhere in the shade, after that they must be regularly syringed

or dipped, and after a short time the young fronds appear and form a regular Fern ball. In autumn the leaves will begin to turn yellow; this is a natural sign that their vegetation period has ended and the supply of water should be stopped; they will lose all their leaves and must be allowed to dry off perfectly, and are kept during the winter in a dry place free from frost.

The next spring the same process is repeated, when the growth of the Fern fronds will be even better than in the first season. So treated these Fern balls can be kept for four or five years until the moss and string begin to rot.

As said before, they have been eagerly taken up by the American public, and my firm has orders in this year for over 100,000. It is of great importance for the commercial value that they travel with perfect safety and that their culture is the easiest, and at last that they are very cheap.

Besides these Fern balls, we are making some other designs, of which I am also sending you a photograph. The upper long design, reproducing my firm's name, this is now with the fronds all out rather indistinct. A very beautiful design are the little temples, and in America the Monkey design is very highly appreciated.

*Yokohama, Japan.*

ALFRED UNGER.

## SYMPHYANDRA HOFMANNI.

[To THE EDITOR OF "THE GARDEN."]

SIR.—In THE GARDEN of the 9th inst. you have a note referring to this Campanula-like plant as sent by Messrs. Veitch, of Exeter. You also ask for some information about its culture and requirements. As I have grown it here for several years my experience may be useful to those further north than Exeter, where some things thrive which are not so satisfactory in the North. Here it is practically a biennial, but it sows itself so freely that one need never trouble to make a sowing for one's self except the first. In some seasons, indeed, it increases too rapidly in this way, and must be well thinned. Plants raised in summer or early autumn will flower the following year. From what I have seen of it, I believe that it prefers a rather cool position to enable it to assume its full beauty, though it will also grow among stones and among the crevices of rockwork. It has done remarkably well this sunless season, and I have never before had such good plants. I have met with it once or twice as S. Kaufmanni—evidently a nurseryman's blunder, as there is no plant recognised by that name.

S. ARNOTT.

*Carsethorn, by Dumfries, N.B.*

## NOTES FROM SCOTLAND.

### SWEET WILLIAMS.

We have several forms of these delightful old-fashioned flowers blooming at present, some of them marked in a manner that the more exacting florist would reckon hideous, but they are very pretty as common flowers nevertheless. The more perfect kinds, now termed Auricula-eyed, have a coloured ring marking off a white edge from a white centre. These are very beautiful, and are not a little varied. I have several masses of these in mixed borders, where they have gone on increasing in size during the past three years. They are not at all novel, a drawing by Sydenham Edwards in "A Dictionary of Practical Gardening, 1807," showing they were common at that date, when, and long previously, they were called "Painted Ladies." The most brilliant of the family, however, is the Dwarf Double Crimson, which the late Mr. Thomas Ware distributed over thirty years ago as "magnificus." It is, unfortunately, difficult to preserve where the soil is naturally dry, large clumps dying without any apparent cause. It is quite easy to increase, however, either by letting the spreading stems into the soil or by covering them with a little light material. September is the best time to break off the pieces rooted.

### WHITE CARNATIONS.

Trojan is a most robust variety of good upright habit, but its flowers are scarcely so fine as those of

A FERN BALL.

exertions. He won it the first year, and I have no doubt that if he had continued at Birch he would frequently have carried it off. Mr. Burnside is a Carthusian, and the living of Great Stambridge, near Rochford, in Essex, is in the gift of Charter House, and, having fallen vacant, he became a candidate for it, and he was elected to it in the early part of last year. There is a large garden attached to the rectory giving ample room for the growth of his favourites. It is not elevated, and therefore does not answer to his idea as to what a Tea Rose garden ought to be, but I have not the slightest doubt that he will overcome this disadvantage, and that we shall see him victorious there as he has been elsewhere. Mr. Burnside is so well known in the Rose world that there is very little need for me to say much concerning him. He is young and energetic, and his pleasant smile and cheery laugh help to make him welcome wherever he is. He is an excellent setter-up of Roses, and

pete with the grafted ones. Such being the case, it is more than probable that we shall go on grumbling, yet buying grafted plants of Paeonies, Rose Acacia, Prunus triloba, and many other things that would all be better on their own roots. T.

## FERN BALLS.

[To THE EDITOR OF "THE GARDEN."]

SIR.—I beg to send you herewith a photograph showing a Fern ball made of "Davallia bullata." These Fern balls have in later years been exported in large quantities to America, and I hear that the article has also been taken up in England.

It is without doubt a very beautiful ornament for the house, verandah, or any place in the garden where there is shade. The structure, so to speak, is made of sphagnum moss, upon which the Fern roots are closely tied. The string used for tying is made of Chamaecrops fibre, which has the advantage that it does not rot for a number of years. The culture is the easiest possible. In spring they are dipped in water and hung up anywhere in the shade, after that they must be regularly syringed

Hildegarde, a remarkably beautiful variety, the white marvellously pure. It also possesses that stout upright habit of growth that is so essential in a Carnation for planting in borders. I have also a good white, very free blooming, sent me from Carton, but the flowers droop somewhat. It is named Carton White. The hardiest white is Lothian Lassie. The bloom is rather small and the white dull, but it is on account of its good habit and late flowering well adapted for border planting.

#### THE SEASON.

The cold and lack of sunshine combined have contributed to produce a thoroughly bad gardening year, inside crops as well as those growing in the open being alike affected. Tomatoes, for example, which have been a drug in the Scotch markets for the past two or three years, have this year, through scarcity, realised high prices. Strawberries also have all along been much above normal prices, and in private gardens there has been a difficulty in supplying the usual requirements. The more tender vegetables, such as French Beans, Runners, and Marrows have been, to a great extent, failures. They have absolutely refused to grow. In flower gardens all the more tender subjects have been unable to make growth, and not a few have died out of the ground. It is, naturally too, a very late season, and without a doubt late flowering hardy plants that have been depended on for years will this season fail to flower at all.

R. P. B.

CUNONIA CAPENSIS IN THE TRINITY COLLEGE GARDENS, DUBLIN (HALF NATURAL SIZE).

## THE INDOOR GARDEN.

### A TREE SAXIFRAGE

(CUNONIA CAPENSIS).

**A**T the Cape and elsewhere in South Africa some of the Saxifrages, which in Europe are mostly dwarf habited or creeping fleshy evergreens, there become stout hard-wooded shrubs or even fair-sized trees. Cunonia and Greyia are well known examples, both occasionally seen in botanical and other gardens. John Christian Cuno, after whom our present plant was named, had a garden at Amsterdam, of which he gave a curious poetical account in or about the year 1750. Cunonia capensis grows 15 feet to 50 feet in height, and was introduced from the Cape about 1816. Its twin spikes of feathery white flowers are 5 inches or 6 inches long, and very pretty as seen in contrast with the dark and glossy pinnate leaves. Our illustration is from a photograph taken by Mr. George E. Low on Christmas Eve in the Trinity College Botanical Gardens at Dublin, and shows the tops of a flowering shoot about half its natural size. The plant may be increased by layers or cuttings, although the last-named are slow in rooting, and it grows well in a cool greenhouse. In Wicklow or Kerry, or in Devon and Cornwall, this distinct plant would most likely prove to be quite hardy in sheltered and half-shady places. From a botanical point of view the plant is remarkable for its large interpetiolar stipules, but it is quite handsome enough in growth and flower for cultivation in greenhouse or conservatory.

### LACHENALIAS.

THESE pretty South African bulbous plants are well worthy of extended cultivation, especially by people whose glass house accommodation is limited,

for I know of no valuable flowering plant that is easier to grow. At no time is much warmth necessary, in fact much fire-heat is harmful to them, and therefore it will be readily understood that no forcing must be resorted to. If they are required to flower at an early date the bulbs must be potted up early. The second week in August is a good time to pot up the main batch, using clean pots 5 inches in diameter. The compost I find to suit the bulbs admirably consists of equal parts of good loam, leaf-soil, and well-decomposed manure, with a liberal addition of sharp sand or road grit. The bulbs should be shaken out of the old soil, and be graded, repotted, placing six of the finest bulbs in a pot; the smaller bulbs may be placed rather closer together in pots or pans for increasing the stock. These will not flower for two years. The draining of the pots should be given special attention, for when well filled with healthy roots copious supplies of water are necessary. The bulbs should be almost covered. A cold frame on a bed of ashes is a good position until severe frosts take place. The plants should, however, be removed to an airy greenhouse from which frost is excluded. Let the lights remain over them in order to throw off rain and encourage the formation of new roots. But little water will be necessary until growth commences. It is a good practice to afford a good watering to settle the soil, and afterwards to keep up sufficient humidity in the frame to start them into growth by syringing twice daily, and shading with a light material during hot days. Give abundance of air when the weather is favourable, and keep the plants as near the roof-glass as possible. There are some thirty different Lachenalias, but several are very similar, therefore I would only advise growing such distinct roots as *L. tricolor*, *L. tricolor aurea*, and *L. Nelsoni*.

H. T. MARTIN.

### NOTES FROM SWANSWICK.

IT is a pity all tastes do not coincide, for were this the happy case, everybody would be satisfied with the novelties bought on the strength of paper praise. As it is, when new plants fail to meet one's expectation, I suppose it should be comforting to reflect that one's neighbour might very probably regard them with rapture. On this text I hang the new striped Ivy-leaved Geranium Mrs. H. J. Jones and the zonal Cactus Fire Dragon. To me

the former's deep crimson stripes or flakes, striking inwards from the edges of the petals, make the flower look ragged—only, of course, as an optical effect—while the Cactus is remarkably like a malformed semi-double. Possibly they will both grow on my affections later on as they increase in size and amount of flower. Up to the present this has been a poor year for all Geraniums in this neighbourhood: they could not be bedded out until very late on account of the cold, and then came the blazing heat and dried up all their poor leaves and roots, which always seem to get less good out of water (more or less hard) than most plants. Perhaps this is a judgment, righteously severe, on people who are not modern enough to despise them, but for those who enjoy strong colour there will never be anything, herbaceous or otherwise, much better than a bed or two of good pink and crimson zonals, and I should be very sorry to pass a year without them.

I have not had an opportunity of being disappointed or otherwise affected by the blooming of another novelty, sordidly but graphically known to us as the "Seven-and-sixpenny Pea." This is the new white everlasting *Lathyrus latifolius grandiflorus*, sent out by Hobbies, Limited. My plant, for some inexplicable reason, refuses to progress in the slightest. It is said to be a very robust thing and highly floriferous, altogether a great advance on the ordinary forms, but if my specimen is robust its strength must be in its roots. It has had plenty of attention, and yet lags far behind others planted at the same time. However, I once before had something of the same experience with *Lathyrus Pink Beauty*, which dawdled and dwindled miserably through one season and came up vigorously enough the next, so that it may be a peculiarity with highly-bred stock of this family.

The strong soil here suits Phloxes, and they are remarkably fine this year as regards growth and size of flower; but, again, they have come too early. These periods of dry heat in June and July, which have been repeated now for the last three years, rush perennials on sadly, the consequence being that the end of August

sees the end of ever so many things that ought to be still going strongly in September.

I am growing a few Fuchsias—because we happened to have them and there was no other subject handy—for the adornment of a very hot, unshaded glass passage or gallery, where the sun has full opportunity of doing mischief. Strange to say, these plants, which did so well in several former years in a perfectly shady bed, do not seem to suffer in the very least from the glaring heat. They are, of course, kept carefully watered, and have liquid manure every other day, so that as far as their roots go they are all right. The leaves, however, and the very abundant flowers might be expected to flag and scorch and scald, but they do not.

A tribute to our own compatriot providers, and, at the same time, a left-handed compliment to the foreigner, is not to be resisted; therefore I must place on record a Carnation experience, very small, but straws show how the wind blows. I bought two packets of the "very best" Carnation seed—one from Germany, the other, a good deal later, from Sutton's. There was about the same quantity of seed in each, and, if anything, the packet from the sausage-land had a better chance, as it was sown while the greenhouse was warm; whereas, when the Sutton packet was committed to precisely similar conditions, the heating apparatus was not in use. Two plants, and two only, appeared in the German box; every single English seed must have germinated, for I pricked out over three dozen a few days ago. Of course, it is still possible that the two Fatherlanders may be two magnificent novelties, while the Britishers may be all single, and if this does occur I shall have to apologise. But, so far as it goes, the deal argues for Protection. M. L. WILLIAMS.

## GARDENING OF THE WEEK.

### INDOOR GARDEN.

#### WINTER FLOWERING BEGONIAS.

**B**EGONIAS are now growing fast and should be well supplied with liquid manure. Plants of Begonia Gloire de Lorraine should be staked, the leading growth being tied and the side growths allowed to hang loosely. The new Turnford Half variety appears to be a stronger grower than even the foregoing—this, at least, is my experience. Nothing is more fatal to the production of stout well-matured growth than cold frame treatment. Therefore, maintain a warm temperature with an abundance of moisture in the atmosphere. Do not pinch the growths but remove all flowers until the plants are required to bloom. Keep them near the glass and avoid overshadowing.

#### POINSETTIAS.

These should be placed well apart, as the best bracts are obtained from strong well-ripened growth. If the pots are well filled with healthy roots weak liquid manure should be given them twice weekly. Very little shading will be required now. These plants should only be shaded from the hottest sun when young.

#### PALMS.

Work will now be reduced indoors, and advantage should be taken to have these plants thoroughly overhauled. They should be sponged over and given a liberal top-dressing. Turfy loam with plenty of coarse sand and charcoal with a little Clay's fertiliser forms a good compost. This should be made firm, afterwards a good watering should be given. Manure water is of great

assistance to Palms, provided the drainage is good and the pots full of healthy roots.

#### ASTERS FOR INDOOR DECORATION.

should now be lifted from the borders, but preparatory to this they should be given a good soaking of water. After potting place the plants in a cold frame or under a north wall, shade, and keep close and freely syringe until re-established. The single varieties are best for pots.

#### HUMEAS.

Another sowing should be made as advised last month. Pot on seedlings as they become ready, using a porous soil, and give plenty of drainage. The old plants in flower are now ripening seed, and should be fully exposed to the sun. Home-grown seed germinates freely and is reliable. Plants that are not required for seed may be cut down and stripped of their leaves and dried for winter decoration.

Few plants bloom more continuously or are more ornamental in winter when in full flower than Abutilons. Expose these freely to light and let the ventilating of the frames be liberal. Judicious feeding must be resorted to when the pots are full of roots. JOHN FLEMING.  
*Wexham Park Gardens, Slough.*

### THE KITCHEN GARDEN.

THE welcome showers we have been having of late have done much to improve the appearance of the crops generally, and it has also been an ideal time for getting in and raising seeds which have to be sown at this season. It has also been favourable to the growth of weeds, necessitating the constant use of the hoe. Weeds should not be allowed at any time to seed in or near the kitchen garden.

Cabbage is probably the most useful of all our vegetables, as there is hardly a day in the whole year when this cannot be had if a judicious system of cultivation is practised, and at this season it should receive thoughtful attention. Continue to plant out Coleworts on any vacant plot of ground, as these are certain to come in useful and are of much more delicate flavour than greens taken from old Cabbage stumps, and the later the plantings, within reason, the more likely are they to withstand severe weather. Make another sowing of Cabbage seed for spring use, choosing a southern aspect.

#### LETTUCE.

Plant out the young seedlings when large enough in warm parts of the garden; these will prove very useful and last a considerable time during the autumn. Make yet another sowing. Endive should be treated likewise, and sow both Batavian and curled varieties.

#### CAULIFLOWERS.

Keep a sharp look out for caterpillars or they will spoil the appearance of the flower. The leaves should either be tied up or broken over them so as to keep them as white as possible. Veitch's Autumn Giant is one of the most useful. Late plantations should have the ground kept constantly stirred about them and well watered in dry weather, and after the plants have made a good growth mulch between them with long stable litter.

#### SPINACH.

Thin out young plants to a distance of 3 inches or 4 inches, hoe frequently, dust with soot in the early morning, and if the ground is in a poor condition apply small quantities of patent vegetable manure in showery weather. Make another good sowing about the 20th on deeply dug and well-manured ground. Give a good surface dressing of burnt garden refuse and make the ground moderately firm.

Continue to thin out young Turnip plants as soon as ready, dust with soot, lime, and wood ashes, and make two or three further sowings of the variety Snowball on various sites in the garden.

#### WINTER ONIONS.

Make one more sowing of these on a southern aspect; they will come in useful for putting in a

green state for salads through the winter, and should a severe winter be in store this sowing will stand better than the earlier ones.

E. BECKETT.

*Aldenham House Gardens, Elstree, Herts.*

### THE FRUIT GARDEN.

#### PEACHES AND NECTARINES.

TREES in successive houses, after their fruit is gathered, must have their borders kept moist throughout, as dryness at the roots would cause premature defoliation. The foliage should also be kept clean by syringing, and the atmosphere as cool as possible by ventilating the structures to their fullest extent. Remove all the wood that has carried fruit and is not required to furnish the trees, and shorten strong growths that have immature ends to sound triple buds, while those that are sturdy and properly exposed to light may with advantage be left their entire length. Trees that are unsatisfactory owing to having made exuberant growths through their roots having penetrated deeply in their borders, or, on the other hand, weak from their soil being exhausted—should, once their leaves are on the point of commencing to fall, have their roots to within a few feet (more or less according to their age) of their stem carefully lifted. Replace them in layers near the surface in fresh compost, consisting of good loam, mixed with crushed mortar rubble, wood ashes, and a dash of bone-meal. Trees treated in this manner should be kept rather close, and syringed several times a day until the roots begin to move, which can be ascertained by the state of the foliage.

#### LATE HOUSES.

It is particularly essential that the trees in late houses have their shoots properly thinned, and the unduly robust ones shortened and kept free of laterals, so that next year's bearing wood may have every opportunity by being adequately exposed to light and air of becoming thoroughly ripened. Keep the foliage clean by syringing, and the borders, while the fruit is swelling and until it approaches ripeness (particularly if the trees are heavily cropped), properly supplied with diluted liquid manures.

#### POT TREES.

The trees that have furnished an early supply of fruit, and have been placed outdoors upon a bed of ashes, should be repotted at an early date before they shed their leaves and while their roots are active. This should be attended to by preparing a compost similar to that recommended above for permanent trees and efficiently drained clean pots. When the trees are turned out of their pots the roots should be disentangled; at the same time cut back any long bare roots and preserve the fibrous ones. Replace the trees in pots that will admit of an inch or so of fresh compost, made quite firm by the aid of a rammer being placed around. When the potting is completed keep the foliage occasionally syringed, and place the trees for about a fortnight in a shaded position. The present time is suitable for selecting young trees for potting purposes, and these, if lifted from open quarters, should be placed in comparatively small pots, but time is saved by purchasing young established trees. The following varieties are suitable for pot culture:—Peaches: Hale's Early, Waterloo, Early Rivers', Bellegarde, Crimson Galande, and Dymond. Nectarines: Cardinal, Early Rivers', Lord Napier, Dryden, Stanwick Erluge, and Victoria.

#### CUCUMBERS.

Young plants for affording a winter supply of fruit must be planted out at an early date. Maintain a humid temperature, frequent syringing being needful in order to keep the foliage healthy and free of red spider. The ventilating of the house must at this season receive close attention, and additional dressings of compost, together with manurial liquids, be given to meet the plant's wants, stop the shoots regularly, and above all things be careful not to overcrop the plants.

T. COOMBER.

*The Hendre Gardens, Monmouth*

## NATURAL GARDENING IN SURREY WILDS.

### A NOTEWORTHY EVENING PRIMROSE.

For several years past *Oenothera insignis* or *lamarckiana* has been grown in every part of the wild garden, and in every different aspect—full sun and complete shade—and in many places has been allowed to seed itself, the self-sown plants often forming large collections, and the seedlings thinned out in the spring and transplanted to other places. The borders now contain hundreds of plants in full flower, beginning to open in June, and continuing to flower freely till October in most years. With me they grow amongst many other things—annual and perennial—shrubs and Ferns, and flourish in very poor, sandy soil, which has not been manured, or even forked over, for ten years or more, and in some places is hard and very dry, down to the gravel on which it lies. Most of the *Oenotheras* are upwards of 5 feet high, with numerous branches, every one of which blooms freely. More than 500 flowers and flower-buds may be counted on one specimen, twelve or more flowers being open at the same time, as they succeed one another each evening until the cold nights and hard weather of late autumn stop further flowering, though many growing flower-buds still remain, which, in favourable weather, would have opened.

The seeds of the *Oenothera* are too numerous to estimate, and may be left to germinate and grow where they fall, or collected and sown in the spring. The plants look well grouped on any out-of-the-way patch of the poorest, driest ground, so arranged as to form collections of fifty or more. Of all easily grown flowers this *Oenothera* is one of the most accommodating. It can be grown as a small single plant of a foot high or less, or as a tall separate specimen measuring 6 feet or more, with large and often regularly arranged side branches, forming a beautiful plant by itself. So, too, with a little management as to the time of sowing and transplanting—plants, varying greatly as to height, may be arranged to succeed one another, series after series, over three or four months, and the flowers, when expanded, often measure 5 inches or more across.

July 28, 1902.

F. R. S.

## BOOKS.

**The Book of Vegetables.**\*—Mr. George Wythes, who for many years has been known as a first-rate cultivator of vegetables, is responsible for the portion of this book that deals with the practical aspect of vegetable culture, and Mr. Harry Roberts adds an interesting editorial chapter upon the history and cookery of vegetables that cannot fail to be of value. The culture of vegetables savours but little of romance, but Mr. Wythes is to be congratulated upon the treatment of his subject, for he has so given valuable information that one can at a glance find out what one wishes to know. His remarks are rightly concise and to the point, for a practical gardening book loses its chief value if this is not the case. The vegetables generally cultivated in British gardens are treated of, and sufficient information is given about each to enable anyone to grow them successfully, and, as to their treatment in the kitchen, Mr. Roberts gives many recipes that are new to us.

**The Book of Orchids.**†—This is the eighth volume of "Handbooks of Practical

Gardening," and is from the pen of Mr. W. H. White, Orchid grower to Sir Trevor Lawrence, Bart. Few are better qualified to write about Orchids and their culture than Mr. White, and his remarks concerning them in the present volume are well worthy of perusal by those interested. One of the most important chapters of the book is that dealing with newly imported Orchids and the way to treat them upon arrival, and alone renders the book of value. Following general cultural details are given descriptions of the genera and most useful species of Orchids, and special notes with reference to their culture. Many are mentioned that are of little value from a purely horticultural point of view, though interesting enough to the collector. Such a book as this should tend to popularise Orchid culture, for the information is clearly given, and the author tries to show that Orchids are not so difficult to grow as was and now is to some extent supposed.

**The Book of the Strawberry.**‡—Mr. Edwin Beckett, Aldenham House Gardens, is the author of this, the ninth volume of the series of practical gardening handbooks. After an interesting introductory chapter concerning the history of the Strawberry, the author proceeds to give directions as to the outdoor culture of this fruit, and also how to produce early fruits by means of forcing under glass. The present volume is relieved from the monotony that characterises so many books on practical gardening by the inclusion of such chapters as those on Alpine Strawberries, Perpetual Strawberries, Strawberries as annuals, in barrels, &c., all of which make interesting reading. Extensive selections of varieties are given and market culture is also treated of. In addition to the Strawberry, the Raspberry, Blackberry, Loganberry, and Japanese Wineberry are referred to at some length. Mr. Beckett has certainly written pleasantly and well upon what is, it must be said, a most interesting subject.

## THE KITCHEN GARDEN.

### AUTUMN - SOWN CABBAGES.

I T is rapidly getting late for sowing Cabbage seed from which to obtain strong plants to stand the winter. Those who want such should sow at once, delaying not a day. When seed is sown late, although good growth may result, it is rare that the plants become stout enough to fit them for late autumn plantings. Generally a sowing made during the third week of this month gives strong plants to put out early in October, an excellent time to secure fairly early heads for cutting in the spring, although then so much depends on the nature of the variety. Sometimes even a later sowing gives fairly strong plants in October, but so much depends on the condition of the soil and the climate; still plants from a late sowing, if they have wintered well, come in very useful for planting out in the spring. There is a common opinion that the bolting off prematurely to seed by Cabbage plants is chiefly due to too early sowing and planting in the autumn.

That matter, however, I was enabled last spring to test, and with eighteen of the best varieties in a total of 700 plants of sowings made in July and August, and planted in September and October on the same plot of ground, whilst not a single one of the late sowing bolted. Only 3 per cent. of the other or earlier sowing bolted, so that early sowing has little to do with the defect. On the other hand the first sowing gave the earliest heads for cutting, so that there is some gain to counter-balance the few losses incidental to bolting. Still it is an undoubted fact that certain varieties or strains do bolt when sown in the autumn whilst admirably suited for spring sowing. No doubt these stocks have in them something of the comparatively annual character of the Coleworts, as plants of those always bolt to flower if autumn-sown. In purchasing Cabbage seed customers

should stipulate for varieties that can be guaranteed not to bolt to flower prematurely when sown in the autumn to furnish spring heads.

A. D.

## SOCIETIES.

### NEWBURY HORTICULTURAL SOCIETY.

THE fifty-fourth annual exhibition of this society was held on the 4th inst. in the charming grounds of Godwell Park, an ideal spot for a flower show, and a large number of persons attended. Our report must be brief, but such an excellent and well managed show would not be complete without referring to the good work of the chairman, committee, and secretaries, the good arrangements made, and what is so pleasing to horticulturists the good material staged. One exhibitor at this show stands out so prominently to call for special notice, this is the veteran Mr. Charles Ross, who secured over forty first and second prizes, and was the leader in all the large plant classes. He was ably assisted by his son.

The larger plant class was keenly contested. Mr. C. Ross, Welford Park Gardens, was an easy winner, having grandly flowered plants; Mr. T. Surman, Donnington Grove Gardens, being a good second, the plants being very fine but scarcely at their best; Mr. T. Leith, Beaurepaire Park Gardens, being third. For best foliage plants, Mr. Ross was an easy first, with large specimens. For exotic Ferns the premier award was easily secured by Mr. T. Leith with grand specimens, Mr. Ross in this case having smaller plants but well grown.

Fuchsias, always a feature at Newbury, were scarcely so good as usual. Mr. T. Surman was the winner, Messrs. Ross and Cox securing second and third place. There were some fine Coleus, Messrs. Surman, Cox, and Johnson taking the prizes in the order named. The same remark applies to Begonias; these were excellent, one rarely sees such high quality; Messrs. Hopson, Maskell, and Surman being the successful exhibitors.

For the best specimen plant in bloom, Mr. Ross was an easy winner with a grand Hydrangea having over 100 tusses, the plant being in a small pot; the second prize was a nice piece of *Plumbago capensis* from Messrs. Abery and Sons, Tilehurst. The best specimen foliage plant came from Mr. Ross, being a large well-grown *Areca catechu*. *Gloxinias* were not so good; Mr. J. King had the best plant.

Cut flowers were a great feature: the large collection of Roses brought forth some good material considering the lateness of the season. Messrs. G. Cooling and Son, Bath, leading; Mr. Mead, Bath, had the next best; and Mr. J. R. Tranter, Henley, the third place. In the smaller class Messrs. Evans, Mead, and Mara were the successful exhibitors, but here most of the blooms were too widely expanded. For the best decorated luncheon table there was a keen competition, and the work of judging was difficult. That given the first prize was a charming combination of Iceland Poppies and grasses, and was arranged by Miss Laura Harrold, Mrs. C. Attewell being second, Mrs. Milson third.

Another feature was the class for decorated stages suitable for conservatory; this was very effective and preferable to the stereotyped groups often seen. The first award in this class went to Mr. Ross, who had a charming combination of foliage and grasses, Mr. H. Clark being a good second with more bloom.

Hardy herbaceous flowers made a grand display. The collection from Messrs. Abery was very fine, Messrs. Smith and Bosty being second and third.

Fruit classes were good, especially Grapes, Mr. Ross having grand bunches of Muscats, scarcely ripe, but fine berries, Mr. R. Maher being a close second. The black Grapes were really fine. Messrs. Mara, Lees, and Surman were the principal winners of prizes. Any other variety found Messrs. Maber and Ross to the front. Peaches were good, and Messrs. Ross and Leith divided the honours. Nectarines were less plentiful, the last-named grower being successful. Plums were a rather small class, Messrs. Elford, Maher, Bosby, and Surman being the winners. Apples and Pears, in most classes, found Mr. Ross to the front, but closely followed by Messrs. Cox and Surman. Mr. Leith had the best red Tomatoes. Mr. Ross had beautiful yellow Jubilee, but others staged good fruits.

Vegetables in some instances showed what an erratic season growers had to contend with; even here Mr. Ross was well to the front, Messrs. Surman, King, Cox, Bosby, and Maskell being the principal exhibitors. For Messrs. Sutton's prizes there was a very poor competition, Messrs. Maskell and Surman being the most successful.

### BRITISH PTERIDOLOGICAL SOCIETY.

THIS society held its customary annual meeting on August Bank Holiday at the Institute, Eowness, Windermere, which was very well attended. After the formal business had been transacted, which included the election of Dr. F. W. Stansfield as president—Mr. Charles T. Drury not offering himself for re-election, having held the chair for several years—two very interesting papers were read, one by the president on "The Lady Fern," and the other by Mr. J. J. Smithies, illustrating, by means of dried fronds, a very large series of intermediate variations of *Lastrea propinqua* (a sub-species of *L. filix mas*) between the normal and prevailing type, and some very fine varieties found by the author of the paper. Although undoubtedly the specimens (twenty to thirty) demonstrated a gradation, they afforded no evidence that the extreme forms were arrived at by subsidiary steps, a theory which is largely nullified by the existence of so many marked variations having been found in other species without such ostensibly linking forms having been discovered. The exhibition of so many varieties in one species and in one direction, which involved a

\* "The Book of Vegetables." By George Wythes. "Handbooks of Practical Gardening," Vol. VII. John Lane. Price 2s. 6d.

† "The Book of Orchids." By W. H. White. "Handbooks of Practical Gardening," Vol. VIII. John Lane. Price 2s. 6d.

‡ "The Book of the Strawberry." By Edwin Beckett. "Handbooks of Practical Gardening," Vol. IX. John Lane. Price 2s. 6d.

great expenditure of time and labour in collecting on the part of Mr. Smithies and his co-worker (Mr. Foster), was highly appreciated, and formed, indeed, an unique one in its way. The chief interest of the meeting, however, centred in the demonstration by other exhibitors especially by Mr. P. Neil Fraser (of Edinburgh) and Mr. J. Edwards (of Manchester)—of the really marvellous extent to which wild "sports" in Ferns can be developed by selective culture. On no previous occasion has this been so clearly shown by the presentation of really exquisite forms, derived, in some cases, from finds of little promise. Mr. Edwards showed at least twenty most delicate types of what is known as the "setigerum" or bristly section of the Lady Fern varieties, some of them, curiously enough, merging into other quite distinct sections, and only differentiated by the bristly character.

It is impossible to convey by mere description the delicacy of cutting and grace of form of many of the exhibits. Setigerum, found by Mr. Garnett, of Bowness, may be roughly described as a bristly normal incrust, but from the outset its spores yielded a large percentage of bristly, finely tasseled forms, with some tendency to revert. Mr. Edwards' exhibits, however, were nearly all uncrusted and simply refinements of the original, while the tendency to dimorphism or reversion appears to be altogether eliminated. Mr. Fraser's exhibits consisted of some sixty odd green fronds of Polystichum angulare, raised from spores from the late Mr. E. G. Lowe's collection. The bulk of these were obviously crosses, few of which were other than "curios," caudate, narrowed, cruciate, &c., but about half a dozen exemplified an entirely new section in the family, which was appropriately named "adiantoides." The fronds of this section are very broad and decompound, and the ultimate divisions cuneate and borne on very long stalks, the effect being to transform the long lanceolate, close set, bipinnate frond of the species into an absolute imitation of a dense adiantum. In Asplenium trichomanes, a new wild kind was shown by Mr. T. Bolton, a true plomosum (incisum), but differing from previous finds in having the deeply cut pinnae curled (Asplenium inciso-crispum). This is certainly the finest form yet discovered.

Subsequent to this exhibition the president announced to the society that its forthcoming new Fern book, "The Book of British Ferns," would be published during the autumn by Messrs. Newnes, and would contain a series of interesting articles on the various branches of the cult, copiously illustrated by photography, and with an appendix giving the scientific side brought up to date.

Finally it was resolved that the society would in future issue certificates of merit for varieties brought before it at its annual meetings in the shape of plants, and finders or raisers, whether members or not, are invited to avail themselves of the opportunity thus afforded for competent judging. A hearty vote of thanks to the officers, and a special one to the retiring president, concluded the proceedings.

#### UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

THE monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening, the 11th inst., Mr. Thomas Winter in the chair. After the minutes of the last meeting had been read and signed, four new members were elected and one nominated. Five members were reported on the sick fund, and two others had been on and off the fund since the last meeting. The secretary was instructed to make the preliminary arrangements for the annual dinner, to be held early in October next.

#### READING.

FAVoured with delightful weather, the fortieth exhibition of the Reading Floral and Horticultural Society, held last week, was a record success, and the "gate" receipts realised no less a sum than £22s. Compared with former years, the entries showed a downward tendency, though this was scarcely to be wondered at considering the rather unfavourable climatic conditions. Speaking generally, the produce was well grown, though the quality of the vegetables was hardly up to the average. The flowers looked well, and there were some really fine specimens. The gardens were also of a satisfactory character. The judges were Messrs. H. Wilson (Hardwick), W. Elphinstone (West Bridgford, Nottingham), J. Cartledge (Butterley), and G. M. Knights (Alfreton).

#### ALFRETON.

THE thirty-second annual exhibition promoted by the Alfreton Floral and Horticultural Society was held last week. The exhibits at this show were far in advance of those seen at any of the other shows in the district, both in regard to quality and quantity. In the class for the best group of plants, staged for effect, the first prize was gained by Mr. Joseph Ward, gardener to T. H. Oakes, Esq., of Reddings House. Mr. Ward's group was a splendid arrangement, and comprised some lovely "rotions," rare specimens of Orchids, and light grasses. The class for the best cultivated gardens aroused keen interest, and reflected the highest credit on the exhibitors, who were all amateurs. The judges were Messrs. J. Ward (Reddings House), G. M. Knights (Alfreton Hall), J. Cartledge (Butterley Hall), and J. C. Tallack (Shipley Hall). The weather, unfortunately, was of a wretched description, and resulted in a material loss to the society.

#### CLAY CROSS FLOWER SHOW.

THIS is the oldest show in the district and one of the most important in the Midlands. It covers a wide area, and some of its competitors have secured more than an average reputation for the growth of produce. There is always a splendid contest here between professional gardeners for the prizes for the best groups for effect, and though a couple of the

competitors scarcely reached the high watermark of previous years, the first prize group could not be excelled. Mr. J. Ward (Mr. J. H. Oakes' gardener at Reddings House, Alfreton) was again the premier, and his success he has repeated for nine or ten years. For colouring and well-grown plants Mr. Ward has few rivals. In the Midlands he maintains a high reputation for grouping. For the second place, Mr. H. Mottershaw of Tupton Hall, and Mr. W. Haslam of Handstow were very close. Mr. Mottershaw had not displayed the taste of Mr. Haslam, but had a few better plants. He got the second place by a majority of votes, Mr. Haslam coming third. Messrs. Artindale of Sheffield was given the fourth card, and Mr. J. Butler of Tilshelf the fifth.

The fruit in the show could not be excelled in any exhibition. Their splendid growth, size, shape, and appearance were in every way admirable. Flowers were not so good, an unfavourable season having a deteriorating effect. Roses and Dahlias especially suffered. Vegetables were admirable.

#### EAST ANGLIAN HORTICULTURAL CLUB.

A LARGE gathering of members assembled at the August meeting of this club under the presidency of Mr. T. B. Field. A well-written paper upon "The Cultivation of Tomatoes" was read by Mr. C. Whitehead, gardener, Thorpe Lodge. Practical points in all classes of cultivation were ably touched upon. A capital discussion followed, which diverted mainly to the ever-debatable subject of fungoid diseases. Upon this subject Mr. Robert Holmes and Mr. F. G. Cole gave many useful hints as to the cause of attack, advocating precautionary measures during cultivation. There was a capital display of cut flowers, fruit, and vegetables upon the exhibition tables. Carnations were a strong class, and some grand border blooms were to be seen, those from Mr. R. Notley, High House, Thorpe, securing the premier award. Peas, too, were also a strong class, and here an amateur—Mr. F. Carrington, Norwich—took leading honours. The floral committee had for adjudication two grand seedling herbaceous Phloxes from Mr. G. Davison, gardener to Captain Petre, Westwick House, Norfolk. One was a pure white of enormous pips and massive head; the other a mixture of pink, carmine, and orange shades, of large form. Both were awarded first-class certificates. Mr. C. Matthews, gardener to Mr. Louis Willett, Thorpe, also received a first-class certificate for a yellow seedling border Carnation, both bloom and "grass" being of sturdy constitution, and it has the advantage of not splitting in the calyx in the driest season. A very pleasant evening was spent.

#### GATEACRE SHOW.

THE thirty-first annual exhibition of this society was held, by the kind permission of the president (Colonel W. H. Walker, M.P.), in the beautiful grounds of The Grange, the glass, flower, and kitchen garden being open to all visitors. This is one of the most successful exhibitions held in the neighbourhood of Liverpool. Unfortunately, the weather was most unpropitious, rain falling from early morning till evening. The aim of the society is to aid cottagers and to improve their gardens. The following exhibits were highly commended:—

Colonel W. H. Walker (gardener, Mr. P. Barham), for a group of flowering plants; C. A. Young, Esq., for a charming collection of cut Carnations; S. D. Skinner, Esq., for cut Sweet Peas, Pansies, &c.; H. D. Bateson, Esq. (gardener, Mr. R. Brittingham), for foliage plants; Dr. Caton (gardener, Mr. F. Butterly), for flowering Begonias, &c.; Lady Forwood (gardener, Mr. W. Morrey), for cut Dahlias and Carnations; J. B. Atherton, Esq. (gardener, Mr. G. Cliffe), for heavily fruited Orange trees; Colonel J. B. Gaskell, J.P. (gardener, Mr. C. E. Moorman), for a well-arranged group of flowering and foliage plants; and S. S. Bacon, Esq., J.P. (gardener, Mr. J. Rothwell), for choice Grapes, Peaches, Nectarines, &c. The arrangements were of a satisfactory character, thanks to Mr. J. Glover, who has been the hon. secretary through the long course of the society's existence.

#### ROCK FERRY, LIVERPOOL.

THIS society was favoured by splendid weather for its show, which was held in the Olympian Gardens, a position entirely inadequate for so fine an exhibition, on the 14th inst. Small tents were dotted amongst the trees, in which the exhibits were much overcrowded. The committee, if desirous of attaining the position they are worthy of, must cater more liberally both for the exhibitors and their subscribers by securing space in which the exhibits can be satisfactorily arranged.

For a group of miscellaneous plants, arranged for effect, out of the four entries Dr. Cook (gardener, Mr. G. Osborne), gained the premier position. Mr. H. Ogden won the next prize.

For six stove or greenhouse plants, Mr. Osborne again took the lead. For a single foliage plant, the same exhibitor won with a good Croton, but wanting in colour. For two exotic Ferns, A. J. Oakshott, Esq. (gardener, Mr. C. W. Findlow), was to the fore with a good Adiantum farleyense and Nephrolepis exaltata.

For six stove or greenhouse plants in small pots, Mr. H. Ogden was first with good examples. For six table plants, Mr. D. Dellamont won with well-coloured plants. For one Orchid, Mr. G. H. Pilkington won with a small Cattleya gaskelliana.

For a group, 45 feet square, G. Atkin, Esq., won with good Caladiums chiefly. For a display of cut flowers, Mr. H. Ogden was to the front. Sweet Peas and Carnations predominating. The class for twelve bunches of cut flowers, grown in the open, brought a good lot, in which Miss Oakshott led. For a collection of Carnations, the Hon. Mrs. Trelewney (gardener, Mr. J. Clarke) won with fine flowers.

Roses were plentiful for the late season, and of fair quality. Mr. G. W. Hodgson won for the twelve and Mr. R. Kellock for the six. Sweet Peas were good, but crowded

both in the bunches and staging. Mr. W. Johnstone had the best. For a table decoration, Mrs. Edmund had the best out of six competitors, using 'oreopsis.

Fruit was excellent throughout. For six dishes, P. C. D. Castle, Esq. (gardener, Mr. Charles Irvine), won with excellent Black Hamburgh Grapes, well-coloured Hale's Early Peaches, &c. For six dishes of hardy fruits, Mr. Irvine again won. For two bunches of Black Hamburgh Grapes, T. B. Kendall, Esq. (gardener, Mr. J. Richards), won with good bunches and large berries. For any other black, Mr. Richards was first with Madresfield Court. For two bunches of Muscat of Alexandria, Mrs. Paterson (gardener, Mr. T. Ferguson) won, and for any other white was first with Buckland Sweetwater. For six Peaches, M. Clover, Esq. (gardener, Mr. A. Crisp) led with very fine Sea Eagle. For nine Nectarines, Mr. T. Ferguson was to the fore with Pineapple, and also for the Melon.

Vegetables were above the average quality, Mr. Clarke securing the chief award in the leading class of nine varieties. For six kinds, R. Brownell, Esq., had the best. For twelve and six fruits of Tomatoes, Mr. W. Millington won in each with fine smooth fruits.

Mr. J. P. Moffat, the hon. treasurer and secretary, done all that could be done under the circumstances.

#### ROYAL HORTICULTURAL SOCIETY.

##### SCIENTIFIC COMMITTEE.

PRESENT: Dr. M. T. Masters (in the chair), Messrs. Douglas, Hooper, Bowles, Saunders, and Baker, Dr. M. C. Cooke, Revs. W. Wilks and G. Henslow, hon. sec.

*Potato tunour.*—Dr. Cooke reported on the specimen sent to the last meeting, which were attacked by a fungus named Chrysophylctis endobiotica, which has never yet been described, though the disease, Dr. Masters observed, was not uncommon.

*Larch disease.*—This has been referred to as a fungus of the name Allescheria laricis, which was unknown to Dr. Cooke. It turned out to be merely a "MS." name only, with no description, and afforded no solution to the problem of the disease.

*Silber leaf disease.*—Dr. Cooke also reported upon this well-known affection of species of Prunus, which has been found by Professor J. Perceval to be due to a fungus, the hyphae occurring where the roots are decayed, which produced sporophores of Stereum purpureum. By inoculating healthy Plum trees with the sporophores, the silvery appearance was visible after eight or nine weeks. The infection appears to take place below ground.

A unanimous vote of thanks was given to Dr. Cooke for his three reports, which will appear in full in the Society's Journal.

*Influence of scion on stock.*—Mr. W. B. Latham, of the Botanical Gardens, Edgbaston, Birmingham, sent a bough of a Laburnum, from which a cluster of shoots of Cytisus purpureus had grown out. It appears that the tree was purchased some twenty-seven or twenty-eight years ago as a young grafted plant of C. purpureus on C. Laburnum. The scion grew very well for a year or two on the stock, till a strong shoot grew out below where the graft was inserted. This was cut off to save the graft, but the graft died quite soon afterwards. The stock was left to grow into a Laburnum tree, which is now from 15 feet to 20 feet high, and as much in diameter. After some three or four years the C. purpureus made its appearance in various parts of the Laburnum, and is now to be seen in tufts all over the tree. A somewhat similar case is recorded in the *Gardener's Chronicle* (1:57, page 382), by Mr. E. Purser, Clapham Park. He wrote: "Some few years ago three grafts of the (Cytisus purpureus) were inserted, and now the whole character of the tree is changing, and every year since losing the yellow flower of the Laburnum and producing the short purple flower."

*Cattleya and Laelia cross.*—Mr. Douglas exhibited a plant, L.C. Juno. Edenside var., being C. Mossiae × L. majalis. It is usually considered an inviable rule that hybrid Orchids betray the characters of both parents. The present plant, though an undoubted cross, was thought to be exceptional. A coloured illustration which Mr. Douglas exhibited of C. Mossiae, together with the plant, showed a degree of yellow in the throat which was wanting in the living plant. L. majalis has a very spotted lip, but this feature was also wanting in the plant. That a cross or hybrid, though usually intermediate, may have one or other parent prepotent is well known; but the second generation, as Dr. Masters observed, will often reveal the other parentage more completely.

*Gynopogon paniculata dimorphic.*—Mr. Henslow called attention to the fact that different plants of this species may have different kinds of flowers, being gynodioecious; that is, in some the styles are greatly elongated, while the stamens are abortive; in others the styles are much shorter and the stamens perfect. They spread outwards and not inwards as in the case of self-fertilising plants.

*Dendrobium dathousaeum synanthic.*—Dr. Masters exhibited a specimen (received from Mr. W. Potter, Beckenham) of two flowers coherent by their ovaries and the two adjacent sepals, all the other parts being distinct.

*Proposed investigations.*—Mr. Elwes wrote, in reference to the Larch disease, of the difficulty experienced in obtaining any assistance from a practical point of view in dealing with what was proving to be a very serious disease among trees, and one of immense economic importance. He suggested that if a qualified person could be found, he should undertake a systematic investigation, for which a small grant from the Royal Society would most probably be forthcoming. Mr. Elwes adds that the disease cannot be studied in the laboratory alone, but only profitably by visiting places where it has appeared, so as to discover the conditions which produce it.

The floral committee met at Chiawick on the 12th inst. to inspect the large collection of Phloxæ growing in the gardens.

Present: W. Marshall, Esq. (in the chair), and Messrs. H. B. May, R. Dean, W. P. Thomaou, R. C. Notcutt, G. Reuthe, C. Dixon and J. Hudson.

The undermentioned varieties received × × × (i.e., highly commended):

Kaiser Wilhelm grows a little over 3 feet high and bears long spikes of bright rosy scarlet flowers with a prominent crimson centre. Sent by Messrs. Barr and Sons, Covent Garden.

Le Vengeur is not quite so tall as the last-named, but it is of sturdier habit and wonderfully free-flowering; flowers large reddish purple or carmine, deepening towards the centre. Sent by Messrs. Veitch and Sons, Chelsea, and Messrs. Barr and Sons.

Regulus, a compact sturdy variety, is distinct, floriferous, and very pretty. Its flower spikes are large, individual "pips" bright salmon, paler near the rose-coloured centre. Sent by Messrs. Barr and Sons.

Ferdinand Cortez grows about 2 feet 9 inches high, and bears massive spikes of attractive rose-pink flowers with a white centre. Sent by Messrs. Dobbie, Rothesay, Messrs. Paul, Chestnut, and Mr. J. Forbes, Hawick.

James Farquhar is one of the most beautiful of light-coloured Phloxes at Chiswick. It handsome spikes of white flowers, slightly suffused and streaked with purple, are borne with great freedom. Sent by Mr. J. Forbes.

Sylphide has been a favourite in good gardens for many years; it is still one of the best white-flowered varieties grown, and possesses all the good qualities one looks for in a first-class Phlox, being of compact sturdy habit and very floriferous. Sent by Messrs. Dobbie and Mr. J. Forbes.

Eclaireur is remarkable for its strong habit, freedom in bloom, and large shapely bright rosy carmine flowers, passing to a softer shade in the centre. Sent by Messrs. Veitch and Messrs. Barr.

Sesostris is vigorous and very free-flowering. Its rich carmine flowers borne on long spikes do not burn in the sun. A grand border plant, sent by Mr. J. Forbes.

Although the Drill Hall on Tuesday last was by no means full, there was a good display of plants and flowers. Messrs. Kelway's Gladioli were a particularly brilliant feature, and several other firms displayed cut flowers largely. The exhibits of fruit and Orchids were not numerous.

#### FRUIT COMMITTEE.

Present: Messrs. H. Balderson, Joseph Cheal, Henry Estling, Alex Dean, Horace J. Wright, J. L. Lane, and G. Kell.

Messrs. James Veitch and Sons, Limited, Chelsea, were given a silver-gilt Knightian medal for an exhibit of Plum tree in pots. They were carrying excellent crops of fruit, and were best represented by Grand Duke, Golden Transparent, Gage, Jefferson, Reine Claude de Comte Hathem, Coe's Golden Drop, and Early Transparent.

A vote of thanks was given to C. C. Paine, Esq., Hillfield, Haverstock Hill (gardener, Mr. H. B. Vyse), for fruits of Monstera deliciosa.

W. W. Shuter, Esq., The Gardens, Belsize Grove, Hampstead (gardener, Mr. Armstrong), exhibited a box of Peaches grown within three miles of Charing Cross from a tree planted in 1876. Vote of thanks.

Dr. Bonavia, Westwood, Richmond Road, Worthing, exhibited the Lucknow Melon, a white-fleshed fruit of fine flavour when fully ripe. It is known in Lucknow as Chital Kharbooz, which in English means Spotted Melon. It is easily grown in Worthing.

Mr. George Kell, South Villa Gardens, Regent's Park, was given a vote of thanks for a dish of Plums McLaughlin's Gage.

Mr. George Wythes, Syon House Gardens, Brentford, showed Vegetable Marrow Wythes' Prolific.

Mr. A. Johnson, Duffield Gardens, Stoke Poges, sent a scarlet flesh seedling Melon.

#### ORCHID COMMITTEE.

Present: Messrs. Harry J. Veitch (chairman), James O'Brien, J. G. Fowler, de B. Crawshay, Walter Cobb, Frank A. Rehder, E. Hill, W. H. White, F. W. Ashton, H. T. Pitt, W. Thompson, and H. Little.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, exhibited several good Orchids, notably Laelia majalis, L. elegans, Cypridium Nandii (C. callosum × C. tanzianum).

A cultural commendation was awarded to Sir Trevor Lawrence, Bart., Burford, Dorking, for a finely-flowered plant of Odontoglossum aspidorhinum. Sir Trevor Lawrence, Bart. (Orchid grower, Mr. W. H. White), was also awarded botanical certificates for Holonetta brocklehurstiana and Sarcansanthus appendiculatus.

Messrs. F. Sander and Sons, St. Albans, exhibited Laelia Catleya blanchetiana, Cypridium William Matthews, C. Mars, L.C. Mrs. E. Rogerson, L.C. Callistoglossa, and others.

Norman C. Cookson, Esq., Wylam-on-Tyne (gardener, Mr. H. Chapman), sent from his famous collection Cypridium × vexillo-fo.

W. M. Appleton, Esq., Weston-super-Mare, showed Cypridium Phœbe, C. tanzianum lepidum, C. Eos, C. Julia, and C. Roltii.

A very good raceme of Laelia crispa, carrying nine blooms, was shown by Mr. H. Little, gardener to A. Howard, Esq., The Barons, Twickenham.

#### NEW ORCHIDS.

*Cattleya × Lady Ingram (Westfield variety)*.—A large, handsome flower, with an extremely richly-coloured lip, orange, except for a bordering of purple. The sepals and petals are almost white. Exhibited by F. Wellesley, Esq., Westfield, Woking (gardener, Mr. F. Gilbert). First-class certificate.

*Laelia-Cattleya Ingrami (Rosslyn variety)*.—An award of merit was given to this Orchid, which was exhibited by H. T. Pitt, Esq., Stamford Hill (gardener, Mr. F. W. Thringgood). The sepals and petals are a rich rose, the colour of C. bowringiana, the lip an intense velvety purple; very handsome indeed.

#### FLORAL COMMITTEE.

Present: Messrs. W. Marshall (chairman), J. Walker, H. B. May, G. Gordon, J. Jennings, J. F. McLeod, G. Renthe, Wm. Howe, J. Fraser, Charles Dixon, R. W.

Wallace, Chas. E. Pearson, W. Cuthbertson, E. H. Jenkins, W. P. Thomson, J. W. Barr, J. H. Pitt, Chas. Bick, George Paul, and E. T. Cook.

Messrs. Barr, Covent Garden, showed hardy flowers in profusion, notably Tufted Pansies, of which we noted Ralph (blue), The Mearns (of the Magpie group), Lucy Franklin (soft yellow and white), and Admiration (rich purple), Phloxes, and Sunflowers. Tritomas and the hybrid were also in great variety. A distinct plant is the erect Eulalia, E. sinensis zebra strigata. Peatstemonea barbata, with several Eryngiums, were also noted. Kniphofia corallina is the most striking of the red forms of this group, and very bold withal. Hardy Nymphacias were very beautiful in many shades and good flowers. Gladioli were also represented in at least two sections. A very interesting array.

Mr. Amos Perry, Winchmore Hill, showed hardy flowers as usual in many good things, for example, the Fire Pink (Silene virginica), a glow of scarlet flowers; Buddleia variabilis, the blue; Gentiana septemfida, Lychnis haageana, in scarlet, crimson, and white; Aster Thompsoni; good lavender-blue; Lythrum, Zauschneria californica, Platycodon Mariesii, Phloxes, Potentillas, and a set of herbaceous Lobelias.

The Hollyhocks from Messrs. Webb and Brand were a reminder of other days: bold effective spikes in many shades of colour, such as rose, pink, black, flesh, cream, scarlet, and the like, while a set of boards arranged in front with two dozen flowers each displayed a remarkable range of colour. Silver Banksian medal.

Messrs. Kelway and Sons, Langport, filled an entire table with their sumptuous Gladioli, many fine spikes, while the flowers were of the best in such a sunless year as the present one. A few of the best in this formidable lot were Countess Amy, pink; Vivid, scarlet; Richard Milner, yellow; Colonel Morgan, salmon; General French, crimson; Gregef, salmon-scarlet; Gibron, white, daked lilac-rose; Fashoda, good scarlet; Hannibal, salmon, with yellow and scarlet flame; and Eris, scarlet-yellow throat, were some of the most distinct in a very fine lot. Silver-gilt Flora medal.

Crotons from Mr. H. B. May, Edmonton, were shown in 100 varieties, filling one table with the gold and yellow and crimson colouring of the plants. The plants were all of the serviceable size in about 5-inch pots, and, being about 1 foot to 2 feet high, were also of useful stature. Russell, Countess, Queen Victoria, Albert Triflant, Thomsoni, Hawkeri, green with yellow in large degree; Evansianus, Mars, Sunshine, Picturatus; Rubellum, very dark; Gordonii, with much twisted leaves; Sunrise, a showy red kind; and Sunset were of the very best in this large array of variegated plants. Silver-gilt Flora medal.

Messrs. Paul and Son, Cheshunt, showed a charming lot of Roses, such as Mrs. Grant, Gustave Regis, Bardou Job, Celine Forester, Sonv. de M. Carnot, Marie Van Houtte, Mine, Falout, and others that, considering the great rainfall, were good in every way. Silver Banksian medal.

Mr. M. Pritchard, Christchurch, Hants, showed a great bank of hardy flowers, Aconites, Gladiolus of the Lemonei group, Day Lilies, double Sunflowers, Pentstemons, Rudbeckia Newmanni, Echinops nivalis, a large head; Clematis coccinea, Montbretia Pottsii grandiflora, very fiery orange; Kniphofia Rufus, red and yellow, very showy; Phloxes in many colours, Chrysanthemum maximum grandiflorum, fine white; Delphinium Zahlii, a fine mass of sulphur-yellow blossom; Montbretia Geo. Davison, fine yellow, very large; Crinum Powellii, Kniphofia Lemon Queen, and many other showy and good plants. Silver Flora medal.

Messrs. T. S. Ware, Feltham, had a display of hardy things in which Phloxes, Eryngiums, Potentillas, Statice, Delphiniums, Platycodons, Sunflowers, Lemones Gladioli, and Lilies of the speciosus section occurred in large numbers; Crinum Powellii album was very fine; and Lobelia cardinalis grandiflora, very striking in colour. The massed Phloxes in this group were very fine, and the flowers delicately fragrant. Many other interesting plants, such as Gentiana Pneumonthe, were shown in small pots. Silver Flora medal.

Messrs. Storrie and Storrie, Dundee, showed Streptocarpus, Lobelias in pots, Celosias, Begonias, and the like. Some of the Lobelias were very fine, that labelled Crystal Palace compacta being one of the richest blues we have seen. Attraction, blue with white eye, is also decided and good; while Miss Masson may be accepted as one of the best pure white kinds. Silver Banksian medal.

Messrs. Cannell and Sons, Swanley, brought a grand lot of Godetias, such as Grandiflora rosea plena, Duke of York and Rosamond, together with Caliopsis atkinsoniana and atror-sanguinea. Lavatera trimestris was a charming lot of a most effective pink. The group was backed with Rochia Scoparia and other things, and was much admired. Silver Flora medal.

A group of mixed plants were shown by P. Purnell, Esq., and consisted of Palms, Fuchsias, Celosias, Ferns, Coleus, and the like. Bronze Banksian medal.

Messrs. Veitch showed the beautiful Encyrtbia pinnatifolia, a mass of white Poppy-like flowers; Buddleia variabilis veitchiana, a remarkable plant from Central China, to which we shall refer again, and Samobucus canadensis, large heads of white flowers.

Mrs. Davis Evans, Llanbyther, South Wales, sent a grand lot of the newer Water Lilies, for which a bronze medal was awarded.

A large group of Crotons arranged on the floor were from G. W. Bellgrove and Sons, Hammersmith. The plants were well grown and finely coloured. Bronze Banksian medal.

A choice set of Cactus Dahlias were from Mr. H. Shoesmith, Woking, the varieties being Primrose Queen, Lord Kitchener, crimson; F. A. Wellesley, crimson shaded purple; H. W. Silken, orange-vermillion, and Lord Milner, fine crimson with deep red centre.

Eleven varieties of Carnations came from B. W. Vernon, Esq., Worcester (gardener, Mr. W. Bachelor), the kind being of self and striped forms.

Mr. George Wythes, gardener to the Duke of Northumberland, showed Campanula pyramidalis in two forms, the flowers larger than usual, and good bold spikes.

Messrs. Low and Co., Enfield, brought a group of Ericas mixed with Statices, for which a vote of thanks was accorded.

Mr. Wm. Bull and Sons, Chelsea, contributed half a dozen plants of *Lilium auratum* var. *virginale*, the flowers of medium size, but very pure and fragrant. In addition the firm had a set of new Caladiums, some very striking and beautiful, and others so dainty and almost transparent, appearing more artificial than real. For instance, one called Rio de Janeiro was of this apparently transparent class, with red markings, while green and red appeared in suffusion over the entire fabric of the leaf. General was of glowing red, and Botafago, a carmine with pale green border. There were several others all more or less conspicuous by their quaint and curious marking or colour combination.

A first-class certificate was awarded to *Buddleia variabilis* var. *reicheniana*, a variety with densely crowded spikes fully 9 inches in length and probably three times larger than the typical kind. In other respects the foliage, &c. partakes of characteristics very similar to the type; indeed, it is a glorified form of this, and a grand addition to flowering shrubs. The plant inhabits Central China, and is said to attain some 15 feet high. Shown by Messrs. Veitch and Sons, Limited, Chelsea.

The following received the award of merit:—

*Senecio clivorum*.—We have in this stately plant some reminder of the larger *Baptisia*s, particularly in the orange flower heads. For the large border or the wild garden the plant will be very effective, being well furnished with huge, almost reniform leaves, set on petioles of nearly 2 feet long. The height is 4 feet or more, and the plant quite of the uncommon kind. From Messrs. Veitch and Sons, Limited, Chelsea.

*Gladiolus Coronation*.—In this handsome flower the colour is white, suffused with delicate pink in the upper region of the flower, while in the lower half a huge blotch of crimson velvet is most conspicuous. This effective colour combination is most remarkable. Shown by Messrs. Kelway and Sons, Langport.

*Gladiolus Empire*.—This is another fine novelty, the chief colours in the upper part of the flower being rose and flesh, while a golden-yellow blotch and purplish crimson cover the larger portion of the lower petals. A fine addition to these flowers. Shown by Messrs. Kelway and Sons, Langport.

*Dahlia F. A. Wellesley*.—A fine Cactus variety, in which the predominant shade is carmine of a rich and bright tone, the sides of the florets revealing a ruby-red tone. Shown by Mr. H. Shoesmith, Woking.

*Coraylea indivisa* P. Elder.—A dark and narrow-leaved form, a finely-grown example of this useful plant. Shown by P. Elder, Esq., Ham, S.W.

*Montbretia Geo. Davison*.—A strong-growing yellow self kind, in which there would appear much of the *Crocosmia* characteristics in the larger and more open flowers. Shown by Mr. Geo. Davison, Westwick Gardens, Norwich.

*Carnation The Shah*.—A yellow ground Carnation lightly striped with bright scarlet; indeed, it is the brightest and most effective of its class we have yet seen. The flowers are large and handsome. Shown by Mr. Martin Smith, Hayes, Kent (gardener, Mr. Bick).

*Caladium Giroud*.—Quite a novelty among these plants; the leaves are greenish and cream, with scarlet blotches. From Mr. W. Bull, Chelsea.

*Kniphofia Rufus*.—A rather effective variety in which the gold and scarlet colours are seen to advantage. Shown by Mr. M. Pritchard, Christchurch.

#### BISHOP'S STORTFORD.

FORTUNATELY, there was little rain to interfere with this annual flower show, one of the most important horticultural events in the Eastern Counties, which was held on the 14th inst. It was the thirty-third show, and held, as usual, at The Grange, a lovely spot for such a purpose. The hon. secretary, Mr. W. Smith, who never tires in promoting anything concerning horticulture, and who directs the affairs of the society, certainly deserves great praise. Mr. Smith is also ably assisted by a splendid committee. The special features of the show were undoubtedly the table decorations and the groups, though fruit and vegetables were well staged, and there was no lack of competition in the plant classes. A separate marquee was entirely devoted to the ladies' exhibits, and no less than thirty-five tables were decorated for the event, a number rarely exceeded at any show.

#### TABLE DECORATIONS.

The first prize was obtained by Mrs. G. Osmond, of Bishop's Stortford, the flowers used being pink Geraniums, Maiden-hair Fern, and Smilax; Miss M. Dixon, Harlow, being second with Sweet Peas, beautifully blended. Miss Spencer was third. The other classes, in which there was good competition, were for decorated fire-places and mantelpieces, there being eleven exhibitors. The first prize was taken by Miss Gwynn, who had a beautiful arrangement of leaves and foliage, with a few light flowers here and there. Miss M. Blyth was a good second. Roses and Ferns being employed. Miss Hughes was third. For baskets of flowers, Miss E. Spencer, Clavering Hall, was an easy first with Gaillardias and Marguerites. Miss Livesey was second. For vases of cut flowers, Mrs. Livesey was first, having a beautiful vase of Hollyhocks and white Campanulas; Miss Harwood being second with scarlet Gladioli.

#### PLANTS.

The groups arranged for effect were much above the average. Mr. A. Jeffries, gardener to J. Balfour, Esq., was first, and Mr. C. Gold second, the latter being very close and having good flowering plants, but too heavy material for the background. Colonel Archer Honblon was third. The best stove and greenhouse foliage plant came from J. Barker, Esq., also the best Ferns; Mr. C. Gold being second. Mrs. A. Taylor had a splendid group of tuberous Begonias, Mr. W. Smith being second, but his plants were scarcely advanced enough. To the other plant classes zonal Geraniums

made a fine display, Messrs. Barker and Taylor taking the prizes in the order named. For table plants, Colonel Houlton and Messrs. Gold and Parker were the most successful. Mr. W. Smith had a fine lot of single Geraniums; Messrs. Taylor and Holland the best Fuchsias.

**CUT FLOWERS.**

In the open class for cut hardy perennials some beautiful groups were staged. Messrs. Paul and Son, Cheshunt, were a good first, Mr. H. A. Hare being second with smaller bunches.

In the other cut flower classes Sweet Peas brought forth a grand array of material for the Eckford prizes, Mr. G. A. Seaward and Miss Newman being the winners. For Messrs. M'Alullen's prizes there were some grand stands, Messrs. Seaward and Barker leading. Mr. J. Barker had the best stove and greenhouse cut blooms, also the best twelve bunches of hardy perennial cut flowers, Mrs. Gee being second. The prize for best Mme. Desgrange Chrysanthemum was taken by Colonel Archer Houlton. Aster and Dahlias made a poor display. Roses also were weak. Carnations small, but plenty of variety.

**FRUIT.**

Fruit was well shown, the collections being above the average. Colonel A. Houlton sent splendid Grapes, Peaches, Apricots, and Nectarines. Mr. Barker was a close second with good dishes of Pears and Grapes. The same exhibitors were first and second for baskets of fruit, the Grapes in the first lot being specially fine. There was a strong competition in the Grape classes, Colonel Houlton, Mr. John Bailey, M.P., and Mrs. Pearson having the best dishes. For Muscats, Messrs. Gosling and Barker had the bunches, Mr. J. Balfour the best Melons. Peaches were good, Messrs. Bailey and Sir J. Blyth having the best. In the Apple and Pear classes Messrs. Neal, Bailey, and Barker were the leading exhibitors. Plums were good, and Mr. Holland had the best Greengages.

**VEGETABLES.**

These made a splendid show, the leading prize for collection being well won by Mr. Jeffries, gardener to J. Balfour, Esq., Mrs. Gee being second. For smaller collections, Messrs. Calvert and Hall were the winners. In the single dish classes there was a strong competition.

Among trade exhibits, Mr. Mortirer, Farnham, Surrey, showed some beautiful stands of Dahlias, two new Cactus varieties—Mrs. Bailey and Mrs. Barker—receiving certificates. Messrs. Hobbs and Brand, Saffron Walden, sent some very fine Hollyhocks, well staged, and carrying grand spikes of bloom.

**NATIONAL AMATEUR GARDENERS' ASSOCIATION.**

In consequence of the Bank Holidays of August interfering with the usual monthly meeting in the first week, the August meeting this year was fixed for Tuesday, 12th inst. On this occasion the large hall of Winchester House, Old Broad Street, E.C., was arranged with an excellent exhibit of garden produce. Cut flowers were the predominating feature of the display, and the varied character of the exhibits proved how wide is the range of subjects which the members interest themselves in. Competitions for six bunches of hardy flowers, six bunches annuals, sprays of Violas, Carnations, and other subjects created considerable interest, and in several instances the competition was very keen. Two excellent classes for competitive displays, one for London growers, and the other for members living in the country—in fact beyond a radius of five miles of the Royal Exchange always bring out some beautiful displays. Each class is for the best exhibit of flowers in the respective divisions, and by its means members can exhibit anything in the way of flowers either on the plant or in a cut state. In the open class twelve bunches of superb Sweet Peas, charmingly arranged, secured first prize for Mr. D. B. Crane, Highgate, and in the limited class Mr. F. W. Barnes, South Woodford, was first for a beautiful exhibit of tuberous Begonias and Petunias artistically displayed. Second prize was won by Mr. Bland G. Sinclair with a capital lot of Gloxinias, grown within four miles of Charing Cross. Seven ladies competed in a class for a bowl of Sweet Peas, and very pleasing were the effect the leading exhibits made. The foregoing will give some idea of what is being done.

In an adjoining hall, under the chairmanship of Mr. D. B. Crane, Mr. G. M. Gross read an interesting and practical paper on "Bulbs, and How to Grow Them." A capital attendance was registered, and all appeared to follow the lecturer with marked attention. This being a subject of very general interest to amateurs, the discussion resulted in a delightful evening being passed. Many questions were asked, each of which Mr. Gross replied to. It was announced that the president, Mr. T. W. Sanders, F.L.S., will give the next lecture on September 2, the subject being "How Plants Grow and Feed." The secretary is Mr. F. Finch, 117, Embleton Road, Lewisham, S.E.

**Shrewsbury flower show.**—This famous show opened in beautiful weather, and there was keen competition in most of the classes. A full report will appear next week. Mr. Shingler, gardener to Lord Hastings, won the first prize and champion cup for twelve bunches of Grapes, gaining 105½ points out of a possible 112. Messrs. Buchanan were second with 98½ points, and Mr. Thomas Lunt third with 95½ points. Mr. Goodacre, The Gardens, Elvaston, won the first prize for a decorated dessert table with a grand exhibit, 121 points; Mr. Mullins, gardener to Lady Somerset, was second with 111 points, and Mr. McIndoe third with 109. Mr. Jordan, Impney

Hall Gardens, was first for sixteen dishes of fruit, Mr. Goodacre second, and Mr. Dawes, Temple Newsam, near Leeds, third. Mr. Jones, York House Gardens, Malvern, was first for twelve dishes of fruit. There were many beautiful trade exhibits. For a group of ornamental plants, Mr. Cypher, of Cheltenham, was first, showing very fine Crotons; Mr. Thompson, gardener to G. H. Turner, Esq., of Derby, was second. Mr. Cypher was also first for a group of miscellaneous plants; Mr. McDonald, gardener to G. H. Kenrick, Esq., was second. Mr. B. Cromwell, gardener to T. S. Timmis, Esq., Allerton, was first for twenty stove and greenhouse plants; Mr. Cypher second.

**Cardiff Gardeners' Association.**

The members of the above association held their annual outing on the 11th inst., and visited Highbury, Birmingham, the seat of the Right Hon. Joseph Chamberlain, M.P. The party, numbering sixty, left Cardiff in saloon carriages at 6.25 a.m., reaching Ye Old Royal Hotel at 12.30, where dinner was thoroughly enjoyed after the long journey. The toast list was a brief one, for time was limited. The loyal toasts were given by Mr. F. G. Treseder, who presided. The next toast was that of "The Right Hon. Joseph Chamberlain, M.P." submitted by Mr. John Julian, who said how deeply indebted they all felt to Mr. Chamberlain for allowing the members to visit his beautiful garden. "The Cardiff Gardeners' Association" was submitted by Mr. Bishop, and responded to by Mr. C. E. Collier, chairman; Mr. Thomas Malpass, hon. treasurer; and Mr. John Julian, hon. secretary. The party then journeyed to Highbury, and Messrs. Deacon and Mackay kindly accompanied the members round the gardens. The contents of the numerous glass houses were greatly admired, as was also the beautiful pleasure grounds. On completing the tour round the gardens a vote of thanks was accorded to Mr. Deacon and Mr. Mackay for their courtesy. The party left Birmingham at 11.30 p.m., reaching Cardiff at 4.30 a.m. on Tuesday, having enjoyed one of the most successful outings the association has ever had.—J. JULIAN, Hon. Secretary.

**ANSWERS  
TO CORRESPONDENTS.****RULES FOR CORRESPONDENTS.**

**Questions and Answers.**—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 29, Tanistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

**Name of plant.**—W. E. C.—*Epidendrum sp.*

**Flower show schedules** (C., Herts).—Unfortunately schedules for the guidance of exhibitors are not always drawn up with that careful accuracy in wording which should characterise a model schedule. Not having all the particulars before us, it is difficult to express an opinion in the case you mention; but from your statement, and the conditions laid down for this class in the schedule, we fail to see any justification for disqualifying your exhibit.

**Veronica cyprioides** (J. M. B.).—We have not noticed the "disease" on Cypress lawsoniana before, but the same longitudinal splitting of the bark occurs in young Pines whose bark has been exposed to sudden bursts of strong sunshine.

**Hardiness of Chinese Ash.**—I should be grateful if you could let me know whether the Chinese Ash (*Fraxinus Mariesii*) is hardy enough to plant in a cold part of Worcestershire. I have observed nice trees of this in southern gardens, but not in any of those which I have visited in the Midlands.—A. R. GOODWIN. [Certainly worth trying in Worcestershire. It has stood 30° of frost without injury.—ED.]

**Potting soil for Geraniums (AMATEUR).**—Our correspondent is fortunate in possessing good loamy soil, the upper surface of a grass field. A better medium for potting soft wooded plants, such as Geraniums, Fuchsias, Begonias, Balsams, Petunias, &c., cannot be had. He should stack as many of the turves as will last him some years. For potting Geraniums the loam should be passed through a half inch sieve (taking care of the rough fibre that will not pass through, as this is the best article to use for placing over the crocks in the pots). To the loam should be added

roadside scrapings or river sand to the extent of one fourth, adding another fourth of horse manure, leaf-mould, or dry short manure. This when well mixed together and kept fairly dry will make excellent soil for potting Geraniums.

**Plantain on lawns** (E. M.).—The common Plantain is a perennial, and unless kept in check will spread both in growth and by seeding. Certainly the best way to rid a lawn of these weeds is to extract them with the aid of a sharp spud or chisel, cutting them low down. If you think that method too slow or costly you can try the use of Watson's lawn sand, as that if freely used settles on the hearts of the plants and gradually burns them out. The result is, whilst killing the plants, to leave them browned, disfiguring the lawn for some time. The lawn mower should be freely used to prevent plants from seeding. You may try a can containing paraffin, and with the aid of a piece of wire and a small piece of rag wound round one end, allow three or four drops of the oil to fall on the heart of each plant. Still that would be almost as slow a process as extracting the weeds, and not so effective.

**Grapes splitting** (H. D. R.).—We think your Grapes are suffering from too moist and close an atmosphere. Give more air day and night and probably the splitting will cease. We of course do not know what sort of a crop your Vines are carrying but suspect not a heavy one. Another year let them carry a heavier crop with a freer circulation of air and the splitting will most likely not recur. The ailment is not disease, and consequently bears no name. It is usually caused by defective ventilation and under cropping. The Grapes being unripe it is difficult to say what the variety is, but we think it is the Royal Muscadine. Send us samples when ripe and we will then give you the name for certain.

**Silene (T.).**—Your flower is simply an annual Silene, one of the many varieties in gardens. It is easily raised from seed sown in the open garden in spring.

**Hop Trefoil on lawn** (JUDGE OWEN).—The plant which seems to have taken possession of your lawn is evidently the creeping Trifolium procumbens, which grows close to the ground, has small yellow flowers, and is sometimes grown as the true Irish Shamrock. It would seem as if the damp, cold nature of the season was responsible for its increase, as hot, dry weather is detrimental to its growth. Only a few days ago we saw the smooth-mown sward of a Surrey churchyard literally a mass of golden-yellow with its tiny flowers, and there it seems to have done what it

is doing with you. You can no doubt remove much of the plant by severely tearing it out with iron rakes; still, it is probable that the next hot, dry season will materially check it. It is an annual, hence comes yearly from seed.

**Grape Madresfield Court cracking** (J. M. BROWN).—This is a common complaint in respect to this, one of the handsomest and best quality Grapes. We have grown it for a great number of years, and have scarcely ever suffered from this annoying complaint. We attribute our exemption to the fact of cropping the Vines fairly heavy and to the practice of admitting air rather freely day and night all the season through, and especially when the swelling of the berry is completed, and also during the time of colouring; in fact, until the Grapes have been cut. Madresfield Court is one of those Grapes which succeeds best under cool treatment; indeed, some of the best samples we have ever seen were grown in a cold viney entirely devoid of any artificial heat whatever. It will succeed better in a Hamburgh viney than in a Muscat house, where a fairly high temperature has to be maintained, but even if a little air is left on the lights opposite the Madresfield Court Grape day and night all the season through, and the Vine is allowed to carry a crop inclining to be heavy, our correspondent we feel sure will, like us, secure exemption from splitting.

**Rosemary dying off** (A. H. MURRAY).—The plant is evidently of considerable age, and this we regard a chief cause of the failing. You should layer some of the best bushy portions at once, and so save the greater part by replanting the young bushes in a fresh spot. Old plants frequently go off in this way when after years the soil becomes exhausted. The little brown insect is a species of scale that, if numerous, may do much harm. It may be checked by syringing with a mixture of petroleum and soft soap. To three gallons of soft water employ one wine-glassful of petroleum and 3oz. of the soap. First dissolve the soap in hot water. Stir freely while using the mixture.

ANNUAL SILENE (NEARLY NATURAL SIZE).

# THE GARDEN

No. 1606.—VOL. LXII.]

[AUGUST 30, 1902]

## A GREAT HORTICULTURAL SHOW.

**A**S a national exhibition of the general product of the garden the Shrewsbury show is perhaps the most important in the British Isles. It is difficult to say which section of the exhibition merits most attention, whether it is the gigantic and superbly grown specimen plants, the wonderful and effective combination of plants, both foliage and flowers arranged in groups for effect, the rich and varied collections of exotic and other cut flowers, the bouquets, baskets of flowers, and other beautiful devices too numerous to mention, or the rich collections of hardy and half-hardy plants and cut flowers collected together in immense masses.

But perhaps the fruit and vegetables are the most conspicuous feature. At the show held last week they were a wonderful sight, and, as most of the tables were decorated with flowers and plants, proved an exceptional feature. The vegetables were remarkable, and showed the high culture now attained. There are great possibilities in this direction, and a rich source of wholesome food is awaiting to be tapped for the teeming population of England. The committee of the Shropshire Horticultural exhibition and the joint hon. secretaries, Messrs. Adnitt and Naunton, deserve unstinted praise for the services they have rendered without fee or reward in bringing about this marvellous collection of national horticultural products.

If only the spectacular point of view were considered the results would not justify the efforts; but it is not so. This is evident to anyone who chooses to follow the crowd through the tents and listen to the expressions of delight and pleasure evinced from the highest to the lowest. Only one conclusion can be arrived at, and that is the good work done at Shrewsbury is reflected far and wide in the homes, the gardens, and the lives of those who are privileged to be present, and as regards the higher art of gardening (gardeners were there by the hundred) such an exhibition provides many good lessons.

The specimen plants were considered the finest seen at any show for some years. We wish they were arranged more effectively, and the immense pots and hideous props hidden from view. The groups arranged for effect were not up to the usual standard, nor the bouquets and choice cut flower classes. The

collections of cut herbaceous flowers, on the other hand, were of remarkable beauty and interest, and showed the greater interest taken in hardy perennials than tender exotics, requiring expensive glass houses for their culture.

The decorated tables of fruit were much admired. They were arranged with great taste, and were among the most interesting and beautiful exhibits in the show.

Apart from some of the Grapes, the fruit classes were not startling, and the finest Grapes were chiefly represented by the coarser varieties, such as Gros Maroc, Alnwick Seedling, and Alicante. Exception must be made, however, in this respect, as superb bunches of Mrs. Pince and Muscat Hamburg were shown respectively by Mr. Lunt and Mr. Goodacre.

With regard to fruit, the great excitement of the show centred round the great Coronation challenge class (to which was attached in the way of first prize a challenge cup of the value of £50, besides a cash prize of £20) for twelve bunches of Grapes in four or more varieties. There were ten entries, a total of 120 bunches, and the two judges, Messrs. Crump and Speed, had no enviable task allotted to them, especially in the short time at their disposal. We think that they must have been hampered more or less by the conditions imposed in the schedule for judging in this class. Far better would it have been to leave such important classes (or indeed classes of any kind) to the ripe judgment and experience of the best gardeners in the land, who are appointed to carry out this duty, than to try and fetter their efforts with irritating conditions. There was a general opinion that three judges would have been better.

## HERBACEOUS PHLOXES.

HERBACEOUS PHLOXES are pre-eminently the hardy flowering plant of the present season. No excuses therefore need be made for commencing so seasonable an article. Showy and varied in their colouring, and in a degree that can only be regarded as remarkable, these easily grown and profusely flowered plants should not merely find their way to all good gardens where now effective masses of colour may be needed, but should also be cultivated as their merits demand. Too frequently, however, the plants are admitted to this or that garden and given a place in the border, and often enough only in the borders that encompass the kitchen garden proper. If the garden is a large one with spacious lawns and pleasure grounds it is but rarely the Phloxes are found in anything like good condition, even if at all.

Yet it is not clear why so good and useful a group of hardy flowering plants should be relegated to an area so limited and, in comparison with their worth, so undignified. Happily in some good gardens these plants are not so restricted, and it is in such instances that we see the value of these plants fully displayed. In the historic gardens at Syon House, Mr. George Wythes, foreseeing the great value of the herbaceous Phlox for effective grouping, has filled many large beds with these plants in separate colours, the only way in which Phloxes may be seen to advantage. In a similar manner at Kew have these things been massed either in beds or in handsome blocks of colour in the border, where snowy purity, brilliant salmon, scarlet, or vermillion, and more recently the remarkable departures in greyish blue and heliotrope violet, and from these to a purplish hue, have all been afforded an opportunity of display or of contrast, not only with their fellows, but with such other things as may be then in season. Not that we want much, if indeed anything, to be quite near the Phloxes, for in these there is a sufficiently large area of colour to satisfy the most fastidious mind. What one most of all deplores perhaps is to see these beautiful plants struggling for life in the usually overcrowded shrubbery border.

"It is not a good Phlox year at all" is an expression by no means uncommon, by which is generally implied that from the nurseryman's point of view the flowering is not good. Obviously, too, it is an inference that no special attention is paid to this class in a dry season. This I regard as a mistake, and one for which the nurserymen must themselves suffer. Thirty years ago I was engaged in the Tooting nurseries of the late Mr. Robert Parker, and Phloxes were always a great success there, yet the very light sandy soil, resting as it did upon a deep bed of pure sand and gravel, was anything but an ideal one for the Phloxes, and had the plants been left alone the results would have been pitiable in the extreme. As it was no such beds of these plants could be seen around London at that time. Giant heads or panicles 18 inches through were usual, and for which frequent attention and much moisture was mainly responsible. Edged around with the common Gentianella, closely run into a dense verge, so to say, it was possible by this means and the low flat surface to deluge the specimen beds containing the plants twice a week in very hot weather. Any beds not so edged around were soiled up for the time. To the perfection to which the plants were grown was due the fact that several thousand plants were sold each year. It certainly can be no encouragement to a would-be purchaser to see the plants weltering in the sun's heat, and few plants so well repay good culture. The need for this watering or mulching, or both, is very clear, as the Phlox is a great surface-rooting plant. This item cannot too strongly be emphasised, the masses

of spreading root fibres often barely covered with soil cover quite a large area. The sun's heat upon these is naturally very quickly felt, hence the greater need for the moisture, which, during the growing and flowering season at least, is of greater importance perhaps even than a large depth of soil. Briefly summed up, however, it is hardly possible during growth either to over-feed or over-water the Phlox. With these facts realised and attended to it is an easy thing to grow herbaceous Phloxes to the highest standard of excellence.

To be more definite, perhaps, and as I hope helpful to many amateurs who, I feel sure, would like to grow these plants well, I will cite an instance of my practice in this district, where the soil is light and much drained. Digging the beds as deeply as the soil permits at any time during autumn or winter, a heavy layer of cow manure is placed in more than 1 foot deep and covered with a little soil; the surface is then lightly trodden. This is done throughout the bed or borders, and to the upper surface soil a good dressing of well-decayed horse manure is added. Even with this double manuring I have on very poor soils given a surface dressing of manure to lay in position during the winter and be lightly forked in early spring before planting. Generally I prefer spring planting, and in heavy soils particularly. In such light soils as I have just mentioned, however, the planting may be done just as well in early autumn; indeed, the plants repay it in this class of soil by their continued rooting. Where the planting can be done at this season there are two classes of plants best suited for planting out, viz., the young ones that have been rooted and potted in the spring; and, secondly, those plants that in soils where Phloxes do well appear a few inches from the main clump. The plants that should never be bedded out are those which have been starved in pots for more than a year. The only way to resuscitate such plants quickly is to shake away all the soil and give a free chance to fresh roots. Much the best plants, however, with which to form a collection are those raised from strong vigorous cuttings taken in March, rooted in a frame gently warmed, potted forthwith into rich soil in 5-inch pots, and after a month plant them in the beds or borders. Such a plant will produce one head of bloom in September or possibly earlier; the next season the same plant will carry four very handsome heads, and a year later about two dozen of bloom, providing a mass of colour nearly or quite 4 feet across. Up to this period the Phlox may be regarded as in its prime, though with plants upwards of four years old I have had even more handsome heads of flowers where the plants have received special treatment. The height to which a variety will attain can only best be judged under such good treatment. In other words, the youthful spring cutting that makes its first head of bloom at 15 inches or 18 inches high will at four years old be fully 4 feet high. Plants of this latter age, however, require some thinning of the stems, and the removal of the central ones is more or less essential. E. J.

(To be continued.)

## EDITOR'S TABLE.

### GLADIOLI FROM MESSRS. KELWAY.

Messrs. Kelway send us from their nurseries at Langport, Somerset, superb spikes of Gladioli. We have seldom seen spikes so strong and well flowered, with flowers individually of great size and beautiful colouring. The most noteworthy varieties were Edward VII., carmine, one of the

most striking of all the varieties raised of recent years; Empress of India, a rich magenta shade; Princess Royal, white, with the petals edged with rose-pink; Lord Roberts, salmon, passing to deep rose; Orme, white, splashed with pink, and Black Meg, crimson-lake. A very handsome and interesting contribution to our table.

### SWEET PEAS.

Mr. Alfred J. Baker, The Hollies, Upper Richmond Road, sends a stem of Sweet Pea bearing seven flowers. This is not usual. The flowers individually were exceptionally fine.

### FASCIADED DAHLIA.

We receive from Lady Braybrooke, Hertfordshire, a remarkable example of fasciation in a Dahlia. There are two blooms joined back to back. A careful search shows that the calyx of both flowers exists, but the florets of the edge are so well brought together that the combination appears to be complete. The actual form of fasciation is not so very uncommon, but what makes it remarkable is that the two blooms are so large and perfect, while the section of the double stem forms a perfect figure of eight. The Dahlia is of a pure strong canary colour of the old florist's type and of excellent development. The joined flowers have a face diameter of 4½ inches and a width from face to face of 2½ inches.

## NOTES OF THE WEEK.

### FORTHCOMING EVENTS.

September 2.—National Dahlia Society's Show and Royal Horticultural Society's Meeting, Drill Hall, Westminster.

September 3.—Glasgow and Preston Shows (each two days), and York Florists' Exhibition.

September 4.—Paisley Horticultural Show (two days).

September 6.—Thornton Heath Dahlia Show.

September 10.—Royal Caledonian Horticultural Show at Edinburgh (two days).

September 16.—Dahlia Show, Royal Aquarium (three days).

September 18.—Great Fruit Show, Crystal Palace (three days).

### FUTURE NUMBERS OF "THE GARDEN."

A series of articles on Wall, Water, and Rock Gardening will appear shortly, Mushroom Growing, Naturalising Bulbous Flowers, Hollyhocks, the Mixed Borders at Hampton Court, Regent's Park, and elsewhere, Perennial Larkspurs, Trees and Shrubs, Sweet Violets, old and new, &c. The usual features will not be interfered with. We are pleased to see that our willingness to give advice to readers is taken great advantage of. We wish to extend this feature of THE GARDEN as being at once interesting and helpful.

**Mixed Sweet Pea seed.**—“B.” only voices a complaint general this season both among amateurs and trade growers in describing the mixtures among his Sweet Peas. The trouble is too widely spread to be attributed to any carelessness among seedsmen, and is said to arise from the unusual prevalence last season of a humble bee, which is strong enough to move the keel of the flower in abstracting the honey and thus effect cross-fertilisation. I do not speak from personal observation, but the report may be useful in stimulating observation and clearing away unjust suspicion.—CHARLES E. PEARSON, Chilwell Nurseries, Loddonham.

**Presentation to Mr. Norman, V.M.H.**—All gardeners will be interested in a presentation that was made a few days ago to Mr. G. Norman, gardener to the Marquis of Salisbury, at Hatfield House. It was the occasion of Mr. Norman's silver wedding, and presents came from many interested in this excellent gardener's work. Mr. Norman came to Hatfield fifteen months after his marriage, and has therefore spent almost the whole of his married life in the service of the Marquis of Salisbury. Among the many presents were a silver inkstand from the

Marquis and Lady Gwenolen Cecil, with the following inscription: “Presented by the Marquis of Salisbury to Mr. G. Norman on his silver wedding, in memory of long and faithful service”; a pair of silver candlesticks from Viscount and Viscountess Cranborne, and also a pair of silver candlesticks from Mr. J. C. McCowan and Mrs. McCowan, the agent at Hatfield. It is always a pleasure to see such evidence of good feeling between master and servant. Mr. Norman is one of the best of English gardeners, as all know who have visited the fruit and kitchen gardens at Hatfield. Few growers of fruit are more skilful. Mr. and Mrs. Norman have our good wishes.

**The Hollyhock and disease.**—The treatment recommended for these beautiful plants in THE GARDEN (August 23) is not really the best. I allude especially to the liberal enrichment of the soil with manure. Owners of gardens round here complain of disease. I myself have grown Hollyhocks from seed only to lose them through disease the third year, while in the cottage gardens—some of them within 400 yards of this place—the same plants flourish magnificently year after year, and disease appears to be unknown. In these gardens manure also is unknown. The facts, which speak for themselves, have converted me. I believe the average gardener systematically overdoes the manure in growing herbaceous plants. Manure, even the strongest, if applied at the right time is undoubtedly invaluable, such as fowl manure applied to Montbretias in May or June.—BASIL LEVETT, Wychnor, County Staffs.

**The Wise Apple.**—I was more than gratified to read the account of this Apple by your esteemed correspondent Mr. Owen Thomas in THE GARDEN of the 16th inst., as the variety Court Pendu Plat has always proved one of the most useful varieties that one could wish to grow. Many times have I been thanked for recommending it to those unacquainted with it, and never yet have I heard a complaint. It is of handsome growth and a free cropper, and will flourish in almost any position. I always found that by keeping the growths well thinned that almost every fruit took on the rich crimson cheek so necessary to a well ordered dessert table, the flavour being very fine and size not too large. It should have a long season to mature, otherwise the fruits soon shrivel and lose their true character.—A. B.

**Shirley Poppies.**—Few things are more beautiful in the open garden than these, more especially when well placed. In our own garden this year they have given much pleasure in a mixed hardy plant border. The seed was sown in boxes in January in a cold pit, and when strong enough the seedlings were planted out in groups. As rabbits are numerous we put 2-feet wire round the groups. When they commenced to grow some small spray stakes were placed amongst them, and the wire kept them in position. When over the spaces will be filled with Cosmos. Having some growing close to my cottage, I have noticed how much more beautiful they look in early morning than later in the day.—J. CROOK.

**Two good light-coloured Roses.**—In certain gardens a few Roses are disappointing. After trying many kinds we find it best to grow those varieties that will always bloom well. This is our position; consequently we have to confine ourselves to a few kinds. Among light-coloured kinds nothing is so satisfactory as Mrs. John Laing and Mme. Gabriel Luizet. They thrive quite as well in the standard form as otherwise. Every year we can depend on them to fill the basket for furnishing. Let the winter be what it may, the plants do not suffer from frost. In the autumn they are prone to mildew, but we keep this under by giving them an occasional syringing with Abol insecticide. In this way good blooms are secured in autumn, especially from Mrs. J. Laing. The flowers are charming when arranged in the house, one kind in a vase, or the two together if wished. I often think how we kill many good colours by mixing. I have a good bowl full of these two kinds on my table, and on several occasions this summer I have had much pleasure from their delicious scent.—J. CROOK.

**Chenostoma hispida.**—Though rarely seen elsewhere, this has for many years been employed for the summer decoration of No. 4 greenhouse at Kew, so that its value in this respect must have been noted by many. It is a neat-growing plant of a sub-shrubby character, of a dense, twiggy growth, about 8 inches high and quite as much through when grown in a 5-inch pot. The tiny pale pinkish flowers are borne in such profusion that the entire plant is quite a mass of that tint. The Chenostoma was introduced from the Cape of Good Hope in 1816. The plants are of easy culture in any good soil, and may be propagated either by cuttings or seeds. It is used at Kew this season for bedding purposes in the open ground, and under such treatment is highly satisfactory, the tiny blossoms, than which little else can be seen, being of a somewhat deeper hue than when produced under glass. It is employed as a carpet plant to a bed of scarlet-flowered tuberous-rooted Begonias, the combination being a very happy one.—H. P.

**Good Abutilons.**—Like many other popular classes of plants, the varieties of Abutilon are now so numerous that it is a difficult matter to make a limited selection. Of yellows the first place must, I think, be assigned to Golden Fleece; of the whites—and I have tried several—the best is Boule de Neige, which must have been grown now for something like thirty years. Langlant I consider far and away the best of the rich red-tinted varieties, and a very good pink is M. Louis Marignac, one of the oldest of this colour. Abutilons not only make neat-flowering plants for the greenhouse, but, grown as tall standards, they are useful for various purposes, the raised position displaying the flowers to the best advantage, which is not always the case when grown as low bushes. Owing to the pendulous nature of the bell-shaped blossoms, these Abutilons form delightful roof plants, a remark that applies equally to some of the Fuchsias. For training on the back wall or furnishing the pillars of a greenhouse, Abutilons are well suited, the rapid rate at which they will cover a considerable space being in their favour for this purpose. Their propagation and cultural requirements, too, are of the simplest.—T.

**The fruit crop in Gloucestershire.**—These on the average may be classed as poor this season. The best crop of Pears seen this year were at Westonbirt on the kitchen garden walls. The stone fruits are in most gardens poor, while in others, especially if the conditions were not quite to their requirements, are a total failure. Down on the Severn Banks the Plum trees are literally burdened with fruit, so that I believe a deficiency in some localities will be made up from others. As regards Apples, they average a fair supply, although the boisterous winds during the last few days have resulted in many being felled and damaged. *Aphis* has undoubtedly during the past dry season ravaged the orchards and Rose trees of many gardens. It has been unusually active on the Plum trees, while on some Rose bushes which I have seen the *aphis* literally covered the twigs and foliage. There seems to be no better remedy than a thorough syringing with a mixture of Quassia chips and soft soap, this being washed off after an interval of two hours with tepid water.—JOHN DENMAN.

**Branches of trees for decoration.**—It is remarkable what a beautiful effect can be produced in entrance halls and other places by the artistic arrangement of large branches of forest trees in tall vases. This is especially the case during the autumn when the leaves of our deciduous forest trees assume their rich colour tints. Even in the summer by the different shades of green to yellow, which are always ready to one's hand, a pretty effect may be produced in all dimly lighted rooms. One of the best and most artistic arrangements of this description I ever saw was carried out by the Countess of Kenmare, at Kenmare House, Killarney. It was the first time I had seen such bold and skilful effects produced by means so simple and so conveniently available. I need only suggest how rich an effect can be produced by a tall full foliated branch of a Copper Beech

arranged in the corner of a room against rich gold drapery, or the beautiful gold and crimson of the ordinary Beech against white, or the pale gold of the common Elm against green; indeed, many positions in such rooms will suggest themselves where this form of decoration in great variety can be enjoyed. In filling such large vases, cases of zinc or tin should be provided to hold water in sufficient quantity to keep the branches fresh, say, for a week. If the rooms are fairly cool they will remain fresh even longer. After reading the above, I can well imagine many lovers of trees being shocked at the idea of anyone having any regard to the beauty and symmetry of our grand old forest trees recommending such a proceeding as this. Let me assure any such that if the work of what I may legitimately call pruning the trees is entrusted to skilful hands the trees may even be improved by such judicious thinning.—O. THOMAS.

## THE FLOWER GARDEN.

### CHRYSANTHEMUMS AT TOTTERIDGE PARK

**C**HRYSANTHEMUMS at this well-known place have so far quite equalled the expectations formed when writing of them in THE GARDEN of May 31 last. Between 300 and 400 plants are grown, and the selection is exclusively confined to the Japanese varieties. The question of bud selection on the occasion above referred to was considered at some length, and, in view of what was then stated, it is interesting to learn that the facts have very largely been verified. With regard to the present condition of the plants, it may be said that many of them are developing their buds rather early, but not to such an extent as to mar the prospect of a successful issue. However carefully a grower may time his buds, the weather may completely upset his calculations. Mr. Brooks has every reason to be pleased with his Chrysanthemums, as they embrace the best of the old sorts as well as a good proportion of the most promising of the newer introductions. In most cases second crown buds will be retained, and these are developing just now. In some cases the plants have been sent on to the third and fourth run, and the buds in these instances were in the embryonic stage on the occasion of our recent visit. The cooler and moister weather has made the plants more "leggy" than usual, but, except in the case of Australie and its white sport Mme. Herewege, and Mrs. J. Bryant, with a few others, their height is no great disadvantage.

The summer quarters or standing ground for the plants is very open and exposed, especially to the north and north-west, and, in consequence, the gale which was experienced on Saturday and Sunday, July 26 and 27 last, caused serious havoc, some plants being completely beheaded, and others losing valuable shoots. During the height of the storm on the Saturday three long rows of plants were blown down. Notwithstanding all these checks and disadvantages, the plants are most promising. Lily Mountford promises well; its growth is sturdy, and the same may be said of Mrs. G. Mileham, a variety of which we are likely to hear more of in the ensuing season. Second crown buds were developing on plants of W. R. Church (the Colonial importation), M. Chenon de Leche, M. Louis Remy (a sturdy plant), Lord Ludlow, Mr. T. Carrington, and Mrs. Barklay. Florence Molyneux is grown on a single stem, the first bud being retained, and even under this system of culture the plant is tall. Calvat's Sun on first crown buds looks well, and the same may be said of Mrs. J. Bryant, which always provides a welcome piece of colour on the show-boards, and in the vases, too. All the members of the Mme. Carnot family of plants seem promising. Vivian Morel and its sports are doing much better than usual; the growths have all along developed freely, and they should in consequence give good

results. The wood of all the plants is ripening well; in fact, it is thought that in some cases it is just a little too matured.

D. B. C.

### LANTANAS.

LIKE the Verbenas, to which they are nearly allied, the Lantanas have been much neglected, but they seem likely to come to the front again. Those who saw the pretty group staged by Messrs. Watkins and Simpson at the Temple show could form an idea of their usefulness as pot plants, and they are equally valuable for bedding, though they are rarely seen out of doors. The dwarf yellow variety Drap d'Or makes a most effective bed; Chelsea Gem, crimson with a bronzy tint, is also good. I have seen these keep up quite a bright display throughout the summer. There are many shades of colour; for instance, pure white, lemon, yellow, orange, pink, crimson, and intermediate shades.

The Lantana may be grown from seed, but it is better to propagate from named varieties, as they can then be kept in distinct colours, and seedlings also vary in habit of growth. Treated in the same manner as Fuchsias through the winter and started in warmth early in the year, plenty of cuttings may be had and they root as easily as Verbenas. They require to be kept growing freely until the time for planting out, or if to be grown in pots they must be potted in a rich loamy compost and potted on before becoming root-bound. As they are of a woody nature they may be grown on from year to year until they form good sized bushes, and they will keep up a succession of bloom so long as they are kept growing freely. There are several species of Lantanas. Those from which we get our garden varieties come from South America; they have often been treated too much as stove plants. Warmth in early spring is beneficial, but later on they succeed well planted out or when grown in the cool greenhouse.

A. HEMSLEY.

### NOTES FROM A DEVON GARDEN.

#### LILIES.

As a Lily grower in a small way I have read Mr. P. Barr's most interesting letters from Japan and Cape Town with great profit. His remarks in the issue of the 16th inst. on the parentage of *L. testaceum* particularly interested me, as this summer a natural hybrid, *L. candidum* × *L. chalcedonicum*, has flowered. Some four years ago the two parent Lilies were flowering very near to each other. This season a strange Lily showed bloom in a large bed of *L. speciosum*. I thought at first it was a young bulb of *L. candidum*, but the flower (only one) soon disproved that, so I asked Mr. Wallace to name it for me. This, with his usual courtesy, he did, saying it was undoubtedly *L. testaceum*. I am now eagerly looking for more bulbs to show themselves; for if one, why not many? One thing is very sure—since the seed got into the bed not a leaf showed above ground till the bulb was ready to flower. It is in such a spot that it must have been seen. It is a wonderful season for Lilies. *L. Henryi* has now grown to its full height, just under 7 feet, and with twenty-nine buds on the strongest stem. I heartily agree with Mr. Barr that it is "Tiger," not "Speciosum," *L. longiflorum* that have been in the same place three years (fourth blooming) are doing as well as new bulbs, and *L. auratum* plants are like trees.

#### GENERAL NOTES.

*Romneya Coulteri* has been, and is, very fine, generally seven to eight of the great flowers out. I measured one, 6½ inches across, but there have been others a good deal larger. The cold spring has suited all sub-tropical bulbs; *Calochortus* and *Tigridia* have been unusually fine and covered with bloom.

I expect the great amount of rain that we have had this summer has had a good deal to do with it, for *Gladioli* and *Hyacinthus candicans* are splendid. Roses are in full bloom, a very unusual thing here in August. If anyone has not yet invested in the three Irish Roses, Beauty, Modesty, and Glory, they ought to. They are lovely, hardy, very free-flowering, fast growing, and do not suffer from

mildew. I think the most beautiful of the Polyantha climbing Roses is Queen Alexandra. I can say for it all that I have said of the Irish ones, only, of course, "free flowering" in the sense of quantity of bloom, for it is not perpetual.

Is not Mr. Fitzherbert mistaken in saying that "Melia Azedarach" is evergreen? I have several trees, yet they are strictly deciduous, and I was certainly told that at Galveston, Texas, where these came from, they were not evergreen.

#### PRIMULAS.

*Primula sikkimensis* is so far perennial here that it has flowered twice. My plants (about sixteen) are quite large clumps: they are on raised ground facing north-east. I have a small collection of fifty Primulas, species and varieties, including *P. obconica*, which has steadily flowered all the summer; *P. chinensis*, a self-sown seedling, which stood very many degrees of frost last winter (the leaves being frozen solid), and flowered gaily from March to May; and looks like staying another winter; *P. Poissoni*, now in full flower, and *P. megaseifolia*, which seems to like cold. A number of Primulas that flowered well in the spring are flowering again, including *P. rosea grandiflora*; *P. capitata* is throwing up strong flower heads. I have *P. imperialis*, but only one tiny plant, so it is to remain with *P. Forbesi* in a cold frame all next winter, going out to the Primrose patch next spring.

#### HYDRANGEAS.

It is just the right weather for Hydrangeas; they have been in flower several weeks, beginning with *H. stellata*, a very beautiful variety, with bright blue fertile blossoms, and large white sterile ones, turning to bright crimson with age.

Dawlish, South Devon.

A. BAYLDON.

## NOTES ON HARDY PLANTS

### POLYGONUM ALPINUM.

I DO not recollect once seeing this catalogued in any nurseryman's list, and yet it is a showy, free-growing, hardy sort, very effective in its day. It is a rather dwarf bushy plant when established, bearing a wealth of creamy white Spirea-like heads of bloom. With me it does anywhere. Its only fault is that it is rather commonplace in appearance after the bloom is over. Still, it is well worth growing, being very effective in clumps in spring.

T. J. W.

### CAMPANULA RAPUNCULOIDES.

ANYONE can get a plant of this—as I did—for sixpence. If planted in the flower border it will then cost considerably more to weed out. Of all the rampant plants I know none are so difficult to eradicate. Every little purple shoot (and what hosts of them there are!) forms itself into an independent plant. Mine has wormed itself among the Peonies, and now I am confronted with the alternative of letting it come up and plucking it off as it comes, which does not kill it, or of lifting the Peonies and freeing them entirely of the little roots of this pest. Let me warn your readers against admitting it into any place but a thoroughly wild garden. There it will hold its own with anything, and, without a question, it is very pretty.

Woodsdale Park.

T. J. W.

### HARDY FLOWERS AT SHAMBELLIE, NEWABBEY.

The dull summer seems to have well suited the bright and dry garden of Captain Stewart, and a visit paid to it at the beginning of August proved of much interest. Among the things which I noted as being in good condition and thriving well were *Heuchera brizoides*. This was the finest plant I have ever seen of this charming *Heuchera*, and the soil, which is light and with a large pro-

portion of granite grit and sand, appears to suit it remarkably well. Tall and splendidly flowered, no one need wish to see this graceful plant in better condition. The rosy flowers were large and fresh on their unusually tall stems.

#### ALSTREMERIAS.

These, again, were very fine, and the manner in which they are inclined to increase has been at times rather perplexing, especially in the case of *A. aurantiaca*. This, however, had led to a pretty feature appearing in the shape of its flowers emerging among the branches of a double yellow Scotch Rose in one of the borders. The Rose was out of flower, but the blooms of the Alstroemeria appearing through the Rose foliage looked unusually pretty. *A. chilensis* is also quite a success in this pretty Kirkcudbrightshire garden.

#### LOBELIA TUPA.

Although not in flower, this Lobelia, or Tupa, as at one time called, was doing unusually well and was remarkably vigorous. The whole of the south-west of Scotland seems to answer well for these south-west American plants.

#### PLAGIUS GRANDIFLORUS.

One does not often meet with this quaint looking old composite, whose flowers are devoid of ray-petals, and which, when well grown, is a striking plant in the flower border, with its large golden-yellow flowers. There is a very good plant at Shambellie, though here, as in most places, it cannot be relied upon as absolutely hardy. It is, however, about three years since it was planted in the border here, and I recollect it in bloom last year. Even in favoured spots in Ireland its life is not usually a long one.

#### PENTSTEMON LEVIGATUS.

This is a capital border Pentstemon, which has proved to be hardy in several Scottish gardens, where its pale purple or lilac flowers produce a pleasing variety at the end of July in ordinary seasons. The granite formation appears to suit it well, as the health of the specimen at Shambellie would indicate. In my own garden, where the general character of the soil is a sandy peat, it is not nearly so long lived as there, nor does it form such healthy looking plants.

#### PHLOMIS TUBEROSA.

This, again, grows remarkably well in Captain Stewart's garden, and the appearance of these "Jerusalem Sages" is so distinct with their whorled labiate flowers that they constitute a welcome change from the plants one ordinarily sees at this season. *P. tuberosus*, an old garden plant, by the way, has dense whorls of purplish rose flowers, with a white fringe to the upper lips. A plant such as this, growing to a height of 4 feet or 5 feet, is worth having in the herbaceous border.

S. ARNOTT.

#### LILIES FOR ENGLISH GARDENS.

I HAVE read with much interest Mr. Peter Barr's remarks on Lilies in your issue of the 16th inst. Some of them are so much at variance with my own belief that I feel compelled to criticise them. Firstly, his statement about *L. Henryi* being only a geographical form of *L. tigrinum*, anyone who has observed *L. Henryi* knows that if there is a distinct Lily it is this one. In only one point does it resemble *L. tigrinum*, viz., that it flowers at the same season. However, it is not worth while discussing the matter further. I only wished not to let Mr. Barr's emphatic statement pass uncontradicted. (I believe Dr. Henry found *L. tigrinum* in the same district as *L. Henryi*.) As we were the first outside Kew to import *L. Henryi*, I suppose I may take it Mr. Barr refers to us when he states "it was put into commerce as a form of *L. speciosum*." We have always catalogued it as a true species and never as a form of *speciosum*, but in speaking of it generally, to convey an idea of its habit, have used the expression "the orange-yellow *speciosum*," which is quite justifiable.

As to the form of *L. longiflorum* named *L. Harrisii*, whatever its origin it is perfectly distinct

from all other forms, and bulbs of *longiflorum* grown on in Bermuda do not obtain the same size and freedom of flowering. *L. eximium* and *L. Wilsonii* I consider identical. It is a very distinct form and has the finest flowers of any, is easily detected in growth by its broad, dark, shining foliage: the flowers are fewer in number, very long in the tube, and widely expanded at the mouth. I do not know whether this is what Mr. Barr means by *L. longiflorum multiflorum*, but I hardly think so.

Will Mr. Barr give his authority for stating that *L. speciosum Krätscheri* is a white form of *roseum* and *album novum* of *punctatum*? The former has been long known as *Krätscheri*, and considered quite a distinct plant, and the true white *speciosum* differs in many points from the Dutch *album*, which I expect originated on the Continent. It also has a yellowish white bulb. *Roseum* is a red bulb. In *album novum* we have a strong vigorous form, far superior to *punctatum*, which has almost died out, and to those who know the two forms they do not appear identical. I have never heard before that *Batemanniae* was another name for *venustum*. I may be wrong in thinking my father correct in giving it specific rank, but granting that is going too far, class it as a form of *Elegans*; in bulb, shade of colour, foliage, and growth it is quite distinct from *venustum*. The full history of this Lily is given on page 177 of "Notes on Lilies," and its distinctiveness clearly established. I remember well how pleased Mrs. Bateman was when it was named after her. I am sorry that Mr. Barr did not contribute all the valuable information he now gives us last year at the time of the Lily conference. It would have added greatly to the interest of the gathering, and his many statements and theories could have been well thrashed out. Apologising for taking up so much of your space.

Colchester.

ROBT. W. WALLACE.

### LILIUM GIGANTEUM IN SCOTLAND.

At different times a good deal has been said about *Lilium giganteum*, but still it may be of interest to many of your readers to know how this fine Lily thrives in the west of Argyll. One specimen at Achnamara, the property of Colonel Malcolm, of Poltalloch, reached the height of 10 feet, the circumference round the stem at ground level 13 inches, a fact I think worth recording. At the same time at Poltalloch three bulbs in a group flowered, the tallest one reaching the height of 8 feet with fifteen flowers, the other two almost as tall. They grow in a border which cannot be called shady, but fairly rich in vegetable matter.

D. S. M.

### ERITRICHIUM NANUM.

NOTHING is perhaps more puzzling than the successful culture of this most lovely of high alpines. You may procure, no matter how promising, a specimen in a pot, and I believe I am not exaggerating when I say it is only by the purest accident the plant ever flowers and lives with us at all. I have collected *Eritrichium nanum* several times, and knowing the difficulty I have taken specimens as small as I could find, and with the best fibrous roots from both sunny or shady positions, and on one occasion I was so pleased at discovering a little colony growing in more or less disintegrated stones among small batches of humus that I emptied my knapsack to store these treasures away. The plants were planted the next day in what I considered the most suitable position, but before another year had passed hardly any *Eritrichiums* were left.

Herr Max Kolb, of Munich, a most successful grower of alpines, says the plant grows in crevices, needs little food and not much moisture; it will grow under the same treatment as, for instance, *Androsace helvetica*. Unfortunately, I cannot speak with the same confidence, excepting that I find *A. helvetica* a comparatively easy plant to manage. The plant resembles and is closely allied to our Forget-me-nots (*Myosotis*), but grows only

about 1 inch high; it is of slow growth, forming dense silky cushions. The rootstock is woolly, deep growing, while the leaves are lanceolate-oblong or spatulate; the radical ones imbricate, often forming rosettes, petiolate; the caudine leaves are sessile. The young leaves are at first covered with silky hairs, which disappear as they get older. The flowers are produced in short racemes, beautiful bright blue, similar to those of the pretty *Myosotis rupicola*. No other alpine seems to me to have as much charm as *Eritrichium nanum*, and to equal it in beauty and elegance. It is a local plant, growing in altitudes of between 7,000 feet and 8,000 feet on the Alps of Switzerland and Austria. It flowers during July and August.

#### PHYTEUMA COMOSUM.

THE earliest recollection I have of this pretty and interesting alpine is from a coloured plate and a dried but well-preserved herbarium specimen. Like *Eritrichium nanum* it was then considered impossible of culture, but since I have not only successfully grown the plant both from collected plants, and still more satisfactorily raised it from seeds, with a little care it can be grown by almost everybody either in pots or on the dry part of the rockery, in crevices with only scraps of peaty soil or humus, with plenty of silver sand. It is slow growing, and only 2 inches in height. The somewhat ornamental foliage is heart-shaped, petiolate, coarsely dentate, at first deep green, later purplish; the caudine leaves are lanceolate. The pretty, interesting, and distinct flowers are capitate, comose, and blue with purplish red points. Although the genus *Phyteuma* consists of several, probably from fifteen to twenty different species, all of which are worth growing, none are as pretty and interesting as *P. comosum*. Its natural habitat is in the Alps of Switzerland and Austria, but it is very local. It also grows on the Carpathians, invariably in the most inaccessible places, usually on vertical walls of rock, hence the difficulty of collecting it with sufficient fibrous roots to ensure success. For this reason plants raised from seed are far superior. When pot grown they are quite certain to live. Some years ago I remember seeing in Dr. Neubert's *Garten Magazin* an interesting article on *Phyteuma comosum*, by the enthusiast bank director, Herr Sendtner, of Munich, who cultivated a number of these plants in pots most successfully in a back yard surrounded by five-storey high walls in the city of Munich, mentioning that these specimens had been for eleven years in his possession. It flowers during July in altitudes of 4,000 feet to 4,500 feet during July and August. On our rockworks or in pots it flowers, however, as early as June.

G. REUTHE.

#### THE EDELWEISS.

THE Edelweiss (*Leontopodium alpinum*) is perhaps one of the most popular plants of the alpine flora, and the one plant of thousands that the average mountain tourist is most anxious to discover. Interesting the plant is undoubtedly, though beyond this it possesses but few attractions from a decorative point of view. Of course its correct home is the rock garden, where it should be planted in not too rich soil, yet quite firm. The plant is seen always to good advantage if rather freely grouped in colonies in the rock garden. The plant may be grown with complete success when a few strong seedlings are firmly planted in a narrow chink of rock, so placed that a deep fissure of gritty or sandy loam may be assured for the roots to ramble in. Plants in pots may be grown and flowered when the collar is tightly wedged between some pieces of stone or old mortar. At this season of the year I have frequently received parcels of the

A COLONY OF EDELWEISS IN THE GARDEN OF THE LATE MR SELFE-LEONARD, HITHERBURY, GUILDFORD.

plant by post merely wrapped in a bit of sphagnum moss and some oiled paper, and in this way they travel well. But whether these collected plants will continue to succeed under cultivation in our lowland gardens depends as much on the way they have been lifted as upon any subsequent treatment on arrival. Assuming such plants do come to hand, and possessing a fair amount of fibrous roots, there is no better way of starting such things than by planting them not too deeply in cocoanut fibre and sand. Many plants that frequently rot, and that rapidly, when placed in soil will start new roots quite quickly when planted in this simple way: Give one good watering when planted, place in a rather shaded place and not a stuffy, ill-ventilated frame, and leave them alone for a week at least without further moisture. In this way scores of rare alpines have been treated after a long journey with a good deal of success. On the other hand, those who have no opportunity of obtaining plants direct from their mountain home will find seeds by far the best method of obtaining a stock. Indeed, seeds must be looked to for perpetuating the stock also, for the plant is not always a success when divided. On the other hand, it may be grown from seeds with perfect ease, and though I have grown the plant with success I am bound to say I have never been able to obtain such results as I saw a few years ago in the gardens of Pusey House, Berkshire. Here the Edelweiss was treated as a biennial, large beds being edged around with it. The plants grew with considerable vigour, making tufts of leaves over a foot high and flowering abundantly. In this way a succession of plants, to flower each year, was maintained, seeds being harvested in great quantity. The plant produces tufts of hairy or woolly leaves from which issues the flower-stem, usually not more than 4 inches or 6 inches high. The true flowers are small and inconspicuous, yellow in colour, and set as it were in a star-like whorl of woolly, oblong leaves, rendered white or nearly so by the density of the down-like tomentum that covers them. To this peculiar and interesting character the plant owes much of its popularity. E. J.

#### NEGLECTED GARDENS.—I.

A NEGLECTED garden is a miserable and depressing place, and the words have a dismal sound with

them, unless, indeed, these neglected gardens pass into the hands of genuine garden lovers; then something is sure to be done to improve them, and the words become fraught with delightful and bewildering possibilities.

There is great pleasure in planning and stocking a new garden, but there is often as much, and sometimes more, in altering and improving a garden that already exists. The neglected garden has this advantage—it will not suffer as an entirely new one would from that look of the nursery garden that is so inartistic and wanting in dignity and repose, and that takes some years to outgrow.

Now, in taking possession of a neglected garden, the first thing is to determine where to begin and what to attack. It may be that there are fine trees, but that below them an undergrowth more or less thick has grown up, and Elders, suckers of the Elms, Chestnuts, &c., and Privet, Laurel, and other quick-growing wood are detracting from the beauty of the trees themselves. This undergrowth must be greatly thinned, and every bit that is left carefully considered as to its decorative use and value. It is curious to notice how reluctant is the ordinary human being to root up and throw away a half-grown Elder tree, Laurel, or what not; but there are occasions, and this is one, when the would-be successful gardener must steel his heart, and ruthlessly use the axe and the knife for anything that is out of place and superfluous.

If it is found that the large trees themselves need a branch lopped here or there it is a good thing for the possessor of the tree to go into the house and from both an upstairs and a downstairs window contemplate exactly what will be the effect of the pruning. What unsightly object is the branch at present hiding from view? What will be the outline of the tree without the branch in question? Let the owner of the tree then stand close beside it and notice the interlaced branches and the effect of thinning them. Too many fine trees that have been neglected and received neither care nor attention for many years are made hideous objects, one-sided, and badly balanced when left to an inexperienced hand or when the pruning is done hastily and without due consideration.

One word as to the manner of going to work may not be out of place here. The branch, if it is a large one and heavy, must be sawn off some 2 feet from the trunk. The remaining 2 feet must then be removed. To leave this portion, as in nine cases

out of ten it is left, is to invite decay for the tree itself, not at once, but in the course of a few years when the portion shall have decayed, and the decay shall gradually spread to the trunk itself. In fact the removal of branches should be treated as a surgical operation.

Gardens that have been planted anything like thirty years, and neglected for the greater portion of the time, will show no more miserable feature than the shrubbery. If this has been allowed to go its own wild way one shrub will have crowded out others that may be of tenderer and more weakly growth; others, from insufficient room, may have become deformed, and most will be thin at the base and unsightly in consequence. It becomes now a serious question what to do. In most cases it will be better to remove the unsightly shrubs entirely. There is no chance of their ever being made well-proportioned specimens. Thirty years of neglect has ruined them completely. Besides this it will be found in the generality of these overgrown gardens that the admission of more light and air gained in this manner is an unmitigated pleasure and relief. A broad border for some of the most beautiful of our herbaceous plants with or without a background of newly put in flowering, evergreen, and deciduous trees may well take the place of the tangled mass that hitherto had been known as the shrubbery. In all gardening matters, and more especially when trees are under consideration, the garden should be grasped as a whole, not only treating one portion. If this were done there would be far greater harmony and character in our gardens. If, after the neglected shrubs have been removed, it is deemed more fitting to replace them with others, then care must be taken that the new shrubs are not too closely planted, that they are thinned out in due season, and that they are planted with due consideration

to their decorative effect when viewed from different parts of the garden. In some cases it will be found that the effect would be greatly enhanced if the beds were raised, say, some 3 feet from the surrounding level. Again, the garden may be badly in need of some markedly distinctive feature, and it may be found advisable to plant a large proportion of some characteristic shrub, such as the upright Cypress for instance. It is a grand opportunity to insist on introducing some such expression of individuality and character. These qualities are sadly lacking in a vast number of our English gardens, and they are among the things that I never tire of pleading for. A garden must, or it should, have some basis on which to work, some one distinctive character that shall make it stand out in the minds of those who see it as separate from every other garden. It ought to have some feature that shall show both the taste and the bent of those who love it.

One last word of caution I would add. If the neglected garden has been badly designed, the would-be improver may go forward with little anxiety; but if the garden is of excellent design already, and suffering only from the neglect that its inhabitants in the way of trees and flowers have undergone, then the would-be improver must pause and consider carefully the effect that his

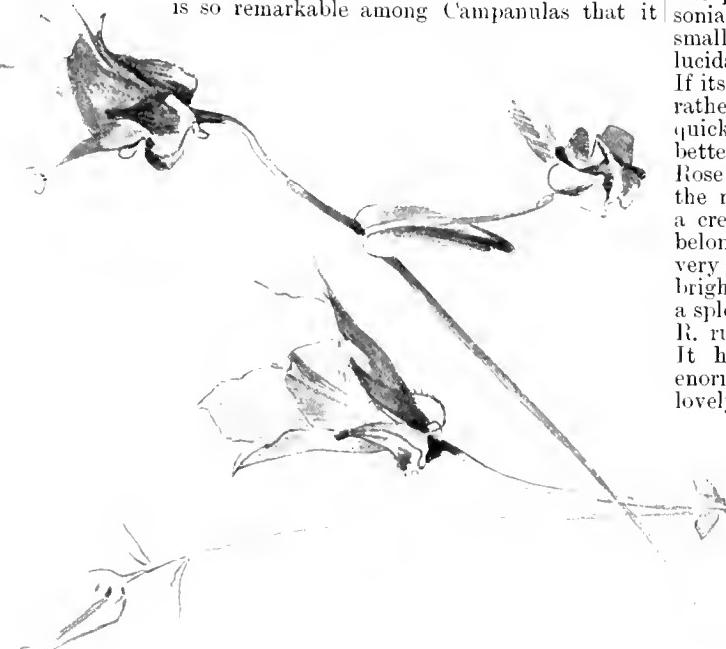

work will have on the old and good design of the garden. I have found in all questions of doubt that if people would determine that everything that is simple, and in broad, bold design shall be permitted to remain, while everything that it is impossible to make beautiful, everything that is complicated, sham, and pretentious, shall be ruthlessly cleared away, they will not err.

F. M. WELLS.

## AN ARTIST'S NOTE-BOOK.

### CAMPANULA SULPHUREA.

**O**UR illustration introduces a new and interesting species of the Bell-flower family, and one that possesses quite a novel shade of colour. So far, however, as we now know, this new Campanula would not appear to possess a very vigorous constitution or a long season of flowering. The plant is of rather frail, lax habit, and grows about 1 foot high. Needless to say, the shade of colour is so remarkable among Campanulas that it

THE NEW CAMPANULA SULPHUREA (LIFE SIZE,  
FLOWERS SULPHUR-YELLOW).

(From a drawing by H. G. Moon.)

would be welcomed by all, and if a stronger and more vigorous kind can be evolved from this, retaining its colour, it will be much appreciated. It is of a sulphur-yellow, more heavily coloured, perhaps, internally than otherwise. The species is of annual duration and a native of Palestine.

## THE ROSE GARDEN.

### ROSES FOR THE ROCK GARDEN.

**A** ROCK garden always seems to me a suitable place for some of the interesting Rose species, and also for a few hybrids.

With the numerous alpines and other plants available, it is impossible to find space for any; but where the rock garden is upon an extensive scale certain

suitable kinds would add a great charm and be quite in harmony with their surroundings. Wherever Roses are planted upon the rock garden, a fairly deep root run should be provided, and unless this can be accomplished among the rock and stone it would be preferable to plant at the base or in the background. One could not well select a more charming tribe of Roses for the rockery than *R. wichuriana*. The type must be found there if no other; but I think all who know Jersey Beauty and Gardenia, and also the more recent rubra, will require no advice to plant one or more of each, although being so gross feeding in their habits the plants must be given ample space to develop. A warm alcove should be allotted to a few of the more tender Roses, such as the small single *R. berberifolia* Hardii, its yellow blossoms, with red blotches at base of petals, being most striking; *R. Macartney alba simplex*, a gem with white blossoms and a wealth of golden anthers, also dainty foliage; *R. xanthina* and *R. Alberti*, two pretty single yellow species, and *R. watsoniana*, a quaint little variety with the smallest foliage of any Rose grown. *R. lucida plena* makes a charming rock plant. If its roots are somewhat confined it will keep rather dwarf, but given a good deep soil it quickly grows into a large bush and is then better in the background. A delightful little Rose for a rockery I saw recently at Kew under the name of *R. Seraphini*. It appeared like a creeping Scotch Rose, although I believe it belongs to the Canina group. The plant is a very dense grower, with very small leaves and bright pink single flowers. There also I saw a splendid hybrid between *R. microphylla* and *R. rugosa*, just the kind for a rock garden. It had large blush flowers, and petals of enormous size. According to the label this lovely Rose was sent to Kew by M. Vilmorin.

In the background a position should be provided, if possible, for *R. spinosissima altaica*, where it could display its large white flowers to the best advantage. The pretty *R. alpina* is one of the earliest to open, and is succeeded by Capsicum-like fruit, and a variety of it

named Malyi is good. Both would make interesting rock garden Roses.

The new hybrid of *R. sinica* named Anemone is one of the loveliest single Roses for creeping over a rockery, the large glistening foliage and Anemone-like flowers of a beautiful pink show up so well when thus grown. Where opportunity offers to plant Roses freely in the background of the rock garden varieties that make fine arching growths would be most appropriate. Of these, I could name several; but one of the loveliest is *R. polyantha grandiflora*, which is also known at Kew as *R. noisettiana*. Other beautiful species and varieties for the rockery are *R. Andersonii*, one of the loveliest of the singles; *R. californica*, *R. carelica*, *R. macrophylla*, a very strong grower; *R. involuta* var. *Wilsoni*, which has rich pink flowers with distinct white eye, the flowers being  $2\frac{1}{2}$  inches

across; *R. mollis* var. *alba vittata*, the outer petals of white buds being margined with pink. Of course, if a Rose dell could be linked on the rockery a splendid opportunity would arise for using masses of several good things in the Rose way for instance. The Dawson Rose makes a delightful picture when liberally planted, so also does *R. multiflora*, which could be grouped behind the latter. Then, too, *R. lutea* and the Copper Austrian Briar cannot be omitted; but they would form interesting groups towards the front, whilst towering in the background fine masses of the Penzance Briars would lend beauty and fragrance to the dell. Practically, the Roses for both rockery and dell are unlimited, and after all the best plan is to make oneself familiar with the interesting species and hybrids, and plant according to individual taste.

PHILOMEL.

## ROSE HEDGES.

THOSE who have never seen a Rose hedge in a garden can form some idea of its beauty by calling to mind a hedge of Dog Roses in some country lane. But whereas a hedge of wild Roses only lasts in beauty of bloom about a month, a hedge of garden Roses, though of course at its best in June and the first half of July, may be more or less in bloom the whole summer. Where large breaks are wanted in a garden, or screens to shut off from view the kitchen garden, waste places, or yards, there can be nothing lovelier than a Rose hedge. It always seems a pity that so much space should be taken up with hedges of Laurel, Box, Yew, Holly, and Privet, which, though pleasing in the winter and just when the young growth is on them in May and June, have nothing much to recommend them the rest of the year. A thicket which nobody can walk through or see through can be made of Roses, most of which keep their leaves on till the severest frosts come, and some even throughout the winter. In addition to the blossom, we also have the red berries in the autumn and early winter, some sorts, such as Lord Penzance's Hybrid Sweet Briar Roses, producing beautiful clusters of bright scarlet berries. Roses love moisture, and for that reason do remarkably well on the banks of ditches, the natural position of wild Roses. The ground is perfectly well drained near a ditch, and yet the roots of the bushes will go near enough to the bottom of the ditch to get supplies of moisture in very dry weather. We have all seen wild Roses hanging in lovely profusion over a pond, and though the more delicate standard Roses might not grow in such a situation, the hardy sorts which are adapted for hedges revel in it.

Considerable thought must be devoted to the selection of Roses for a hedge, according to the purpose for which it is intended. If only a moderately high hedge is wanted, say, 4 feet, such as would be suitable for a terrace bank, or for breaking up a long stretch of lawn or garden without shutting off the rest from view, the lower growing sorts must be selected, such as the Penzance Briar Roses, above alluded to; the Austrian Briar Roses, with their lovely shades from yellow to copper; the Japanese Roses or *Rosa rugosa*, which are also remarkable for their brilliant scarlet fruit pods; and the China Roses, some

of which, such as the old common and the crimson, often called Monthly Roses, are seldom out of bloom from May to December. This latter part of the work with garden shears in March as if it were an ordinary field hedge.

All the above mentioned require no pruning, except the cutting out of dead and weak wood and keeping them within bounds; in fact, in the case of the Briar Roses, pruning is said to injure them. These Roses, if planted for a hedge, should be put in a double row—one in front of the space between two others—about 3 feet or less apart. The ground should be well trenched before planting, with the addition of a good dressing of well-rotted manure and basic slag, the latter at the rate of 20lb. to the 40 square yards, so as to give them a good start. Then, if kept pretty free from weeds they will go on for years without much further trouble, except the slight cutting above referred to.

Where taller hedges are wanted for screens or garden boundaries different classes of Roses must be chosen. The ground should be prepared as above described, and before planting stout poles 6 feet to 8 feet high should be fixed firmly in the ground at moderate intervals, and strong galvanised wires attached to the poles from end to end of the proposed hedge and about 2 feet apart. If the appearance of this is objected to while the hedge is growing up it may be left till the bushes have made a year's growth, when it will be a good deal covered up at once if the long shoots are tied up to the wires and poles. The sorts of Roses used for this hedge being of a more vigorous habit than those used for the hedge first described, the bushes may be planted 4 feet apart. In two years, or three years at the most, the bushes will have pretty well covered up the whole of the supports, and whenever the poles give way the hedge will probably be thick enough and strong enough to stand without them. No pruning is absolutely necessary; but it is best to cut out dead and useless wood so as to let the air into the bushes, and to keep them from blocking up walks or occupying more ground.

As to the sorts of Roses to plant for this purpose, there is now a wide choice, owing to the introduction of so many strong growing varieties or ramblers during the past few years. Some of the Ayrshires and hardy evergreen climbers are very rapid growers and very free bloomers, and are most valuable for covering up spaces quickly. Among them might be mentioned Félicité Perpetué, creamy white and good shape; Elegans, large crimson semi-double; Polyantha grandiflora, very strong grower, bearing large clusters of pure white flowers; Rubra, pale flesh, semi-double and very sweet-scented, with glossy foliage; and Alpina, bright rose, the leaves of which take on a fine tint in the autumn. Outside the class to which these belong are many others which are just as good for the purpose.

I would, if desired, suggest Paul's Carmine Pillar, single rosy carmine and free bloomer; Reine Olga de Wurtemburg, vivid red and semi-double; Longworth Rambler, light crimson and semi-double; Aglaia, or Yellow Rambler, bearing pyramids of fifty to a hundred flowers; Thalia, or White Rambler; Euphrosyne, or Pink Rambler; and Turner's Crimson Rambler, which, though only introduced in 1893, has become well-nigh universal. The last-named is extremely beautiful, but it blooms for less than a month in the year. Two other Roses, the individual blooms of which are much superior to the above, are Réve d'Or and Gloire de Dijon, which will succeed as hedge Roses if in a good position.

Rose hedges will undoubtedly become more common in the future now that there is such a wide choice of Roses suitable for forming them. I know a garden which cannot be much more than an acre in extent, but by having parts of the garden completely

HEDGE OF MAIDEN'S BLUSH ROSE 6 FEET TO 7 FEET HIGH IN THE GARDEN OF MR. WILLIAM PAUL,  
WALTHAM HOUSE, WALTHAM CROSS.

A RIVERSIDE GARDEN, HEDSOR WHARF, MAIDENHEAD.

shut off by Rose hedges, seems to the visitor who walks round it as if it must be two or three times the size.

ALGER PETTS.

**ROSA WICHURIANA RUBRA.**

This interesting novelty resulted from a cross between *R. wichuriana* and Crimson Rambler, and I doubt if any hybrid ever showed its parentage in such a marked degree. The fine trusses of single flowers are of the rich pink colour seen in Begonia *Gloire de Lorraine*, perhaps a shade or two deeper. The foliage is of the bright green of Crimson Rambler, but shining as in *R. wichuriana*. I should not recommend these hybrid *wichurianas* exclusively for ground work, believing them to be worthy subjects for clambering over old trees, rockeries, or to train over a low fence. The latter position is an ideal one; the long growths soon reach the top and will fall gracefully over the other side. A rustic fence could be constructed in the garden for them. If about 4 feet high the view would not be obstructed, and when the Roses reached the ground they would continue their growth along the surface.

This new comer will be splendid for table decoration, its sprays are so light, and if gathered rather young and placed in a cool shady place in water the flowers expand freely. The rich array of golden stamens is a noticeable feature of a beautiful variety, and there is, moreover, a delicate Violet-like fragrance. *Rosa wichuriana rubra* apparently inherits the late flowering habit of the type, so that one may make quite an attractive mound of these two, the crimson variety trailing over a clump of roots in the centre, and the white variety surrounding it, and nearer to the ground.

**MME. JULES GROLEZ (H.T.)**

EACH season this lovely Hybrid Tea increases its popularity, and I certainly think it is one of the most useful M. Guillot has given us. Under glass I much prefer it to Mrs. W. J. Grant, for the

reason that it retains the brightness of colour for a longer period. Then, too, Mme. Jules Grolez is of the most perfect shape, not too coarse or large, but yet quite good enough for a front row flower in an exhibition box. It is, however, as a garden Rose that the variety will be most welcome. All who see this Rose are charmed with the bright colour and beautiful shape of its buds and blossoms.

PHILOMEL.

**HEDSOR WHARF.**

"Parva domus, magna quies."

**A RIVERSIDE GARDEN.**

THE old wharf house at Hedsor, a photograph of which accompanies this note, is of considerable antiquity, the first mention of it occurring in a document bearing the date 1575. Though additions to the building have been made from time to time, it still retains a quaint and old-world appearance. Facing due south, and screened by thickly-wooded cliffs from easterly gales and winds, it catches every gleam of sun, and during the winter months many little bulbs and flowers may be found blossoming in sheltered corners near the house. Here the earliest Snowdrops and Narcissi are gathered, and Iris alata, I. bakeriana, I. Histrio, I. stylosa, I. reticulata, I. Danfordiae, &c., opening in bright succession, bring on wintry days the promise of better things to come. An old Vine rambling along the front ripens every year a generous crop of small sweet Grapes, red and pink China Roses climb almost to the roof, and a large specimen of *Laurus nobilis* flourishes at the further end.

Conscious as one is of the strange feeling of peace and rest which now seems to pervade the place, it is difficult to realise that here in earlier days was a busy timber wharf, and that before the advent of railways heavily laden

barges moored alongside and discharged their cargoes of wood and stone. The hum of workmen's voices, the clang of tools, the trampling of horses' hoofs have passed away, and now the quiet lawn slopes gently to the riverside, and on still sunny days no sound is heard but the sharp, shrill cry of a kingfisher or the distant murmur of the weir.

By the still waterside numberless families of happy wild things find a sanctuary and home. Here is the safe retreat of lesser grebe, waterhen, and wild duck, who in warm July weather paddle fearlessly with their small black chicks in and out among the Water Lilies. Many turtle-doves nest in the Willows, and kingfishers flash up and down the stream or hover momentarily above the shallows.

No trace of old garden remains with the exception of a few large bushes of Monthly Roses, a straggling perennial Pea, and the small Cherry and Apple orchard, bright in spring with Daffodils beneath the trees. The Rose garden, mixed flower borders, quaintly-cut Yews and hedge are all of recent date, and a rustic

bridge crossing the clear Watercress stream leads to where a less formal garden is in process of formation. Here are Water Lily pools, masses of blue Forget-me-not, rambling Roses on arches and poles, large plantings of Day Lilies, and many varieties of Iris, so fitted to adorn—by grace of form and beauty of flower—the Garden by the Waterside.

IRIS.

**TREES AND SHRUBS FOR ENGLISH GARDENS.**

(Continued from page 127.)

**A FLOWER GARDEN IN WINTER.**

I HAVE previously drawn attention in these pages to the possibility of making a new feature in gardens by setting apart a piece of ground exclusively for the cultivation of trees, shrubs, and bulbs—in short, any plants that flower or are bright with fruit or bark between, say, the beginning of November and the end of February. One might term it "an outdoor winter garden." For the purpose there would be required a well-drained piece of ground, the soil of which was fertile and open. The situation should be fully exposed to the south and west, but guarded well on the north and east sides by a thick belt of evergreen trees and shrubs. The shelter would be still more complete if the site sloped rather steeply to the south-west. Such shelter would be welcome, not only to the plants that grew there, but to those who might visit and tend them. Some of the more noteworthy trees and shrubs with ornamental barks I have already mentioned. Plants that carry their fruit into winter might

be included, such as the Hollies, especially the yellow-berried Holly; *Crataegus Crus-galli* and *C. spathulata*; *Cotoneaster rotundifolia*, which is the best of all the Cotoneasters and frequently carries its bright scarlet berries till March; and *Hippophae rhamnoides*, the Sea Buckthorn, whose orange-coloured fruits are borne in such profusion and retain their colour till past Christmas if the frosts are not too severe. The scarlet-fruited *Skimmia japonica* and its varieties are very ornamental during the winter months, but of these (as well as the *Hippophae*) it is necessary to grow male and female plants together. Groups of variegated evergreens would not only help to give shelter and warmth, but would also add to the brightness of the garden. The best of them are the golden and silver variegated Eleagnuses, the Hollies of a similar character, and the best of the Aucubas, of which there are now some very fine forms; the female plants are also very ornamental as fruit bearers. *Pinus sylvestris aurea*, a variety of the Scotch Pine that turns golden in winter but is green at other seasons, and *Cupressus macrocarpa lutea* are the two best conifers of their class. Many of the variegated conifers lose most or all of their colour as autumn and winter approach.

With regard to the trees and shrubs that bear flowers between November and February, the number is not, of course, great; still, they constitute a group that is larger, perhaps, than is generally supposed. The following list, which comprises all that I can call to mind, may be useful even to those who would not intend to bring them together in one spot. Some country houses are only occupied during the shooting and hunting seasons, and these winter-flowering plants are of especial value in such places.

#### November.

<i>Arbutus hybrida</i>	<i>Hamamelis virginica</i>
Unedo and vars.	<i>Jasminum nudiflorum</i>
<i>Daphne Mezereum grandiflora</i>	<i>Lonicera fragrantissima</i>
<i>Elaeagnus glabra</i> , macrophylla, and pungens (all delightfully fragrant)	" <i>Standishii</i>

#### December and January.

<i>Chimonanthus fragrans</i>	<i>Erica carnea</i>
<i>Clematis calycina</i>	" <i>alba</i>
<i>Crataegus monogyna praecox</i> (Glastonbury Thorn)	<i>Garrya elliptica</i>
<i>Erica mediterranea hybrida</i>	<i>Viburnum Tinus</i>

#### February and early March.

<i>Berberis japonica nepalensis</i>	<i>Hamamelis zuccariniana</i>
<i>Cornus Mas</i>	<i>Prunus davidiana</i> (pink and white forms)
<i>Corylopsis spicata</i>	" <i>amygdalus persicoides</i>
<i>Daphne blagayana</i>	<i>Populus tremuloides pendula</i>
" <i>Laureola</i>	<i>Parrotia persica</i>
" <i>Mezereum</i>	<i>Pyrus japonica</i>
" <i>oleoides</i>	<i>Rhododendron altaclarens</i>
<i>Erica mediterranea</i>	" <i>dauricum</i>
<i>Hamamelis arborea</i>	" <i>nobleanum</i>
" <i>japonica</i>	" <i>praecox</i>
" <i>mollis</i>	

#### TREES AND SHRUBS IN AUTUMN.

*Autumn Colours.*—There is a certain amount of mystery about the autumn colouring of the foliage of hardy trees and shrubs in this country. I have never yet been able to ascertain with any degree of exactness the conditions that produce the richest and brightest colours. Probably the conditions most favourable generally are provided by a good growing season—that is, a warm, moist summer—followed by a dry, sunny autumn. But it frequently happens after what one would regard as favourable seasons that species fail to colour well which one regards as very reliable in this matter. Probably one set of conditions does not suit all trees and shrubs in this respect. To produce the colouration of the leaf just before it falls certain subtle chemical changes in its composition take place. And to bring about these changes certain conditions in regard to sun-

light, temperature, and moisture are necessary. But in a climate such as that of Britain, where the seasons are never alike two years together, we can never hope to obtain the same regularity of autumnal colouring that characterises the vegetation, for instance, of the Eastern United States. Still, when all is said, we possess in our gardens a large number of trees and shrubs and climbers that are delightful in their autumnal livery of crimson, purple, scarlet, or gold. It is curious that every season we may notice species not usually conspicuous for their autumn tints beautifully coloured.

An over-vigorous, sappy growth often consequent on a wet, warm autumn, or due to too great a richness of soil, is certainly detrimental to autumn colouring. *Rhus cotinoides*, an American Sumach, worth growing for the beauty of its colours in autumn, is one of the most unfailing in this matter I know of. But young plants put out in well-trenched, heavily-manured soil will often fail to colour at all till they get older and less vigorous. The most beautifully coloured examples of this Sumach that I have seen grow in rather light sandy soil. I have frequently noticed, too, that various species of Vine (*Vitis*) when starved in pots will colour exquisitely, whilst others, planted out in the ordinary way, completely fail. I believe, therefore, when planting with a view to the production of autumnal colour, any great enrichment of the soil is neither necessary nor advisable, provided it is of moderate quality to start with.

In the following notes, brief mention is made of some of the best trees, shrubs, and climbers that colour in autumn.

*Trees.*—First among these are the American Red Oaks. Undoubtedly the best of these is a variety of *Quercus coccinea* known as *splendens* and *grayana*. This not only turns to a fine scarlet-crimson, but it retains its foliage for some weeks after the colour has been acquired—sometimes almost up to Christmas. Other good Oaks, not so certain, however, as the preceding, are *Quercus marylandica* (or *nigra*), *Q. heterophylla*, *Q. imbricaria*, and *Q. palustris*, all of which turn red. The Tupelo tree (*Nyssa sylvatica*) turns a fine burnished bronzy red. A tree remarkable for the size of its leaves, and especially for the rich golden-yellow they put on in autumn, is *Carya tomentosa*, but, like most of the Hickories, it is scarcely known in gardens. *Carya siccata* is somewhat similar. The common Elm is usually very beautiful in the soft yellow tints of its leaves in autumn, but another Elm of more distinct aspect is *Ulmus pumila*, a low tree whose small leaves are retained till late in the year and turn golden-yellow before they fall. *Liquidambar styraciflua* has long been valued for its fading foliage of purple-red, but not so well known is the lovely yellow of the Fern-like foliage of the Honey Locust (*Gleditschia triacanthos*). The Tulip Tree (*Liriodendron*), the Nettle Trees (*Celtis*), the Zelkowas, and several of the Birches turn

yellow, one of the best of the Birches being *Betula corylifolia*, which turns a rich orange-yellow.

(To be continued.)

#### EREMURUS ROBUSTUS.

The accompanying illustration is taken from a plant growing in Captain C. B. Balfour's garden at Newton Don. Its height is 10 feet 6 inches, and when in flower was greatly admired by all who saw it. The plant was procured three years ago from Mr. Forbes, of

EREMURUS ROBUSTUS IN CAPTAIN C. B. BALFOUR'S GARDEN.  
(From a photograph by Mr. McGregor, Kelso.)

Hawick. It did not flower the first year after planting, but made a good growth. Last year it sent up a strong flower-spike, but it got broken before it expanded. This year it came away very strongly early in the spring, and was protected by Spruce branches from late frosts and cold winds. It received a liberal supply of liquid manure during its growth, and grew very rapidly. Notwithstanding its height it did not require staking. It is growing with other plants in the herbaceous border, and had when first planted a good allowance of old loam and well-decayed cow manure. It

has not received any protection during the winter months, but, as before noted, had to be protected in the spring after it came through the ground. I consider it a perfectly hardy herbaceous plant, and well worthy of cultivation.

W.

### THE KENTISH NUT CROP.

In a season of many disappointments it is satisfactory to note that the crop of Cob Nuts and Filberts is above the average, and if prices only keep up to a fair level growers will reap a good return. I say "if" because Nuts, like fruit, have a way of dropping in value when the supply is plentiful, and this is what the growers are afraid of just now. Not for years have the bushes been so heavily laden, and all that is wanted now is warm sunny weather to help on proper ripening.

Cobs and Filberts form an important crop in the county of Kent, though they are confined to certain districts. One might travel for miles through the Cherry-growing country in the Sittingbourne neighbourhood without seeing a plantation, and in the Weald of Kent, where Apples grow so well, Nuts are barely represented. Again, in the fertile district stretching away from Canterbury to Sandwich, where bush fruits and vegetables are grown to perfection, you may look in vain for Cobs and Filberts; but turn to the brashy hillsides round Maidstone and the sandy slopes in the neighbourhood of Wrotham and Sevenoaks you will find Cobs and Filberts growing under conditions that would be unsuitable for fruit crops generally. The system of culture is common to the county, and the methods adopted in pruning and general treatment are by no means of recent origin. Illustrations show that Nuts are not fastidious in their requirements, but give them what they want and they will go on for many years, this fact being proved by the aged specimens to be seen in Kentish plantations.

In some places Cobs and Filberts form the entire crop, and the bushes are so thick when in full foliage as to leave scarcely any space between them. Yet they do well and grow vigorously enough with the sparse manuring they get. The soil is not rich and deep, but loose, brashy, and in many places sandy. Yet it suits Nuts, and acres of land that would otherwise remain idle are profitably employed in the cultivation of this important crop. In other places the Nuts are grown as a bottom crop, the bushes being kept low, and standard Plums and other fruits are planted between them. The standards are manured and the Nuts get sufficient benefit from the dressings to keep them going, for growers know the evils of over-feeding. Soil too rich or manure too freely applied leads to rank vigorous growth on the bushes, which is useless for bearing, instead of the short twiggy shoots on which the Nuts are borne. There are advantages in growing Cobs and Filberts with standard trees, because the overhead growth of the latter affords a means of protection against spring frosts when the Nuts are in bloom. The fact that over-manuring is an evil perhaps tends to mistakes in the opposite direction, and some growers never think of feeding their Nuts at all. Others adopt the wise and medium course and give periodical dressings of wool waste or some other mild and slow acting fertiliser.

The training and pruning of Nut bushes is an art which belongs largely to Kentish growers. It is true that Cobs and Filberts are represented in many private establishments all over the country, but for the most part they grow on a free and easy principle of their own, which is all very well so far as appearances are concerned, but it does not result in the maximum quantity of Nuts being obtained. The Kentish grower does not study appearances, and it would be a great stretch of exaggeration to say that a Nut bush pruned on the orthodox system is an object of beauty. The specimen is taken in hand at an early stage and if it is intended for a low specimen a hoop is fastened in the centre and the main branches are compressed to in saucer-shape. To sum the process up in a few words the training process in all cases is to

furnish the bushes with a sufficient complement of main branches.

This done the object in pruning is to remove vigorous growths and keep the main branches furnished along their entire length with the twiggy shoots on which the Nuts are borne. On all specimens the main limbs look gnarled and ugly through frequent prunings, but they produce the class of growth wanted, and there seems hardly any limit to the time during which an established specimen will go on bearing.

Care has to be taken in pruning so as to leave sufficient catkins to distribute the pollen necessary for the fertilisation of the female blossoms, and after the process the bushes look bare and skeleton-like, but as soon as growth is completed they represent mantles of leafy verdure, and whole plantations are dense thickets of foliage. This year the caterpillar common to Nuts has played havoc with the leaves, and in many places the foliage is riddled with holes caused by the ravages of the above pest. The caterpillars are not easy to eradicate, and the method adopted by some growers is to spread tarred sheets under the trees and shake the pests on to them. The majority, however, pay little heed to the caterpillars, and, because they do not actually feed on the Nuts, they are allowed to remain. The Nut weevil is another pest which has to be dealt with, and a formidable one when represented in force, as it eats the kernels inside the Nut shells. The above method is also adopted for the destruction of this injurious beetle. Several varieties of Nuts are grown for market, but the one most commonly met with is the well-known Kentish Cob, a very hardy and prolific kind. Nuts must always be reckoned amongst the important crops of the county of Kent, as they frequently give good returns from apparently worthless soil. Prices vary, of course, according to the supply, and as this is what may be called a Nut year growers are speculating as to the effect that the quantity will have on the returns.

G. H. H.

### AMERICAN NOTES.

#### SHRUBS IN AUGUST.

**N**OT without interest is the shrubbery, although few shrubs are now in bloom. Large fruit, looking like unripe Apples, hang on the Xanthoceras. This fruit contains edible seeds. We have here two of these little trees, for they grow in tree form. One of them, that covers herself in a garment of beauty every May, is twelve years old, 15 feet in height, and has never set any fruit. The other, only three years from the nursery and not over 1 foot high when planted, has several large green "Apples" upon it, and we are waiting for them to ripen in order to taste the seeds.

Many bush Honeysuckles are now displaying their bright coral beads, and the Barberries are adorned with ropes of Plum-coloured fruit. Especially pretty are the purple-leaved Barberries at this time, as the fruit matches the colour of the foliage. Of all purple-leaved shrubs this seems to me the most beautiful, with its glowing ruby, wine, and mulberry tints, and its graceful habit of growth.

Kolreuterias have never been so fine. Owing perhaps to the wet season that we have had the bloom has been unusually profuse. The flowers are in large paniced thyrses. The trees are low and spreading, tents of dark green foliage, with cool shady recesses between and beneath the branches. Now that the bloom is over it is succeeded by fruit which is almost as ornamental as the flowers, for it is in large bladdery pods of a soft sea-green colour that contrasts very effectively with the dark foliage. Altogether the Kolreuteria is a most beautiful little tree. The seeds germinate readily, and a number of seedlings has sprung up around the parents. In one place they have sprouted along a low ledge of rocks, where the tender young foliage is as delicately cut

as the fronds of some Ferns, which it somewhat resembles.

The fragrant flowers of Clethra alnifolia are now perfuming the air. The Clethra is a native of some of our Eastern States, and forms a compact little shrub from 3 feet to 6 feet in height. The obovate leaves are cuneate at the base, serrate, and usually  $1\frac{1}{2}$  inches in length, and the white, spicy fragrant flowers are in spikes and quite freely produced. It is usually found in damp, shady places, such as wooded swamps. Under cultivation it forms a symmetrical low bush, and gives variety to the August shrubbery. There are two species in our neighbourhood. Clethra acuminata is quite common in the Virginias, is a taller species than *C. alnifolia*, and is sometimes found in tree form. The leaves are much larger also, and the racemes of small white fragrant flowers are sometimes 8 inches in length.

Several species of small-flowered Clematis are beginning to bloom, scrambling over dead trees, large stumps, and the old stone wall that surrounds the grove, and the scarlet Trumpet Creeper riots over the palings, clothes the rock brakes with a fresh mantle of green, and ascends the old Cherry tree to the height of 20 feet, making it look like some strange denizen of the tropics, adorned with hundreds of great scarlet trumpets. The profusion of this bloom has attracted to our garden a great many ruby-throated humming birds, and it is a pretty sight to watch them darting about the creepers that hold up their deep red goblets in hospitable invitation.

An interesting group of blooming shrubs has in the centre a tall Aralia spinosa just coming into flower. The feathery blossoms, in large, umbiliferous panicles, give the plant an airy elegance, which makes it a worthy companion to Osbeck's Sumach (*Rhus Osbeckii*), which is the most graceful of its class. Its delicate, cream-coloured florets open a week or ten days before those of the Aralia.

Near by is a handsome large Chaste Tree (*Vitex Agnus-castus*) covered with its paniculate cymes of bright bluish purple blossoms. The leaves of this shrub are aromatic, resembling those of the Black Walnut, but with a more powerful fragrance. The sap of the Chaste Tree is quite poisonous, as I once found to my cost. Having a tendency to browse and nibble among my plants, I experimented with odorous twigs of the Vitex. A sore mouth was, however, the worst consequence of the taste in which I indulged.

The Vitex forms a shrub 10 feet or 12 feet in height, and has handsome palmate leaves and very pretty little flowers in small, showy cymes. It is not quite hardy, but though it dies down to the ground sometimes, it always springs up again and grows with great rapidity. It comes from the South of Europe. Very ornamental at this season are the large bright red hips of the Rugosa Roses, and I can even recommend them to the palate of the curious. They are as large as Crab Apples and pleasantly sweet, though rather insipid to the taste. These Roses still give us a few blossoms.

Hovenia dulcis is a rather uncommon little tree from Asia, the fruit of which is said to make men mad. It blooms in June in axillary and terminal panicles. The little flowers are cream-coloured, and have a perfume like that of Elder blossoms. The odd-looking fruit consists of the fleshy seed pods and thickened twigs or flower-stalks, which swell after the bloom has faded. This part is eaten, but does not seem a desirable fruit. I tried it one year, but without unpleasant results. It makes a pretty little tree and gives a dense shade, but, like the Chaste Tree, it is not entirely reliable in this climate.

Osbeck's Sumach, as it grows here, makes a slender, open-branched tree, much in the shape of the capital letter Y. It is 20 feet in height, with handsome compound leaves and beautiful, large, and upright panicles of creamy flowers. No other Sumach known to me has such showy flowers.

*Rhus typhina* (the Stag-horn Sumach) makes picturesque masses for parks and private places, and is usually seen as a low shrub, not over 5 feet or 6 feet in height. It does, however, in its native haunts sometimes attain the height of 40 feet. The pinnate leaves are from 8 inches to 15 inches

long. The twigs of this beautiful plant are covered with a velvety pubescence, like the young horns of a stag. The green flowers, in a dense terminal panicle, are not as showy as the heads of fruit, which are covered with bright red hairs.

*Rhus copallina* is the dwarf Mountain Sumach, smaller than either of the other two species, and worthy of a place in the shrubbery for its pretty green flowers, its showy crimson fruit, and especially for the very beautiful colours its foliage assumes in the autumn. All the members of this family have acrid sap, and two of them—*Rhus venenata*, which is a beautiful shrub, and *Rhus radicans*, which is a Vine—are poisonous to the touch. *Rhus venenata* often grows in the middle of inaccessible swamps, as if Nature, because of its dangerous properties, had purposely planted it where it could do no mischief. In such a situation it lights up its surroundings as with a flame when the frost has changed its foliage to a glowing scarlet mass.

One other Sumach is pretty and desirable in the home grounds. This is *Rhus aromatica*, which does not much resemble the other kinds, as the Strawberry-like leaves are trifoliate instead of pinnate, and the yellowish green flowers in small dense heads are produced early in April before the leaves. The foliage of *Rhus aromatica* is pleasantly fragrant, and, as is the case with all the Sumachs, its autumn colouring is superb.

The familiar Smoke Tree is now, I believe, called *Cotinus cotinoides* instead of *Rhus cotinoides*. It is too well known to need any description here.

DANSKE DANDRIDGE.

Shepherdstown, West Virginia, U.S.A.

#### AN AVENUE OF CHILI PINE AT MURTHLY.

*ARAUCARIA IMBRICATA* is not a tree for general planting, but the avenue at Murthly Castle is so interesting that we are glad to be able to illustrate it. In THE GARDEN of May 19, 1900, an interesting account appeared of the conifers at Murthly, Mr. Steuart Fotheringham, the owner, mentioning that *Araucaria imbricata* was planted in 1847, but many had lost their branches, and some were killed by frost in 1894-95. They cone freely, and young ones are growing from seed.

#### ORCHIDS.

#### ODONTOGLOSSUMS AT THE WARREN HOUSE, STANMORE.

"A THING worth doing at all is worth doing well." The spirit of this maxim must exist in the minds of both H. S. Bischoffsheim, Esq., the owner of this well-kept place, and his able gardener, Mr. M. Gleeson, judging by the collection of Orchids they are now forming and the general efficiency of the garden. Thoroughness in every detail is insisted on by Mr. Gleeson, and the effect is well shown in the superb condition of the Orchids.

It has been said that position is a *sine quâ non* in the culture of *Odontoglossum crispum*, and no doubt a suitable position does go far to their well-being. A happier position than that in which the *Odontoglossum* house under mention has been constructed could not well have been found. Its selection speaks volumes for Mr. Gleeson's experience and knowledge of the requirements of the plants. Both the position and structure of the house have been cleverly thought out, and the result is an ideal building—a model for

AVENUE OF THE CHILI PINE (*ARAUCARIA IMBRICATA*) AT MURTHLY.

intending *Odontoglossum* growers. The house in itself is a three-quarter span with a northerly aspect. Nothing whatever obstructs the northern light, but on the south not only does the back wall serve as shade, but the house has been built the necessary distance from a group of deciduous trees, the foliage of which gives the requisite amount of shade in summer and the greatest possible amount of light during winter, consistent with what may be termed permanent shading. The surface of the ground beneath the trees is frequently watered with a hose pipe, which tends to keep the atmosphere cool, while the foliage conserves its humidity, two important factors towards the well-doing of *Odontoglossums*. So perfect is the house and surroundings, and so well do the inmates revel under the conditions imposed on them, that the owner already contemplates adding an additional length to the house of from 40 feet to 75 feet.

Although the collection of *O. crispum* at the Warren House has not yet been formed a year, the extraordinary success which has attended their culture leaves nothing to be desired. It is doubtful if better growths could anywhere be found. The vigour of the plants, the substance and size of the blossoms, and the great length of the spikes produced are really superb. No doubt the house, its position, and the cultural skill of Mr. Gleeson have proved the main essentials to success, but much is due to the Belgian leaf-mould, in which potting material Mr. Gleeson is a firm believer. Both the *Odontoglossums* and *Cattleyas*—of which a brief account will appear on a future occasion—are potted in this substance, and their excellence is a strong testimony in its favour.

Two interesting and probably new *Odontoglossums* flowered among the *crispums* this year, and the plants are being watched with much interest. In the one the petals are of a light golden yellow, wholly of the one shade, the sepals bear a bright reddish central blotch or rather a number of smaller blotches fused into one, while the lip is white, suggestive of *crispum* in size and somewhat so in shape, but differing in details of the crest and its greater length. It may prove to be a natural hybrid, with *crispum* as the one parent, but in its present state the second parent is extremely problematical. The other is of a decided heliotrope colour, an undoubted *crispum*, and a very handsome and quite distinct kind. Mr. Bischoffsheim has only formed his Orchid collection within the last two years, but he has started in the right way, with good houses and good plants, which in the hands of Mr. Gleeson

will soon attain a premier position. Among the whole of the *Odontoglossums* not one poor variety was to be seen; all were fine, and most of them exceptionally so.

ARGUTUS.

#### THE KITCHEN GARDEN.

##### LATE FRENCH BEANS.

EARLY in the autumn it frequently happens that we get one severe frost that entirely cripples the growth of dwarf French Beans, and if sown now on sheltered borders, no matter how well protected by walls, the growth is badly injured. Many growers may have spare sash-lights to cover the plants or place movable frames over them and protect for a time, but I would advise sowing in frames if the latter can be spared, as it is then an easy matter to get good Beans well into December if the frame is heated so that frost and damp can be excluded. I am aware it is not an easy matter to spare frames when every inch of space is devoted to housing plants, but here I would recommend such structures as low pits or small houses, as these answer admirably for this crop. When there is a fair command of heat the plants crop for a long time. Many growers who have just cleared a crop of Melons or Cucumbers at this season—middle of August—may with advantage sow dwarf Beans. Of course for some time no warmth will be required if the supply is to follow the outdoor one, as the aim of the cultivator at this date should be to get a sturdy free growth, and later on, when a little warmth is applied, the plants respond freely.

I am aware that many small growers fight shy of growing French or dwarf Beans in winter, and rightly so, as I consider forced Beans, say from November to February, are the most critical and unprofitable crop grown. I mean Beans sown at that period for a midwinter supply, but this does not apply to late French Beans sown early in or during August for a supply when the open ground crop is over. I do not give any exact date for sowing, as much depends where sown and the season, but those who have to grow vegetables largely and need ample variety will find those grown for use during that season are most valuable, as after a severe frost one misses such things as Peas, Marrows, and Beans, and there is

always a demand for choice vegetables. For this work I do not advise pot culture, as I find frames or pits give a much larger and longer supply.

I like a good grower with free leafage and what may be termed a long cropper; the small early kinds are not so good for this work—they do not yield so freely. The best I have grown is the old Canadian Wonder, Everbearing, and Progress. The last-named is a very fine Bean for late supplies, and gives a good-sized pod in addition. I prefer the two last-named to the larger Canadian Wonder.

Our method of culture is to sow in low pits and expose freely till we get cold nights. The sashes are removed entirely except in wet weather for several weeks at the start, and I have always found that the best results are obtained when the young plant is well hardened. No attempt should be made to hurry the crop, as they are not required as long as the plants in the open continue to yield. It is also important to well thin the plants. It can be seen which are the best to retain when the seedlings are well through the soil. Later on, if the soil is at all poor, they well repay a mulch of decayed manure between the roots. In dry weather or after a warm day damp the plants overhead late in the day, and when watering give liquid manure occasionally. Grown thus the plants will crop freely through October and November. After that season pot culture may be given, though I do not advise sowing this vegetable till the new year. I may add that for spring supplies, where house or pit space can be afforded, the plants are far more profitable than when in pots; indeed, two or even three crops can be taken from the same plants if the latter are given good culture.

G. WYTHES.

Syon House Gardens, Brentford.

### MOUNTAIN FLOWERS.—III.

AT 1,200 feet above the Lake of Geneva, even at its most sheltered north-eastern end, one is above the vineyards and among the rich pastures that in the earlier year are full of Pheasant-eye Narcissus. Just now their prettiest plant is St. Bernard's Lily (*Anthericum Liliago*), here and there in patches so thick that the thin heads of starry bloom are like a broken mist hanging over the grass. Two months hence the most noticeable flowers will be the Colchicums.

The steepest of the slopes are clothed with a thick forest of Spruce varied with Beech. One such stretch of mountain forest is close at hand. Where it is all of Spruce the trunks stand thick, sometimes only a foot or two apart, and the shade is so dense that nothing grows below, but where there is a little light there is Ivy and Wood Sorrel, Woodruff and Dog Mercury. Some patches of the forest are cut down every year and immediately replanted. Two such patches, perhaps 100 yards wide and three or four times as much up and down, are within an easy walk. The path is very narrow and is often crossed by the wood slides, shallow hollows going straight down hill, that allow of a stick of timber being shot down the mountain to the lower lands, and that does away with all need of forest roads for hauling. The slope is so steep that there is only width

the narrowest footpath. Where this crosses the slide it is as well to take it at

a run in order to be sure to get safely across. The change of temperature from the cool black wood into the clearing is almost startling. Last night the moon wore a rain-promising halo, and a steady downpour fell in the early hours of the morning. The forenoon is cloudy, but the clouds are high. It is perfectly windless, and the soaked ground is

giving out its steamy moisture, and with it the cordial scent of earth and of the slow decay of the coniferous vegetation. The first clearing is evidently of two winters ago. It is interesting to see what is the natural growth that follows. The mountains are of limestone; in many places the solid rock comes through, and everywhere it is close to the surface. But as is so often the case in chalky places, what soil there is is excessively rich. It is a strong blackish loam, producing growths of a size and vigour that are surprising to English eyes. Thistles are 8 feet high, *Campanula Trachelium* over my head; coarse grasses also 7 feet to 8 feet; the beautiful pink *Centaury* 2 feet 6 inches; yellow *Foxglove* 4 feet. Other common plants of the clearing and thinner wood edge are wild Strawberry, wild Raspberry, Scabious, Columbine, and Marjoram. Of bushy things there is the handsome *Viburnum Lantana*, Dogwood, Privet, *Clematis Vitalba*, scarlet-berried Elder, weighed down with the great red fruit-clusters; Maple, Hazel, and Holly. With so many of the plants and trees that one is used to find in calcareous woodland the complete absence of Yew strikes one as remarkable.

Further along is another clearing of last winter only. In some places are thick layers of the remains of small Spruce branches, now rusty red and flattened—almost felted together—evidently from the weight of some feet of snow. Compared with the luxuriant vegetation of the two year old clearing, this one looks bare, though the young growths of a few months show that next year there will be the same rank vegetation. But here is a glad surprise in the shape of some patches of the handsome *Melittis Melissophyllum*. What a prosperous-looking plant, with its dark green

leaves of solid build and its large white rosy-blotted flowers and its hooded calyx that increases in size as the four large quickly-ripening seeds swell to maturity; while flowers are out three tiers above, seeds are ripening below, a fact that is taken advantage of for the benefit of the home garden. A few steps further and there is another plant of great interest—a bush in size—the deadly Nightshade (*Atropa Belladonna*). Its lurid purple flowers, something like *Cobaea* in miniature, look small for the size of the plant, but are made up for by the large size of the poisonous berry in its star of calyx. They are still green: later they will turn almost black, like the darkest cherries. A little way on is a large patch of something of a very bright green colour, and the ground gets damp. It is a bed of *Equisetum Telmateia*, here oddly enough rather smaller than in England. A little trickle of water comes down through the rank greenery, just audible with its pleasant little quiet tinkling sound, and here is the rosy *Lythrum*, and, brighter still, spreading patches of *Epilobium*, and Horse-mint and the Great Valerian.

Another near walk is down hill through the rich pasture to the bottom of the deep rift through which a true mountain torrent tumbles on its way to the lake. The bottom and lower sides are thickly wooded, and the path, more or less following the course of the stream, is full of the beautiful variety that can only be shown by such a mountain glen. Where there is a little more light a scramble among the trees and boulders shows quantities of Hepaticas. The rocky sides narrow, leaving only space for path and torrent, then they widen again, and in a bed of deep green moss there is a patch of Pyrola, the only other growing thing in sight upon the ground—a perfect little gem of flower and leaf, as fitly set as possible in its simple mossy bed with its background of white, black-seamed rock and grey tree-trunk, all dimly mysterious in the half light of the wooded gorge; the quiet little flower looking all the more peaceful for the dash and roar of the water that tears down among the boulders only a yard or two away.

July 28.

### CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

### FLOWER SHOW FANCIES.

[To THE EDITOR OF "THE GARDEN."]

**S**IR,—The reading of the article on "Flower Show Fancies" in *THE GARDEN*, August 16, brings into one's mind once more the question whether the gospel of "broad effects," so often preached, is really and truly the one legitimate form of good gardening, and whether the cultivation of a large variety of plants, so severely condemned and deplored as "scrappiness," is really the very undesirable thing it is made to appear. May not the desire and endeavour to accumulate and grow many varieties in a limited space be as legitimate as the desire for broad effects? Did space allow, no doubt all would prefer to grow their plants in masses, but where space and means deny may it not be equally right to grow a variety of individual plants as to grow a quantity of five or six? Is it a

fact that the artistic and the beautiful is the only aim for the gardener? May not the garden of many kinds be as good and as desirable as the garden of masses and colour schemes? Even the writer of the article is at times constrained to forsake the masses of Daffodils and Tulips for the "tailor's pattern book" of Messrs. Barr's rockery. I go further, might it not well be contended that interest ranks higher than mere beauty, and that what really satisfies the heart is not that which charms the eye alone, but that which goes beyond to the mind. What, after all, is the doctrine of broad effects of colour but a development of what used to be condemned in the once universal ribbon borders? Taste has changed; we no longer admire a blaze of red, blue, and yellow, yet the idea, surely, is the same, an appeal to the eye.

Must one feel wrong when one loves to add plant to plant and variety to variety? Must one sacrifice all to the god of appearances? Surely the one aim is as legitimate and as desirable as the other, and is not the real mistake to try and impose upon all one and the same ideal, rather than to allow us in our gardens that difference which is the true characteristic of nature.

Fairford, Gloucestershire.

R. H. W.

[We quite agree in one sense with our correspondent's remarks, but it is only in free groups that the true beauty of many shrubs and hardy flowers is seen. As all things in Nature are grouped, so we may follow this teaching in the garden. Mere collections are, of course, interesting, but those who love their gardens rejoice in seeing flowers grow in their own way and develop their true nature. This is impossible where everything is jumbled up in a meaningless mass. A collection of hardy flowers thrust into a border a hundred times too small to accommodate it is not beautiful. —ED.]

## MISCELLANEOUS.

### REMOVAL OF LARGE TREES AND SHRUBS.

**P**ROBABLY no garden operation requires more time and labour than the proper removal of large trees and shrubs from one part of a garden to another. Time, as it will take two, or even three, days to remove a large tree to a distance; and labour, as the services of from eight to twelve men will be required to accomplish the work. It is not, therefore, an operation to be lightly undertaken or got through in a hurry.

Before proceeding to describe the various ways of moving large specimen plants, it will be well to consider the trees and shrubs that are generally required to be moved. Three numbered lists are given arranged according to the roots of the shrubs or trees—that is, those that, when they have stood for some time in one place, are most alike as regards the way their roots are placed together; and the lists are also some guide when transplanting, as the chances of life after removal are greatest in No. 1, less in No. 2, and considerably lower in No. 3.

#### No. 1.

Andromeda	Clethra	Rhododendron
Azalea	Kalmia	Vaccinium

Diospyros	Magnolia	
Elaeagnus	Osmanthus	
Halesia	Phillyrea	Coniferæ

It will be noticed that conifers are mentioned in the third list, and even in nurseries where they are regularly moved the mortality amongst them is very high; and the removal of large conifers should never be attempted except with a transplanting machine, and expert men to handle it. As a rule, it will be found cheaper and better to buy young plants than to attempt the removal of large ones that have stood for some years without root disturbance.

Such flowering shrubs as Spirea, Philadelphus, Kerria, Ribes, &c., can be safely moved without much trouble, as they make a mass of roots which will hold a good ball of soil unless it is very dry. All are practically certain to live if carefully planted and well watered afterwards.

There are several ways of moving large trees, the simplest and quickest being by a proper transplanting machine, which consists of a framework on wheels fitted with a system of rollers and levers. For moderately-sized trees, say, to about 12 feet high, a two-wheeled machine is sufficient. This is moved by eight or ten men. For trees above 12 feet high a four-wheeled machine is required, with two, or perhaps three, horses to draw it. The first will take a ball of soil weighing from two to three tons, the latter anything to ten tons, or even more.

In preparing the tree for the small machine the ball is made round and slightly smaller than the width of the machine, a trench being cut round the tree to a depth of 3 feet or so, the actual depth depending on the roots, but the soil should be removed a foot lower than the lowest roots. On no account undermine the ball until the proper depth has been reached. A proper machine-pick is the best thing to use under the ball.

The illustration shows a tree being transplanted from one part of a garden to another. Lifting and replanting large trees is interesting, but, as I have already mentioned, must be carefully undertaken.

J.

to keep the foliage fresh and to encourage root action. Plants in pots should be well supplied with manure water. Keep a sharp look out for red spider, which often attacks Solanums grown in pots.

#### CHRYSANTHEMUMS.

Early-flowering plants are now beginning to expand their blooms, and should be placed in a light, airy, and cool house for the flowers to open. The ventilators should be left open night and day. Thoroughly cleanse the pots before taking them inside, and the plants should be well fumigated, using XL All vaporiser, which I have found one of the safest and most effectual remedies. Should

TRANSPLANTING A TREE, SHOWING MACHINE USED.

mildew make its appearance then dust the foliage thoroughly with black sulphur. Avoid crowding the plants and give weak liquid manure frequently.

#### CALADIUMS.

As the beauty of these plants fades the supply of water should be gradually lessened, decreasing the quantity until it is entirely withheld. By this time the foliage will have died down, the pots should then be laid on their sides under the stage in the stove where they can be given water when required. The tubers should never be allowed to get very dry or they are likely to rot.

#### GENERAL WORK.

Many of the summer-flowering plants will now be passing out of flower, and this will give an opportunity of getting the houses in readiness for the autumn and winter-flowering plants, which will soon have to be brought in. Thoroughly wash the woodwork and glass, and the walls should be coated over with hot lime. When well painted the wood-work will stand a greater amount of wear and

## GARDENING OF THE WEEK.

### INDOOR GARDEN.

#### SOLANUMS.

**C**UT round the roots of those planted out with a sharp spade to prepare them for being placed in pots. Should the soil be dry give a liberal watering; in a week's time they may be potted up. Do not use large unsightly pots, but give ample drainage and a rich open porous soil, which should be well pressed around the roots. Afford a good watering and place the plants in a close, warm, and shaded frame. Syringe frequently

tear, will harbour no insects, and is easily kept clean. With shortening days and cold nights it will be wise to place the lights over winter-flowering zonal Pelargoniums. Abundance of air should be given at all times, as the best flowers are obtained from strong well ripened growth. In the stove the temperature must be maintained with fire-heat. In cold and wet weather a little fire-heat may be required in the greenhouses to dispel dampness, but this must at all times be accompanied with as much air as possible.

JOHN FLEMING.

Wexham Park Gardens, Slough.

## THE KITCHEN GARDEN.

### PARSLEY.

EVERY care should be taken to ensure a constant and regular supply of this useful herb during the whole year. To make certain of this, frequent sowings and transplantings must be made throughout the summer and autumn, and though comparatively hardy means must be taken to protect it during the winter months in most parts of the country. The earliest sowings should now be cut fairly hard back to encourage young growth before too late, and young plants sown later should be thinned and pricked out a fair distance apart in cold frames. Rake the soil to within 1 foot of the glass, press thoroughly firm, keep the young plants frequently syringed till they have taken root, after which air should be admitted pretty freely, and, when the weather will allow, remove the lights entirely.

### SPRING-SOWN ONIONS.

Very much will depend on the keeping qualities of these as to the way they are harvested and finished off, and the sooner this is begun the better. Onions are exactly like fruit, they suffer in the same way through being roughly handled, consequently they require to be treated almost as carefully. After about a week the bulbs should be pulled up and laid on their sides on the ground and turned every other day till they are fairly well ripened. Choose a fine day and arrange them thinly where the air can play about them freely. On wet days they can be roped up or stored away on shelves in a cool room for use as required.

### CUCUMBERS.

Good strong plants should now be planted in the Cucumber house on a gentle hot-bed. These plants should not be allowed to commence bearing too early or they will become exhausted before the short days, and they should last well on into mid-winter. Make yet one more sowing of an approved winter fruiting variety, the old Syon House is perhaps the most reliable of any for midwinter; though small it is very prolific and the flavour excellent. Plants which are now in full bearing should receive assistance by way of frequent slight top-dressings of turf loam, leaf-soil, and horse manure, which should be thoroughly warmed before applying, and at every other watering some farmyard liquid manure should be given. The houses and pits should be shut up quite early in the afternoon to ensure as much sun-heat as possible.

### RUNNER BEANS,

though very late, are now bearing abundantly, and making rapid growth. See that they are securely staked by placing extra strong supports to keep them in an upright position. The growths should be stopped with the shears after reaching the top of the stakes. Climbing French Beans will require to be picked daily or in a short time they become stringy and unfit for use.

Aldenham House Gardens, Elstree.

## THE FRUIT GARDEN.

### RASPBERRIES.

THERE should be no further delay in cutting out the old bearing canes now that the fruit is gathered, and if the young ones have not been sufficiently thinned this should at the same time receive attention, care being taken not to damage the foliage of those retained for next year's fruiting.

This operation will admit of more air and sunlight amongst the selected canes, with the result of their being the better matured, and for this reason they should not be tied closely to the trellis until their foliage has fallen, but merely loosely secured to prevent injury by wind. If liquid manure is available, a good soaking with it will at this season be beneficial, particularly to old plantations that are declining in strength. Autumn fruiting kinds should have their flowering canes exposed as much as possible to the sun, and consequently kept well thinned, otherwise the fruit will not ripen satisfactorily. Such varieties as Belle de Fontenay, October Red, and Large Monthly, if carefully managed, will afford a useful supply of fruit until the frosts.

### PEACHES AND NECTARINES.

Early varieties are later than usual, but as the trees are relieved of their fruit they should be cleared of all useless wood that has carried the crop, and superfluous side growths should be shortened to their basal buds. Give the trees a thorough washing with a good insecticide, and subsequently keep them well syringed in fine weather. Bellegarde, Crimson Galande, Dymond, and other mid-season kinds should, in order to enhance their colour, have their fruits exposed, and they should also be protected from wasps and birds. The quality of the fruit of such late varieties as Violette Hâtive, Raymaeker's, and Exquisite will be much improved if the roots of the trees in dry periods are watered, supplied with liquid manure, and mulched with short litter, and this assistance is especially needful in dry, porous soils. In wet seasons mulching does more injury than benefit upon heavy soils by keeping the roots inactive, and under such circumstances artificial fertilisers should take the place of liquid manure.

### PLANTING PREPARATIONS.

The planting season being near at hand, if the necessary preparations for planting bush fruits suitable for gardens have not been accomplished they should be at once attended to. In the first place, suitable drainage, by means of ordinary tile drains, placed at least 3 feet in depth and some 24 feet apart, should be ensured, and the land trenched at least 2 feet in depth, except in very favourable positions, leaving the top spit, which is invariably the best, to prevent the roots of the trees from penetrating deeply. In necessary cases lime rubble, road scrapings, or decayed rubbish heap material may be, as the work proceeds, incorporated in the soil, and although ordinary farmyard manure should not be applied under ordinary conditions for the Apple, Pear, Plum, or Cherry at the time of planting, it may with advantage be liberally used for the Raspberry, Gooseberry, Currant, and similar fruits.

The Hendre Gardens, Monmouth.

## SOCIETIES.

### SHREWSBURY FLORAL FETE.

ON the 20th and 21st inst. this greatest of provincial flower shows was held in the delightful Quarry Grounds. The weather was all that could be desired, and tremendous crowds attended on both days, the receipts at the gates being record ones. The fruits, plants, flowers, and vegetables were magnificent, and particularly so the Grapes. Never had finer black Grapes been seen at Shrewsbury. The White Muscats were for the most part colourless, owing, no doubt, to the sunless season. The Champion Grape Cup was won by Mr. Shindler, with very large bunches, the black varieties being also well finished. Mr. Thomas Lunt, who was third, showed smaller bunches, but they were of almost perfect finish, and there were many who thought Mr. Lunt's exhibit deserving of a higher place. The decorated dessert tables were very attractive, and the fruit good.

The first prize for twenty specimen plants went this time to Mr. Cromwell, gardener to T. S. Timmis, Esq., Allerton, who deserves much credit for his magnificent plants. The cut flowers were not of extraordinary merit. Dahlias were not shown so well or so extensively as usual. The non-competitive groups were a noteworthy feature, and the vegetables were excellent. The worthy honorary secretaries, Messrs. Admitt and Nannton, are to be heartily congratulated upon the success of this year's exhibition.

### PLANTS.

In the division for plants open to all it is questionable whether Shrewsbury has ever seen such a fine array of plants, whether regarded from the point of size or cultural

skill. The class for twenty plants brought four competitors, these in themselves making a display that can only be seen at this important function. The groups fully maintained the high position that has been held here in past years, the visitors being nostrited in their praise at the marvellous beauty of the flowers and the artistic skill shown in the arrangements.

For twenty stove and greenhouse plants, not less than twelve in bloom, the premier award went for the first time to Liverpool—to T. S. Timmis, Esq., Cleveley, Allerton (gardener, Mr. B. Cromwell). His plants throughout were noticeable for their size and perfect freshness. They were backed by Palms (*Kentia fosteriana*) at each side, with *K. belmoreana* for the centre, each about 12 feet in diameter and of a similar height; Crotons, of which there were five; *Mortefontaine*, superbly coloured; *Williamsonii*, large foliage; Queen Victoria, Countess, all upwards of 6 feet in diameter and well finished; Ixoras, which numbered six, were remarkably well flowered, the varieties being *Williamsii* (two), *Coccinea superba* (two), *Pilgrimii*, *Dutii* (the spikes), *Stephanotis floribunda*, well flowered; *Lapageria rosea* and *alba*, heavily laden with their telling blooms; *Statice profusa*, 6 feet in diameter, in robust health, and heavily flowered; *Allamanda* *Hendersonii*, and *Rhododendron Taylori* completed this exhibition of giant plants.

Messrs. J. Cypher and Son, Cheltenham, were second with somewhat smaller plants, but of greater variety; especially grand were *Bougainvillea Cyphera*, *Erica marnockiana* (well flowered), *Phoenicomea prolixa* *Barnesii*, *Rondoletia speciosa major*, *Bougainvillea sanderaiana*, with splendid *Statice profusa*, even larger than in the first prize lot, *Statice intermedia*, with good Crotons, &c., made up a grand display. Mr. W. Vanse, Leamington, followed with smaller plants, in which *Ericas* were the most telling. One other collection was staged, which received an extra award.

For the group of miscellaneous plants in and out of bloom, to occupy 300 square feet, arranged to produce the best effect. Messrs. Cypher and Son easily held their own with a display arranged very artistically. It consisted of an arch in cork as the centre of the background, with Pyramids on either side, the summits surmounted with well-grown Palms. The groundwork was of Asparagus, Ferns, *Panicum*, &c., from which were arranged Crotons, Ixoras, Liliums, &c. The foreground was occupied with three Pyramids, the centre one of Bamboo. Other foliage plants included Begonias, Asparagus, and Crotons, the flowering portion being entirely Orchids, including *Oncidium Papilio*, *Dendrobium*, *Laelias*, *Odontoglossums*, &c. The side groups were composed of *Cocos weddelliana*, Crotons, Begonias, Caladiums, Asparagus, &c.

G. H. Kenrick, Esq., Edgbaston (gardener, Mr. J. V. Macdonald), was second with a tasteful arrangement, but lacking in colour. The chief points were Crotons (good in colour), Palms, Bamboos, Ferns, Liliums *longiflorum*, *Francoae*, Ixoras, &c. The remaining award was secured by Mr. W. Finch, Coventry, with a group in which Liliums, Tuberoses, and Odontoglossums were noteworthy.

For a group of ornamental foliage plants, Palms, Ferns, &c., Messrs. Cypher were again to the fore, the Crotons being vivid in their colouring. *Warrenii*, *Reidii*, and others were especially fine. Palms in variety, Aralias, Begonias, Acalyphas, and Caladiums played an important part in this very fine array.

G. H. Turner, Esq., Derby (gardener, Mr. J. Thompson), was second. His arrangement was somewhat flatter than the foregoing. The best features were fine single-stemmed Crotons furnished to the pot, Begonias, Caladiums, &c. G. H. Kenrick, Esq., received the remaining award.

Six Dracenas: Lord Harlech, Brogynlyn (gardener, Mr. T. Lambert), was first with large well grown plants unnamed; second, Mrs. R. Darby, Adeote, Baschurch (gardener, Mr. R. Lawley), with smaller but well finished plants.

For thirty miscellaneous plants, Lord Harlech led with a pretty combination, in which Ixoras were well flowered; T. S. Timmis, Esq., was second with bright plants; W. J. Scott, Esq., Besford House (gardener, Mr. J. Carter), third.

Single stove or greenhouse plants in flower: Mr. W. Vanse, Leamington Spa, took the lead with a well-flowered *Erica*; Messrs. Cypher second with *Statice intermedia*; Mr. W. Finch took the remaining award with *Statice profusa*.

Six Fuchsias: Mr. J. Jenks, Castle Fields, took the lead with small well bloomed plants.

Group of miscellaneous plants, 150 square feet: Mrs. Swann (gardener, Mr. C. Roberts) led with a well arranged combination; second, H. H. Hayhurst, Esq., Wellington (gardener, Mr. S. Bramwell); third, T. F. Kynnersley, Esq., Leighton Hall (gardener, Mr. W. Phillips).

Thirty stove and greenhouse plants in pots not exceeding 10 inches: Lord Harlech led with charming plants remarkably well done, the best being *Ixora Dutii*, *I. Pilgrimii*, *Dipladenia amabilis*, and *Clerodendron Balfourii*; T. S. Timmis, Esq., an excellent second; Messrs. Cypher third.

Four Coleus: J. Barker, Esq., Shrewsbury (gardener, Mr. H. Worrall), led with Pyramids, good foliage and colour; second, Mrs. J. H. Staney, Wellington (gardener, Mr. T. Stevenson).

Six stove and greenhouse plants: W. J. Scott, Esq., won, having good *Bougainvillea glabra*, *Stephanotis floribunda*, &c.; Mr. J. Tarrant, G. Burr, Esq., Oaks, London, and Mr. A. Jones as placed.

Six stove and greenhouse plants: Lord Harlech led, having a very fine *Eucharis amazonica*, *Vinca rosea*, &c.; T. F. Kynnersley, Esq., was second, his exhibit including a huge *Hydrangea*.

Four exotic Ferns: T. S. Timmis, Esq., won with grand examples of *Nephrolepis rufescens*, *N. davalliioides furcans*, *Adiantum cuneatum*, and *Microlepia hirta cristata* 10 feet in diameter; second, Mrs. J. H. Staney; third, W. J. Scott, Esq.

Six Caladiums: T. S. Timmis Esq., was again to the fore with a grand lot, beautifully coloured; second, H. H. Francis Hayhurst, Esq.; third, R. A. Newill, Esq. (gardener, Mr. W. Ashwood).

Twelve table plants: T. S. Timmis, Esq., led with brilliant coloured Crotons, Aralias, &c.; J. E. Waterhouse, Esq., Preethbury, Macclesfield (gardener, Mr. A. H. Hall),

second; T. Corbett, Esq., Impney Hall, Droitwich (gardener, F. Jordan), third.

Six double Geraniums: The winners were Messrs. R. Taylor, E. S. Godsell (gardener, Mr. W. Payne), and J. Tarrant.

Four Begonias: Messrs. W. J. Scott, R. Taylor, and J. Tarrant were the prize takers.

In the open class for three double and three single flowering Begonias, Messrs. B. R. Davis and Sons, Yeovil, won with very fine forms; R. Taylor, Esq., second.

#### CUT FLOWERS.

For a display of floral arrangements, Messrs. Jones and Sons, Shrewsbury, were first. They had a number of beautiful arrangements, notably a harp of *Eucharis*, white *Lilium*, &c., vases and baskets of Carnations, Roses, &c. A silver cup, given by the Shropshire Society in London goes with this prize.

Mr. H. Hayward, Kingston-on-Thames, was first for ball and bridal bouquets; Messrs. Jones and Sons a good second; and Mr. J. Derbyshire, Altringham, third.

For a similar exhibit (Orchids excluded), Mr. W. Treseder, Cardiff, was well first; Messrs. Jones and Sons second. Mr. W. Treseder was first also for a shower bouquet of *Cactus Dahlias* and for one of Roses. Mr. J. Derbyshire was second in the latter class. Mr. Treseder also won for a stand of *Cactus Dahlias*, Messrs. Keynes, Williams, and Co., Salisbury, second.

Messrs. Jones and Sons were first for buttonhole bouquets and ladies' sprays.

For a collection of hardy perennials, Messrs. Harkness and Son, Leeming Barr, was first with a bright display of good things; second, Messrs. Isaac House and Son, Westbury-on-Trym, Bristol; third, Messrs. Gibson and Co., Bedale.

For a collection of *Cactus Dahlias*, Messrs. Keynes, Williams, and Co., Salisbury, were first, with some lovely flowers, well arranged; second, Messrs. Jones and Sons, Shrewsbury, with very good flowers; third, Messrs. W. B. Rowe and Son, Worcester.

For a collection of Dahlias, any varieties, Mr. W. Treseder, Cardiff, was first; his double varieties were very fine; second, Messrs. Keynes, Williams, and Co., Salisbury; third, Messrs. Jones and Sons.

Collection of Carnations and Picotees: First, Messrs. Thomson and Co., Sparkhill, with a beautiful lot; second, Messrs. M. Campbell and Son, High Blantyre; third, Messrs. Blackmore and Langdon.

Twenty-four bunches of hardy flowers: First, Mr. Wakefield, gardener to Miss Humbert, Chester; second, Messrs. Isaac House and Son, Westbury-on-Trym; third, Messrs. Gibson and Co., Bedale.

Thirty-six Gladioli: First, Messrs. Harkness and Co., Leeming Barr; second, Messrs. R. Harkness and Co., Hitchin.

Twenty-four Roses: First, Messrs. R. Harkness and Co., Hitchin; Messrs. D. and W. Croll, Dundee, being a good second; third, King's Acer Nursery Co.

Twenty-four blooms show Dahlias: First, Messrs. Campbell and Son, Blantyre, with a splendid lot; Mr. S. Mortimer, Farnham, Surrey, was a good second; third, Mr. W. Treseder, Cardiff.

For twelve show Dahlias (nurserymen excluded), Mr. S. Cooper, Chippenham, was first; Mr. T. Jones, Ruabon, second; and Mr. W. E. King, Bodenham, Leominster, third.

Twenty-four Cactus Dahlias: First, Mr. S. Mortimer, with some beautiful flowers; second, Messrs. Vernon and Barnard, Willaston, Cheshire; third, Messrs. Keynes, Williams, and Co., Salisbury.

In a similar class (nurserymen excluded), Mr. W. E. King was first, showing well; second, the Hon. Mrs. E. Kenyon, Maesfen; third, Mr. T. Cooke, Bicton.

Special prizes were offered by Messrs. Jones and Sons, Shrewsbury, for Dahlias; by Mr. Robert Sydenham, Tenby Street, Birmingham, for Sweet Peas; and by Mr. Henry Eckford, Wem.

#### FRUIT.

The first prize for a dessert table decorated with plants in pots, cut flowers, and foliage was won by Mr. J. H. Goodacre, Elveston Hall Gardens, with a grand display. This exhibit obtained 121 points. The Grapes, Muscat of Alexandria and Muscat Hamburgh, were very fine; and Pear Triomphe de Vienne, Peach Royal George, Apple Ribston Pippin, Nectarine Erluge, the Melons, and, in fact, all the dishes were of great excellence. The floral decoration was of Montbretias, Francoas, Heuchera, Gypsophila, and grasses in the large glasses, Selaginella and Asparagus forming a delicate and effective draping. For beauty of foliage and flower 7 points were given, 8 for harmonious blending of colouring, and 8 for general arrangement for effect.

Mr. G. Mullins, gardener to Lady Henry Somerset, Ledbury, was second. His table was arranged very much like the first prize one; it was not, however, so well filled. The number of points obtained for this was 111. The Grapes were not so good, but Nectarine Dryden, Apricot Moor Park, Melon Countess, Peach Barrington, and Nectarine Stanwick Erluge were very fine. The floral decorations, though almost identical with those of the first prize table, were hardly so well done.

Mr. J. McIndoe, Guisborough Hall Gardens, was third. The Peaches, Apple Washington, Pears Souvenir du Congrès and Triomphe de Vienne, Nectarine Stanwick Erluge, and Melon Best of All were the best dishes. Francoa, Heuchera, Acacia, and Asparagus were used in the decorations. Mr. McIndoe obtained 109 points. Mr. R. Dawes, Temple Newsam Gardens, was fourth, gaining 100 points; and Mr. S. Bremmell fifth, with 83½ points.

#### GREAT GRAPE CLASS.

The silver champion cup (value fifty guineas, to be won three times) and the first prize for twelve bunches of Grapes was won by Mr. W. Shingler, gardener to Lord Hastings, Melton Constable, Norfolk. This exhibit obtained 105½ points out of a possible 112. A bunch of Gros Maroc obtained the full points. The Muscat of Alexandria were

somewhat greasy and unshapely, but the black Grapes were splendidly finished, while the bunches were enormous, those of Alnwick Seedling were huge, as also were those of Alicante.

The second prize, together with a special prize presented by Messrs. Wm. Wood and Sons, Limited, was won by Messrs. D. and W. Buchanan, Kippen, Stirling. Their produce obtained 98½ points. These Grapes were all of splendid finish, one of Alnwick Seedling obtaining the maximum points, and one of Muscat of Alexandria and Alnwick Seedling losing only by half a point. The bunches of Alicante were huge but the berries small.

The third prize was won by Mr. Thomas Lunt, Keir House Gardens, Dunblane, N.B., whose bunches, although of almost perfect finish, lacked the size of those previously named. No less than four obtained the maximum number of points, viz., Black Hamburgh (twice) and Mrs. Pince (twice). The Madresfield Court and Muscat of Alexandria were very good also. They obtained 95½ points.

Mr. J. H. Goodacre, Elveston Castle Gardens, was fourth, gaining 93 points. Madresfield Court and Muscat Hamburgh were best represented.

The three prizes for decorative arrangements in this class were awarded as follows: First, Mr. A. Coates, gardener to Colonel Platt, C.B., Gordong, Wales, who was sixth for Grapes. Mr. G. Mullein won the second prize for decoration, and Messrs. Buchanan took the third.

For sixteen dishes of fruit, Mr. F. Jordan, Impney Hall Gardens, Droitwich, was first with an admirable exhibit. The Madresfield Court and Black Hamburgh Grapes were excellent; the Muscats slightly green. Melons Hero of Lockinge and Frogmore Scarlet were good, Lord Napier Nectarine, Apricot Large Early, and Peach Violette Erlative were excellent. Mr. J. H. Goodacre, Elveston Castle Gardens, was second. Madresfield Court and Muscat Grapes were very good. Marguerite Marillat Pear was a splendid dish, and Nectarine Lord Napier and the Nectarine Peach good; third, Mr. R. Dawes, Temple Newsam Gardens, Melon Temple Newsam Hybrid, Peach Dymond, and Pear Clapp's Favourite being the best dishes; Mr. R. Cairns, Baldrudder Gardens, Dundee, was fourth.

The prizes for decoration in this class were awarded as follows: First, Mr. Jordan, very few flowers, Asparagus effectively used; second, Mr. Goodacre, with Francoa and Ferns; third, Mr. J. McIndoe, who used Orchids and Ferns. Mr. McIndoe was fifth for fruit.

For a collection of twelve dishes of fruit: Mr. J. Jones, York House Gardens, Great Malvern, won the first prize. The best Grapes were Gros Maroc, and Nectarine Violette Erlative, Pear Poire Boussouf, Peach Violette Erlative, and Stirling Castle were very good. Mr. G. Hall, Melchet Court Gardens, Romsey, was second. The Grapes were of good quality, the Melons good; but the remaining fruit rather small. The third prize fell to Mr. T. Bannerman, the Gardens, Rugeley, Staffordshire, who had good Peaches and Melons.

The prizes for decoration in this class were awarded thus: First, Mr. J. Jones, who used Gypsophila, Cypridium, a few Carnations, and a draping of Selaginella; Mr. G. Hall was second, using Smilax for draping and Montbretias in the glasses; third, Mr. T. Bannerman, who had white Roses and Asparagus.

For a collection of nine dishes: Mr. J. Langley, gardener to the Rev. T. M. Bulkeley Owen, Tedsmore Hall, West Fenton, was first. He showed good Madresfield Court Grapes, Hale's Early Peaches, and Early Rivers' Nectarine. Mr. W. Dawes, gardener to Lord Trevor, Brynkinalt, was second, showing good Appley Towers Grapes, Peaches, and Nectarines.

The first prize for decoration was given to this exhibit. A white Dipladenia and Gypsophila were used in the glasses, and Smilax sparingly on the table. The second prize for decoration went to Mr. H. Huxter, gardener to J. E. Wood, Esq., Ludlow, who used small Croton plants, Cornflowers, and Gypsophila. Mr. Wilkins, gardener to C. F. K. Mainwaring, Esq., Ellesmere, was third for the collection of fruit, and also for decoration; Mr. J. Bremmell, gardener to H. H. F. Hayhurst, Esq., Wellington, was fourth.

Four bunches of Grapes: First, Mr. T. Lambert, gardener to Lord Harlech, with very good Madresfield Court and large, somewhat green Muscats; second, Mr. J. H. Goodacre, with the Muscat Hamburgh, and good Muscat of Alexandria; a good third, Mr. W. Fyfe, Lockinge Gardens.

For two bunches of Black Hamburgh Grapes: Granville Farquhar, Esq., Cholmondeley Castle, was first with finely-coloured bunches, whose berries were rather thick; second, Mr. Thomas Lunt, with highly-finished smaller bunches; third, Mr. T. Lambert.

Mr. T. Lunt was first for one bunch of Black Hamburgh Grapes, showing a bunch of perfect finish; Mr. Goodacre was a good second; and Mr. G. Hall, Romsey Gardens, Hants, third.

Two bunches of Madresfield Court: First, Mr. W. Shingler, with grand examples; second, Mr. G. R. Fielder, North Mymmes Park Gardens, Hatfield; third, Mr. A. H. Hall, Collar House Gardens.

Two bunches Alicante: First, Mr. W. Shingler, with very large, well-finished bunches; a good second, Messrs. D. and W. Buchanan, Kippen; third, Mr. A. H. Hall.

Two bunches of Gros Colmar or Gros Maroc: First, Mr. W. Shingler, with grand Gros Maroc; second, Mr. C. Wilkins, Oteley Gardens, Ellesmere; third, Mr. T. Lambert.

Two bunches of Muscats: First, Mr. A. H. Hall, with good sized bunches splendidly coloured and finished; second, Mr. F. W. Everett, Tal-y-Cafn, R.S.O., with larger bunches, but very green; third, Mr. W. Fyfe. The first prize bunches were much superior to the others.

One bunch Muscat: First, Mr. W. Fyfe, with a large and somewhat green bunch; second, Mr. C. R. Fielder; third, Mr. James Inglis, Douglas, Isle of Man. The Muscats on the whole were very green.

Two bunches any other white Grapes: First, Mr. A. H. Hall, with very good Chasselas Napoleon; second, Mr. A. Child, Daventry Gardens; third, Mr. R. Lawley, with Buckland Sweetwater.

Six Peaches: First, Mr. J. Wilkes, Creswell Gardens, Stafford, with grand Bellegarde; second, Mr. J. Jones, gardener to Mrs. F. Need, Malvern, with good Stirling Castle; third, Mr. R. R. Grindrod, Whitfield Gardens, Hereford.

Six Nectarines: First, Mr. W. Phillips, Leighton Hall Gardens, with very fine Pine-apple; second, Mr. J. Jones, with Violette Erlative; third, Mr. F. Jordac, Impney, with splendidly coloured Stanwick Erluge.

Six Apricots: First, Mr. Robert Grindrod, with grand Early Red; second, Mr. F. Clark, Wistow Hall Gardens; third, Mr. Jordan.

Green flesh Melon: First, Mr. George Davies; second, Mr. B. Ashton; third, Mr. F. J. Clark.

Scarlet flesh Melon: First, Mr. F. Jordan, with fine Gunton Scarlet; second, Mr. R. Lawley; third, Mr. F. J. Clark.

White flesh Melon: First, Mr. W. Pilgrim, Anglesea, gardener to Sir G. Mayrick, Bart., with Hero of Lockinge; second, Mr. C. Ritchings; third, Mr. G. Hall.

The chief prize winners in the classes for Plums were Messrs. S. Bremmell, James Davies, J. H. Goodacre, and J. McIndoe.

For Cherries, Mr. A. Ruddock, Eangor; Mr. W. Powell, Addlestone; and Mr. Davies, Leominster.

#### VEGETABLES.

These were staged in very fine quality. This section is enhanced in value by the generous support of the leading seedsmen, who offer in many cases liberal prizes for collections and single dishes.

In the class for nine distinct kinds (prizes presented by Messrs. Sutton and Sons), R. W. Hudson, Esq., Marlow (gardener, Mr. J. Gibson), held the post of honour, showing very good Celery Sulham's Prize, Cauliflower Autumn Mammoth, Leek Prizetaker, Tomato Eclipse, Onion Ailsa Craig (very fine), Carrot Intermediate, Pea The Gladstone, Potato Supreme, and Scarlet Runner Best of All; second, Lord Aldenham, Elstree (gardener, Mr. E. Beckett), Cauliflowers and Tomato Perfection being excellent; third, Earl of Lathom, Ormskirk (gardener, Mr. B. Ashton).

For nine distinct kinds (prizes presented by Messrs. J. Carter and Co.), R. W. Hudson, Esq., again had the premier lot, in which Carter's Autumn Giant Cauliflowers, Ivory White Celery, Perfection Carrot, Jubilee Runner Beans, and Perfection Tomatoes were excellent. Lord Aldenham was second, and the Earl of Lathom third.

For twelve kinds (prizes given by Messrs. R. Smith and Co.), Mr. R. A. Horspool, Ruabon, held the coveted position, his Celery, Leeks, Beet, and Carrots being amongst the best. T. Corbett, Esq., Impney Hall Gardens, followed, and Mr. G. Davies, Pool Parva, was third.

For a collection of eight kinds (prizes presented by Mr. Edwin Murrell), the leader proved to be Captain H. L. Butler, Shotton Hall (gardener, Mr. J. Birch), with fair specimens; J. B. Akroyd, Esq., Chalfont Park, Bucks (gardener, Mr. R. C. Townsend), was second; H. H. Francis Havhurst, Esq., third.

For six kinds (prizes presented by Mr. E. Murrell), Mrs. James Cock, Ridgbourne (gardener, Mr. E. Clowes), was to the fore with good Onions; second, Mrs. C. Guise, Hadnall; third, Captain T. A. M. Dickin, Wem (gardener, Mr. G. Gilbert).

For eight kinds (prizes presented by Messrs. Webb and Sons), Lord Aldenham (gardener, Mr. E. Beckett) led with a fine lot. Carrot Prizewinner, Cauliflower Early Mammoth, Celery Giant White, Onion Masterpiece, Potato Progress, Tomato Sensation, Runner Bean New Exhibition, and Pea Talisman were excellent; second, Sir Alexander Henderson, B.M.P., Farnington, Berks (gardener, Mr. W. L. Bastin), with grand Runner Beans Webb's Eclipse and Onion Ailsa Craig; third, Earl of Lathom.

For a collection of twelve kinds, the Eight Hon. Lord Aldenham was to the fore with an exhibit, in which Parship Maltese, Cauliflower Early Autumn Giant, Onion Ailsa Craig, and Pea Telegraph Improved were the best; the Earl of Lathom was second with good Cauliflowers Carter's Early Giant; the Right Hon. Earl of Carnarvon, Newbury (gardener, Mr. W. Pope) was third.

For a collection of nine kinds, the winners were: First, J. H. Lees-Milne, Esq., Ruyton Park (gardener, Mr. J. Hay); second, J. B. Wood, Esq.; third, Captain H. L. Butler.

Two varieties of Potatoes (prizes presented by Mr. R. Sydenham), Sir W. Honyman, Bart., took the lead with Satisfaction and Up-to-date. For eight Onions, Colonel O. R. Middleton, The Chase, Ross (gardener, Mr. W. Leith), led with Excelsior of good size. For eight Tomatoes, the Earl of Carnarvon won with fine formed fruits of Polegate. For six Turnips, Mr. R. A. Horspool was first. For three sticks of Celery, Colonel O. R. Middleton was first with Bibby's Defiance. For six Parsnips, the same exhibitor was first with Hollow Crown, and also won for six Carrots.

For three Cauliflowers, Sir W. Honyman, Bart., was first, with good heads of Veitch's Autumn Giant. One dish of Runner Beans, Mr. R. A. Horspool was first with Ne Plus Ultra; and for two dishes of Peas the same competitor won with Duke of Albany and Grads.

For one dish of Peas, Mr. E. Cumberbatch, Silverdale, was first with Gladstone. For six Onions, Mr. G. Davies won. Two Cauliflowers, G. F. Ward, Esq., with fine heads. Nine Spring Onions, Lord Aldenham won with good Ailsa Craig. Nine Autumn Onions, Earl of Lathom was first with heavy specimens. Four Carrots, Colonel O. R. Middleton was first. Four Parsnips, the Hon. Kenyon Stanleigh, M.P., was first. Three heads of Celery, Sir Colley, Scotland, with solid specimens. Two Cauliflowers, E. A. Young, Esq., was first with Eclipse.

For Runner Beans, Mr. D. Breeze was first with a good lot. French Beans, C. T. Weatherly, Esq., Addlestone, Surrey, first. Dish of Peas, Mr. J. Weston, first. Two Cucumbers, first, Lord Aldenham, with Stourbridge Gem. Six Tomatoes, first, J. C. Waterhouse, Esq., with grand fruits. Six Potatoes, first, the Right Hon. Earl of Lathom with well-shaped Sutton's Ideal out of fifty-three competitors.

## NON-COMPETITIVE EXHIBITS.

Messrs. Webb and Sons, Wordsley, Stourbridge, had a bright and extensive display. The centre of their group consisted of Gloxinias, well-grown and well-flowered plants, whilst on either side of them were banks of miscellaneous hardy flowers, amongst which Hollyhocks were conspicuously fine. A collection of splendidly-grown vegetables was also shown by Messrs. Webb.

Mr. Edwin Murrell, Portland Nursery, Shrewsbury, had an excellent exhibit of cut Roses, the blooms were both bright and fresh. Niphatos and Perle des Jardins were represented by fine masses, and besides numerous Hybrid Perpetuals there were such good garden Roses as Dorothy Perkins (new, a lovely pink rambler), Mme. Lanthan, Ard's Rover, Longworth Rambler, General Jacqueminot, Mme. Abel Chatenay, &c.

Messrs. Dicksons, Chester, showed a very bright group of hardy flowers, in which Phloxes were particularly fine. Kniphofias, Gladioli, Romneya Coulteri, Carnations, Pentstemons, &c., were also very good.

Messrs. Bobbie and Co., Rothesay, had an extensive exhibit that comprised a grand display of Violas, for which this firm is famed, an excellent lot of Sweet Peas, Bobbie's Marigolds, and a representative collection of Potatoes of about seventy dishes.

Messrs. James Veitch and Sons, Limited, Chelsea, arranged an extensive group of choice stove flowering and foliage plants. From a groundwork of Ferns and other greenery, specimen Dracenas, Alocasias, Aralias, Crotons, and Nepenthes were irregularly arranged, the whole forming an exceedingly effective display. A good plant of Caryota Alberti was in the centre, and in front of it a group of Orchids in flower. Some of the most notable specimens in the group were Roupala corcovadensis, Acalypha hispida, Aralia elegansissima, Aerostichum viscosum, Crotons Prince of Wales, Reidi, and Dracaena Doncetti.

Mr. John Russell, Richmond, Surrey, showed a group of miscellaneous stove plants that contained well-grown Crotons, Alocasias, Palms, Caladiums, and Dracenas of the best variety.

Messrs. William Bull and Sons, 536, King's Road, Chelsea, exhibited a group of choice stove plants, consisting chiefly of Crotons Reidi, Flamingo, Aiglonth Gen., and others, Dracena Victoria, and Caladiums in variety. Polypodium irioides ramocristatum and Anemia rotundifolia were two notable plants included.

Messrs. Geo. Jackman and Son, Woking Nursery, Surrey, showed hardy flowers very extensively. Cactus, Pompon, and double Dahlias were included, and Gladioli, Kniphofias, Eryngiums, Pyrethrums, and many more were well shown.

Mr. Maurice Pritchard, Christchurch, Hants, in his group of hardy flowers had some splendid Kniphofias, Montbretias, Gladioli, Lobelia cardinalis, Veronicas, Phloxes, &c.

Messrs. Jones and Sons, Shrewsbury, showed a pretty lot of Sweet Peas and Lillies, very tastefully arranged with suitable greenery, Asparagus Sprengerii, Ferns, &c., making a very pleasing display.

Mr. S. Mortimer, Rowledge, Farnham, Surrey, exhibited a specimen lot of Dahlias, both Cactus and double varieties. Particularly fine were Mrs. H. A. Needs, Mrs. J. J. Crowe, Mrs. Clinton (new), Mrs. James Bailey (new), all Cactus sorts; and of the doubles, some of the best were Mrs. C. Noyes, Mrs. Foster, Mrs. Kendal, Professor Fawcett, and Rosamund.

Hobbies, Limited, Dereham, had a large display of Roses, Dahlias, Sweet Peas, Gloxinias, Cannas, &c., all well arranged and forming an attractive exhibit. There were mounds of Crimson Rambler Rose, almost surrounded by vases of Teas, Hybrid Teas, &c., at one end of the display, and Dahlias in many excellent sorts at the other. Mounds of Cannas flanked a central group of the Sweet Pea Dorothy Eckford.

Messrs. Richard Hartland and Son, The Lough Nurseries, Cork, showed a collection of tuberous Begonia blooms in many grand varieties, as well as spikes of Gladioli.

Mr. Henry Eckford, Wem, exhibited a beautiful display of Cactus Dahlias, nicely set up in vases, with suitable greenery.

Messrs. John Peed and Son, West Norwood, London, S.E., had a display of blooms of single and double tuberous Begonias; the singles were especially fine.

Messrs. W. and J. Brown, Stamford and Peterborough, showed a miscellaneous lot of flowers, that comprised Carnation Pride of Peterborough, Heliotrope Lord Roberts, garden Roses, zonal Pelargoniums, &c.

Mr. Robert Brown, Warton, Carnforth, showed an extensive collection of Sweet Peas. Many of the best varieties were well represented, but the flowers were much crowded in the vases.

Sweet Peas were also extensively shown by Mr. John Derbyshire Hall, Altringham.

Messrs. Jarman and Co., Limited, Chard, made a pretty display with Sweet Peas, Roses, and Dahlias (Cactus, Pompon, and double varieties). A collection of vegetables was also shown by Messrs. Jarman.

Mr. J. H. White, Worcester, exhibited hardy flowers extensively. Notably good were the Gladioli, Hollyhocks, Ixochiums, Phloxes, &c. Several good Cactus Dahlia blooms were included.

Messrs. Prichard and Sons, Shrewsbury, showed dwarf Japanese trees and Fern balls in a variety of shapes.

Messrs. B. R. Davis and Son, Yeovil Nurseries, showed a grand lot of tuberous Begonias in pots. They made a splendid display, both double, single, and crested sorts were shown, and the plants were well flowered.

Mr. F. Davis, Woolas Hill, Pershore, showed a group of very fine tuberous Begonias, the double blooms were some of the best in the show.

Leopold de Rothschild, Esq., Gunnersbury House, Acton, London (gardener, Mr. James Hudson), exhibited a beautiful lot of Nymphaea blooms very prettily arranged amongst their own foliage. Some of the flowers were very fine. Nymphaea Marliacea chronicatella, N. M. albida, N. odorata rosacea, N. ellisiana, N. lucida, N. tuberosa, N. Robinsoni, N. gloriosa, N. stellata (Berlin variety), N. stellata

bulberrina, and N. s. Miss Ward (new, a beautiful rose colour) were also very fine. Nelumbium speciosum, grown out of doors, and numerous water-loving plants were arranged as a background.

Messrs. Blackmore and Langdon, Tiverton Nursery, Bath, had an excellent display of tuberous Begonias in pots, the double blooms being very fine.

Messrs. Richard Smith and Co., Worcester, exhibited a very good group of miscellaneous flowering plants, in which Yuccas, Lillies, Hydrangeas, Phloxes, Clematis, Kniphofias, Veronicas, Gladioli, and many more were pleasingly set up.

Messrs. W. Wood and Son, Limited, Wood Green, New, exhibited several of their specialities, notably the new suspending baskets, effectively filled with flowering plants, Bamboo canes (dyed green), green raffia, the Muratori hand spray, &c.

Mr. Walter B. Child, Acocks Green, displayed a splendid bank of hardy herbaceous plants in great variety. They were well arranged, and formed a very conspicuous feature at the end of one of the tents.

Mr. Albert Myers, Sutton Lane Nurseries, Shrewsbury, showed zonal Pelargoniums beautifully. The trusses were very handsome, and his exhibit was arranged with much taste.

Messrs. Barr and Sons, King Street, Covent Garden, London, exhibited hardy flowers in great variety. The Kniphofias and Pentstemons were most conspicuous, while Water Lilies, Violas in variety, Bocconia cordata, Campanulas, &c., were also well represented. A very interesting and beautiful display.

Mr. R. Greenfield, jun., Leamington Spa, showed Asparagus Myriocladus, a new and good plant.

Messrs. Thomson, Sparkhill, Birmingham, exhibited cut blooms of Carnations in many beautiful varieties.

Mr. W. L. Pattison, Cherry Orchard, Shrewsbury, showed a most beautiful lot of Pansies and Viola blooms prettily arranged.

Messrs. Stuart and Mein, Kelso, showed some excellent Malmaison Carnations as well as several border varieties.

Mr. W. Waters, Westleigh, Acocks Green, showed a collection of Violas that contained some very pretty varieties.

Messrs. Hewitt and Co., Solihull, Birmingham, exhibited a bank of miscellaneous hardy flowers that was very bright. Gladioli, Heleniums, Rudbeckias, Carnations, Campanulas, &c., were well shown.

Mr. H. Deverill, Banbury, showed Phloxes and other hardy flowers in considerable variety.

Mr. John Wood, Penrith, exhibited a collection of Sweet Peas that were bright and fresh, also his Golden Bean Wood's Centenary.

The King's Acre Nursery Co., Hereford, showed a good collection of hardy fruit. Apple and Pear trees in pots were very well grown.

Messrs. Isaac House and Son, Westbury-on-Trym, exhibited a pretty collection of Phloxes.

## AWARDS.

## LARGE GOLD MEDALS.

Messrs. Richard Smith and Co., Worcester, Mr. F. Davis, Pershore, Messrs. Blackmore and Langdon, Messrs. B. R. Davis and Son, Leopold de Rothschild, Esq., Messrs. James Veitch and Sons, Limited, Messrs. Bobbie and Co., Mr. E. Murrell, Messrs. Hartland and Sons, Messrs. Pritchard and Sons, and Hobbies, Limited.

## SMALL GOLD MEDALS.

Mr. John Russell, Mr. J. H. White, Mr. Maurice Pritchard, Messrs. Jackman and Sons, Mr. A. Myers, Mr. Child, the King's Acre Nursery Co., Messrs. Webb and Sons, Messrs. Jones and Sons, Mr. Bolton, Messrs. Jarman and Co., Mr. W. S. Mortimer, Messrs. Hewitt and Co., Messrs. Laing and Mather, and Mr. S. Mortimer.

## SILVER MEDALS.

Mr. W. J. Scott, Besford House, Messrs. William Bull and Sons, Messrs. Barr and Sons, Messrs. Dicksons, Messrs. Isaac House and Son, Mr. John Wood, Penrith, Mr. Eckford, Messrs. Peed and Son, Messrs. W. and B. Brown, Mr. Darbyshire, Mr. Deverill, Messrs. Thomson and Co., Mr. W. L. Pattison, and Mr. Waters.

## CERTIFICATES.

Messrs. Hobbies, Limited, for Cactus Dahlias, Loogain and Winsome, for Lathyrus latifolius grandiflorus album, for Sweet Pea Dorothy Eckford, and for Cactus Dahlia Miss Hetty Dean.

Mr. S. Mortimer for Cactus Dahlias Mrs. Clinton and Mrs. James Bailey.

Mr. Bradley, Peterborough, for Carnation Edward VII.

Mr. Greenfield, jun., Leamington, for Asparagus Myriocladus.

Mr. William Bunn for Tomato Superlative.

## DUMFRIESSHIRE AND GALLOWAY SHOW.

This show, held at Castledykes, Dumfries, on the 15th and 16th inst., was the best held under the auspices of this old-established society for many years. The new directorate is being well supported by exhibitors and the public. The show was declared open by Mrs. Glover, wife of Provost Glover, after an eloquent introductory speech by Sir James Crichton Brown, in which he referred approvingly to the "Garden City" movement.

The large marquee presented a bright spectacle with its display of horticultural produce, which was generally of high quality, though the season greatly reduced the exhibits of some flowers, Dahlias in particular being poorly represented, and Carnations and Picotees grown in the open were too late for this early date. Sweet Peas, hardy flowers, and Roses were very fine for the season, while fruit and vegetables were excellent. Pot plants were weak in the greater number of classes, but bouquets and baskets of flowers were unusually well done for this show. The most successful exhibitor over all was Mr. J. M. Stewart, Mollance, Castle Douglas, N.B., who also won the Dumfries Corporation Cup with a beautiful table of plants, composed largely of Codicums (Crotons), with Palms and flowering plants. Messrs. James Service and Sons were second, and Mr. Houston, winner of the cup last year, was third in this class. Table decorations were beautiful, the first prize going to Miss Rutherford, Crichton House, Dumfries, for a charming table with Shirley Poppies and Marguerites; her sister, Miss D. Rutherford, being second with a pleasing arrangement of white Marguerites and blue Cornflowers, which found even more favour than the other in the eyes of some.

Messrs. D. and W. Croll, Dundee, led with Roses, which were also well exhibited. Among the non-competitive exhibits Messrs. Palmer and Sons, Annan, Messrs. Smith and Sons, Stranraer, and some local nurserymen also had capital displays.

## EAST ANGLIAN CLUB.

## VISIT TO LORD BATTERSEA'S GARDEN

THERE is a spot high up upon those breezy cliffs of Norfolk, around the Cromer district, named by Lord Battersea The Pleasance. Recently the East Anglian Horticultural Club received an invitation to pay visit to this once dreary district, and they went in force of about 100 strong. Lord Battersea met the party, and after exchanging courtesies with the President (Mr. J. Powley) and the Vice-President (Mr. T. B. Field), he personally conducted the party round the gardens. To be brief, would be to say every species and variety of hardy shrub and flower was there, and everything was simply revelling in health. However, we must mention the nature of this ten year transformation. What shrubs! flowering and foliage. The Genistas at the time of the visit were alone a revelation. Hardy flowers of every kind, beds of Carnations, masses of annuals, and last, but not least, almost a mile of pergola-covered walks (these mostly paved with old flag-stones from the streets of London). There were splendid masses of Olearia Haastii and Romneya Coulteri with its almost transparent satiny blooms. Lord Battersea allowed the party the use of the cricket field and bowling-green. A hearty round of applause was given to his lordship on the motion of Mr. Powley, and another to the gardener (Mr. Clements), proposed by Mr. T. B. Field.

**The Gardeners' Royal Benevolent Institution.**—This great gardening charity has marked the Coronation year in a praiseworthy way. As a thank-offering for the King's recovery and to commemorate the Coronation, the committee have placed on the funds, without election, all the candidates who were subscribers without election, and given to each of the applicants who were not subscribers the sum of £5, this coming from the excellent "Good Samaritan Fund."

## Flower show at the Crystal Palace.

—The National Co-operative Festival was held at the Crystal Palace on Saturday, the 23rd inst., and was attended by a large number of persons from all parts of the country who are interested in the movement. As the Agricultural and Horticultural Association were not prepared to carry out a flower show on the scale of previous years, and as the display of garden produce had always been a great source of attraction, it was decided at the last moment to have an exhibition, though on a small scale, and it took place in the basement of the building. A somewhat large space was occupied with garden produce, ranging from elaborate table decorations to vegetables, and though only two somewhat general classes were instituted, a considerable number of exhibits were staged. The task set the judges was a somewhat difficult one, and it necessitated going through the details of each exhibit, estimating each part of it according to a schedule of points. Several money prizes and certificates were awarded. Tables of plants only, some with the addition of cut flowers, others comprised fruit and vegetables, while others were composed wholly of floral decorations, made up an attractive show, and the co-operators crowded about the tables so soon as the show was opened to the public. There is no doubt but that in the future a flower show will form a part of the annual co-operative festival as it has in the past.

**Fringed Begonias.**—When first exhibited a few years ago many prophesied their doom without waiting for results, whilst others, recognising their value for hybridising, set to work with will and were fortunate enough to raise numerous seedlings. Expectation was at its highest as to whether the seedlings would keep true to the original type, and it is satisfactory to record the large percentage that came true, many being more deeply fringed. Of good habit and with flowers well set up, the shades of colour at present known will before long be largely multiplied.—R. PINNINGTON.

# THE GARDEN

No. 1607.—VOL. LXII.]

[SEPTEMBER 6, 1902.

## YOUNG TREES AND SUNSTROKE.

**I**T is most noticeable that the stems of young trees of from 8 feet to about 14 feet in height are apt in some seasons to get much damaged, so much so that the trees are rarely fit for much for some years afterwards, even if they do not die outright. The mischief is usually not seen until it is too late to mend matters, and is found more as a rule on young trees with small heads standing out singly than where they are planted amongst undergrowth or in a partially shaded spot. If careful notice is taken it will be found that the stems are damaged on the south side, or it may be east or west of south, but never on the north side, and is directly caused by the rays of the sun being too hot for the young stems to bear. The trees most liable to sunstroke—which it practically amounts to—are the Lime, Willow, Horse Chestnut, Sweet Chestnut, Birch, Mountain Ash, Ash, and Plane, and generally in the order they are given, the softer wooded trees suffering most. The Oak, Elm, and Beech are seldom much damaged by the sun, though in cases of failure it will be well to notice the stems and see how far the direct rays of the sun are responsible for the death of the tree.

The first marks of sunstroke are seen in the shape of longitudinal cracks in the bark, which is also slightly browned and flattened, as if there were a hollow beneath. The part affected is from about 1 foot to 3 feet in length, and from 1 inch to 3 inches in width. If the bark is cut away the wood beneath will be found perfectly firm but hard and dry, more like a piece of seasoned wood than part of a growing tree. When such is the case the only thing that can be done is to cut the bark back to the living tissue, thoroughly coat the wound with gas tar, and shade the stem afterwards with a few branches or something that does not need to be fastened on the stem. Hay or straw bands cannot be altogether recommended, as anything which excludes the light tends to the softening of the young bark. This should be avoided, as the firmer the bark the better will be the ultimate success of the tree. Iron tree-guards, though not beautiful, have the advantage of protecting the stems of young trees from the sun as well as from the attacks of animals. In addition to the slight shade they give, the iron, being a good conductor of heat, takes up

a large amount of the heat rays which would otherwise be directed full upon the stem.

A hot, dry season is no more likely to cause sunstroke than a wet one, and probably not so much, as we have noticed it this year quite as much as in former ones. The time when it is most likely to happen is when a few days of hot sunshine follow a spell of wet weather, as the wood is then soft and full of moisture, and is more liable to be scorched than during a period of prolonged sunshine.

When trees are planted out singly it is well to choose those with spreading heads and low stems, as then the tree will shade itself to a great extent, the short amount of bare stem being less exposed to the sun's rays than a taller one. After all, this is only Nature's method of protection, as, in a wild state, no young tree is bare-stemmed, except in a wood, where it is shaded by those around it. On the edge of a wood, or in the open, young trees are furnished to the ground with foliage, which is not shed until the stem has become hardened enough to withstand climatic vicissitudes. If trees with tall stems are the only ones available, then the stems should be shaded by some means for a year or two, especially when they have become established and are making strong, sappy growths, as the stem is practically in the same condition and apt to be scorched by a sudden burst of hot sunshine.

Sunstroke must not be confounded with the ravages of the caterpillars of the Goat Moth and Wood-Leopard Moth, the external signs of which are much the same, but on the bark being removed one or two channels almost the size of a man's little finger are to be seen, together with accumulations of wet sawdust-like material deposited by the caterpillar. These are exterminated by thrusting a stout wire into the chanuels until the grub is killed, and afterwards cutting away the dead bark and tarring the wound thoroughly. The tree should also be securely staked to prevent it snapping off in a high wind.

## WHY HOLLYHOCKS FAIL.

We have received several letters of late complaining of the diseased condition, not only of Hollyhocks propagated from cuttings and in other ways, but also those from seed, although seedlings are supposed to be almost disease proof. We wrote to the well-known growers, Messrs. Webb and Brand, of Saffron Walden, and their reply will interest all lovers of a noble garden flower:-

"Replying to yours in reference to the

Hollyhock disease, we have found nothing of any good in the way of dressing, but find from experience that the hardier the plants are treated the less they suffer from it. Instead of wintering under glass as formerly, they succeed much better by being planted in the autumn in moderately rich soil away from the drip of trees, and as much exposed as possible to the fresh air, with liberal watering with liquid manure when the buds are forming. By this time the leaves have completed their growth and matured, hence are not so susceptible to the disease as the coarse, over-fed growths often caused by strong feeding when the plants are young. The plants may be cut down after flowering, the crowns and stalk at the base covered over entirely with cinder ashes; this not only protects them from frost but also shields them against the disease; remove this about March, when the new growth should be thinned out."

## ROUND ABOUT A GARDEN.

### WHAT IS A GARDEN?

My view of a garden is one which I never knew any gardener to hold. It is primarily that of a secluded place where one can wander after breakfast with contentment, noticing what has happened there since yesterday. There is a superior class of persons who wander in their gardens before breakfast; but I have never risen to this giddy height of virtue except by an effort or an accident, and have on such occasions always felt the worse all day for my walk before breakfast. The man who outraged the wisdom of the ages by misquoting, "Early to bed and early to rise gives you a baggy look under the eyes," evidently suffered from the same contrary disposition which makes it much easier for me to sit up all night to hear the birds sing, than to get up early for the same purpose.

### GETTING OUT OF YOUR OWN SIGHT.

After breakfast, however, I yield to no one in the enjoyment which I can get out of a garden, provided that it is sufficiently irregular or extensive to offer changes of view as you wander along. There are many gardens, brilliant and costly enough, of which the whole is always in view from every point. Of such a garden you exhaust the pleasure in five minutes, though it may take you half an hour to read all the plant-labels. The ideal garden is one where you can almost get out of your own sight and enjoy some new glimpse of prettiness in every few yards. In such a garden you feel that you could wander idly for ever, "communing with Nature."

### AT LOGGERHEADS WITH NATURE.

But Nature is a contrary jade; and, if you take an interest in the garden as a garden and not only as a promenade, you will not have been there five minutes before you are at loggerheads with her. You catch sight of a weed, placed by Nature exactly where you do not want a weed. So—up it comes. But in stooping to seize it, you catch sight of others, and before you realise what is happening you have embarked upon an impromptu campaign against Nature. And to weed properly you need a basket and gloves and a fork, armed

with which you look and feel a very different sort of person from the one who came out a few minutes ago to saunter in the garden and look about you.

#### WITHERED BLOOMS.

Almost more aggravatingly incentive to labour when you least want to work is the withered blossom. The weed, at any rate, looks green and happy, and you can leave it "until next time"—though it is astonishing how often "next time" does not arrive before the weed has ripened and shed its seed—but, when you come upon, say, a group of clustered Bell-flowers which you admired yesterday, and you find their collective beauty spoiled by a withering bloom here and there, how can you be expected to resist the laudable temptation to remove them? But this concession to your aesthetic conscience renders it so sensitive that you become hypercritical in your survey of the next coup of flowers; and you are lucky if the snip-snip of the scissors does not betray your whereabouts in the garden long after you ought to be somewhere else engrossed on other business.

#### THE PLEASURE OF ENDLESS WORK.

That is the worst—and also the best—of a garden in the tending of which you take any active part. There is no part of it in which at any hour of any day in any season you will not find something to do for its improvement; and, if your saunters are cut short thereby, I doubt whether any man ever has more honest pleasure than he who straightens his bent back and looks behind at a long vista of beautiful things which are all the better for the care which he has just been bestowing upon them. Thus you can never finish the work nor exhaust the pleasure of a garden; and whether you are "communing with Nature," or waging war upon her, you are learning to understand and appreciate her all the time. For there is no ill-will in your campaigning. The flowers on whose behalf you destroy the weeds are equally Nature's darlings with the others, and the more you help them the more she co-operates with you, until a triumph has been achieved which is a credit to you both.

#### INVADING THE JUNGLE.

It is this personal element of struggle and victory which lends most pleasure to a phase of gardening that the trained gardener regards as a great waste of labour. Three years ago I came into tenancy of a garden ringed with a young plantation choked with Nettles from end to end. Through this a winding path has been made, and a shrubby border occupies the margin, and from these two scientific frontiers garden plants have been encouraged to invade the Nettle realm with such success that these are now being driven to the outskirts.

E. K. R.

#### EDITOR'S TABLE.

##### CARNATION GEORGE MACQUAY.

Mr. Watts, Bronwylfa, St. Asaph, sends flowers of this beautiful white Carnation with this note: "I was interested in the note in THE GARDEN about white Carnations, and am sending a few flowers of my best George Macquay, which is a grand grower, a profuse bloomer, never bursts, and has very erect and stout stems. I have tried Trojan, Wild Swan, The Briton, Ptarmigan, and others against it, but they are nowhere. I grow all my Carnations in the open border without shelter in summer and winter, and the enclosed white is one of my best doers."

A superb flower, and one we have long admired. We hope to reproduce the photograph of the plant kindly sent by Mr. Watts in a week or two.

##### NEW CACTUS DAHLIA ALPHA.

Mr. F. H. Chapman, Guldeford Lodge, Rye, sends flowers of a very pretty new Dahlia. Our correspondent writes: "It was sent out this season by Messrs. Stredwick, of Silverhill Park, St.

Leonards. It was aptly described to me by Mr. Stredwick as the first fancy Cactus Dahlia yet raised. It possesses the merit of being free in blooming—the blossoms sent were all cut from one plant—and it also holds its flowers well away from the foliage. Messrs. Stredwick are not sending out their new Dahlia Lilac till next spring. This

latter flower possesses to my thinking, the most delicate colouring of any Cactus variety

yet raised, and the shape is also unique. It was certificated last autumn, and there will no doubt be a big demand for it when it is issued." It is a distinct flower.

##### CUSCUTA EUROPEA.

"E. G." sends for our table a bit of Nettle with this Dodder twining round the stem. We made a drawing of

natural size. It is found on Nettles in particular, and also on Vetches. The little flowers, packed into ball-like masses, are quite pretty with their pinkish colouring.

#### NOTES OF THE WEEK.

##### FORTHCOMING EVENTS.

September 10.—Royal Caledonian Horticultural Show at Edinburgh (two days).

September 16.—Dahlia Show, Royal Aquarium (three days).

September 18.—Great Fruit Show, Crystal Palace (three days).

**Rare plants in flower at Kew.**—In future a list of the rare plants flowering at Kew will be given each week, to enable those who have an opportunity of so doing to see them in bloom.

**The floral and fruit (R. H. S.) committee cricket match.**—A match was played between these two committees on Wednesday last, through the kindness of Mr. Leopold de Rothschild, in Gunnersbury Park. The teams were as follows:—*Floral*, Mr. W. Howe (captain), and Messrs. C. E. Pearson, C. J. Salter, C. Dixon, J. Hudson, C. R. Fielder, J. Walker, E. Jenkins, C. T. Druery, H. J. Jones, and R. Dean. *Fruit*, Mr. G. Woodward (captain), and Messrs. A. H. Pearson, G. Reynolds, W. Bates, E. Beckett, H. Esling, M. Gleeson, G. Kelf, A. Dean, and W. Iggleden. The fruit committee scored forty-three in the first innings, and the floral committee thirty-one. Mr. S. T. Wright and Mr. Humphreys umpired. Mr. R. Dean scored. It was a sunny day, and about sixty sat down to lunch. Mr. W. Marshall proposed and Mr. Balderson seconded, a hearty vote of thanks to Mr. Leopold de Rothschild for his kindness in allowing them the use of the field. Amongst others present were:—Messrs. George Paul, H. B. May, Harry Turner, H. Balderson, Owen Thomas, W. J. James, and several ladies. The gardens were visited in the afternoon. They are now in their full autumn beauty.

**The Floral Committee and its awards.**—The work of this committee would be more instructive and interesting if those who send exhibits were compelled to give full particulars of the origin, &c., of the plants shown. The committee are asked to judge flowers of which they know nothing with regard to their origin,

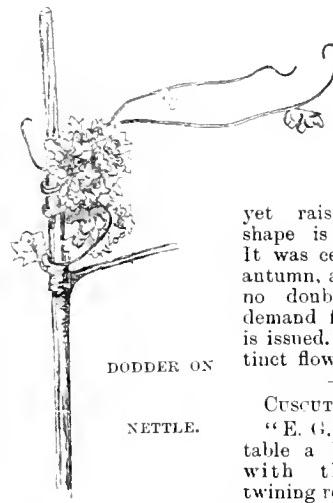

where grown, or their likely value in the garden. A plant, as far as the committee is aware, may have come from the Himalayas or from New Zealand. It is of the greatest importance to the committee to know something of the new plants and flowers shown, and not to make guesses as to their probable habitat.

**Crystal Palace Fruit Show.**—The Royal Horticultural Society's great show of British-grown fruit takes place at the Crystal Palace on the 18th inst. and two following days. Copies of the prize schedule, with entry form, can be obtained on application to the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster. Intending exhibitors must give notice in writing not later than Thursday next, the 11th inst., of the class or classes in which they propose to exhibit and the amount of space required. On each day of the show after 10 a.m. Fellows of the Society, on showing their tickets at the turnstile, will be admitted to the Palace free.

**Obituary.**—The death of Mr. Angus Macleod, on August 20, is announced. The deceased retired from the superintendence of the Edinburgh parks and gardens nearly two years ago, and during the twenty-five years he held that position he did much towards bringing Edinburgh horticulturally into line with other cities.—R. B.

**Torquay Flower Show.**—Mr. R. P. Kitson, the hon. secretary, writes: "The committee regret that owing to lack of funds they are compelled to cancel the schedule for the annual Chrysanthemum show fixed for November 5, with the exception of the special prizes, classes 29-33. It is, however, intended to hold a show on the same day for honorary exhibits, and it is hoped that the friends and supporters will endeavour to send as many exhibits as possible in order to make the show a success. For any further information apply to George Lee, hon. assistant secretary, The Lodge, Upton Leigh, Torquay."

**Late dessert Cherries.**—It may not be considered necessary to have many varieties of late Cherries, but where fruit is required in quantity I find the late Cherries most valuable. Another good point in the case of most of the late dessert varieties is their good cropping qualities. Although in heavy clay or badly-drained soils the late fruits split badly in wet seasons, it is an easy matter to make the soil suitable by efficient drainage. It should also be borne in mind that Cherry trees are not usually deep rooters; indeed, the nearer the roots are to the surface and well fed the better the crop. A most valuable variety only recently introduced promises to be excellent for dessert. This is the new Noble, a very large fruit and well flavoured. So far with me Noble has not made the most liberal growth, but often young trees behave thus, and it is early to criticise in any way. Our best late Cherry is the older St. Margaret's, and for late dessert it is superb. When grown on a west or east wall this variety may be had good well into August. For latest use I would advise an east aspect, especially if the locality is in the warmer portion of the kingdom. In the North a southwest wall is more suitable. Florence is another excellent late variety. This, like the others named, does best against a wall, and we have only this week (August 23) gathered our last fruits. It is a large pale yellow fruit of fair quality. Another very fine Cherry that should be in all gardens where late fruits are valued and variety is needed is the Guigne de Winkler. This with us will keep as long as the Morello. It is a bright red fruit, luscious and juicy, and a good cropper. The Late Duke is also worth room in all gardens. In our own case this in the North is better than the Morello as regards the crop, and it keeps well into September. It is a large, bright red, slightly acid fruit, but of good flavour, and a grand cropper. In the South it is a favourite late dessert variety. When grown on a north wall it may be kept well into September. In some parts of the country this variety is grown under the name of Ronald's Cherry. In many places I have seen the Morello grown on a warm wall for late dessert. Grown thus it is much better than the fruits on a north aspect.—G. W. S.

**Anthericum ramosum.**—The Anthericums—and among them one includes the Paradisia or Czackia—are very pleasing garden plants, to whose numbers in our gardens there is surely room for some additions, as may be seen from scanning the long list of names in the "Index Kewensis." A considerable number of these ought to be hardy with us, and their introduction might yield welcome variety. Still, I do not think we make enough of those we already have, and I have been surprised to find how little cultivated is *A. ramosum*, a South Europe species hardy with me here, and a distinct thing from either *Liliago* or *Liliastrum*, the two most commonly seen. At times we meet with it under the name of *A. graminifolium*, which the work already alluded to refers to as *A. undulatum*, a South African species. The plant generally known as *A. graminifolium* is, however, *A. ramosum*, a pretty, if not showy, species, with long grassy leaves and tallish spikes of white flowers, with almost saffron-coloured anthers. When in good soil it grows about 2 feet high, and its hard wiry stems are so firm and erect that they do not require any staking or tying. The flowers are rather too sparsely produced to please some, but then they are so graceful in their arrangement and individually so very pretty with their clear white segments and their yellow reproductive organs. It is hardy with me, and is, I think, one of the many plants which are none the worse for having partial shade during the hottest part of the day. I grow it here in a rather light and peaty soil at the base of rockwork.—S. ARNOTT.

**Lilium Kelloggii.**—One hopes that the illustration and description of the new *Lilium Kelloggii* which appeared in THE GARDEN last year, and was, I believe, the first of the kind in the British horticultural Press, induced many of your readers to secure this pretty *Lilium*. As one, at least, who was glad to have an opportunity of doing so, I am pleased to be able to say that I have bloomed it here, and also to be able to express my appreciation of such a distinct Turk's Cap *Lily*. I am growing it in a position shaded from all but the morning sun and in a sandy peat, not too dry, yet not excessively wet. It has bloomed well, beginning early in July, and giving a considerable number of its pretty pink flowers, which, though not large, are of a pleasing colour and attractive. There are many more showy *Lilies*, but we have few of its colour, while its habit is pleasing also with its whorled leaves and its stems of medium height. It has made such good growth and is ripening so satisfactorily that I hope it is going to become a permanent occupant of my garden.—S. ARNOTT, *Carsehorn, by Dumfries, N.B.*

**Flowers in Ravenscourt Park, Hammersmith.**—In this pretty little park there are some good flower arrangements. A bed of *Fuchsias*, with an undergrowth of *Viola Mauve Queen*, is a very simple and happy mixture. There are some good beds of *Celosias* on a groundwork of *Antennaria tomentosa*, also mixtures of *Plumbago capensis*, *Pentstemons*, *Grevillea robusta*, and *Amaranthus melancholicus*. A large scroll—that will look better later—is composed of *Begonias* on a groundwork of *Mesembryanthemum cordifolium*, edged with *Echeveria secunda glauca*. A large bed (facing the Public Library) of *Abutilons* and *Coleus Verschaffeltii*, edged with white *Iberis*, is quite worth a note. On the building there is a fine display of *Jasmine*, *Clematis Jackmani*, *Crimson Rambler Rose*, and that fine old creeper *Ceanothus azureus*, not planted so largely as it should be in gardens. In the little conservatory adjoining there is a fine lot of mauve and white *Campanula pyramidalis* and *Salvia splendens*. A striking combination of colour is seen in one of the shrubbery borders by a fine lot of scarlet *Dahlias*, with *Acer Negundo*, *Golden Privet*, and a purple-leaved *Hazel*. There is a good star-shaped bed in front of the refreshment room planted with *Alternantheras* in variety, with dot plants of *Pachyphytum bracteosum* and *Pandanus* edged with *Echeverias*.—Quo.

**Tufted Pansies raised by the late Dr. Stuart.**—I much admire the Violas raised by the late Dr. Charles Stuart, of Churnside, N.B.,

as the plants of the majority of his raising possessed points of merit not met with in other collections. It is well known that this enthusiastic admirer and grower of these delightful flowers worked upon a stock (*Viola cornuta*) which other raisers appeared to ignore. Because of this fact it is fairly easy to trace the parentage of many of his charming seedlings, his plants in almost every instance having a quite tufted habit. A special point is the fragrance of the flowers. A few in a small vase in a room fill it quickly with their fragrance. The miniature-flowered *Violetta* was one of the very earliest of his seedlings, and as this variety possesses a good constitution the plant has come to stay. The flowers are pure white with a suffusion of yellow on the lower petal. *Blue Gown*, a mauve-blue, is a perfect bedder of tufted habit and extremely free-flowering. *Florizel* is one of the very best, its growth being all that one can desire, and the colour a lovely lilac-lavender. *Rosea Pallida* is another gem, very much resembling the last named, but with more circular flowers and of a paler rose-colouring. *Sylvia* was for years considered an ideal bedding creamy white kind. The lovely yellow *Pensee d'Or* is but little known, its colour is orange-yellow, and the habit is perfect. There is very little stock of this plant about; fortunately the raiser sent me half a dozen plants last year, and with these there has been a wonderful display this season.—D. B. CRANE.

**Asclepias curassavica.**—I was much interested in the note by "T." in the issue of THE GARDEN for August 23 on this useful plant. In the course of my wanderings I have seldom seen this plant, and this is due probably to the fact that it is insufficiently known. Having grown it for several years in the cool conservatory during the summer and autumn months, I can recommend it for its extreme usefulness for making a brilliant display over a long period. In my opinion this *Asclepias* is one of those useful plants that has been thrust aside for newer introductions or for plants that obtain more favour at the present day. It is an excellent decorative plant for arrangement with other flowering and foliage plants and not as a cut flower; the stems of the plants when cut bleed so profusely that the leafage and flower flag soon after they are severed from the plant. The individual spikes or umbels of flowers may be broken out of their socket and made up into buttonholes with a background of *Fern* or *Asparagus* for a dinner party. I have also utilised the umbels of flowers among greenery traced upon the dinner-table with pretty effect. Seed is freely produced, and a pinch may be sown in peat in the month of February and another at intervals of a month or six weeks to form a succession. By having three batches of plants at various stages it is possible to have them in bloom for several months, as the flowers are borne at the point of the shoot. As each shoot grows, it continues to produce an abundance of its orange-scarlet blossoms. Plants plunged in the open garden at Kew or other favoured spots are a success; but here in the Midlands I find they quickly show signs of failing. This *Asclepias* was some years ago cultivated in hothouses, but I find that a greenhouse temperature suits the plant best, at any rate in this locality.—H. T. MARTIN, *Stoneleigh*.

**Fuchsias at Trowbridge.**—Almost for the whole period that the Trowbridge Horticultural Society has been in existence, namely, fifty-three years, this Wiltshire town has been famous for its *Fuchsias*, and finer specimens—if indeed so fine—cannot, I think, be found in any other exhibition about the country. At the fifty-third annual exhibition, held on the 20th ult., there were two open classes for *Fuchsias*, namely, for six specimens and for four specimens. Trowbridge thinks so much of its *Fuchsias* that it gives them the place of honour in its schedule of prizes, and so closely does the Trowbridge show follow upon the old lines of thirty years ago that the plants always occupy the same positions in the large plant tent—viz., at one end of it. The principal cultivator of specimen *Fuchsias* is Mr. George Tucker, a nurseryman at Hilpertown, near Trowbridge. Formerly a gardener at a private place, he, on the death of his employer and the

breaking up of the establishment, took over the collection of plants, and he is an exhibitor at the various flower shows held in the district. At the recent show Mr. Tucker staged ten specimens, four in one class and six in another, and he won the first prizes in both classes. A Trowbridge exhibition *Fuchsia* is a plant two, three, and four years old, cut back of course in early spring to a mere trunk, grown on for a time in warmth, and generally finished off in the open air during the last six or eight weeks before being exhibited. The plants are generally in 10-inch pots, they average from 6 feet to 8 feet in height, of vigorous growth, the shoots tied in closely, so that the plants are of a somewhat severe cone shape, and they, when at their best, are literally sheeted with fine blossoms. The reason why the plants have their shoots tied in so closely is in the interest of safety when conveyed by road, and also in the interests of economy in van space. When it is remembered that the plants are too tall to be conveyed by rail, and have to be sent twenty and thirty miles by road, the necessity for this method of training is at once seen. But their formal training notwithstanding, they are triumphs of cultural skill. In the case of perfectly finished examples the pots are scarcely seen. In his half dozen Mr. Tucker had four dark varieties, namely, *Charming*, *Final*, and *Brilliant*, all raised by the veteran James Lye, and *Doel's Favourite*, an excellent free-blooming variety raised some forty years ago by a local grower of the name of *Doel*, who was present at the Trowbridge show to see his seedling in such fine character. There were two light varieties, viz., *Mrs. Bright* and *Western Beauty*, both raised by Lye, the last extremely fine but apparently little known outside the locality. His four specimens included *Charming*, which is one of the best dark decorative or exhibition *Fuchsias* ever raised, and *Bountiful*, one of Lye's darks, with Mr. H. Roberts, which has rose-coloured tube and sepals, the corolla of a peculiar dark crimson, and *Western Beauty*. As the second and third prize collections were much above the average of specimens seen at our large provincial shows, they can be regarded as worthy specimens to compete with Mr. Tucker's superb plants.—R. DEAN.

**Flowers in Park Lane, Hyde Park.**—The bedding here is now beginning to make a show, but owing to the unfavourable season is rather late. We may mention some of the beds which are at the present time worthy of note. It is always the aim of Mr. W. Brown, the superintendent, to introduce some new features—by no means an easy task—year by year. In illustration of this may be noted an arrangement of *Abelia rupestris* (a new plant for bedding), which, with its Myrtle-like foliage and pretty little white bell-shaped flowers, presents a very elegant appearance, associated with a band of *Alternanthera amena* and a carpet of *Amaranthus tricolor*. A circular bed planted with *Lantana delicatissima*, with an undergrowth of that Fern-like plant *Orecome Candolii*, presents a very neat appearance, and will still improve. Very good is a combination of pink-flowered *Pelargoniums*, with dots of *Iresine brilliantissima*. *Fuchsia Scarcity*, with a carpet of mixed *Mimulus*, is pleasing. A rich bed is that furnished with crimson tuberous *Begonias*, variegated *Alyssum*, and *Grevillea robusta*. A dark *Canna*, named *Adrien Robinii*, associates well with variegated *Maize*. *Ivy-leaved Pelargonium Galilee* (pink) and the beautiful *Francesco ramosa* is a very charming mixture. Mixed *Lantanas*, with *Begonia semperflorens rubra* and a carpet of *Alternanthera aurea*, will look well soon. Large plants of scarlet *Pelargonium* (George Potter, with *Coreopsis grandiflora* and *Linum angustifolium*, make a rich display. *Ivy-leaved Pelargonium Abel Carrière*, dark crimson *Verbena venosa*, and bronze *Coreopsis* are good. A pair of beds having *Lantana delicatissima*, a carpet of *Viola Duchess of Fife*, with intermediate plants of *Celosia plumosa*, is a very rich arrangement. A pair planted with *Cuphea platycarpa variegata*, dots of *Scabious caucasica*, and carpeted with *Viola William Neil*, is very good. Crimson *Pelargonium*, with dot plants of *Coreopsis grandiflora*,

flora, is a telling combination, and the same praise is due to pink Pelargonium, with dots of Veronica Andersoni variegata. Heliotrope President Garfield, with Ivy-leaved Pelargonium Mme. Crousse, and a band of Fuchsia Meteor, is a happy arrangement. Very handsome is a bed of mixed Petunias, Swainsonia gallegifolia, with a carpet of Mimulus and a band of Viola William Neil, a seldom seen but pretty mixture. The bold flowering Hydrangea paniculata grandiflora, in a carpet of Earl Beaconsfield Pansies, looks well. Lantana Drap d'Or, a yellow variety, planted in a bed of Viola Blue Bell, is very telling. Very graceful is Abelia rupestris, associated with Bouvardias (pink and crimson), and Begonia semperflorens rosea. Large plants of Acalypha musaica, the beautiful Plumbago capensis, and white-flowered Lantanias make a bold and striking mixture. There is a good bed of Carnation Alice Ayres, white, tipped with carmine, fine quality, and strong grower. Fuchsia Display and variegated Maize is an effective arrangement. A bed of standard crimson Pelargoniums, Artemisia, and the pretty white and pink Gaura Lindheimeri looks very neat. Nierembergia gracilis, mixed with scarlet Pelargoniums, is an uncommon and pretty mixture. A fine bed is furnished by Plumbago capensis alba, Begonia fuchsoides, and the rich Salvia splendens. A fine group of Hydrangea Hortensia arrests immediate attention; also the bold and effective grouping of Bamboos, Heliotropes, Bougainvillea glabra, Palms, &c.—Quo.

#### MOUNTAIN FLOWERS.—IV.

##### THE ALPINE GARDEN AT THE ROCHERS DE NAYE.

AT page 97 some account was given of the wild flowers at the Rochers de Naye above the north-eastern end of the Lake of Geneva, at an altitude of 6,000 feet. The Botanical Society "Rambertia" here has its lately-established alpine garden, the presidency of the society and directorship of the garden being both in the able hands of Mr. Correvon, who has also for many years undertaken the same duties in the case of the older garden of "La Linnaea" at Bourg St. Pierre. This is on the granite, while the one at the Rochers de Naye is on the limestone, and is devoted to the range of alpine plants of all countries that occurs on that formation.

A narrow rocky footpath, beginning at the hotel and terminus of the little alpine railway, takes the easiest way along the shoulder of the ridge among limestone boulders bedded in a short growth of grass and Whortleberry, dwarf Willow, Rhododendron, and Juniper, enlivened by the starry bloom of Dryas and Ranunculus alpestris and the more important flowers of Anemone alpina and A. narcissiflora, of Trollius, and Primula elatior. Just down to the left, on the steep grassy slope, are still large patches of unmelted snow. The day is warm, with hot sun and cloudless sky, and, standing still for a moment on the way to the garden, the ear is delighted with the sound of the many little tinkling rills that run on warm days from the remaining snow patches on both sides of the high mountain valley.

The site of the garden is mainly on the southern slope of a steep gorge that begins, narrow at the top, between the two "Denteaux," great masses of calcareous rock that tower up into the sky on the crest of the ridge, but it also comprises the crests and sides of the "Denteaux" themselves, and lately has received

considerable additions at their southern base, where plantings of Arollas (*Pinus Cembra*) and other conifers promise their future shade to the visitors in years to come of this highly interesting garden. The Arolla, the ancient alpine Pine that is dying out in its native places in Switzerland, where formerly it covered large tracts, is also planted here in almost inaccessible places: the young trees are thriving and promise well for future beauty as well as usefulness, for they will help to stop the rolling stones that fall from the rocky heights. The situation of the garden is ideal both for natural beauty and for general suitability, presenting a complete variety of aspect and of natural disposition of mountain mass and stony declivity. The tops of the great "Denteaux" are crowned with natural vegetation of short scrub and grass. The space between them, narrow at the top, widens a little down the steep southern slope. Paths, forming rather close zig-zags, give access to every part of the slope, and rock and earth are arranged to form places for the already large collection of plants. It was begun six years ago, and every year sees a marked advance.

The alpine Campanulas are largely represented. The beautiful *C. pusilla* is a native of these rocks, growing in the narrowest clefts, and the curious *C. thyrsoidea*, one of the only two Campanulas with yellow flowers, is here also in the wild state among the boulders facing the south. Among the planted collection is *C. Allionii* of Piedmont, with its strangely large flowers; *C. pulla*, which has become almost a weed; *C. excisa*, of the Simplon and the Alps of Saas; *C. carpatica*, *C. tyroliensis*, *C. barbata*, *C. collina* from the Caucasus, and even *C. gorganica* from Central Italy on the Adriatic, which lives and flowers, though more sparingly than at less trying altitudes. The Edraianthus group, nearly related to the Campanulas, natives of the mountains of Austria and the Balkans, have been tried, but only two have allowed themselves to be acclimatised. The garden has a good group of the alpine Geraniums. Among those well established are *G. cinereum* and *G. Endressi* from the Pyrenees, *G. macrorhizon* from the Eastern Alps, *G. pratense* of Central Europe, *G. tauricum* from the Caucasus, and *G. argenteum* from the Italian Tyrol, which seeds itself about.

The collection of Androsaces is almost a complete one. Some are planted in upright rifts of the great cliff, stones being cemented in to give bases to their niches. *A. helvetica* is there in a wild state. Of Primulas the collection is young, but is increasing. A rather full collection of *Sempervivum* was planted, but, unfortunately, all were eaten down to the roots by some mountain sheep that got in before the garden was adequately fenced. Chamois are also occasional predators. The charming little *Papaver alpinum* has been introduced, and now seeds itself about. *P. nudicaule* has also taken kindly to the garden, and comes up everywhere from self-sown seed. It was especially beautiful at the time of my visit in the second week of July, too early a

date to see the bulk of the collection in flower—September being the best time. It happened that there was a long patch of Iceland Poppy along the edge of a high ridge. Standing below, it was fine to see it clear against the deep blue sky, the colour of both being intensified by the juxtaposition of the two exactly complementary colours. Conspicuous in the upper part of the garden was a large patch of young plants of *Eryngium alpinum*, the young radical leaves looking at the first glance like *Caltha*. It is good to know of so healthy a stock of the true plant, so rarely to be obtained right in nurseries, the rule being that every sort of poor substitute is sold for one of the most beautiful plants we can have in our gardens. It is a rare plant even in nature, occurring only here and there throughout the alpine range and never in any quantity. It would seem to be one of those ancient plants that are dying out, but its beauty is so remarkable, both of bluish metallic colouring and of richly fringed bract, that it is pleasant to know that in the good stock at the Rochers de Naye and the promise of abundant seed that the vigour of the young plants seems to hold forth, this good plant is safe and accessible to all who want the very best for their own careful cultivation.

It would be impossible to enumerate the varied contents of this highly interesting garden. It is in the first instance a gathering together of the plants of the Vaudois Alps, with the addition of plants of beauty and interest from many a far-away alpine region of limestone formation. Among much that is useful and interesting it will demonstrate which are the plants from lower regions that will endure or receive benefit from the long-retained coating of snow at the high altitude; already it has been shown that exotic plants that perish at Geneva survive at Naye, which is the highest botanic or alpine garden in Europe. Its useful progress is only hampered by want of sufficient funds to enable the contemplated extensions and plantings to go on as quickly as would be desirable; as it is, these can only proceed very cautiously and slowly; but its work deserves the sympathy and practical support of the large number of English amateurs who love alpine plants. There is a small annual subscription and a proportionally modest sum as the price of life membership. I have no note of these amounts, but this and any other information may be obtained from Mr. H. Correvon, Jardin alpin d'acclimatation, Geneva.

The garden at the Rochers de Naye has the advantage of being in charge of a clever and enthusiastic young gardener, Mr. Louis Recordon, whose courteous willingness to impart information adds much to the pleasure and profit of visitors who are in sympathy with the plants of the mountains. Mr. Recordon is making a collection of dried plants of the region to which visitors have access. It is proposed that when this is a little forwarder that it should be housed at the hotel with the society's library, where it will be accessible to botanical visitors.

G. J.

## TREES AND SHRUBS FOR ENGLISH GARDENS.

### THE PEARL BUSH

(*EXOCHORDA GRANDIFLORA*).

**A**Nother CHINA deciduous shrub sometimes known as *Spiraea grandiflora*; it is a handsome shrub when covered with its snow-white flowers. Too seldom do we see it even in large gardens. At times it is treated as a wall plant, but it is more beautiful when allowed to assume its natural half-drooping habit. It will flourish in almost any kind of soil, given a warm sheltered position from

good plan to remove weakly branches from the centre after flowering to admit more light and air to those remaining. E. MOLYNEUX.

### AUTUMN COLOURS.

(Continued from page 149.)

AMONG commoner trees the yellow of the Horse Chestnut, the lovely crimson of the wild Cherry, the golden shades of the Black and Lombardy Poplars, add much to the rich beauty of autumn. Several of the Maples are noteworthy in this respect, more especially the numerous varieties of Japanese Maples (*Acer palmatum* and *A. japonicum*), these, as well as the Mandshurian Acer *Ginnala*, turning to various shades of red. The common Sycamore and Norway Maple change to yellow, but

Schwedler's variety of the latter becomes red. Other trees that deserve mention are *Amelanchier canadensis*, whose foliage changes to lovely crimson shades in autumn; *Kelreuteria japonica*, soft yellow; *Pyrus terminalis*, bronzy red; *Ginkgo biloba*, pale gold; *Cladrastris tinctoria*, yellow; *Parrotia persica* and *Hamelia*, bronzy red and yellow. The common Beech is nearly always beautiful, changing first to yellow, then to warm brown tints. Among conifers the yellow-leaved variety (*aurea*) of the Scotch Pine is remarkable in retaining its colour during the winter months only, becoming green in spring and summer. *Retinospora squarrosa* and *Cryptomeria elegans* turn bronzy red in winter. The warm reddish-brown tints of the deciduous Cypress are charming.

*Shrubs.* — The Sumachs (*Rhus*) furnish some of the most striking of autumn-colouring shrubs; the best of them, *R. cotinoides*, I have already described; other fine species are *R. typhina*,

*R. glabra* (with the cut-leaved variety *laciniata*), and *R. Toxicodendron*, all of which turn red. The Venetian Sumach, *R. Cotinus*, becomes yellow. *Berberis Thunbergi*, which dies off a rich scarlet, is so beautiful in autumn that on some estates it has been planted in great quantity, not only for cover, but so that sportsmen may enjoy its colour during the shooting season. Its evergreen ally, *B. Aquifolium*, turns a glowing red or purple after the first frosts. The Ghent Azaleas almost always colour richly, either deep glowing crimson, bronzy red, or gold; and of other ericaceous plants the warm tints of *Pieris mariana* and the rich crimson of the *Enkianthus* should be mentioned. The taller American *Vacciniums*

(*corymbosum* and its various forms) are always lovely. Our native Guelder Rose (*Viburnum Opulus*) becomes crimson in autumn, whilst the common Hazel and *Rhamnus Frangula* often produce fine effects in yellow. The feathery foliage of *Spiraea Thunbergi* is singularly beautiful when it changes from its natural pale green to crimson; and two other Japanese shrubs (both, unfortunately, very rare) are remarkable for their autumnal beauty. These are *Disanthus cercidifolia*, an ally of the Witch Hazels, lovely claret colour; and *Viburnum alnifolium*, crimson.

Other noteworthy shrubs are *Fothergilla alnifolia*, rich red; *Euonymus alatus*, crimson; *Deutzia crenata*, yellow; and *Pyrus arbutifolia*, red. The common Brambles of our woods should not be passed over without mention: they turn a rich glowing red, and for their autumnal beauty alone may be used as undergrowth in wilder parts of the garden and woodland.

*Climbers.* — First among these, of course, is Veitch's *Ampelopsis*, the finest of all deciduous climbers for walls, being self-supporting and changing to crimson in autumn. *Vitis Coignetiae* is one of the noblest of all Vines, and turns crimson also. Other Vines useful in this respect are the Teinturier Vine, purple; *V. Romaneti*, red; and the Virginian Creeper, especially that variety known as *muralis* or *Engelmannii*, which clings to walls or tree trunks without any artificial support, and acquires beautiful red shades in autumn. Among Honeysuckle, *Lonicera japonica* var. *flexuosa* is noteworthy for the fine red-purple of its decaying leaves.

W. J. BEAN.

### LIGUSTRUM SINENSE.

THIS handsome evergreen Privet is a native of China, and should be represented in every garden, as it is one of the most ornamental of the genus. It is very accommodating in respect to soil, but flowers most profusely when growing in a moderately dry, sandy loam. With age it will attain a height of 15 feet or more, with a graceful and spreading habit, and is covered during the latter part of July and the beginning of August with its large panicles of pure white flowers. The Privets are objected to by many on account of the odour of the flowers, but *L. sinense* outdoors has not an altogether unpleasant smell, though the scent is stronger and more disagreeable when the flowers are cut and taken into a room.

The plant is easily propagated by cuttings taken at almost any time of the year, pieces of ripened wood 6 inches to 1 foot in length inserted in the ground outdoors in winter rooting readily, and forming strong young plants in twelve months. These are all the better for an annual cutting down for the first year or two to induce a bushy habit, and to prevent the bare stems in after years that are sometimes seen with this plant.

*Buyshot, Surrey.*

J. CLARK.

### NEGLECTED GARDENS.—II.

In the previous article on this subject of neglected gardens, I spoke more especially of the attention that must be paid to trees and shrubs that for many years have been allowed to grow uncared for and unpruned.

To-day let us consider the flowering plants themselves and the positions they occupy in the garden that has run wild so long. More than likely if the garden was laid out from thirty to fifty years ago, it belongs to the period when pretentiousness, garishness, and ugliness generally were the main features of garden design. This will probably mean that the ground is very much cut up into tortuous and exasperating pattern beds, and that there exist few of those long wide borders where a wealth of bloom can be got. Small beds mean "patchy" planting, and, com-

THE PEARL BUSH (*EXOCHORDA GRANDIFLORA*) IN THE NURSERY OF MR. NOTCUTT, WOODBRIDGE, SUFFOLK.

cutting east winds in spring. Exposure to the full sun is necessary as maturity of growth is important, flowering as it does from current shoots springing almost from every node of last season's growth. I have counted as many as seventeen flower racemes from a single shoot but 15 inches long, thus showing how freely its blossoms are produced under favourable conditions.

Each raceme is furnished with from six to twelve blooms, each having five rounded petals with a green or brownish disc or centre. The leaves are pale green, slightly obtuse. As maturity of the present season's growth is all important in ensuring a full crop of blossom the following May, it is a

paratively, a poor and mean result. We must have borders if we would grow in those grand broad masses, the glory of our English gardens—our beautiful perennials.

A garden without perennials is like jewellery without the precious stones. Beds are all very well, and if only they are simple enough in design and of sufficient size the plants in them must of necessity be effective; besides, we cannot have a garden consisting only of borders, unless it be a very small one. But do let us make our beds—each one—a definite spot that we may enjoy as such, and not part of a vague and ineffectual plan of which we get no clear conception.

We must never forget, however, that in dealing with an old garden we must go forward cautiously. Every garden should have about it an atmosphere of enchantment. Old gardens often have this; it comes partly with the weight of years, partly with the dignity that belongs to those things that have been long established. It must be our care to maintain this greatest charm that a garden can possess, while at the same time we try to efface the signs of long neglect and carelessness.

The soil is now the next subject for consideration. If the garden generally has been neglected we may conclude that the soil has become impoverished, and in many cases too exhausted to sustain in health and vigour the plants we mean to entrust to it. Deep trenching and plenty of fresh leaf-mould and stable manure worked in as the trenching is in progress will make matters better. Of course if part of the old worn-out soil be carted away and fresh brought in to take its place so much the better. Trenching to a depth of 3 feet is none too deep, and its beneficial effect will be apparent for years afterwards. So many of the stateliest and most beautiful perennials are those that seek their nutriment far from the surface, and the deeper their roots can penetrate the less will the plants be affected by summer droughts and winter frosts. Everything that we can do at this stage in the matter of good drainage, suitable soil, and the thorough working of it is of the utmost importance.

We must turn now to the plants themselves. Here again a word of caution is necessary. On no account must we ruthlessly dig up and throw away all and sundry of the plants that already exist in the neglected garden. We must not be in too great a hurry to rid ourselves of these long-established plants, and certainly we should make a point of retaining them until we have studied their habit and growth and have seen them during their flowering period.

New and improved varieties of old favourites are continually coming before our notice. At the same time, beautiful as these are it is not always wise to neglect the old treasures for the latest novelty. Many a well-known favourite may we gladly retain in its older form. Some of the older varieties are more beautiful in every way than the new. More than that, the time has come that some of these treasures are almost impossible to obtain except in their more modern development.

Perennials gain much in beauty by being massed. The larger the garden the more necessary does this become in order that boldness of effect be achieved. A well-planted, well-proportioned group of some one or another of the numerous larger families, such as the Asters or Campanulas, makes a delightful and characteristic feature.

I well remember a beautiful old Surrey garden. A copse of Nut bushes ended in a broad and massive planting of many different varieties of these delightful Asters or—as we like to call them—Michaelmas Daisies. Again, I remember an old garden with a long winding pathway that led from beds and borders, brightly brilliant even with the glory of August flowers, to a walk under the dense shade of forest trees. Now this winding pathway—the link between the sunshine and the shadow—was planted on either side with hundreds of Evening Primroses. I can find no adequate words of praise for this restful and altogether beautiful bit of planting. Not the brightly-hued beds and borders made the marked impression to carry away with one, but that wide dense planting of Evening Primroses in just that portion of the

garden where many toned, gay and brilliant hues would have been out of place.

Rightly or wrongly, I have a theory that for every season of the year there should be some dominant flower in the garden, or in some portion of it, to make the poetry of that particular garden for the time being. In a future article I shall hope to touch on the borders and beds of mixed perennials.

F. M. WELLS.

## THE FLOWER GARDEN.

### CUTTING OVER THE FOLIAGE OF HARDY PLANTS.

**A**FTER many years of observation, I have come to the conclusion that more errors are committed by an injudicious use of the knife than from any other cause. A large number of herbaceous plants are weakened every year through having their flower-stems and large foliage removed prematurely. It is an uncommon thing to see growers cut down stems of Delphiniums close to the ground immediately the flowering is over, also of Sweet Rocket, Pyrethrums, and many other things I could name. Asked why they treated them in this way, the reply would be to clear away the unsightly stems and old leaves. But such people should not grow hardy flowers. Such treatment means a great check to the root. Every good cultivator knows the injury Asparagus sustains when the strong growths are allowed to blow off by the wind, and where is the difference when they cut down the stems and leafage of hardy plants just after flowering?

A few years ago I had an object-lesson in this way when cultivating a big collection of hardy plants for a gentleman who was a devoted lover of open-air gardening, but he was too tidy, and this was the cause of many a plant being treated in an unnatural way. I well remember many a fine Pyrethrum and Delphinium coming up so weakly the following year that they did not bloom. Rocketts were great favourites. We grew the Purple, large French White, and the small double Scotch White. One year I grew a fine lot of plants in the reserve garden, removing them to the garden proper the next year to bloom. Immediately the blooming was over I was obliged to remove the flower-stems close to the ground, with the result that it weakened the Purple and Scotch kinds so much that they did not flower the following year. The French White, being stronger and having plenty of leaves close to the ground, did not suffer so much, while a few of the same plants that were left in the reserve garden did splendidly.

It may be asked: How are these things to be grown in the flower garden so as to have a neat appearance? Most of the evils in this way arise from not placing those kinds that die down somewhat early in the proper positions. Such things as the tall-growing Delphiniums should be planted behind something coming into bloom later on or amongst evergreens. We have some in our garden growing amongst dwarf shrubs. When in flower they are 2 feet to 4 feet above them, and when over we cut them just below the seed-stems, and thus the stems are not seen, but allowed to ripen off in their own way. Last year I observed these growing amongst Rhododendrons in the pleasure grounds at Bournemouth with grand effect.

The common white Rocket should be placed just behind some annual that is growing up and coming into bloom. I use Phlox Drummondii with good effect, placing a few small spray sticks to keep up the Phlox in a natural way. The early-blooming Pyrethrums, Potentillas, and many other earlier plants may be so placed that either autumn-blooming annuals or tender plants can be worked amongst them to keep up the display, and also to hide the ripening foliage. Bunches of Sweet Peas, Sunflowers, Cannas, and many other things can be used well for back positions. With regard to the spring-flowering bulbs, I have found it an excellent way to grow these in big clumps, placing a wooden

(Oak) peg to mark the spot, and when these are about to die off have some annuals sown in boxes ready to prick out clumps between these large patches of bulbs. When the autumn comes round the surface-soil from the bulbs may be moved, adding good material to stimulate them. In the spring the spaces where the annuals are grown can be removed and fresh soil added. I well remember a border in a kitchen garden in Norfolk treated in this way. There were flowers from the Snowdrop till the last Michaelmas Daisy was over, and such bulbs as the Muscaris, Iris reticulata, Turban Ranunculus, and scarlet Anemones.

Amongst the best gardens I have seen of late years are those where hardy plants of all kinds, tender plants, and annuals are used together. But to do this effectively judgment and observation must be used both in the selection and treatment. Along the very front rows can be grown many of the mossy Saxifrages and such like, and the lovely bulbs will come through the carpet of green, which keeps the rain from spoiling the early blooms. When these early bulbs are over their leafage can be allowed to ripen and then pulled up, leaving the ground covered with the Saxifrage or whatever is used. Personally, the ripening foliage is not an eyesore.

On the approach of winter some thought should be given to the ripened leafage. When this is removed at the beginning of winter much injury is done to many things should the weather be severe unless some frost-resisting material is put on them. Many herbaceous plants that need slight protection in winter receive it naturally through the summer, leafage dropping down on the ground and protecting the roots. Alstroemerias, Montbretias, many Irises, Spiraeas, and a very large number of kinds that die down are protected by their own leafage. In winter I have been interested in noticing what a grand protection many plants get in this way. Many growers do not succeed with somewhat tender plants owing to the natural protection being removed. When spring comes and the plants are gone over, then this protection may be removed with advantage.

J. CROOK.

### GLADIOLI AT THE SHREWSBURY SHOW.

ON the whole these were not up to the high standard of quality which one usually meets with at this exhibition. In common with most outdoor flowers, the cold, wet, sunless weather has checked the full development of the spikes, and in many cases damaged the flowers. Still, in spite of these unfavourable conditions, some noteworthy varieties were exhibited by Messrs. W. B. Hartland (Cork), Harkness and Sons, J. H. White, Dicksons, Limited, and M. Prichard. Undoubtedly the finest collection came from the first-named grower, which proves that Gladioli find a congenial home in the Sister Isle, as indeed is the case with many other bulbs. It is greatly to be regretted that this fine collection was unnamed, as it contained many striking and beautiful varieties.

When planning colour effects with Gladioli it is of the utmost importance to purchase corms of such named sorts as one may be acquainted with. Too often, however, the temptation to buy "extra fine mixed in separate selected colours" proves too strong to be resisted, but I have found to my cost that amaranth and purple-crimson are apt to steal in amongst the "red and scarlet grounds," and the same kind of thing happens in the other colours. Perhaps, therefore, the names and descriptions of a few of the varieties which I singled out as the best may prove of interest.

*Mme. P. Palmer.*—A bold spike, and very large flowers of a pale rose-pink, suffused with a pleasing shade of carmine-red. There is a blotch of creamy yellow, and an edging of red.

*The Sultan.*—This was noticed in Mr. J. H. White's exhibit. Colour almost a blackish crimson, with a touch of white in the throat which extends in narrow strips part of the way up the flower. Of the same type is Prince Ranjitsinhji, which is dark purple, shaded with chestnut-crimson on the lower segments.

*J. C. Batten*.—A striking bright red flower, with a white blotch, faintly speckled crimson. An excellent spike was shown by Mr. J. H. White.

*Colossal*.—A magnificent Kelwayi variety; vermillion, shaded with pink, and touched with crimson-lake in the centre of the throat.

*A. de la Deransay*.—A fine bunch of spikes of this noble Nanceianus variety was exhibited by Messrs. Dicksons, of Chester. Its colouring cannot fail to please, being a delightful shade of salmon, while the two lower segments are splashed with straw-yellow and spotted with deep orange.

*Gil Blas*.—This is an old but very good variety, belonging to the Lemoinei section; colour, a pale salmon-pink, shaded with lemon-white, and deep red-brown centre.

*Ministre Pichon*.—An enormous flowered variety of the Nanceianus section, raised by Messrs. Lemoine, and distributed by them in 1900; colour, brilliant carmine-red, the lower segments being blottedched with white, spotted and veined with bright crimson. Three grand spikes of this were exhibited by Mr. M. Prichard and one by Mr. J. H. White.

*Belle Alliance*.—A pale shade of lilac, merging to a dark violet on the lower segments, part of which are splashed with sulphur-yellow and speckled with dark violet. This distinctive-coloured variety belongs to the Lemoinei section, and was shown by Mr. Prichard, as also was

*Baron Joseph Hulot*, another splendid Lemoinei variety, with flowers of a rich violet-blue. Space will not permit me to describe several other kinds

whose beauty claimed my attention, such as *Nautch Girl*, *Sir Charles Russell*, *Docteur H. P. Walcott*, and many others.

ARTHUR R. GOODWIN.

### ROCK GARDENING.

We shall shortly begin a series of articles on Wall and Rock Gardening, and will first of all make a few general introductory remarks. Those who have fairly spacious rock gardens and wish them to be beautiful places and not merely the receptacles of a quantity of different plants, can only secure such a result by putting upon themselves severe restraint as to the number of kinds to be used at a time. In gardening, as in painting, no picture can be beautiful whose composition is crowded and confused. There are various considerations that influence the choice of the plants that the rock planter will put together, but we think that the following suggestions would be worthy of consideration. First, to determine which are the plants that give us the truest pleasure. Then to consider which of these will group best together and flower at the same time; for, supposing four or five favourite kinds of plants to be grouped or partly intergrouped, it is a great advantage to let them be those that will bloom together and make one complete picture, and to have the intermediate sets of groups to bloom later in their turn. This is a much more pictorial arrangement than to have the plants flowering in scattered irrelevant patches quite unrelated to each other.

Suppose, therefore, that a spur of rock garden is crowned with bushes of *Andromeda floribunda*, and that steep rocks below it are clothed with *Aubrieta* and *Arabis*, and that at their foot in cool peaty ground there is a generous planting of *Primula denticulata*. Here are four capital things of early April, all in full flower together, making one complete picture, and these four are quite enough. The colouring is of the simplest possible and delightfully harmonious, and the whole thing is so good a picture that one dwells upon it, and comes back and back to it to enjoy its beauty in a way that one never does to a more mixed planting of individual objects.

It is, of course, more easy to do in large spaces, but even in small ones the same thing may be done in square inches instead of square feet by choosing plants of smaller dimensions.

Such an arrangement for the pictorial part of a garden by no means precludes the enjoyment of individual plants, but we think it is wiser to have these in a separate place in a series of rectangular raised beds, where each plant may occupy its own pocket, and be as easily visible and accessible as a book on a shelf or a specimen in an economic museum. Such raised beds as are in Messrs. Fröbel's delightful nursery at Zurich could hardly be improved upon. They are perhaps 6 feet wide at the bottom and 15 feet long. They are steeply rock built, and accommodate a large quantity of plants. If the beds are placed east and west as to their length it will give each a shady and sunny side; a ridge of small shrubs at the top would give more shade on the north side. Such beds also

A ROCK GARDEN WITHOUT A PREPONDERANCE OF ROCK AND LABELS.

NYMPHEA PYGMAEA HELVOLA, ONE OF THE SMALLEST FLOWERED OF THE WATER LILIES AT SANDHURST LODGE.

afford the best opportunity of suiting plants with special soils, for one may be built of limestone, another of granite, another of sandstone, and so on, so that plants from all kinds of geological formations would find themselves at home. The plants in these rock beds would be grown distinctly as samples and labelled, then those that were the best liked and that showed the most aptitude for making good combinations for the rock garden could be increased and brought into the better use.

Labels should never be seen in the beautiful rock garden; they are destructive of all pictorial effect and damping to the sentiment of the truest enjoyment of plant beauty. You want your rock plant to say to you in cheerful sympathy: "I am one of the loveliest of the plants that God has given you for purest pleasure and for your bettering in gladness and thankfulness;" and not merely to inform you with cold official austerity, "I am Aubrieta deltoidea (De Candolle)."

view over North Hampshire country, with dear old Eversley, once the residence of Charles Kingsley, forming part of the picture. The entrance lodge gate, close at hand on the left, leads up a broad, winding road through trees, shrubs in masses, and open expanses of verdure to the house. Fine masses of trees and shrubs embower it on the north-east and west sides, whilst south it looks upon a broad lawn, on which are some charmingly planted flower-beds, and from the elevation are delightful views over beautiful woodland scenery. On the west side is a spacious and well-furnished conservatory. Dotted here and there on the lawn, especially on its southern slope, are numerous plants in

pots, Fuchsias, Pelargoniums, Streptosolen, Plumbagos, Heliotropes, sweet-scented Verbenas, Solanum jasminoides, scarlet Salvias, &c., which are dropped into holes in the turf, where they remain firm and erect. This is a special feature at this place, and its effect is very pleasing. There is a small lawn in front of the gardener's pretty cottage, which is partially hidden behind bowers of climbing Roses, and on this are many fine bush and standard Fuchsias, also sunk in the grass.

A specially attractive feature in the outer pleasure grounds, which run southwards from the lawn, are the several ponds placed one lower than the other, the water from the higher one ultimately passing into the lower one, thus warming it, in which are grown a fine collection of the newer and very beautiful Nymphæas, for so planted they are more effectively displayed than when in large ponds. The higher pond is chiefly filled with strong growers, especially whites, the less robust ones being planted in the lower ponds. In these they bloom profusely. In some warm

tanks *N. stellata* and other blue forms do well. Beyond the ponds, where small streamlets meander amidst a profusion of flowering plants of a semi-aquatic nature, scarlet Lobelias grow luxuriantly, and even seed freely, so much do they like the moisture. Grass walks are a feature here, and beyond are extensive woods, where Bracken or other Ferns thrive luxuriantly, and amidst which broad walks extend long distances and create a beautiful rural retreat.

There are numerous houses devoted to plant culture, and in their respective seasons Mr. Townsend has splendid collections of *Primula obconica*, a fine strain of *Achimenes*, and many other plants. Fruit, too, is well done, inclusive

## BRITISH HOMES AND GARDENS.

### SANDHURST LODGE, THE RESIDENCE OF SIR WILLIAM FARRER.

**A**LTHOUGH not in the ordinary acceptance of the term a great place, Sandhurst Lodge, Berks, is at once homely and delightful. Sir William Farrer is an enthusiastic lover of gardening, and he is assisted by his quiet and earnest gardener, Mr. W. J. Townsend. This charming place is near the Wellington College station of the South-Eastern Railway, and as the visitor walks to the lodge gates there lies before him, sweeping up to the summit some half a mile distant, the famous Wellingtonia avenue, planted some thirty-five years ago by the late Mr. John Walter, and it is interesting to note that the trees on the sandy soil have grown into noble specimens, worthy both of name and place. At the extreme end of the avenue are the heights known as the Finchampstead Ridges, from which is seen a grand

ROSE-DRAPE WALL AT SANDHURST LODGE.

of Melons and Tomatoes. Roses seem to thrive there luxuriantly, and climbers of all descriptions grow in all directions as though wild. An interesting garden feature close to the pleasure ground is found in three rather long walks, entirely covered with cordon Pear trees arched over. There are many varieties, which are generally planted in groups, but in almost every case carry excellent crops.

In an extensive walled-in garden, the ranges of glass houses and frames being on the upper side, and the centre chiefly devoted to vegetables, there is along the lower side or north aspect a most interesting fruit border some 18 feet wide. This runs the entire length of the garden, and on the wall are Morello Cherries and Plums, and crosswise, at intervals of 4 feet, cordons of Gooseberries, Currants, and Raspberries, remarkable crops being thus obtained.

Of course, to secure them the culture is of the best, but as birds are very plentiful here it is found needful to protect the crops by covering the whole with fish netting from the top of the wall to the ground close to the path in front of the border. As the nets are carried on light framework well above the cordons, and access to the border is obtained at one end, the fruit is well protected, yet is readily gathered. With such poor crops generally elsewhere, here the entire crop this year was a most abundant one. Sandhurst Lodge has all its garden departments well done, and nothing is sacrificed to any one feature.

A. D.

## AN ARTIST'S NOTE-BOOK.

### A NOBLE MULLEIN.

(*VERBASCUM LONGIFOLIUM* VAR.  
*PANNOSUM*)

FOR several weeks past this plant has been one of the most striking objects in the herbaceous collection at Kew. It is upwards of 7 feet in height, and of imposing appearance. The lower 2 feet consist of a dense rosette of handsome leaves, the largest of which are between 2 feet and 3 feet long and 6 inches wide, the smaller and upper ones being scarcely one-third the size of the lower ones. The inflorescence rises from the centre of the leaves, and forms a huge, upright, branched raceme more than 5 feet in length. On

the lower portion of the flower-stem about a score of branches are borne, some of which are nearly 3 feet long. The flowers are borne so abundantly as to almost hide the stem, which, together with the leaves, is covered with a dense whitish tomentum. The individual

flowers are yellow, and larger than those of most *Verbascums*, the largest being rather more than 2 inches across. It would make a good wild garden plant. Most *Verbascums* naturalise readily, and this variety being more showy than the majority would be the best to use.

### HERBACEOUS PHLOXES.

(Continued from p. 142.)

I HAVE already spoken of spring propagation, and to this may be added a word on autumn propagation, which is not merely a very successful mode of increase but a quick and certain way also, quite apart from the fact of its dispensing with the cutting down of young plants in spring. In this way also it saves time. The method is quite simple, and consists first in removing the fading head at the point where branching begins. After a short time young shoots will appear, and these may be plucked out when 3 inches long and inserted in a cold frame for the winter.

twelve young plants, which, if potted, cared for, and planted out in March will be a long way ahead of spring cuttings. It is also a means of utilising what is virtually waste material in the creation of valuable stock. I would say to those who usually plant everything in beds with raised centres that there is nothing worse for these moisture-loving Phloxes, which cannot be effectually watered in such beds, as it is not possible to supply the plants too liberally with water and liquid manure. Old beds are much benefited by a mulch in spring of soil and manure in equal parts, well treading this in position that the roots below may more quickly take possession. I will conclude these remarks with a selection of good kinds, giving their heights as established plants and when subjected to good cultivation generally.

#### PURE WHITE.

*Albatre*, a large handsome truss, flowers of good size, very smooth and firm petal; 3 feet.

*Diadem*, very pure handsome spreading trusses; 2½ feet.

*Mrs. E. H. Jenkins*, a handsome kind of snowy purity, immense panicles of bloom; from its vigorous and free growth it is certainly one of the best for massing for effect; 3 feet to 3½ feet.

*Sylphide*, in form and substance, is rather superior to the last, and is slightly purer when quite true. Occasionally it is given to sporting, and shows faint stripes of red; fine habit and large head of bloom; 2½ feet to 3 feet.

*Panama*, large, massive, and well-formed branching head; 3 feet.

*Jeanne d'Arc*, creamy white, erect growth, and compact pyramidal truss; 3½ feet.

*Lawrence*, capital white pyramidal truss; 2½ feet.

#### SALMON, SCARLET, AND VERMILION.

*Aurore Boreale*, rich salmon-scarlet grand truss; 3 feet.

*Boule de Feu*, fiery scarlet with darker coloured eye; 3 feet.

*Coquelicot*, probably the most intensely coloured of all Phloxes, almost vermilion-orange, flowers large, truss medium size, a most valuable sort; 3 feet.

*Etna*, brilliant salmon-scarlet, producing a noble truss of bloom with large-sized flowers; 2½ feet.

*Coccinea*, vermilion-scarlet shaded crimson, habit dwarf and compact, blossoms medium size; 2½ feet.

*Pantheon*, rosy salmon, with whitish centre, truss large and showy, a fine form; 3½ feet.

*Embrasement*, bright orange-scarlet, flowers very large, grand truss, a most effective sort; 3½ feet.

*W. Robinson*. — A beautiful salmon-rose colour; a good garden variety.

#### PALE SALMON AND ALLIED SHADES.

*Le Soleil*, soft rose-pink, white centre, very fine; 3 feet.

*Mr. Gladstone*, handsome heads of delicate rose-salmon; 3 feet.

*Le Siecle*, warm rose-pink, white centre, enormous truss, very handsome; 2½ feet.

#### WHITE WITH COLOURED CENTRE.

*Croix de Sud*, white, violet centre; 3 feet.

*Countess of Aberdeen*, pure white, carmine

A NOBLE MULLEIN: *VERBASCUM LONGIFOLIUM* VAR. *PANNOSUM*.

(From a drawing made by H. G. Moon in the Royal Gardens, Kew.)

Generally the original growth perishes, and from the base issues one or more fresh shoots, of which there is no evidence to the naked eye at the time of insertion. By this method each flowering stem of this year may be made to yield six to

eye, very large flower and truss, extra fine variety : 2½ feet.

*Edith*, white, with purplish centre, a good showy and early variety ; 2½ feet.

*M. Bouquet de la Cîr*, white, rose-carmine centre, very fine head of bloom ; 3½ feet.

*Giant des Batailles*, pure white, with conspicuous crimson eye, handsome truss : 3 feet.

#### PURPLE, LILAC, AND NEAR SHADES.

*Le Mahli*, purple-violet, large flower ; 2½ feet.

*Robur*, large flowers and good truss, colour purple ; 3 feet.

*Sesotris*, royal purple, free branching spikes ; 2½ feet.

*Lord Raleigh*, deep violet self, good form and truss : 3 feet.

*Paul Bert*, violet-blue, with light centre, a showy and handsome kind ; 3 feet.

*Eugénie Danzauvilliers*, soft lilac-blue, with conspicuous white centre, a most attractive kind ; 2½ feet.

Apart from this selection there are many good things somewhat intermediate in colour. Those, however, who have no opportunity of inspecting a collection in flower will find in the above sets many of the finest kinds at present in cultivation.

Hampton Hill. E. J.

## NOTES ON HARDY PLANTS

### NOTES FROM WORCESTERSHIRE.

ARABIS ALBIDA FL.-PL.

**B**OOTH in my own garden and in many others this has been in flower all the summer, and now (August 22) there are quite a number of its little spikes of bloom to be seen. It seems almost a perpetual bloomer. I have noticed, however, that the individual flowers are neither so pure nor so fine as they are in spring, owing to their centres being green. They are also infested with thrips, for which there seems to be no cure—at any rate on dry sandy soil such as we have in this neighbourhood.

HEUCHERA SANGUINEA × HEUCHERA CYLINDRICA.

This was included in my "gift box" from Chiswick Gardens, and has proved an acquisition. The flowers are reddish pink on the exterior, while the inside of the flower is pinky white, changing with age to the same colour as that of the outside. The deep orange anthers set off the flower and complete its charm. While neither so bright as *H. sanguinea* nor so fine as *H. zabeliana*, it is well worth a place in the herbaceous border.

SAXIFRAGA GRIESEBACHII.

Under this name I have lately received a handsome member of the encrusted section from Mr. F. W. Meyer. According to Messrs. R. Veitch and Son's catalogue it is a recent introduction from Macedonia, flowering in early spring, and "bearing numerous spikes of flowers of a deep purplish carmine colour densely covered with silvery hairs, and bearing numerous bracts of a deep purplish rose colour, tipped with green at the apex." The rosettes in my plant are 2 inches across, almost flat, and charmingly silvered. I am giving it the same treatment as that required by most of the members of the encrusted section—i.e., a sunny position and limestone in the soil.

IRIS LÆVIGATA MAJOR SHIBO.

This is a splendid kind sent out by Messrs. Kelway. It is a dwarf grower, with greyish mauve and white flowers with a yellow blotch, which attain to 8 inches across. One is always glad to make a note of such a striking variety as Major Shibo, because named varieties are legion, and, as they never seem to have been classified, these usually convey nothing to the would-be purchaser. Certainly anyone who buys a mixed

collection of these Irises will be lucky if at least 50 per cent. of them do not turn out to be various gradations of magenta. If the Royal Horticultural Society would offer a special prize for a collection of these to be shown at one of the Drill Hall meetings during July or August, the confusion of names in this class might perhaps be lessened. At any rate it would give many a better chance to make comparisons than they now possess. Messrs. Dicksons, Limited, of Chester, who grow these gorgeous plants well, exhibited at the recent Shrewsbury show a fine pure white seedling, with four yellow streaks in the centre of each flower. This is as yet unnamed, and was shown as Seedling No. 45. It attracted considerable attention, and I learn from Mr. John Dickson that it will be distributed shortly.

MONARDA DIDYMIA.

The wet cold weather seems to have suited this sweetly-scented old plant, and its brilliant blossoms are now very beautiful. On hot sandy soils it is difficult to grow well, and is often ruined by drought. It proves most effective when grouped between clumps of the Paris Daisies (*Chrysanthemum frutescens*).

Worcestershire.

ARTHUR R. GOODWIN.

### HABRANTHUS ROBUSTUS.

THIS resembles the *Zephyranthes* in appearance, but is easily distinguished by having not one flowered peduncle as in *Zephyranthes*, but several flowers arranged in an umbel. It is quite as hardy as *Zephyranthes rosea*, and grows freely in a similar position in light sandy or loamy soil, with a slight protection during severe wintry weather. The plant produces its leaves during the autumn; they are about a foot long and a quarter of an inch broad, smooth, and dark green; the peduncle of three to nine tubular flowers, which are bright rosy purple, is stout, about a foot high. The time of flowering is during early autumn. It does not increase so quickly as *Zephyranthes rosea*.

### ZEPHYRANTHES ROSEA.

A LARGE clump of this lovely Amaryllid has been in bloom here for over two months. Sometimes the whole plant seems to be ablaze with bright rosy funnel-shaped flowers, while at other times, when the weather is less favourable, there are only a few flowers, but in either case the plant is most attractive with its mass of dark green leaves. Although the plant, which I believe is a native of Cuba, is a little tender in some positions, under proper treatment it rarely suffers. My plant came from the collection of the late Mr. Tyerman, and is remarkably large flowering, bright coloured, and free, and has never missed a year without flowering. The bulbs, contrary to the requirements of this class, are never allowed to dry quite off, consequently they are never wholly without leaves, and though their usual time of flowering is late October, they have invariably flowered here much earlier. The best position for them is against a bank facing south or west, or wall, planted in good loamy soil. With care this species grows quite as well in pots as when planted out; the showy long stalked flowers are very useful for cutting.

Ashford, Middlesex.

G. REUTHE.

### INCARVILLEA DELAVAYI.

FEW hardy perennials in recent years have attracted so much attention as this, which may be described as among the most distinct of recent introductions. So distinct, indeed, is it that a group creates quite a new feature in the hardy garden. From the standpoint of novelty as well as beauty and character the plant is most welcome, and doubly so because it may be grown, with every chance of success, in quite ordinary soils. What is still more to the point is the fact that the species will soon be plentiful, and being a free and great seeder will also be very cheap. This some may view with dismay, yet my own experience in hardy plants is this, that for the good, showy, everywhere-hardy, easily-grown perennials there is a steadily increasing demand, and that it is far more profitable commercially and

more satisfactory all round when a good plant can be sold by the hundreds each year as compared with the plant that few can grow. Some roots of *I. Delavayi* remain quite dormant for a whole year, flowering well, say, in 1900, remaining quite dormant and regarded as dead in 1901, yet springing up and flowering as though nothing had happened in 1902. This is not a solitary case, and I mention it so that readers should not destroy dormant crowns by planting too near. Whatever the cause, I hope the warning may have come in time, and that no stocks of a valuable plant have been ruthlessly and in haste discarded. If this dormant character is general then I would suggest in those gardens where a large number of plants are grown that some, for the sake of experiment and knowledge, be not allowed to flower, but develop growth to the utmost extent. Curiously enough neither leaf nor flower spike have arisen in those I have referred to, which makes the matter more perplexing. With this solitary shortcoming, however, it yet remains a perfectly good plant, and will do so till the richer coloured *I. grandiflora* is plentiful. The latter well merits its specific name, in so far as the flowers are concerned, while in respect to leafage and growth it may be described as less vigorous or bold, while possessing a neatness in its roundly ovate and nearly opposite leaves that at once distinguishes it from the plant which is made the subject of the present note.

E. J.

### VERONICA LONGIFOLIA SUB-SESSILIS.

WHEN sent out by the Messrs. E. G. Henderson nearly twenty-five years ago this plant was called *V. Hendersoni*, and was readily purchased by a few at that time. It is one of the finest violet or violet-purple flowering plants for the present season, and no attempt so far as I know has been made either to improve it (which may be difficult perhaps) or to impart some of its fine colour to the more weedy early-flowering members of the race. Had the plants not been so easily raised from cuttings we should doubtless long ago had varieties of it or the result of crosses with other kinds. In this way plants that are kept in hand by cuttings or division appear to offer little encouragement for improvement by the best of all methods, viz., raising plants from seeds.

E. H. J.

## THE ROSE GARDEN.

### FESTOONS OF CRIMSON RAMBLER ROSE.

IT was decided three years ago this autumn to form some festoons and cover them with the above Rose. In one case the supports were of iron and in the other of wood. The iron standards are 5 feet in height, 12 feet apart, with small chains suspended from the head of each standard. The wooden posts are higher, viz., 6 feet out of the ground, the arches being made of small ash rods, fastened to the head of each post and bent over and tied together. In both cases stout plants of the Rose in question were planted. The soil is a stiff loamy one, inclined to clay. They have practically covered the whole of the festoons, and for the past month have been gorgeous masses of flowers, consequently very much admired. The swinging festoons are on each side of a walk in our Rose garden, which leads from a fountain to a marble statue on a pedestal at the other end. They are about 5 feet distant from the edge of the walk. The rising festoons are at the back of a balustrade wall. They stand on an elevated terrace overlooking a portion of a well-wooded bit of the park, hence form a series of beautiful peeps seen through a mass of crimson flowers. Occasionally of an evening, when the setting sun throws its rays at right angles across the picture, the effect is very charming. I ought to mention that the whole of the groundwork from whence Rambler Roses spring is covered with *Rosa rugosa*, which rise to fully

half the height of the standards that form the base of arches. Seen through the open balustrades the occasional flowers, ripening heps, and very handsome foliage of the latter add a good deal to the whole picture, which, except the balustrade, is one that could be formed at a very small cost if set about in earnest. It is intended to substitute light iron in the place of the wood, as the position is a very bleak one, facing north, hence the wooden posts are very apt to be broken down by the winds after the first year or two. I am sorry not to be able to send you a photograph of both forms; the one taken of the latter got damaged.

Tadcaster.

H. J. CLAYTON.

### SOME BEAUTIFUL ROSES.

**GRUSS AN TEPLITZ.**—This brilliant Rose is giving much satisfaction, especially to those who have used it largely for public parks. At present it seems to be the ideal Rose for massing. It may be that it is a little disappointing in the early summer, but there can be no fault to find with the Rose in autumn, the brilliancy of the colour all through August and right on till the frost comes being most conspicuous. I believe the best treatment is to cut the plants hard back each year, even close to the ground, then we obtain a more uniform growth, which is best fitted for bedding, and the flowers are better from this new wood. A few half-standards of a good white Rose dotted about a large bed of Gruss an Teplitz would produce a pleasing contrast. Suitable whites or creamy whites for the purpose would be Aimée Vibert, Mrs. Bosanquet, Mme. Alfred Carrière, Souvenir de la Malmaison, Baronne de Maynard, Enchantress, Augustine Guinooiseau, or Mme. Pernet Ducher.

**Mme. Renée de St. Marceau (Tea-scented).**—At one time I thought this Rose was too much like Souvenir de Catherine Guillot, but on further acquaintance the colour is more brilliant. The intense coppery red is almost as rich as that of Beauté Inconstante; in fact, it is a more trustworthy Rose, but I fear it has not such a sturdy constitution. Such lovely coloured varieties, however, deserve extra trouble to cultivate and protect, and really a good earthing up with soil or burnt earth suffices. For such Roses I consider it rather an advantage than otherwise if they are pruned back close to the ground each year. They quickly recover in the summer and their autumnal blossoming is all the more charming.

**Mme. Ravary and Billiard and Barré.**—To the popular Hybrid Tea group varieties of yellow shades are gradually being added to fill a long-felt want. Of all colours, Roses of yellow shades are the most sought after, doubtless because of their rarity. Perhaps I should say rarity as regards bedding kinds, for we already have among climbers many good rich yellows, as, for instance, Henriette de Beauveau, Bouquet d'Or, Rêve d'Or, &c. Mme. Ravary is catalogued as golden yellow, but if we accept Maréchal Niel as a typical Rose of this colour, then Mme. Ravary cannot be so described. I think rich apricot with orange shading is a more appropriate description of its colour. This particular shade is seen in Roses such as Mme. Charles, Mme. Chauvry, and Sunset, but in the case of Mme. Ravary the intense colour pervades the whole flower in its quarter and half-open stage; unfortunately, the fully expanded blossoms pale off to a chamois yellow, which somewhat detracts from its usefulness as a bedder. It will, however, be largely planted until someone combines the rich yellow of Georges Schwartz to the fine sturdy H.P.-like growth of Mme. Ravary. As a standard it is a distinct success, and for pot culture very useful and good. A superb Rose from the same raiser, and almost a pure golden yellow, is Billiard and Barré. I would recommend it as a tall bedding kind, believing that such Roses as this, Gustave Regis, Germaine Trochou, and the like may be profitably employed in this way. A really effective bed could be formed by planting Billiard and Barré in the centre and Mme. Ravary around, or the former could be interspersed here and there as low pillars among a mass of the latter. Billiard and Barré surpasses all Roses of its colour for outdoor culture. The buds are simply delight-

ful. Nothing more beautiful has appeared for some years, and it is such a good grower. It shows what influence the pollen parent can impart to the seedling, both in the way of colour and vigour, the seed parent, Alice Furon, in this case being a very stumpy grower, where as Duchesse d'Auerstadt, the other parent, is of the most vigorous description and of an intense citron yellow colour.

PHILOMEL.

### THE NEW ROSE BEN CANT.

This splendid Hybrid Perpetual Rose was given an award of merit by the Royal Horticultural Society on July 22 last, and deserved the honour. It is a pleasure to write about a new addition to that somewhat overshadowed group the Hybrid Perpetual, which has contributed so much brightness to gardens in the past and formed the chief feature of interest at exhibitions. Moreover, Ben Cant is a British-raised seedling. The flowers, as our illustration suggests, are

of superb form and finish, broad, robust petals

of glowing crimson colouring, and a sweet fragrance.

It should appear in many exhibition stands next year. We congratulate the raisers—Messrs. B. R. Cant and Co., of Colchester—upon raising so fine a novelty.

THE NEW HYBRID PERPETUAL ROSE BEN CANT (CONSIDERABLY REDUCED).

### CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

### HISTORY OF THE CHEROKEE ROSE.

[TO THE EDITOR OF "THE GARDEN."]

**S**IR,—In a recent number of THE GARDEN a writer asks why this Rose bears this misleading name, at the same time giving some particulars of its history. Through a confusion of species in books many errors are still current concerning the Cherokee Rose, and it is therefore worth while giving a more complete history than has perhaps hitherto appeared. In the first place, Aiton's statement ("Hortus Kewensis," ed. 2, iii, 1811, page 261) that Philip Miller had it in cultivation in 1759 is erroneous. This arose in consequence of the name Rosa sinica having been applied to more than one species, and the record in all probability belongs to some variety of *R. indica*. Many names have been given to the Cherokee Rose.

ITS FIRST BOTANICAL NAME.

The French botanist Michaux ("Flora

Boreali - Americana," i, 1803, page 295) described it under the name of *Rosa leavigata*, from specimens collected by Pursh in Georgia, where, at that period, it "inhabited shady woods, climbing to the tops of the tallest trees." Nearly twenty years later, Elliott ("Sketch of the Botany of South Carolina and Georgia," i, 1821, page 566) mentioned that this species had been cultivated in the gardens of Georgia for upwards of forty years under the name of the Cherokee Rose—the earliest record I have found of this popular name. Elliott goes on to say that its origin was still obscure.

Leonard Plukenet was the first to record this species ("Amaltheum Botanicum," 1705, page 185), from a dried specimen sent to him by James Cunningham from China, and still preserved in the British Museum. I have not actually seen the specimen, but my friend Mr. J. G. Baker has, and he tells me that it is unmistakable, although it has no flowers. Plukenet designates it thus: "*R. alba chesnaniensis foliorum marginibus et rachi medio spinosis.*" This then is indisputable evidence that the Cherokee Rose was first introduced into this country from China and in the form of a dried branch; and Cunninghamia sinensis commemorates its discoverer and introducer. Assuming Elliott's statement, quoted above, to be correct, it was cultivated in Georgia as early as 1780, and in 1804 it was in cultivation in France from a Chinese source. It was published by Poiret (Lamarek's "Encyclopédie, Suppl.," vi, page 284) under the name of *Rosa*

ternata. From a sentimental standpoint it is a pity that this name had been anticipated, as it is so very appropriate, and was given with the knowledge that the real home of this Rose is China. Somewhere about the same date it was described by Boce in another French publication ("Dict. d'Agrie," ed. 2, xxiii., page 280) under the name of *R. trifoliata*. As I have not seen this work I can give no particulars, but it may have been several years later. Poiret states that it had been several years in cultivation but had never flowered.

The next stage in this history brings us back to England, for we find the Cherokee-Rose included in Donn's "Hortus Cantabrigiensis" (ed. 6, 1811, page 144), and named *Rosa cherokeensis*, but without description and

*Plantarum Horti Botanici Monspeliensis*," 1813, page 137) described this Rose under the name of *nivea*, and it was subsequently (1821) figured under this name by Redouté in his "Les Liliacées," ii., page 81, with a coloured plate and one or two additional synonyms, which I shall refer to further on. But I am getting in advance of history and must go back to 1811, when Aiton ("Hortus Kewensis," ed. 2, iii., page 261) confused *R. levigata* with *R. sinica* of Linnaeus. Eventually this led to the adoption of the name *sinica* instead of *levigata*, as being more appropriate and signifying its native country, in spite of the latter name having priority. Subsequently, it was ascertained that Linnaeus's *sinica* was the same as his earlier *indica*. Aiton quoted Linnaeus's definition of *sinica* (*indica*) for the "three-leaved Chinese Rose," and this led Crédin and others to the conclusion that Aiton's species could not be the same as *levigata*.

In 1818 a selection of coloured folio drawings of Chinese plants, without names, was published under the title of "Icones pictae Indo-Asiatica Plantarum excerptae e codicibus Dom. Cattley"; and the third plate is a very good representation of *R. levigata*. These very same plates were reissued in 1821 under the title of "Icones Plantarum sponte China nascentium e Bibliotheca braamiana excerptae," and again without either names or descriptions. In this edition the figure of *R. levigata* is numbered 19.

Strange to relate two monographers of the genus *Rosa* shortly afterwards founded a new species on this figure. Trattinick, in 1823 ("Rosacearum Monographia," page 181), described it and named it *R. cucumerina*, adding: "Species est ab omnibus usquedam cognitis distinctissima seriem propriam constitutens." Yet he recognised the fact that it was closely allied to *levigata* (Michaux) and *hystrix* (Lindley). Seringe followed, in De Candolle's "Prodromus," ii. (1825), page 601, by naming it *R. amygdalifolia*, citing the same figure. Another synonym, *R. triphylla*, was added in Roxburgh's posthumous "Flora Indica," ii. (1832), page 515, where it is stated that this Rose was introduced from China into the Calcutta Botanic Garden previous to 1794.

There yet remain the garden synonyms, *R. Camellia* and *R. camelliae-flora*. The former, according to Crédin ("Bull. Soc. Bot. Belg." xiv., 1875, page 161), was the name under which Siebold introduced *levigata* into cultivation from Japan. So far as I know, the first record of the flowering of the Cherokee Rose in this country is by Sir William Hooker (*Botanical Magazine*, 1828, t. 2847). The figure cited was made from a plant that flowered in the Glasgow Botanic Gardens. It was imported from Savannah, bearing the name Cherokee Rose. Crédin ("Journal R. Hort. Society," n.s., xi., 1889, page 227), follows Thory, and, in a sense, Trattinick, in regarding *R. levigata* as constituting, in itself, a distinct section. In the same place Crédin states that *R. Fortuneana* is the issue of a cross between *R. levigata* and *R. Banksiae*.

Another Rose, figured in Braam's "Icones,"

cited above, plate 16, has been associated with *R. levigata* by Regel ("Acta Horti Petropolitani," v., page 327), who names it var. *braamiana*; but it seems to be *R. involucrata*, Roxb., though wild specimens of this Indian Rose have not been recorded from China. My thanks for several of the foregoing references are due to my friends J. G. Baker and G. Nicholson.

#### SUMMARY OF SYNONYMY.

- Rosa alba chesnuensis*, &c., Plukenet, 1705.
- " *levigata*, Michaux, 1803.
- " *ternata*, Poiret, 1804.
- " *sinica*, Aiton, 1811, not of Linnaeus.
- " *cherokeensis*, Donn, 1811.
- " *nivea*, De Candolle, 1813.
- " *trifoliata*, Boce, exact date not ascertained.
- " *hystrix*, Lindley, 1820.
- " *cucumerina*, Trattinick, 1823.
- " *amygdalifolia*, Seringe, 1825.
- " *triphylla*, Roxburgh, 1832.
- " *Camellia*, Hort., exact date unknown.
- " *camelliae-flora*, Hort., exact date unknown.

*Kew.*

W. BOTTING HEMSLEY.

#### VIBURNUM CARLESI.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I beg to send you herewith a photograph of a comparatively new or at least very little known plant which I received about five years ago from Corea. I grew it first in a pot, and had it during winter in a greenhouse, but it would not succeed until I heard from the friend through whom I received the plant that it was perfectly hardy and that I should grow it outdoors. I acted accordingly, and since that the plant has grown well; it blossomed the first spring afterwards. I omitted then to cut and press some of the flowers for identification, but only wrote a description of the flower to Kew Gardens, together with some leaves. The reply was that they thought the plant in question was *Viburnum Carlesii*, but could not tell me for certain without having some flowers. Last year I sent the flowers, and received then the reply that it was *Viburnum Carlesii*. In autumn last year I also sent a small plant to Kew, together with a shipment of various articles which were ordered from my firm. The shrub flowered this spring so beautifully here that I had a few branches cut and had the enclosed photograph taken. The colour of the flower is first a pinkish white, which turns into a pure white when fully open, and resembles very much a *Laurustinus* or a *Bouvardia*, and has a delicious perfume. It blossoms here in early spring, together with *Magnolias*, *Pyrus*, *Cydonia*, &c., and it is my belief that it is just as hardy as those in England, and that it should be a valuable addition to European gardens.

A. UNGER (L. BOEHMER AND CO.).

*Yokohama.*

#### LILIUM HENRYI AND L. TIGRINUM.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—To criticise any of Mr. Barr's remarks on the subject of Lilies may appear presumptuous, yet I venture to question the assertion on page 118 that *Lilium Henryi* is simply a geographical form of *L. tigrinum*. It is certainly in all respects widely removed from the Tiger Lily—in bulb, manner of rooting, foliage, and habit, and although the flowers are somewhat in the same way there are yet many points of difference. Certainly the person who described the flower of *L. Henryi* as like a yellowish *speciosum* was quite as near the mark as if he had referred it to *L. tigrinum*; indeed, in Barr's catalogue I see *Lilium Henryi* is thus spoken of:—"A most handsome and elegant Lily, discovered by Dr. Henry in Northern China, the flowers resemble in form *L. speciosum*, but are of a soft orange-yellow colour."

The raised excrescences and the greenish star-like centre common to *L. speciosum* Krætzeri also

VIBURNUM CARLESI.  
(From a photograph taken in Japan.)

without history. However, from its designation, we may fairly assume that it was received directly or indirectly from America.

Lindley, in his "Rosarium Monographia" (1820), retains both *R. levigata* and *R. sinica* (page 126, t. 16), and describes his *R. hystrix* (page 129, t. 17), though he recognises that all three are very closely allied. But he then had only incomplete dried specimens. In 1837 he figured *levigata*, under the name of *sinica*, in the "Botanical Register," t. 1922, from cultivated specimens "of great beauty, grown in the nursery of Messrs. Whitley and Osborn at Fulham." It was there trained to a south wall. At this date Lindley accepted the specific identity of *levigata*, *sinica*, and *hystrix*, and he added several other synonyms.

In the meantime De Candolle ("Catalogus"

occur in L. Henryi. In pointing out the various items of resemblance between L. speciosum and L. Henryi it is by no means my intention to suggest that this last-named is but a variety of the other, but rather to point out that, in my opinion at least, L. Henryi is quite as nearly related to L. speciosum as it is to L. tigrinum, and that when the several points of difference are taken into consideration it is certainly entitled to the specific rank which has been assigned it. If not, then the entire genus might easily be cut down to about half-a-dozen species. Concerning L. longiflorum we are greatly indebted to Mr. Barr for pointing out that the varieties grandiflora and Takesima are identical, for a great deal of confusion exists regarding the varieties of the long-flowered Lily.

Lilium tigrinum splendens, that is to say, the variety so much grown by the Dutch (and which is a far better pot plant than any of the others), I have, like Mr. Barr, never found among the large importations from Japan, though the double flowered form is now sent from that country.

Lilium auratum is in many cases both an erratic and disappointing Lily, in fact, it seems far less trustworthy than it was a few years ago, while the huge importations from Japan contain a large proportion of bulbs greatly inferior to those that were at one time sent here. This may be owing to disease or to increased competition that leads to the bulbs being taken up and sent away before they are mature. Last year, at the Chiswick Lily conference, Mr. George Massee, of Kew, stated that the disease of L. auratum was caused by a fungus, and that horticulturists were to blame for not taking precautions to combat it. It is a pity Mr. Massee has not put his knowledge to the test in the Royal Gardens, where there is ample scope, for a practical illustration would have more weight than words.

H. P.

[Lilium Henryi was described as a new and distinct species by Mr. Baker in the *Gardeners' Chronicle*, 1888, Vol. IV., page 660, and the plant was described as a new species a good while before it came into commerce, from dried specimens sent by Augustus Henry to Kew in May, 1888. Mr. Baker is still of the opinion that it is quite distinct. In the Journal of the Royal Horticultural Society, December, 1901, page 339, Baker says:—"A most distinct and beautiful species." A coloured plate of L. Henryi appeared

in THE GARDEN, March 7, 1891.—ED.]

### THE BEST ROSES OF THE SEASON.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I think a very useful service would be rendered to planters if some of your correspondents in various parts of the country could be induced to give a list of say twelve of the best Roses that have blossomed with them this season.

Speaking to a well-known gardener recently, I asked him what variety had given him the most satisfaction this year, and his reply was La France. As this gardener has charge of a considerable collection, it occurred to me that a useful purpose would be served if the names of about two dozen varieties were furnished by your many correspondents from at least every county of the kingdom.

This enquiry would be for Roses most useful in the garden and not from an exhibitor's point of view. The exhibitor regards the Rose as only useful for one purpose, and the rules as to form would exclude some of the loveliest varieties for the garden. I think I shall not be far out if I say that Caroline Testout stands a poor chance of obtaining the medal as the best Hybrid Tea in the exhibition tent, but how superb it is in the garden. No other Rose can approach it for beauty. It is therefore with a view of assisting would-be planters dwelling all over the land that I make

this request, so that they may be assured of a display in their gardens that will give them the utmost pleasure for the longest period.

W.

[We hope our readers will help us to make this list. The planting season is approaching, and this help will be appreciated by those who intend to make Rose gardens in the coming autumn and winter.—ED.]

### A PEAR TREE WALK.

In planting a fruit garden there is much scope for judgment and good taste in arrangement. The first object of the owner of a garden in planting fruit trees, of course, is to bring a return of ample crops of useful produce. At the same time, an experienced planter would bear in mind that a well-grown fruit tree or a collection of them is a beautiful as well as a useful object for the eye to rest on at all times, but especially so when in bloom and in fruit, when they help to invest the fruit garden with an interest and a charm second to none in the garden in spring and autumn.

One of the most attractive and useful ways in which to train the Pear is undoubtedly over pergolas or arches over garden walks. Planted in this way they are pretty to look upon with the fruit hanging down, and they afford agreeable shade to sit or walk under during hot weather. One simple way of constructing an archway of this description (and any ordinary blacksmith can put it up) is by iron hoops thrown over the walk as wide as itself and 8 feet high in the centre, high enough to prevent idle hands from plucking the fruit. The base of these cross arches must be fixed to stones buried in the ground. They should be fixed 9 feet apart, and made of bars of iron 1½ inches deep by a quarter of an inch wide. These cross arches would be laced and made rigid by horizontal wires being fixed through them at distances apart of 10 inches. The quickest way—and the most interesting also—of covering these arches is by planting single cordon trees on either side at distances apart of 20 inches. By this means the archway is covered in a comparatively short time with fruit-bearing trees, and this style of planting enables the planter to include an interesting number of varieties in a short compass.

Another way is to plant the trees singly, 10 feet apart, by the margin of the walk and to grow them singly as pyramidal columns, and when they become tall enough to bend them over the walk. These will require no supports. By this system of training the archway takes longer to form, but when accomplished will be very handsome, and the trees will yield heavier crops of better fruit, as they are more exposed to light and air than are the cordons planted closer together.

OWEN THOMAS.

### GARDENING OF THE WEEK.

#### KITCHEN GARDEN.

##### BLANCHING CELERY.

MUCH attention will have to be paid to this important crop for the next two months to keep up a succession of well-finished heads. The earliest planting should by this date be well blanched and fit for use. Celery always blanches much more quickly at this season than later on. The main and principal crops have been much benefited by the past showery weather, and good results may be looked for if they are now properly attended to. All side shoots and deformed leaves should be removed, and on fine days when quite dry small quantities of soil should be placed round it, always bearing in mind that it is a mistake to heap too much round at once. This should be done at least three or four times, and when possible three pairs of hands should be employed to do it, one on each side of the trench, and the other place the soil firmly round the plant with one hand, and with the other hold the leaves tightly together so that the earth is kept from getting between them, always making it as fine as possible. The day previous make quite certain that the roots are thoroughly drenched with water, as good Celery cannot possibly be expected if at any time it is allowed to suffer for want of water. The latest plantations which will be wanted for March and April use should not have any earth placed to them for at least another two months, but the offsets should be removed and the soil stirred up with the Dutch hoe.

THE BEAUTIFUL ARCHED PEAR TREE WALK AT SWALLOWFIELD PARK.

**CELERIAC OR TURNIP-ROOTED CELERY,** which I am glad to say is being grown much more in this country than it was a few years since, should receive every encouragement to make good roots before the winter sets in, as severe weather will injure it. Keep the surface soil constantly stirred, and drench the plants with manure water; it is safe to say hardly too much can be given.

#### CARROONS,

like Celery, will require to be blanched piecemeal, and unless this is thoroughly done this vegetable, which is much esteemed in some establishments, will be of little use, and to do this successfully use firstly strips of brown paper, secondly hay bands, and finally bank up plenty of soil about them. Copious supplies of water should also be given this crop at the roots.

#### GENERAL SOWINGS.

Make good sowings of French Breakfast, Black Spanish, and other winter Radishes on fine and well-tilled ground. The seed should be sown thinly, and protected against birds.

#### CAULIFLOWERS.

Make another small sowing of Walcheren and Early London on a south border for wintering in cold frames; after raking in strew some finely-sifted wood and cinder ashes over the surface, and protect against birds.

#### CABBAGE.

Make the last plantation if not already done of Coleworts on a warm border: plant thickly, 11 inches or 12 inches apart, and ply the hoe frequently about the earlier plants. Prepare the ground as soon as possible for the earliest bed of spring Cabbage; the land should be heavily dressed with good farmyard manure, and either deeply dug or trenched, the latter for preference. That which has been occupied with spring-sown Onions will come in well for this, and it is always well to arrange this if possible.

#### MUSHROOMS.

Prepare the material and make up beds in the Mushroom house to keep up a succession. Keep the structure cool and moist, and avoid fire-heat.

E. BECKETT.

*Aldenham House Gardens, Elstree, Herts.*

#### THE INDOOR GARDEN.

##### PERSIAN CYCLAMENS.

SEED may be sown at any time of the year, but I have found September is the most suitable period to obtain the strongest and most robust plants. Liberal culture is essential, and the first start should be made in a rich sound loam, with a fair addition of leaf-soil and silver sand. Press this mixture well into the pots or pans, and dibble the seed about 1 inch apart and a quarter of an inch deep, covering the surface with a thin layer of Cocoonut fibre. This will check rapid evaporation. See that the pots are well drained, and place them in a frame with a temperature of about 50°. Germination is both slow and irregular. Sometimes a few plants will come up long after others have made a good start. Extremes of temperature are injurious to Cyclamens, but they should be given all the air possible to promote a sturdy growth. Last year's seedlings are now growing apace, and should be well supplied with liquid stimulants. Keep a sharp look out for thrips, which is often troublesome as the plants become pot-bound. As the evenings shorten, the lights should be kept on to prevent the plants getting chilled, as this means deformed flowers.

##### NERINES.

Frequent disturbance of the roots should be particularly avoided in the cultivation of these beautiful greenhouse bulbous plants. Top-dressing and weak liquid manure are of material advantage to them as the flower-spikes are being pushed up. The best time to shift these plants into larger sized pots is just before they start into fresh growth. The proper soil for them is turf loam, leaf-soil, with charcoal and sharp silver sand added. When first potted give them only a little water, gradually increasing the supply as the plants progress.

#### TUBEROUS-ROOTED BEGONIAS.

A sowing made now will furnish young stock to stand the winter. These will flower next spring and early summer. Fill well-drained pots to within half an inch of the rim with a light porous compost of sandy loam and leaf-soil. Sow the seed evenly, and sift over it a mere dusting of fine soil. Place a sheet of glass over each pot, and shade from sunshine, affording an even, moist temperature of about 65°.

#### HIPPEASTRUMS.

As the growth is now showing signs of ripening, gradually withhold water, but these bulbs should never be dust-dry. The plants may be placed in a light, cool, and moderately dry pit during winter, and allowed to rest till starting time.

#### BULBS.

Hyacinths are now coming to hand, and should be potted into 4½-inch and 6-inch pots. A rich, light soil is essential, and should consist chiefly of turf loam, leaf-soil, and sharp sand. Fill the pots full of the compost, then press the bulb into it. If potted too firmly the bulbs will rise as soon as they begin to grow. If potted too loosely they will not thrive. Plunge them in Cocoonut fibre, covering them with a few inches of the plunging material.

#### GLADIOLUS.

The varieties of the early-flowering section are particularly suitable for pot-culture and forcing for indoor decoration, and are also invaluable as cut flowers. The spikes when cut will last a long time in water. All the corms of these varieties are small. Place from three to five corms in a 4½-inch pot, give similar soil, and plunge as recommended for Hyacinths. JOHN FLEMING.  
*Wexham Park Gardens, Slough.*

#### THE FRUIT GARDEN.

##### FIGS IN POTS.

TREES that were forced early, and have since been top-dressed or repotted and otherwise treated as recommended in previous notes, should be now placed outdoors in a sheltered sunny position. The object of this is to thoroughly mature the young wood. This will be accelerated if the root supply of water is limited and the rainfall prevented—by the pots being laid upon their sides in wet weather—from making the soil saturated. If the top-dressing or repotting of the trees was not attended to when advised, it should now be done before the foliage falls and root action has become inactive.

##### PERMANENT TREES.

Those from which the crop of fruit has been gathered and have—as not infrequently happens when the borders are old—made sappy unfruitful wood should now be attended to at the roots. This should be accomplished by making an opening at the end of the border and carefully removing the soil from amongst the roots down to the drainage to within 2 feet or 3 feet of the stem of each tree according to their size and age. Shorten any long and unnecessarily strong roots, rectify defects in the drainage, and cover it with a layer of turves. This done, half fill the vacant space with compost, after which, as the filling proceeds, arrange the roots in layers through the upper portion of the border. The compost, which should be formed of turf loam, liberally mixed with crushed mortar rubble, wood ashes, and road scrapings, according to its texture, with a little bone-meal or fine bones added, must be made quite firm. This completed, lightly mulch the border, and thoroughly moisten it with tepid water. Lightly syringe the trees daily in fine weather until the foliage falls.

##### MELONS.

Houses containing plants bearing fruit nearing maturity must be carefully watered, giving enough only to keep the soil moist. At the same time guard against permitting it to become dry, for if the plants are allowed to suffer and their foliage flag the flavour of the fruit will be impaired. A continual supply of fresh air should be given, but regulated to agree with the conditions of the

weather, while the supply of artificial warmth and atmospheric moisture must be controlled by similar circumstances.

#### LATE CROPS.

With the decline of solar warmth and shortening days, the vitality of the plants will correspondingly decrease, and naturally become less vigorous and consequently more prone to ailments, causing an increase of vigilance on the part of the cultivator. For very late crops especially a less amount of compost will suffice to meet the plants' requirements, and the demand for water and nutrient will not be so great as is required by earlier plants, while atmospheric moisture must be more discreetly given. On the other hand, artificial heat will be in greater request. The atmosphere should be regulated according to outside conditions, while a constant bottom heat should be kept up. On no account let the plants become crowded with superfluous growth, for it is at this late season most important that the foliage is properly exposed to the sun, and that there is no waste of energy from any cause. It is equally important that the house is kept properly ventilated so that the growths set comparatively firm. Stop laterals at one leaf beyond the fertile blossoms, which fertilise, and limit the plants to two or three fruits to each plant. Canker is a troublesome malady, and plants for affording late crops, owing to the state of the weather, are most prone to attack. A very close, moist atmosphere, especially if the temperature is kept low and the soil wet close up to the stems of the plants, is favourable to it. The best remedy is to promote a circulation of warm, moderately dry air. Apply dry lime or powdered charcoal to the affected stems and keep them dry, as by doing so the crops upon diseased plants may be matured; but plants badly attacked rarely produce fruits of high quality.

#### SOCIETIES.

##### CROYDON HORTICULTURAL IMPROVEMENT SOCIETY.

THE usual meeting was held in the society's room at the Sunflower Hotel, George Street, on Tuesday evening, August 19. Mr. Simpson presided, and there was a good attendance of members to meet Mr. J. Lyne, the Gardens, Foxburg, Chislehurst, who gave an interesting lecture on Strawberries, indoor and out. The lecturer dealt with his subject in a most able and practical manner, and his wide and extensive experience in the culture of this delicious fruit and his pleasant way of imparting his knowledge to those present was much appreciated. Mr. Lyne first dealt with outdoor culture, and emphasised the importance of deep trenching and heavy manuring of the ground. Preparation of runners, and planting, and mulching received attention, and suitable varieties were pointed out. Indoor cultivation next claimed attention, and was well handled by Mr. Lyne, proving the lecturer well at home with his subject. Several questions were asked and ably answered by the lecturer, to whom, on the proposition of the chairman, seconded by Mr. P. F. Bonnyard, a hearty vote of thanks was given.

**SANDY AND DISTRICT HORTICULTURAL SOCIETY.** I AM calling the attention of the readers of THE GARDEN to the operations of this society, which on the 28th ult. held its thirty-fourth annual exhibition, because it is unique in its way and worthy of as much attention from the Press as the gardening papers give to Shrewsbury. For genuine human interest I doubt if there is any exhibition held about the country that can compare with the one held in this Bedfordshire village. Everyone interested in country pursuits and living within reasonable distance from Sandy should see the Sandy show and the enormous crowd of persons who attend it.

Sandy is a fair-sized village, a little over forty miles from London on the Great Northern Railway. It lies in the midst of a huge market gardening and agricultural district, without any towns of note near it other than Bedford and Huntingdon, yet the district round pours in its thousands of visitors by road and rail. It is the occasion of the district holiday; residents entertain their friends, and the whole day appears to be given up to the Sandy show, yet there is an absence of anything in the way of side-shows to attract beyond music. Sandy folk will have good music, and crack military as well as local bands are engaged. The show is always held in the small park of Sandy Place, which is very near the railway station, and is, therefore, easily reached. Given a fine day, such as it was on the 28th ult., and by 4 p.m. Sandy Place Park is simply a moving mass of humanity.

The great source of attraction of the Sandy show is that the schedule of prizes, which consists of some 330 classes, comprises something of everything which interests county

people. Division A, open to all, comprises fifteen classes, and among them is one for ten stove and greenhouse plants in flower, which attracts such growers as Messrs. Cypher, Vause, and Finch. There are classes for Roses and Dahlias, which bring to Sandy with their flowers the leading trade growers and exhibitors, and yet there are no large money prizes, really a very modest and yet reasonable adjustment of them. Division B is open to all, but nurserymen and market gardeners are excluded, and here there are ninety-one classes for plants, flowers, fruits, and vegetables. Amateurs have fifteen classes, an amateur being defined as "an exhibitor not being a nurseryman, gentleman's gardener, or growing for sale, and not employing a gardener solely in that capacity." Cottagers have thirty-five classes for their produce; farmers, eighteen; market gardeners—market gardening being the staple industry of the district—forty classes. In addition, there are six classes for floral decorations in flower.

It will be seen, from a recital of the remaining classes in the schedule, how extensively country pursuits and industries, as well as at-home work, are cared for. Specimens of needle-work are invited in eight classes; stuffed animals, birds (from which, happily, the kingfisher is excluded), fish, and wood and chip carving in three; honey, butter, eggs, trussed fowls, with loaves of bread from bakers, as well as home-made, in fourteen classes; dogs in sixty-two classes; poultry in forty-nine; pigeons in eighty; rabbits in twenty-nine; cats, separated into long-haired and short-haired, thirty-two classes; and there are five other classes for beagles, judged under Kennel Club Rules. A large number of additional special prizes are offered for dogs, and it must be obvious a large number of tents are required to house the exhibits, also judges to make the awards.

The public being admitted at noon, the tents immediately become crowded, rendering note-taking a practical impossibility. Mr. Cypher, of Cheltenham, was first with ten stove and greenhouse plants in flower; Mr. W. Finch, Coventry, with a charming group; the veteran Thomas Lockie, of Diddington Hall Gardens, with six superb Cockscombs; Messrs. Harkness and Co., Hitchin, with forty-eight cut Roses and eighteen Tea-scented; Mr. C. Bright, Cambridge, with twenty-four spikes of Gladioli; Mr. S. Mortimer, Farnham, with thirty-six blooms of show Dahlias; Mr. Trauter, Henley-on-Thames, with twenty-four blooms; Messrs. Keynes, Williams, and Co., Salisbury, for twenty-four blooms of *Cactus* Dahlias, shown on boards, and twelve bunches of six blooms each; Mr. John Walker, Thame, with twelve bunches of pompon Dahlias; Messrs. Harkness and Sons, Bedale, for twenty-four bunches of hardy and bulbous plants; and Mr. F. M. Bradley, Peterborough, with twenty-four bunches of Sweet Peas. All the foregoing exhibits were highly meritorious. Excellent fruit and vegetables were shown; high quality is necessary at Sandy to win prizes.

A few trade exhibits were well worthy of notice. Mr. John Green (Hobbies and Co.), Dereham, had a very fine collection of *Cactus* Dahlias and other flowers, which was awarded the silver-gilt medal of the society, and certificates of merit were awarded to *Cactus* Dahlias Winsome (a charming white) and Hetty Dean; also to Sweet Pea Dorothy Eckford and Everlasting Pea (*Lathyrus latifolius albus grandiflorus*), both shown in superb character. Mr. W. B. Child, Acock's Green, had a fine collection of hardy flowers, and received the same award. Silver medals were awarded to Messrs. Harris and Son, Leicester; W. and J. Brown, Stamford; Harkness and Co., Hitchin; and F. M. Bradley, Peterborough, for attractive collections. Certificates of merit were awarded to *Cactus* Dahlias Clarence Webb (soft rosy salmon) and Coronation (brilliant red), from Messrs. Keynes and Co.; and show Dahlia Lilac Queen (a pleasing shade of lilac), from Mr. S. Mortimer.

The weather was fine, though somewhat cloudy, and there was a record attendance. One main secret of the success of this show is that there are district committees or agents in all the towns and villages within a radius of about twenty miles.

R. D.

## NATIONAL DAHLIA SOCIETY.

## ANNUAL SHOW.

THE committee of the above society had no reason, having regard to the effectiveness of their annual display, to regret the change from the Crystal Palace to the Drill Hall, Westminster; the exhibitors, too, must have felt gratified not to have to undergo the journey through London to Sydenham. The Drill Hall was filled to overflowing with representatives of the genus Dahlia. The large and symmetrical show and fancy varieties were in good force, notwithstanding that the season has been unfavourable to their development; the *Cactus*, Pompon, and single varieties were very good, and in the collection shown by Messrs. H. Cannell and Sons could be seen examples of the latest addition to the types, viz., President Viger, a large crimson single form with a collar of small white petals round the yellow disc, and another single form having in the centre a cushion of quilled florets. Whether these two departures will ever "catch on" remains to be seen; at present the overpowering form is the *Cactus*, and of the huge array of Dahlias seen in the Drill Hall the *Cactus* type formed one-half of the whole bulk. It is a section which grows with surprising rapidity; new varieties spring up on every hand, and a very large number of seedlings were submitted for certificates. The committee were commendably careful in granting their certificate of merit to new varieties, and of those which gained this distinction very few indeed secured an unanimous vote; the majorities in some cases were very small. There were a few good new Pompon and single varieties, and also of the show section, and certificates of merit were only sparingly given to them.

The trade exhibits were ranged round the sides of the hall, leaving the tables in the centre for the competitive exhibits. The arrangement of these by Mr. S. T. Wright was highly favourable to the prosecution of the work of the judges, and it was got through with commendable rapidity. All the

SILVER INKSTAND PRESENTED BY THE MARQUIS OF SALISBURY TO HIS GARDENER, MR. G. NORMAN,  
V.M.H. (See "The Garden," August 30, page 142.)

seedlings were exhibited apart from the competitive exhibits, but the condition of some of them by the time they came before the committee was of a nature to excite commiseration; they hung their heads as if too well aware of their radical weakness of stem.

The nurserymen had five classes for show and fancy Dahlias in which they could compete. Mr. John Walker, Thame, Oxon, was placed first with forty-eight blooms, distinct. The following were selected as the finest bloom in the stand and as affording a good selection: R. T. Rawlings, Majestic; James Cocker, John Hickling, Purple Prince, William Powell, Wm. Keith, Imperial, John Walker, Arthur Rawlings, Marjorie, Sailor Prince, John Standish, Watchman, Victor, Duke of Fife, Golden Gem, Kathleen, Plutarch, Mrs. W. Slack, Dr. Keynes, Queen of the Belgians, John Bennett, Mabel Stanton, Nubian, Mrs. Saunders, and Muriel Hobbs. Mr. S. Mortimer, Farnham, was placed second; he had good representatives of Criterion, Wm. Powell, Archibald Mortimer, James Cocker, Harry Thrner, Victor, Mrs. D. Johnson, Matthew Campbell, Sunset, and Rosamond. Mr. W. Treseder, Cardiff, was third. With thirty-six varieties, Mr. Walker was again first; his leading blooms were R. T. Rawlings, James Cocker, J. Hickling, Imperial, Arthur Rawlings, Queen of the Belgians, Chieftain, Mrs. Fisher, Golden Queen, Marjorie, John Walker, J. T. Saltmarsh, J. T. West, W. Powell, and Duchess of York. Mr. S. Mortimer was again second, and Mr. W. Treseder third. With twenty-four varieties, from exhibitors not showing in the two previous classes, Messrs. J. Cray and Son, Frome, a firm which is rapidly coming forward as successful exhibitors of Dahlias, were first, having—with very little change, indeed—the varieties already named; and Mr. F. W. Seale, Sevenoaks, was placed second. With eighteen varieties Messrs. Cray and Son were again first and Mr. Seale second. There was but one trade exhibitor of twelve blooms, viz., Mr. J. R. Tranter, Henley-on-Thames. He had a pretty light variety, Florence Trauter, in fine character; also T. W. Girdlestone, J. T. West, J. R. Tranter, Earl of Ravensworth, Dr. Keynes, &c. The first prize was awarded to this stand.

Then followed, in the order of the schedule, the *Cactus* and the classes for eighteen and twelve bunches made a most imposing bank of bloom, and several highly promising seedlings were exhibited among them. The first prizes were awarded to Messrs. James Stredwick and Sons, Silverhill, St. Leonards, one of the most successful raisers of new varieties in the present day, but it was a near thing between him and Messrs. Keynes and Co., Salisbury. Mr. Stredwick had fresh and bright bunches of Tasmania, pale yellow; Eva, white; Mary Farnsworth, delicate primrose tipped with white; Etna, lilac; Raymond Parks, bright red; Clara, white; H. F. Robertson, pale yellow; Mrs. E. Mawley, Bruce, primrose centre deeply tipped with rosy salmon; Miss F. M. Stredwick, a highly promising white; Vesta, lilac-pink; J. W. Wilkinson, and Uncle Tom. Messrs. Keynes and Co., who were second, had Ophir, Clarence Webb, a fine new variety of 1901; Mrs. J. W. Jackson, dark; Columbia and Gabriel, two very striking varieties, being tipped with white on dark grounds; Coronation, bright orange-red; Mrs. Clarke, Prince of Orange, bright orange-red; Mrs. J. J. Crowe, Maid of Kent, pale rose; Spotless Queen, white; Mrs. Carter Page, &c.; third, Messrs. J. Burrell and Co., Cambridge, who had some highly promising novelties in their stand. With twelve bunches Mr. John Walker was placed first; he had Lottie Dean, a pleasing salmon-tinted variety; Mrs. E. Mawley, Lord Alfreton, Mrs. Carter Page, J. F. Hudson, Aunt Chloe, Galliard, Lord Roberts, a most useful white; J. W. Fife, crimson-purple, a shading of colours found in very few *Cactus* Dahlias, &c.; second, Mr. C. Turner, Slough, who had Meteor, Vesta, Zephyr, and Uncle Tom in very good character.

Then came boards of *Cactus* varieties as in the first five classes, some very fine blooms being staged: With forty-eight blooms, Messrs. J. Stredwick and Sons were placed first with excellent examples of Mabel, white; Mrs. Winstanley, Hercules, Comet, yellow striped with crimson-purple; Etna, Clara, Mary Farnsworth, Miss F. M. Stredwick, Marjorie, Gabriel, J. W. Wilkinson, H. F. Robertson, Aunt Chloe, Eric, Ringdon, Friar Tuck, &c.; Messrs. J. Burrell and Co. were second, also with admirable blooms, having in excellent form Phoenix, Decima, Mrs. E. Mawley, Ianthe, Sheen, Zoe,

J. W. Wilkinson, Alpha, Crispin, Britannia, Columbia, Mrs. J. P. Clark, Mrs. Hobart, Olive, and Richard Dean, a fine bloom of this, one of the leading novelties of last year. This stand included several highly promising novelties. Messrs. Keynes and Co. were third. With twenty-four blooms Mr. W. Treseder, Cardiff, was first, and this stand afforded a good representation of the leading varieties in commerce, such as Britannia, Loyalty, J. H. Jackson (a fine dark), Bernice, Galliard, Up to Date, Lottie Dean, Alpha, Vesta, Uncle Tom, Mrs. E. Mawley, &c.; second, Mr. W. Baxter, florist, Woking.

The following class for twelve varieties of *Cactus* Dahlias, six blooms of each, shown in vases with any suitable foliage, grasses, or berries, was one of the most attractive features of the show, but in order to account for the upright character of the blooms it may be stated they were allowed to be stiffened by the use of wire. Mr. F. W. Seale, Sevenoaks, was most deservedly placed first, the vases being arranged upon a white cloth. The leading varieties were J. H. Jackson, Mrs. J. J. Crowe, Viscountess Sherbrooke, Britannia, Floradora, Jealousy, Starfish, Vesta, Galliard, Uncle Tom, and Lord Roberts. Messrs. Keynes and Co. were second. They had excellent bunches of Coronation, Lord Roberts, Lyric, Clarence Webb, R. Dean, Artas, Night, and Mrs. J. J. Crowe. Messrs. J. Cheal and Sons, Crawley, were third.

The Pompon varieties, with their attractive symmetrical flowers, followed next. For twenty-four varieties, ten blooms of each, Mr. C. Turner, Slough, took the first prize with a very pleasing selection of small, even blooms, and this stand afforded an excellent selection of some of the best in the section, such as Fosco, Thalis, Bacchus, Lilian, Adelaide, Douglas Cyril, Monna, Jessica, Mephisto, Daisy, Elsa, Darkest of All (nearly black), Nerissa, Galatea, Buttercup, Emily Hopper, and Snowflake as the best. Mr. F. W. Seale came second. He had, differing from the foregoing, Captain Boyton, Ganymede, Hypatia, Nellie Bromhead, &c. With twelve bunches of a similar size, Messrs. J. Burrell and Co. were placed first, having, in their beat character, such leading varieties as Nellie Bromhead, Bacchus, Violet, Emily Hopper, Daisy, Nerissa, Distinction, Ganymede, and Jessica. Messrs. J. Cray and Sons were second, and Mr. John Walker third.

Then followed the single varieties, and they also formed a delightful feature set up in bunches of ten blooms, the first prize falling to the lot of Mr. F. W. Seale, who had charming bunches of Percy Bucknell, Miss Zuleika, Girlie, Ted Seale, Yellow Queen, Adonis, Royal Sovereign, Victoria, Oceana, Yellow Perfection, Rubin Adair, Jeanette, Urban Younes, Beauty's Eye, The Geisha, &c. Messrs. J. Cheal and Sons were second; they had very pretty bunches of the Duchess of Marlborough, Miss Morland, Cicely, Victoria, Hilda, Princess Beatrice, Girlie, Miss Girklestone, W. Parrott, Naomi Tighe, &c. With twelve bunches, Mr. J. Walker was first, he had capital blooms of the Bride, Elsa, Fascination, Robin Adair, Columbine, Leslie Seale, Miss Roberts, &c. Messrs. J. Cray and Sons were second.

Then followed certain classes for amateurs, classes which at one time excited great deal more interest than they do in the present day. With twenty-four blooms of show and fancy Dahlias, Mr. Thomas Hobbs, Downend, Bristol, was placed first with excellent examples of the Rev. J. B. M. Camm, Mrs. Langtry, the Rev. T. S. Ware, Sailor Prince, Arthur Rawlings, Southern Queen, R. T. Rawlings, Dr. Keynes, Shotesham Hero, Earl of Ravensworth, Marjorie, Prince of Denmark, &c.; Mr. Thomas Anstiss, Brill, Bucks, was awarded the second prize. With eighteen blooms, Mr. S. Cooper, Chippenham, was first; and Mr. A. Parker, Ivyhatch, Sevenoaks, was second, showing mostly some of the foregoing varieties. With twelve blooms of show Dahlias only, Mr. H. Blundell, gardener to Mrs. Harris, Orpington, Kent, was placed first with good blooms, being the only exhibitor. With six blooms of show varieties, Mr. E. Jefferies, Laogley, Chippenham, was first; and Mr. A. Parker second.

The best twelve blooms of fancy Dahlias only came from Mr. S. Cooper, who had in good form Lottie Eckford, Sunset, Dandy, Frank Pearce, Salamander, Peacock, Mrs. J. Downie, Watchman, and Mrs. Saunders. Mr. T. Anstiss was second. With six blooms, Mr. T. Hobbs was placed first and Mr. A. Parker second.

Cactus Dahlias were numerously shown by amateurs. The best twelve bunches, six blooms of each, were from Mr. L. McKenna, Waltham St. Lawrence, Twyford, Berks, who had in good character Stella, Britannia, Mrs. E. Mawley, W. Jowett, Lord Roberts, Innovation, &c. Mr. T. Peters, Baldslow, Hastings, was second, with nine varieties in bunches of three blooms. Mr. P. W. Tolloch, Newchurch Road, Hove, was first; his best bunches were those of Ajax, Galliard, Lucifer, Loyalty, Mrs. E. Mawley, P. W. Tolloch, and Alpha. Mr. H. L. Gronsson, Sidcup Place, Kent, was second. With six bunches, Mr. S. Cooper won the first prizes. With eighteen blooms of Cactus Dahlias, shown on boards, Mr. H. A. Needs, Horsell, Woking, was first, having finally developed flowers of leading varieties, especially of Alpha, J. F. Hudson, Mrs. J. J. Crowe, Eclipse, Mrs. H. J. Jones, J. W. Wilkinson, Cornucopia, &c. Mr. J. Bryant, Salisbury, was second. With twelve blooms, Mr. L. McKenna came first, and Mr. H. Brown, Luton, second.

With twelve bunches of Pompon Dahlias, of which there were five stands, Mr. A. Brown, Luton, was first, and Mr. W. C. Pagram, Weybridge, second. Mr. A. Brown was also first with six bunches; and Mr. S. Cooper was second.

With six bunches of single Dahlias, ten blooms in a bunch, Mr. J. F. Hudson, Gunnersbury House, Acton, was first. He had, in excellent character, Donna Casilda, Tommy, Leslie Seale, Columbia, and Aurora. The Rev. S. S. Pearce, Woodstock, Oxon, was second. With six bunches, six blooms of each, Mr. E. Mawley, the president, Rosebank, Berkhamstead, was first, and the Rev. S. S. Pearce second.

Baskets of Dahlia blooms made a charming feature, Mr. R. Edwards, Oxford, Sevenoaks, taking the first prize, having yellow and salmon Cactus Dahlias, nicely arranged with foliage; Mr. H. A. Needs was second; he had yellow and red Cactus; Mr. F. W. Fellowes, Luton, was third. The best vase of twelve blooms came from Mr. R. Edwards; he had Cactus Britannia nicely arranged with bronze and green foliage; Mr. F. G. Oliver, 97, Tollington Road, was second. With three vases of Cactus Dahlias, six blooms of each, arranged with foliage, of which there were six exhibitors, Mr. H. A. Needs was first, he had a vase each of white, red, and maroon colour; Mr. A. Taylor, East Finchley, was second, with mixed colours; and Mr. R. Edwards third, with a vase each of red, yellow, and salmon.

There were three classes for maiden growers who had never won a prize at a show of the society. Mr. H. S. Stevens was first, with six blooms of show Dahlias; Mr. H. Brown, with six bunches of Cactus; and Mr. G. Quinland, with six blooms of Cactus.

Mr. W. Treseider took the first prize with a shower bouquet of Dahlias, using yellow flowers well distributed with foliage; Mr. F. W. Felton was second with red and maroon blooms; and Messrs. Jones and Son, Shrewsbury, third with yellow and dark, but too much overburdened with foliage.

Lastly came a class for six bunches of fancy single Dahlias, i.e., varieties whose florets are striped, tipped, or edged. Mr. F. W. Seale was placed first with Duchess of Marlborough, Alice Seale, Victoria, Adonis, Urban Yousen, and Columbine. Mr. J. F. Hudson was second; he had Fairy, Phyllis, Madge, Hilda, Girlie, and Northern Star.

Trade exhibits comprised a very large and representative collection of Cactus Dahlias, finely arranged, from Mr. John Green (Hobbies and Co.), Dereham; and a representative collection of nearly 180 bunches from Messrs. H. Cannell and Sons. Messrs. Cutbush and Sons, Highgate, had a collection also. There was an interesting one from Messrs. Barr and Sons, King Street, Covent Garden, a larger one of a decorative character from Messrs. Jones and Son, Shrewsbury, and one from Messrs. Smith Brothers, Upper Norwood.

Seedlings will be reported upon next week.

#### ROYAL HORTICULTURAL SOCIETY.

##### ORCHID COMMITTEE.

Present: H. J. Veitch, Esq. (chairman), Messrs. H. J. Chapman, Jeremiah Colman, F. W. Ashton, W. H. Young, W. Boxall, W. H. White, W. B. Latham, F. Sander, de B. Crawshay, H. P. Tracy, W. Cobb, J. W. Potter, J. Douglas, J. W. Odell, T. W. Bond, E. Hill, and H. Ballantine.

The following received the first-class certificate:—

*Odontoglossum × wilcockianum rothschildianum*.—A very fine form, in which the sepals are of a creamy white tone and deeply and acutely notched at the margin. The whole flower is heavily barred and blotched with chocolate. The fringed lip is covered with a glossy brown blotch to one-half its length. From Norman Cookson, Esq. (gardener, Mr. H. J. Chapman).

*Laelia Cattleya Cooksonae*.—This is the result of crossing L. C. Cive and Cattleya labiata, and is a handsome as well as distinct novelty. The sepals are rosy lilac and quite self-coloured, while the lip is of crimson-purple, interspersed with rosy purple, on which the pure white column is seen to advantage. The entire lip is overspread with a velvet-like sheen, that gives the impression of much richness and substance generally. Shown by Norman C. Cookson, Esq. (gardener, Mr. Barker).

*Odontoglossum × crasshyeanum* (Hallii × harryanum).—This was unfortunately removed before a description was obtained. It was shown by de B. Crawshay, Esq., Rosefield, Sevenoaks.

The following received the award of merit:—

*Cattleya schofieldiana* Hesse variety.—The sepals are about 3 inches long, oblong-ovate, yellow, freely spotted with crimson. The lip is widely fringed at the margin, and coloured rosy carnine on the inner portion. A distinct and showy form. Shown by W. P. Burkhaw, Esq., Hesse, Kent (gardener, Mr. Barker).

*Occidium Forbesii* var. *Bradshawae*.—This is virtually an albino form of O. Forbesii, yet in a sense imaginary, seeing the flowers are of a yellow tone, in which also is reflected the well-known markings of the typical plant. It is one of the surprise-packets that now and again appear among imported Orchids, and is doubtless a welcome addition to its section. The plant shown was quite small, yet unique

of its kind, and we may look with confidence to see much larger flowers as the plant gains strength. Shown by Messrs. Stanley Ashton and Co., Southgate.

*Cypripedium hybrid seedling*, resulting from the crossing of C. rothschildianum and C. Curtissii, the first-named being the male parent. Sepals purple, with ciliated margins, the dorsal sepal showing the effect of the male parent, while the labellum was that of a much improved Curtissi. It transpired, however, that the same plant had been produced previously from the same parentage, when it was named C. A. de Lairesse, by which name, by order of priority, it will be known. The leafage is very handsome, and the plant very strong and vigorous. It was raised and exhibited by Mr. W. B. Latham, Botanical Gardens, Birmingham.

*Laelia ionia*, *Westfield variety* (*Tenebrosa* × *pumila* var. *dayana*)—Shown by F. Wellesley, Esq., Westfield Common, near Woking.

A botanical certificate was awarded to *Ascoctochilus conicus*, a neat little plant, with white flowers borne on quite hirsute pedicels. Shown by Mr. E. Kromer, Roraima Nursery, Brandon Hill, Croydon.

##### FLORAL COMMITTEE.

W. Marshall, Esq. (chairman), and Messrs. C. T. Drury, H. B. May, James Walker, R. Dean, James Hudson, J. F. McLeod, Wm. Howe, C. R. Fielder, W. Bain, G. Reuthé, Charles Dixon, E. T. Cook, Charles E. Pearson, H. J. Jones, E. H. Jenkins, W. J. James, Harry Turner, and J. Fraser.

The following received the award of merit:—

*Sterculia russelliana*.—An excellent plant for table and general decorative work. In appearance and effect it is Aracea-like, but has plain not ribbed leaves, and the latter are of a pale glaucous hue. Shown by Mr. J. Russell, Richmond.

*Rose Peace*.—A very free flowering Tea Rose, sweetly scented, and of a creamy shade throughout. The variety has the habit of G. Nabonnand. From Mr. G. W. Piper, Uckfield, Sussex.

*Pea Dorothy Eckford*.—This appears to be the fixed name of a good white Sweet Pea, probably the best white so far.

Shown by Hobbes, Limited, East Dereham, Norfolk.

*Thuya eucommiana pygmaea aurea*.—In its dwarf compactness of growth this resembles the golden Retinoospora, and with just the same widely-set base. An attractive and good plant. Shown by Mr. Charles Turner, Royal Nurseries, Slough.

*Ceanothus Indigo*.—This is quite a descriptive name for a finely-coloured form, quite a good shade of deep blue, and like many others very free flowering. Shown by Mrs. W. H. Burns, North Mymms Park, Hatfield (gardener, Mr. R. C. Fielder).

*Nymphaea Mrs. Ward*.—This is virtually a rose-coloured N. stellata, having the pointed petals and general character of that species, with nicely tinted flowers of a rose-pink shade. Exhibited by Leopold de Rothschild, Esq., Gunnersbury House, Acton (gardener, Mr. James Hudson).

##### FRUIT COMMITTEE.

A. H. Pearson, Esq. (chairman), and Messrs. G. Relf, A. Dean, W. Bates, F. Lane, H. Esling, H. Markham, H. Baldwin, and S. Mortimer.

Very little came before the committee on this occasion. A cultural commendation was awarded to Mr. G. Shawyer, Cranford, Hounslow, for Tomato Cranford Prolific. This is very showy kind, and evidently free setting in a dry no means good season. The fruits were from seven to ten in a spray of good size, firm, and of fine colour. It is for all practical purposes quite a smooth kind. Several Melons were also before the committee.

"Cherry" Plums were shown in three or four kinds by Sir W. Gilbey, Bart., Elsenham, Essex. The colours were yellow, red, and crimson. In size and form the fruits are attractive at sight, and in this way would make a good appearance at dessert. The flavour, however, is not very good.

\* \* \* The report of the Royal Horticultural Society of Ireland has been unavoidably held over until next week.

## ANSWERS TO CORRESPONDENTS.

**Questions and Answers.**—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

**Names of plants.**—*Tempus Fugit*.—1, Rose Duchesne d'Auerstadt; 2, Anna Olivier.—B. L.—*Bog Pimpernel* (*Anagallis tenella*).—J. H.—1, Rose The Garland; 2, Rose Mme. d'Arblay.—R.—1, *Raphiolepis japonica* (ovata); 2, *Lachenalia pusilla*.—A. C. B.—*Homogyne alpina*.—*Inquirer*.—*Astilbe rivularis*.—J. R. D.—Japan Knotweed (*Polygonum cuspidatum*).

**Earwigs to destroy** (Miss E.).—We have no garden pest more difficult to deal with than the earwig, and we know of no better way of destroying them than by trapping, either by Bean stalks cut into short lengths and placed amongst the branches of the trees or by placing a bit of fruit or a small piece of Carrot inside a flower-pot along

with a bit of hay or moss for cover. They usually enter these traps freely and may be destroyed in this way. The earwig dislikes damp situations, and we have known them compelled to shift their quarters by copious and persistent application of water. If one position does not please them they soon migrate to another. If the old wall has deep crevices between the bricks likely to afford them shelter and encouragement it should be pointed over.

**Roses for New Zealand** (SQUEAK).—September

and October are considered to be the best time of year in which to despatch Roses to this part of the world. The sap is then going down, and consequently the plants travel in the best possible condition. As you only propose to send one or two, we should advise you to procure pot-grown plants, if possible, on their own roots. Climbing varieties most appreciated in New Zealand are Climbing Devonensis, Rêve d'Or, Bouquet d'Or, Gloire de Dijon, Lamarque, Mme. Gerard, and Cheshunt Hybrid. You could not send your friend a better reminder of the Old Country than a Rose and Climbing Devonensis, being of English origin, would perhaps be the best variety.

**Propagating scarlet Rhododendron** (A. P.).—

Cuttings of this class of Rhododendrons are very difficult to strike, hence the only mode of increase open to you is grafting. For this purpose the best stocks are young seedling plants of *Rhododendron ponticum*, about the thickness of small pencil, which have been potted up some time previously. The operation is best carried out in July and August, according to the condition of the scions, which should be formed of the present season's shoots just as they are becoming woody. Side grafting is the method generally followed, and the head of the stock should be left untouched, or, at all events, only shortened back for convenience sake. Take care that an exact union is effected, as in this respect the Rhododendron is very particular; tie securely in position, then cover the point of union with grafting wax, and place in a close and shaded frame. Even then it will take about six weeks for a union to take place, and after all you must not be surprised if your percentage of successes is small, as Rhododendrons are not easy subjects for an amateur to manage.

**Peaches to prune and Plum leaves diseased** (HOPE).—Your Plum trees are evidently suffering from a severe attack of the Pear and Plum blight,

a virulent fungus, which, if not destroyed, spreads rapidly. It is difficult to account for its presence; it may have been communicated by other trees (some conifers are subject to it) adjacent to the wall. In any case the affected leaves should be cut off and burnt, and the trees washed over with water in which lime and sulphur has been mixed in the following proportion: To two gallons of water add half a pint of sulphur, the same of quicklime, also a wine-glassful of soft soap. (The water should be allowed time to clear.) It should never be forgotten that the best way to prevent the attacks of disease or insects on fruit trees is to maintain them in robust health. When these conditions are present it is very seldom they suffer, but once in indifferent health they are a prey to disease and insect pests. Gumming is usually caused by defective stoning. On cutting the fruit you will most likely find the stone more or less decayed. The Peach trees can be safely moved as soon as the leaves have fallen. The blight is caused by chills from cold weather in spring and early summer. By removing the trees to a warmer position your trees, we hope, will be spared this infection in future. The pruning had better be deferred until January. The shoots of the current year's growth should not be cut at all, only thinned out where too crowded.

**ERRATUM.**—A mistake occurs in the report of the Shrewsbury show, top line, middle column, page 155. For greasy, read green.

HER MAJESTY THE QUEEN has been graciously pleased to accept the dedication of Mr. H. Inigo Trigg's work on "The Formal Gardens of England and Scotland," the concluding part of which will be shortly issued to the subscribers by Mr. B. T. Batsford.

## GARDENING APPOINTMENTS.

J. E. SADLER, who has represented Messrs. James Backhouse and Son, of York, for upwards of twenty years, has joined the staff of Messrs. Richard Smith and Co., nursery and seed merchants, Worcester, whom he will represent in the future.

MR. WILLIAMSON, for the past thirty years gardener at Tarvit House, N.B., becomes, next November, lecturer on horticulture in connexion with the East of Scotland Agricultural College.

## CATALOGUES RECEIVED.

**Bedding and other Plants.**—Wood and Ingram, Nurseries, Huntingdon.

**American Trees and Shrubs.**—J. M. Thorburn and Co., New York, U.S.A.

**Bulbs, Roots, and Orchids.**—Dammann and Co., San Giovanni a Teduccio, Naples.

**Lily of the Valley.**—Ernest Riemschneider, 46, Hambrug Street, Altona-Hambrug.

**Flower Roots.**—Dicksons, Waterloo Place, Edinburgh.

**Bulbs.**—Barr and Sons, 12, King Street, Covent Garden; Dobbie and Co., Royal Florists, Rothesay; A. F. Upstone, 35, Church Street, Rotherham; B. Soddy, 243, Walworth Road, London; Toogood and Sons, Southampton.

**Daffodils.**—Barr and Sons, 12, King Street, Covent Garden.

**Carnations, Pinks, Pansies, &c.**—Clibrans, Oldfield Nurseries, Altringham.

**Bulbs, Carnations, Roses, &c.**—R. H. Bath, Limited, Floral Farms, Wisbech.

**Roses and Fruit Trees.**—A. F. Upstone, 35, Church Street, Rotherham.

**Bulbs and Fruits.**—L. Spath, Baumschulenweg-Berlin.

**General.**—Pinehurst Nursery Company, Pinehurst, U.S.A.

**Field Crop Seeds.**—Toogood and Sons, Southampton.

# THE GARDEN

No. 1608.—VOL. LXII.]

[SEPTEMBER 13, 1902.

## COTTAGE GARDEN SHOWS.

**T**IME was when cottage garden shows were set on foot mainly through the agency and energy of the country clergy. It was often uphill work, and we cannot be too grateful to the pioneers who put their willing shoulders to the wheel for the sake of their fellow-men. But with the lapse of time, as in all such movements, there has come a day when enthusiasm flags, and signs are not lacking that cottage garden shows of the old sort are somewhat on the wane. Now and again we hear of one that flourishes apace from some local cause, but as a rule we are told that they have been tried and found wanting, and their best promoters of past years are getting weary and a little out of heart over unrequited labours. We would fain galvanise them into new life, more especially because we are convinced that, so far from their usefulness being diminished, it is likely to be augmented in the future that lies before us, and it strongly occurs to mind that the electric touch which is needed will be found in corporate management and control.

By chance, on the recent August Bank Holiday, we were in a pretty old-world town of one of our fairest English counties, and were present at a country flower show and fête of the kind we would indicate. The ancient borough in question is blessed with a prosperous workman's club. Finding that a popular race meeting held every year in the vicinity on the summer Bank Holiday drew large numbers of people away from the town, whilst it emptied the pockets of not a few to the detriment of wives and children left at home, some of the most astute and leading members put their heads together and suggested that a working men's flower show on that day, controlled entirely by themselves, would afford at once a counter attraction and a pleasant recreation at their own doors in which their families could share. The idea was welcomed, and for some years now has been successfully carried out. No one who was an eye-witness of the fête on August 4 could doubt the beneficent influence of this effort on all concerned. The large tent was crammed to overflowing with a continuous stream of eager and interested onlookers. Various sports and amusements were provided.

Surely a flower show such as this cannot be too highly commended, and it is suggestive. The benefit to the village, or, better still, the

group of villages, which is the centre of some such co-operative effort on the part of the people themselves, is incalculable. There is the hobby to work for all the year round; there is the incentive of emulation which human nature needs to rouse it out of its normal inertia; there is the pleasant intercourse over kindred interests to fill many an otherwise idle and ill-spent Sunday afternoon with innocent occupation; there is wholesome food and rich reward of flower beauty at the command of instructed head and diligent hands in every rood of garden ground around each cottage door.

All who have beautiful homes of their own may help on the good cause of bringing cheer into other lives by wise and kindly intercourse and help to the neighbour with fewer opportunities.

We have before us the schedule of prizes of the cottage garden show held at Warley Place on Thursday in last week. The president is Miss Willmott, who has many helpers in this good work of making gardeners of the villagers. There were no fewer than ninety classes. It is a pleasure to help forward in all possible ways such wholesome recreation.

## BEST ROSES OF THE SEASON.

### THE MOST BEAUTIFUL VARIETIES FOR AUTUMN PLANTING.

In response to our request for lists of the Roses that our readers have found most satisfactory we have received the following interesting communications:—

#### HYBRID PERPETUALS.

A. K. Williams, although not a large Rose, is beautiful when perfect.

Clio of 1894 is good as a white, but for its habit of massing its buds and making disbudding almost impossible.

Captain Hayward, a splendid flower, cut in bud before expanding; this was very well shown this year at the Temple show.

Helen Keller, a splendid plant, flowering freely, colour good; it is often apt to come irregular in form, and this cold year has produced many ill-shaped flowers.

Mme. E. Luiset, an old and valuable Rose, flowers freely, fairly good colour.

Magna Charta, a free-flowering Rose and a useful exhibition bloom for a dozen box.

Marchioness of Londonderry is splendid but for its nasty dull white colour, which is not pleasant; best on three year old Briar budding, and treated by annually cutting away all the former year's growth, only leaving maiden wood.

Mavourneen, one of Messrs. Dickson's white

Roses, of solid petal, and flowering freely, but rarely seen at an exhibition.

Margaret Dickson splendid, and most useful both for bedding and for show, flowers freely, and, but for autumn mildew, does well anywhere.

Mrs. John Laing good, but must have careful attention, and, although flowering freely, requires an early and warm spring to develop well.

Mrs. Sharman Crawford a lovely Rose; be careful to disbud freely.

Ulrich Brunner, one of the very best and freest Roses sent out, grand on the Briar and no trouble; will flower well in light soil.

Ulster, a new Rose of Messrs. Dickson's hybridisation, but not a free one, and the buds often too long in opening.

Lawrence Alleu, good colour and substantial, but rather too flat in form.

#### THE HYBRID TEAS.

Bessie Brown.—This stands well to the front with its handsome white blooms; although apt to droop and open badly it does well if carefully treated.

Baldwin, a Rose I am testing and hope next year to succeed with.

Caroline Testout, well known, and, with Cheshunt Hybrid, very free and good.

Charlotte Gillemot, again a white and solid Rose, but of poor growth, splendid when cut in a half expanded state.

Clara Watson, glorious, especially when seen alongside a bloom of Caroline Testout.

Countess of Caledon, bright colour and flowers freely, useful for show purposes.

Ferdinand Batel and Ferdinand Jamain are both very good, and will be popular as they bloom freely. The former Rose is greatly in demand in America, and called there American Beauty.

Grace Darling, a pretty Rose but for its bad habit of growth.

Helena Cambier, good and free but opens badly.

Kaiserin Augusta Victoria, well known and admired; do not prune this Rose too much as its habit is to grow tall before throwing its buds.

Killarney.—This Rose does not do well with me, but I hear from friends who grow it that it is one of the finest of this class.

La France, a Rose I am trying on its own roots, and learn that it does splendidly in this way.

Mme. C. Ramey, very elegant, and similar in many respects to Ferdinand Batel.

Marjorie, very free indeed, and some blooms of perfect form and substance.

Marquise Litta, a splendid solid Rose, and of good colour and form, not a very free grower.

Mrs. W. J. Grant, a glorious Rose, most free, and when well treated throws fine strong petalled blooms.

Shandon, one of Messrs. Dickson's latest, good and free.

White Lady, very useful and capital for exhibition.

Viscountess Folkestone, a splendid and prolific Rose.

Irish Glory and Irish Beauty, singles, gems both for colour and beauty of foliage, free and strong.

CHARLES W. CROSEY.

*Broome Hurst, Dorking.*

Mrs. W. J. GRANT, earliest to start with show blooms, and has bloomed uninterruptedly until now (September 8), and still shows quantities of buds; the early blooms on the climbing variety are magnificent. Mme. Abel Chatenay, excellent in every respect as a garden Rose, both as to colour, scent, lasting qualities, and freedom of bloom; La France, White Lady (very fine in early summer), Viscountess Folkestone, Maman Cochet, Caroline Testout, Mrs. Sharman Crawford, Hon. Edith Gifford, Killarney, Grace Darling, Marie Van Houtte, Mrs. Edward Mawley, Grüss an Teplitz, Prince Camille de Rohan, Abel Carrière, Louis Van Houtte, Gloire Lyonnaise (bad autumnal), Margaret Dickson (bad autumnal), Captain Hayward, Innocente Pirola, L'Ideal, Belle Lyonnaise, Gloire de Dijon, Mrs. Paul, Augustine Guinoisseau, Camoens, Charles Lefebvre, Mme. Lambard, Suzanne Marie Rodocanachi, and Captain Christy.

HERBERT NASH.  
Winash, Brislington, near Bristol.

#### KEW NOTES.\*

##### INTERESTING PLANTS IN FLOWER.

###### Temperate House.

Asparagus umbellatus, Begonia coccinea, B. kewensis, Bougainvillea glabra var. sanderiana, Cianthus Dampieri, Cyphomandra fragrans, Dianthus arboreus, Helmholzia glaberrima, Lilium Batemannae, L. Henryi, L. sulphureum, Lonicera etrusca, Musschia Wollastonii, Solanum pensile, and Tacsonia insignis.

###### Palm House.

Faradaya splendida, Gomphia Theophrasta, Hymenocallis speciosa, and Ixora javanica and I. spectabilis.

###### Water Lily House.

Hedychiums and Nymphaeas in variety.

###### T Range.

Acalypha hispida, Anthurium andreanum var., Begonias (shrubby and tuberous), Calliprische aurantiaca, Chirita simensis, Exacum affine, Heliconia psittacorum, Hamanthus Lindenii, Kleinia Galpini, Klugia notoniana, Moegragia umbellata, Pentas carnea, Thunbergia grandiflora, and Victoria Regia.

###### Orchid Houses.

Angraecum eichlerianum, A. scottianum, Anguloa Ruckeri, Catasetum Naso, Cattleya bicolor, C. Eros, C. granulosa var., C. schofieldiana, C. Grossi, Cynorkis purpurascens, Cypripedium Ashburtonii, C. A. var. superbum, Epidendrum ciliare, E. equitans, E. prismatocarpum, Eulophia pulchra, E. Woodfordii, Laelia elegans, L. Loddigesii var., L. Harrisoniae, Miltonia candida, M. castanea, M. Clowesii, M. massaiana, M. Regnelli, Polystachya laxiflora, P. leonensis, Rodriguezia secunda, Rhynchostylis retusa, and Stenoglottis longifolia.

###### Greenhouse.

Caleolaria Burbidgei, Hidalgoa Wercklei, Lanaria salivifolia, and Nicotiana alata.

###### Rock Garden.

Allium carinatum, Chrysanthemum Zawadskii, Coreopsis rosea, Dianthus meeanus, Epilobium Dodonei, Gentiana asclepiadea, G. a. var. alba, Kirengeshoma palmata, Parnassia caroliniana, Polygonum affine, Satureja montana, Senecio pulcher, Silene Schafta, and Statice subpuberula.

#### Herbaceous Borders.

Argemone grandiflora, Cimicifuga cordifolia, Colchicum autumnale, C. byzantinum, C. laetum, Glaucium luteum var. tricolor, Hunnemannia fumarifolia, Impatiens Roylei, Silene Fortunei, and Silphium (various).

#### Shrubs.

Ceanothus in variety, Clematis aromatic, C. campaniflora, C. connata, C. crispa, C. Flammula, C. Hendersoni, C. intermedia, C. Jackmani vars., C. orientalis, C. Viticella, Hypericum aureum, H. densiflorum, H. hircinum, H. moserianum, H. patulum, H. prolificum, Microglossa albescens, Romneya Coulteri, Rubus ulmifolius, and Roses.

#### EDITOR'S TABLE.

##### LILUM LONGIFLORUM.

Mrs. A. Bayldon, Oaklands, Dawlish, Devon, sends superb spikes of *Lilium longiflorum*, showing how well this Lily succeeds in Devonshire. The stems were tall, leafy, and carried several flowers each.

##### SEEDLING CARNATIONS.

Mr. W. A. Watts, Bronwylfa, St. Asaph, who recently sent us beautiful flowers of the pure white George Macquay, sends a box of seedlings of rare promise. Mr. Watts writes: "I send a few of my last year's and this year's seedling Carnations, which I think are pretty good considering they have been grown entirely in the open without any protection." The seedlings sent show that Mr. Watts is working in the right direction. One variety, a scarlet on deep apricot, is particularly fine, and all the flowers were of good colour, with broad, stout petals held well within the calyx, not tumbling out or needing a little indiarubber band to hold them in place. The flowers are also sweetly scented. As is mentioned in the note, the plants have not been coddled in any way.

##### A BEAUTIFUL CLIMBING TEA ROSE RARELY SEEN.

We have received from Mr. George Prince, of Oxford, flowers of a new Tea Rose named E. Veyrat Hermanos. Mr. Prince writes: "It is of a fine climbing growth, vigorous, and especially good in autumn; but we have shown this Rose equally good at the early shows of the National Rose Society." The flowers are superb in every way; the stem is strong, thick, and brownish crimson, the petals broad, yellow, shaded with buff, a warm salmon tint suffuses the centre, and the scent is delicious. There is so much substance and strength in the flowers that we think exhibitors of Tea Roses will hail it with delight. It is exceptionally beautiful in colour, and its powerful and true Tea Rose scent adds to its importance. A good garden Rose.

#### NOTES OF THE WEEK.

##### FORTHCOMING EVENTS.

September 16.—Dahlia Show, Royal Aquarium (three days).

September 18.—Great Fruit Show, Crystal Palace (three days).

September 23.—Royal Horticultural Society, meeting of committees, Drill Hall, 12; committee meeting of National Dahlia Society.

**Bulb Number.**—We shall devote several pages in our next number to bulbs, as this is the season for planting. A few of the subjects considered will be Naturalising Bulbs in Meadow-lands, Tulips, the Irish Anemones, Carpeting Plants for Bulbs (a hint for making good effects in spring), Some Rare Lilies, Crocus speciosus, New Daffodils, &c., but the usual features will be disturbed as little as possible.

**The finest Sweet Peas.**—On another page is given the report of the Sweet Pea Society with regard to the best varieties of the present year. Those interested in Sweet Peas and wish to know the finest varieties to select for

sowing in November or next spring should keep this list.

**September Roses.**—Given a few sunny days we are promised a grand display of Roses, and those who wish to make their gardens gay at this season would do well to make selections from those at their best now. I do not remember a more promising lot of buds on the plants. The La France race is—as always—well to the front, and Caroline Testout, Mrs. W. J. Grant, Grüss an Teplitz, and others of the Hybrid Teas; and also Corallina, Enchantress, among the Teas, are splendid. Then, too, we have the lovely China Teas, such as Mme. E. Resal, Mme. L. Messimy, and a whole host of others that will give brilliancy and colour to our gardens right into October.—P.

**Veronica longiflora subsessilis.**—Having taken a good deal of notice of the hardy herbaceous Veronicas for twenty years I have never been able to master the history of this. Concerning its introduction to English gardens I know that it was first introduced by Henderson and was called after his name. A few years afterwards it was again introduced as a novelty by Mr. Ware, of Hale Farm Nurseries, Tottenham, who said that it came to him from Japan. I was told by an amateur who had been in Japan that he believed he had seen it there, but whether as a wild plant or in a garden he could not tell me, and I have never taken an opportunity of looking for this variety in the Kew herbarium, where something might be learnt about it. It is undoubtedly the finest of the garden hardy Veronicas, but as for gardeners not taking the trouble to raise it from seed I should only be too thankful to anyone who would send me or tell me of a fertile seed of it. I have raised from seed I may literally say a hundred forms of *V. spicata* and *V. longifolia* and their intermediates, but I have never seen one in which I could suspect this fine form of being a father. It seems to me absolutely barren, both in seed bearing and in pollen.—C. WOLLEY DOD, Edge Hall, Malpas.

**Early-flowering Chrysanthemum show at Tamworth.**—There is to be a gathering of those interested in the cultivation of the early-flowering Chrysanthemum at Bolehall House Gardens, Tamworth, on Saturday, the 27th inst., when some 3,000 plants, in great variety, will be open for inspection. Both the Japanese and Pompon types will be freely represented, close upon 200 varieties, and these representing the best now in commerce, will enable the fortunate visitors to make comparison between the older and newer sorts. To add to the interest of the meeting, Mr. William Sydenham offers four silver cups for competition, one in each of the following classes: For twelve bunches early-flowering decorative Chrysanthemums, distinct; twelve bunches early-flowering Pompon Chrysanthemums, distinct; six bunches early-flowering decorative Chrysanthemums, distinct, catalogued in 1900 or since; and six bunches (three yellow and three white) early-flowering decorative Chrysanthemums, distinct. The blossoms must have been grown by the exhibitor in the open and not disbudded. The exhibits are to be ready for judging at noon, and there will be an exhibitors' lunch at one o'clock. Mr. William Sydenham, who conceived the idea of a Chrysanthemum feast, gives a hearty welcome to growers and others, but application for tickets should be made not later than the 25th inst. The early-flowering Chrysanthemums have advanced in popular favour during recent years, and an event such as the one under notice should give a stimulus to their culture. As a plant for brightening the outdoor garden in the autumn months the early Chrysanthemum is unsurpassed, and with the addition of newer kinds these plants are enhanced in value.—D. B. C.

**Verbascum Chaixi.**—One plant of this has given distinction to a cottage garden in Reigate. No one could pass by without noticing it. The very small garden is filled with beautifully grown Phlox decussata in pots and two patches of *Coreopsis tinctoria*, over which the graceful yellow flowers with purple filaments of the Verbascum hover like butterflies.—WINIFRED SPURLING.

\* This will be a feature every week.

**Galtonia candicans.**—This fine Cape bulb is grown more largely and with finer effect at Highclere Castle than I have seen it elsewhere. On a long narrow border fronting a wall, on a north aspect, there are dozens of huge clumps interspersed with clumps of Iris. Just now the Galtonias are in fine bloom, and far more attractive in a mass than when grown thinly and in a warm, dry position. Evidently the bulbs like a cool site and moisture.—A. D.

**Rose Mme. Antoine Mari.**—We have in this pretty novelty a Rose likely to prove almost as useful as G. Nabonnand. The colours form a most pleasing combination—French white in the centre, heavily suffused, with bright rose on outer petals. The buds are very shapely, opening to a loose large petalled flower, after the style of G. Nabonnand, only not quite so large. The foliage is very beautiful, contrasting well with the unique coloured blossoms. M. Mari, the superintendent of the Public Gardens, Nice, is, I believe, the raiser.—P.

**Fibrous Begonias.**—With so many failures in flowering bedding plants this season, arising from so much rain and so little sunshine, it is particularly pleasant to find fibrous-rooted Begonias so very bright and effective. I saw recently masses of Fairy Queen, a lovely pink variety; Princess Beatrice, tinted white; and Crimson Gem at Highclere Castle literally full of bloom. When will Messrs. Sutton and Sons succeed in giving to gardens a good yellow-flowered variety? Such a plant would be indeed a welcome bedder.—A. D.

**Strawberry The Laxton.**—In the summer of 1901 Mr. Pope, of Highclere Castle Gardens, went with others to Bedford to see the Laxton Strawberry growing and fruiting in quantity, and was so much impressed with its great excellence that he ordered 100 plants. That order was executed a week or two since, and when at Highclere recently I saw the plants, good strong rooted layers in pots, and also saw them planted out on a south-east border in well-manured soil. There they will more or less fruit next year, as planting at the end of August should give ample time to make strong crowns, which may be trusted also to give an abundance of runners. Hence in paying a big price for such a consignment there is every prospect of securing a good return in a year or two. If this splendid Strawberry generally justifies its present reputation there will be an enormous demand for it.—A. D.

**Spiraea japonica Anthony Waterer.**—This hardy shrub deserves to be better known and more generally cultivated. Where planted in large beds on lawns or as broad margins to choice shrubberies it gives a wealth of colour in late summer and early autumn. The colour of the flower is a warm, deep claret, and it is distinct from any other plant in bloom at this time that I know of. On a recent occasion I saw it planted in a mass in this way on the lawn some distance from the mansion, and the effect was most pleasing. If the soil in which the Spiraea has been planted has previously been deeply trenched and well manured it will give little or no further trouble afterwards, with the exception of an occasional good soaking of water during dry weather in summer.—O. T.

**Onosma echinoides at Rothesay.**—This interesting little plant for the rock garden is, and has been for some time past, flowering in great profusion here. It is a charming little plant that should be more grown than it is. It seems to have got a bad reputation, owing no doubt to the fact that it is killed with kindness. It should be planted in the sunniest spot in the rock garden in very sandy soil, where it can have a deep root run, a crevice between two pieces of rock suiting it well. It must, however, have good drainage, as anything approaching stagnation is fatal. The flowers are of a golden-yellow colour, tubular, about 1½ inches long and ½ inch across, in a branched cyme about 1 foot high. The leaves have coarse hairs. Cuttings made from the young shoots and put in almost pure sand during the month of August root well. It is a good

plan to place a sheet of glass over it during the autumn and winter to throw off some of the rain, otherwise the leaves being hispid hold the water and are likely to rot. It is perfectly hardy here. Most nurserymen catalogue it under the name of O. tauricum. In "Nicholson's Dictionary" it is called O. stellulatum tauricum, but according to the new "Kew List of Herbaceous Plants" it is O. echinoides. It was introduced from the Caucasus about 1801, so that it has been with us over a hundred years and is still scarce.—G. M., Rothesay, N.B.

**Mixed Sweet Pea.**—I am cutting out of THE GARDEN "B.'s" remarks about Sweet Peas. His experience has been mine also, and I am sending it to one of the first Sweet Pea growers in England. Neither time nor expense were saved to secure the finest selections. In spite, however, of this, more than half the seeds have come up plain white, and of the remaining half there has been a quite undue quantity of dark purple—hard and quite uninteresting in colour. Some of the finest sorts were entirely absent, not indeed a single blossom of them, and hardly any fine crimsons, roses, pinks, and flushed pinks and salmons, or pale blues, or those blues with pearly marks like a lovely shell that one has often seen before and rejoiced in. The result this year, therefore, has been that from the very first the Sweet Pea hedges had the cold dreary colour of autumn on them. I am not in the least alluding to the late heavy rains, but before the rains came. The same decadence has followed many of the green Peas also.—A CONSTANT READER, Worthing.

**Olearia Haastii.**—I question if we have anything in flower at the present time to vie with this handsome evergreen flowering shrub, which is literally now a wreath of snow, so abundantly flowered that the small leaves are scarcely visible, this being more noticeable at seaside resorts, where the plants flourish to perfection. To gain the most satisfactory results it well repays the cultivator's attention in the matter of good compost, which should consist of loam, burnt refuse, and some thoroughly decayed manure. If planted in this at the beginning the plants make a free start, flower luxuriantly, and keep in the best of condition for several years. For small gardens it is eminently suitable, as its growth is moderate and pruning is seldom required.—A. B.

**Eucryphia pinnatifolia.**—Like many other Chilian shrubs, a more humid atmosphere than that experienced in some parts of this country suits it best, hence it succeeds better in the West of England and in Ireland than in many other districts. Still, with care it can be successfully grown elsewhere, and when in full flower, such as in the specimen shown by Messrs. Veitch at the Drill Hall on August 19, it forms a delightful shrub, not the least attractive feature being the fact that its season of blooming is after the bulk of flowering shrubs are past. Its usual habit is to form a rather upright freely-branched specimen, which in its native country is said to reach a height of 10 feet to 15 feet, but it has not at present attained these dimensions here, although where happily situated it promises to do so. The dark green pinnate leaves are composed of fine ovate-toothed leaflets about 1 inch long. The pure white flowers are, except in colour, suggestive of a Hypericum, having the same cluster of prominent stamens. They are from 2½ inches to 3 inches in diameter, and are produced from the axils of the upper leaves. To succeed with this Eucryphia it needs a fairly moist yet well-drained soil, with a moderate proportion of peat and sand, a spot sheltered from cold winds, and where the full rays of the sun are somewhat broken. It may be propagated by cuttings of the half-ripened shoots put in sandy soil and kept close, but as it does not strike very readily it is often layered.—H. P.

**Early-flowering Chrysanthemums.**—Notwithstanding the late season the early-flowering Chrysanthemums are doing remarkably well. Their growth this season has been extremely free, and on this account it is quite safe to predict a gorgeous display soon. Already there are several good Japanese sorts in blossom, and

their effect in the border is very striking. Plants of Henri Yoon, not more than 18 inches high, are developing quite handsome blooms of a rosy buff colour, and each flower may be cut with a long foot-stalk. Mrs. R. Mollinson is another member of the same family of plants, but with me is rather more vigorous in its growth, and consequently is slightly taller. This variety is a profuse bloomer, and at this early period the usual bronzy yellow colouring of the flowers is tinted quite freely with crimson. Mychett Pink is a distinct acquisition. The plants are not more than 2 feet high, and each one has a number of pale silvery pink flowers. The plants of Mme. Marie Massee and its sports are already making a display, and one may confidently look forward to it extending over two months at least. The original of the type Mme. Marie Massee is developing its flowers quite freely, and their colour is brighter than usual. This is usually described as lilac-mauve, but this season the shade of colour is much richer. Crimson Marie Massee is really a deep rich bronzy crimson sort, and blooms profusely. Rabbie Burns is another excellent sport, the colour of the flowers of this variety being a charming salmon-cerise. Undoubtedly the best acquisition among the early sorts for years is the latest sport from Mme. Marie Massee, and named Horace Martin. This plant was certificated last autumn and distributed in the spring of the present year. It is a sturdy variety; the colour is a clear rich yellow. The yellow sports from Mme. C. Desgranges have for many years supplied the needs of those requiring Chrysanthemums of a yellow colour quite early in the season, but these are much poorer than Horace Martin. The plants should be only very partially disbudded, as each bloom is developed on a long foot-stalk, an important consideration with cut flowers.—D. B. CRANE.

**Outdoor Carnations.**—When looking through the stock of border Carnations the other day to select varieties and quantities for this season's layering, I came across four or five sorts that remain from the original stock acquired nearly twenty years ago, and have held their own ever since on the open border in various parts of the garden, subject, of course, to the annual layering and October planting. The retention of some of these is perhaps almost a matter of sentiment, although a couple of Mrs. Reynolds Hole and Raby are useful when a lot of cut flowers are required, and one at least, Countess of Paris, is nearly as good as anything that has been raised of late years from whatever standpoint the flower is considered. The question as to the hardiness of border Carnations has often been discussed, but I do not think any hard and fast rule can be laid down. In two places, not many miles apart, some hundreds of plants may be put out in October, with the result that in one case the loss may be as low as 3 per cent., and in the other as high as 50 per cent. Soil, situation, shelter, together with immunity against exceptionally severe frost and continued fog, have all much to do with successful "all the year round" outdoor culture, together with a judicious selection of varieties, the latter about the most important point to be considered. Detrimental natural conditions may be altered as in the case of soil and situation, or mitigated as by the use of slight protection against frost and fog, but these are secondary considerations when compared to a careful selection of sorts—I am writing of absolute open air treatment; potting up layers, keeping them under glass through the winter, and planting out in late spring are other matters altogether. It is not so much a question of hardiness as the difference between a free vigorous habit as opposed to weak spindly growth, the former characteristics being so essential towards the rapid development of strong healthy plants for October planting. To put out a small weakly layer, to which only a tiny root is attached, and expect it to come safely through the winter is simply to court disaster. Special points we always consider when trying new varieties for our outdoor border are a free vigorous habit that throws strong healthy grass, flowers that do not split, fair average size of bloom, and colour clear and well defined. In naming a few varieties grown I do not claim that they are superior to others,

only that they meet all requirements above noted and have come through several winters at small loss. They are The Countess and Mrs. Eric Hambro, white; Countess of Paris, Cassandra, and Ibis, blush; Miss Audrey Campbell, yellow; The Pasha and Carolus Duran, buff; Sadek, rose; Braw Lass, bright rose; Boadicea, rosy scarlet; Hayes' Scarlet and Black Bess, the most vigorous of the Mephisto shade. I have not grown many fancy varieties, as there is generally a tendency to split. Lady Ardianna, Cardinal Wolsey, Hidalgo, and Queen Bess are all fine flowers. I said above that slight winter protection was occasionally necessary, but it has only been so with us twice in eighteen years—once during a very cold February and once when a thick yellow fog prevailed both day and night for several days. We have for several years dispensed with the traditional large amount of leaf soil in the layering compost, experience showing that in hot dry summers it was of far too drying a nature. I like a compost of three parts old Cucumber and Melon soil and one of horse manure well broken up. Once get this thoroughly soaked the moisture is well retained, and it is pleasant when lifting the layers to notice the goodly array of roots clinging so tenaciously to the bits of manure; also for the reason above stated—*i.e.*, the retention of moisture. It is not advisable to heap the layering compost too high round the old stools if the ground has been previously loosened with a fork; 2 inches of fresh soil is all that will be necessary. For the October planting a south-west border is a good site, and this should have a dressing of thoroughly decomposed manure and be deeply dug. Spent Mushroom or peat moss manure is a good mulching material.—E. BURRELL, Claremont.

## THE FLOWER GARDEN.

### SWEET VIOLETS—NEW AND OLD.

**V**IOLETS are found in most parts of our island, and universally esteemed for their sweetness. They are usually seen in woods and on moist banks near streams, and this fact should be borne in mind in determining the position in the field or garden in which it is proposed to grow them. More attention has been given to the cultivation of the Violet of late years than was formerly the case, for in addition to the value placed on a good supply in a private garden, the commercial importance of the plant has increased immensely both at home and on the continent. Speaking of the scent of the Violet reminds me that the English Violet, and also the English Rose, give infinitely sweeter perfume than the foreign ones, yet for extracts of Roses and Violets we must perforce go abroad when we have the raw material in abundance at our doors!

One absolute essential to the growth of the Violet is pure air. In the absence of this, it is useless to attempt its cultivation. Those living in or near great cities and towns know this only too well, for however much they would like to grow their own Violets, and how hard they may try, the modest little flower consistently refuses to grow except in the pure air of the country. I have not come across a single instance of successful Violet culture in the immediate suburbs of the great city.

#### DOUBLE VIOLETS.

The Violet may be divided into two sections, the single and the double. This is rendered necessary as far as their culture is concerned, as double varieties are less hardy and require more care and skill in their cultivation than the single ones. We will take the double varieties first, of which the following are the best:—

*Marie Louise*.—A well-known and grand old favourite.

*Lady Hume Campbell*.—One of the best doubles. It is a little later than *Marie Louise*, and is there-

fore useful for extending the Violet season. This is an indispensable variety.

*Mrs. J. J. Astor*.—This is a distinct and beautiful variety, exceedingly sweet. Its colour is a mixture of violet, heliotrope, and pink.

*Bertha Baron*.—Dark purple, one of the best.

*De Parme*.—Pale blue, one of the sweetest.

*Neapolitan*.—An old and general favourite, and very sweet, but its constitution is delicate, and it is difficult to grow it well.

*Blue and White*.—This is a delicately coloured variety, and strongly scented.

*Comte de Brazza*.—Pure white, and the only white variety worth growing.

In giving instructions as to one of the best methods of growing the double Violet the simpler way will be, I think, to start at that season of the year when the Violet has ceased blooming, and when our attention will be naturally turned to propagation and to prepare plants for the following autumn, winter, and spring displays. This will be towards the middle of April. The first thing to do will be to take the old plants up, shake all the soil away, and pull them into pieces. One plant will make half a dozen. These small pieces must have a few roots and healthy leaves attached. The next process is to pot these little pieces into 3-inch pots in soil composed of loam and leaf-mould in equal proportions (the pots drained, of course). I must here mention a matter which exercises much influence in the successful culture of the Violet. I refer to the

#### INSECT ENEMIES

from which it is liable to attack. The only formidable one we have to guard against is red spider. I mention it at this juncture because the old plants after the exhaustion of flowering (at the time of propagation) are nearly always more or less suffering from an attack of this destructive little pest, and it would never do to translate, knowingly at any rate, this pest from the parent plant to the young one at this initial stage. What we have to do then is to dip those small pieces in the following emulsion before they are potted, taking care that every part of the leaves and stems is well immersed in the liquid. After this they should be put on one side to dry in a shady place, and in the course of three or four hours carefully examined—noder the microscope by those whose eyes are not so good as they used to be—and if any are found alive they must be immersed again, when it will be found that the second application will have had the effect of freeing the young plants of red spider. The emulsion should consist of one wine-glassful of paraffin to a gallon of water, adding a quarter of a pound of soft soap and the same of flowers of sulphur. These ingredients should be mixed to a paste in a mortar first, and the gallon of water added afterwards. As soon as the plants are dry they should be potted into small pots as mentioned before, and placed close together in a cold frame. The young plants must be syringed four or five times a day and shaded from strong sunshine. Two or three days after potting they should be well watered. Under this moist and shady treatment the young plants will soon fill the small pots with abundance of new roots, and many new leaves will be developed. When this is the case shade must be reduced and abundance of air admitted. Towards the middle or end of May the plants will be well rooted and large enough to plant in their summer quarters, and to the preparation of those quarters attention must be now directed.

#### ASPECT.

The plants will succeed fairly well if planted in the open garden or field, where they may be exposed to the full light of the sun all day, but they will succeed much better if they are in a border which is shaded during the warmest part of the day. Such a position would be secured by planting in a border under a wall or fence facing north-east. The

#### PREPARATION OF THE BORDER.

The soil should be moderately light, and before it is dug over a liberal application of leaf-mould should be added, as well as a good sprinkling of quicklime, say half a gallon to a square yard,

and if the land is in any way inclined to be stiff, road scrapings or river sand should be added. The ground should be dug deeply in the winter, and left as rough on the surface as possible, so as to expose it to the action of the weather. When planting time has come round all we shall have to do will be to fork it over, reducing the surface to a proper level ready for planting. The distance apart at which the double Violet should be planted is 16 inches between plant and plant in the row and the same distance between the rows. Before the plants are turned out of the pots ready for planting they should again be carefully examined, in order to be sure that red spider is not present, and if any are suspected let all the plants be dipped in the emulsion as instructed before at the time of propagation. In planting, select the strongest plants to go by themselves, and the weaker ones to plant by themselves at less distance apart (15 inches will suit them). Let them be planted deep enough to cover the whole surface of the ball about half an inch, and let the soil be pressed firmly round them.

#### SUMMER MANAGEMENT.

This will consist in timely attention to watering, syringing, hoeing, mulching, and taking off the runners. They should receive a good soaking as soon as they are planted. This will suffice for a week or two; but the young plants should receive a spray from the syringe at least three times a day when the weather is dry and warm, namely, in the morning about eight, in the afternoon about three, and in the evening between six and seven. The hoe should be plied as often as convenient, not only for the purpose of preventing the growth of weeds, but also for the sweetening of the soil, and thus promoting the best possible growth in the shortest time. Close attention must be given to taking off the runners, as if allowed to grow they exhaust the plants and prevent that full development of the crown on which our hope of a rich harvest of bloom entirely depends. In the case of varieties it is wished to increase the stock of, the runners may be preserved and planted close together in a shady position, where they will soon root and form useful plants for stock another year at planting out time.

As soon as the plants are fairly well established it is an excellent plan to spread a layer of short manure round their roots; this forms a mulch to prevent the plants drying up too quickly, and also stimulates the roots by the ammonia washed down from the manure by the action of rain. If possible the syringe should be applied every evening throughout the summer; this not only helps and encourages growth, but keeps red spider at bay, if this should unfortunately attack the plants during their season of growth in summer. The best remedy to apply will be to syringe the plants thoroughly with the emulsion previously recommended, reducing its strength by one-half. Whilst the plants are growing freely they should be assisted with a moderate application of weak liquid manure from the stable-yard every ten days or a fortnight. If all the details of culture as very imperfectly given in the foregoing have been well attended to, by the end of August the grower ought to have fine sturdy plants 10 inches across and with strong and well developed crowns. The time has now arrived when we must decide as to the best treatment of the plants during winter.

OWEN THOMAS.

(To be continued.)

## AUTUMN FLOWERS FOR THE WILD GARDEN.

WHERE the road dips at the beginning of the copse at Rose Brake the ground is moister, or rather less dry, than anywhere else in the grove. This copse is about 200 yards west of the house, and here, partially shaded by Ash and Oak trees, we have made a wild garden, among the young sapling Tulip trees and Hickories, in which to naturalise some of our more showy native plants that are too coarse for dainty garden beds. Our native flora is exceedingly rich in bright-flowered members of the great family of the Composita.

Many of these plants we have collected in our excursions from the woods, meadows, and mountains of the neighbourhood. Some of them have been sent to us by friends at a distance, and some we obtain from plant dealers. In this copse we have established some of the Asters, which spread too rapidly for introduction into the choicer Aster garden, but which here are kept in check by their equally strong-rooting neighbours, such as some of the marsh Golden Rods and Sunflowers.

Our researches in the woods and waste places of the neighbourhood for plants to naturalise in the copse have resulted in some interesting discoveries. One early-flowering and very handsome Golden Rod now blooming here is *Solidago neglecta*, which comes into flower early in August, and will, I think, from present appearances, prove to be one of the few desirable Golden Rods that do not encroach too much upon their neighbours. It is a fine, showy species, 3 feet in height, with bright, eight-rayed florets in a thyrsoid panicle. The early-flowering *Solidago arguta*, which is a slender

tall branched stems, white flowers, and a hairy rough appearance. Then there is the rather rank-looking *E. altissimum*, found in dry, open woodlands, where it reaches the height of 8 feet. This also has white flowers. *Eupatorium aromaticum* is a much smaller and prettier species, rarely exceeding 2 feet in height, with pretty white flowers and a pleasant healthy smell. But the best of the Eupatoriums is the one that used to be called *Conoclinium coelestinum*, now changed to *Eupatorium coelestinum*. It is of lower growth than most of the species, and has fine lavender-blue flowers. It is a useful plant for forming the undergrowth between shrubs or larger plants in such a garden. It spreads by underground stolons, and needs a good deal of moisture to perfect its growth. Beds of this plant in marshy places are beautiful in late summer and early autumn.

Among the Snakeroots, now called Lacinarias, but always known heretofore as Liatris, we find several good species to naturalise. One of these is Lacinaria (or Liatris, if you prefer) squarrosa,

which is a native of some of our Southern States. It is of very low growth for a Liatris, about  $1\frac{1}{2}$  feet in height, and has bright mauve-coloured flowers in narrow spikes that remain a long time in bloom. Nearly all the Lacinarias are showy plants, but I have found only three species in this neighbourhood. These are *L. elegans*, *L. scariosa*, and *L. apicata*.

*Liatris odoratissima*, a very interesting species with corymbose-paniculate heads, unlike the other kinds, but more like those of the Eupatorium, has very fragrant leaves, from which it takes its common name of Vanilla Leaf. It is said to occur sometimes in the Pine barrens of Virginia, but I have never found it. I have obtained it from a dealer in native plants. The fragrant leaves are used in curing an excellent kind of smoking tobacco. It is a very desirable plant for the wild garden, both for its pretty flowers and its delightful perfume.

The botanists have now put this plant in a separate genus and created for it the name

*Trilisa odoratissima*. There is one other species, also a native of Pine barrens, but I have never met with it. It is called *Trilisa paniculata*. The genus *Chrysopsis* contains some pretty species, with flowers like yellow Daisies. One of the best of these is *Chrysopsis Mariana*, the Maryland Golden Star. This has long been known to English gardeners, where it was first introduced as far back as 1742 by Dr. Dale, a Marylander, from which State it takes its specific name. It is a common plant on dry and sandy barrens. It has a peculiar cobwebby appearance when the plant is young, owing to the fact that the stems are clothed with very fine silky hairs, which fall off as it grows older.

Another species of this interesting genus is the Cottony Golden Aster (*Chrysopsis pilosa*), a native of the South. It has stout stems covered with white cotton-like pubescence, and bright flowers a little larger than those of the former species, that is to say, about an inch across. It is little known to gardens, and not often met in a wild state. There are several other showy species of

*Chrysopsis* in the West, but I do not know whether they have been introduced into gardens.

One pretty species of *Boltonia* grows in this neighbourhood, and one only. It is *Boltonia asteroides*, which forms a stout bush 6 feet or 8 feet high, and is a fine sight in August, when it is covered with its Aster-like, many petalled flowers, which in the different varieties are white, mauve, or lavender-blue. *Boltonia latisquama*, a native of the West, is also naturalised here, and is a much smaller plant, with a slender weak stem, requiring staking, but very pretty in the Aster garden for its abundant blue flowers.

These are only a few of the charming wild flowers with which this region abounds, but I will describe the Sunflowers, Rudbeckias, and other Composites at some future day.

DANSKE DANTRIDGE.

Rose Brake, Shepherdstown, Jefferson County, W. Va.

[Although Mrs. Dandridge writes from America, the flowers mentioned are quite happy in English gardens. The English autumn garden owes much to the prairies and woodlands of America.—ED.]

## NOTES ON HARDY PLANTS

### THE BEST WHITE CARNATION.

THE photograph from which the accompanying illustration was reproduced was kindly sent by Mr. Watts, Bronwyld, St. Asaph, whose note appeared in THE GARDEN last week, page 158. George Macquay is a beautiful garden variety, and is one of the best we have ever planted in groups, as its flower stems are strong, erect, and bear a wealth of flowers pure as driven snow, full, and without the least indication of splitting, while they have a sweet fragrance. It is not only the best white, but one of the finest of all Carnations for the outdoor garden.

### HABRANTHUS ANDERSONI.

ALTHOUGH not so showy as either of the two former, this is well worth growing. In habit it is very distinct, the leaves being about 9 inches to 12 inches long, narrow, and glaucous green; the peduncle is one flowered, and the perianth almost erect, bright yellow inside, and coppery yellow or bronze on the outside. Almost quite hardy everywhere, succeeding best in a good loamy soil, planted out in clumps in the open, slightly sheltered border, or grown in pots. It increases fast and becomes sometimes quite a weed; it ripens seeds freely, which if left alone will flower the second year, while the bulbs multiply rapidly. It flowers during August and September, often earlier.

### HABRANTHUS PRATENSE FULGENS.

THIS is not only one of the most distinct and showy of this genus, but is also quite hardy. I well remember about twenty years ago a clump in the garden of Mr. Ware (Tottenham) on a slope of a low rockery and planted in heavy loam. It flowered remarkably well, producing such an abundance of most perfect flowers as I have never seen since. This clump had to be lifted, and was later on divided and partly sold, but the remainder never did quite so well again. On another occasion I saw a small clump of about half a dozen bulbs in a garden in the suburbs of London having at the time six to eight flowers open. It certainly seems to be a very peculiar plant, growing well in a certain spot, while if planted again in almost the same soil and position refuses to thrive. It has a short necked, dark skinned bulb, with leaves over a foot long and half an inch broad, linear, deep green, appearing with the flowers during spring. The peduncle is stout, 1 foot to  $1\frac{1}{2}$  feet in height, bearing two to four fairly large flowers of a bright scarlet colour. At present this form is very rare in English gardens. A native of Chili, where, according to all

CARNATION GEORGE MACQUAY, THE BEST WHITE VARIETY FOR THE GARDEN.

and graceful Golden Rod, with brilliant light orange heads of flowers, is also in bloom in this place in the company of the tall Aster Novae Angliae, which is just opening a few of its rich crimson blossoms. *Solidago neglecta* is not often found so far south as West Virginia. According to the books Maryland is its southern limit. Here we discovered it on the West Virginian side of the Potomac which divides the two States.

We have naturalised one or two of our native Eupatoriums in the copse garden. The best white Eupatorium that grows hereabouts is *E. ageratoides*, which has heads of pure white florets. Several other species are abundant on the river cliffs, and the pink Joe Pye Weed, named, I believe, after an Indian doctor who made extensive use of it, is common in marshy places. It is very showy in masses in such places, mingling with clumps of tall crimson, and purple, and white Marsh Asters, blue Lobelias, and bright yellow Golden Rod and Rudbeckias.

Besides these we have much *Eupatorium perfoliatum*, the commonest species here, with

accounts, it grows in masses on the mountain sides. One feels surprised that no effort is made to import this plant again as there should be little difficulty in getting a good supply.

#### LYCORIS SQUAMIGERA.

THIS is one of the few species of *Lycoris* introduced from Japan. If planted in a certain spot, not too exposed, in almost any garden soil and left alone for a year or two, it will flower freely every year. It differs from *L. radiata*, or as it is more often called *Nerine japonica*, which is an inferior and disappointing plant not worth the trouble of planting, as it never or very rarely flowers. Japanese exporters send it, I should say, as ballast over to Europe. *L. squamigera* has a large globose bulb with brown or black tunic. The leaves are produced during the spring, and are about a foot long and three-quarters to 1 inch broad, deep glaucous green. The peduncle is about 18 inches high, rather stout, with an umbel of several pretty flowers: the perianth is rosy lilac or lilac-purple, the segments slightly wavy. During warm weather the flowers are sweetly scented. Clumps of this perfectly hardy bulb are in flower here at the present time. This plant came first under my notice some fifteen years ago, sold and supplied by an American firm under the erroneous name of *Amaryllis Hallii*, small bulbs, which only flowered after three years, being sold at exorbitant prices.

*Ashford, Middlesex.*

G. REUTHE.

#### CORYDALIS THALICTRIFOLIA AT KEW.

THE floral committee of the Royal Horticultural Society gave an award to this plant in the early part of the present year, and the award is amply justified. Originally it was thought to be of doubtful hardiness, yet excellent if bedded out quite early in the year. To my mind, however, any glass treatment would detract from the full beauty of the plant. Last year a strong plant of this species was for many months a thing of beauty in the rock garden at Kew, flowering indeed from May to the time of frost, in short, well into October. Not only from a point of suspected tenderness, but equally perhaps from its great continuous flowering, was it thought the plant would succumb, and so completely did it disappear that these thoughts appeared to be fully realised. Happily this is not the fact, for the original plant reappeared again in the spring of the present year, and has flowered away again with all its original vigour, freedom, and profuseness. The plant is so distinct a gain to good rock garden subjects that I doubt not the news will be generally welcomed. Less than 1 foot high, the flowering head or tuft rather, i.e., leaves and flowers combined, is more than 18 inches across. The plant seeds freely also, and in this way promises to almost take care of itself. When seeds are sufficiently plentiful these should be sown in walls and ruins, for in such positions the plant will have a special charm.

E. J.

#### MERTENSIA PRIMULOIDES.

COMPARED to the better known *M. virginica*, the above species would not be called showy, yet in its smaller and vari-coloured blossoms it is certainly very charming and interesting. The principal colours are a mixture of violet-purple with blue, and the gold of the anthers shines out clearly. Like the other species of the genus, this also is a plant for a shady and cool, if not also a moist, spot. There is a sort of intimacy off hand as it were that a peat mixture would be best fitted to its requirements. Indeed, the shade already mentioned and the spongy peaty soil well mingled with sand will go a long way towards making this rather rare species fairly happy. Without the glaucous leaf character of the other species named, the

present one is not unlike a rough-coated type of *Myosotis*, particularly in the larger leaves. There is also not a little of the form and character of the *Myosotis* in the leafage. The individual flowers are about half an inch across, and strong plants bloom profusely. In the colony where *Dentarias*, *Trilliums*, and such are found this interesting plant will prove a welcome addition.

E. J.

attain 1½ feet, but it is not general. Seeds are produced at times, therefore the stock may be easily kept up when once secured.

E. J.

## THE ROSE GARDEN.

#### A NEW TEA ROSE.

##### SULPHUREA.

S we mentioned in THE GARDEN on August 16 last, this Rose is likely to be much heard of in the future. The beautiful sulphur-yellow buds are produced on such erect stems that the effect on the plant is just what we have been looking for in a Rose of its colour. It will make a fine bedding kind, far better than the now little grown *Isabella Sprunt*. The expanded flower, only then semi-double, changes almost to white, yet there is a yellow shade when seen in the mass. Not the least charm of the variety is the foliage, which is nearly as rich in colour as the Copper Beech. Messrs. William Paul and Son are to be congratulated in giving us this fine novelty, which must rank as a garden Rose in the same degree as their *Medea* does among the show Teas. Florists, or all who grow Roses in midwinter for cutting, will find *Sulphurea* a useful Rose, the petals being so firm. This enables the buds to remain in the bud stage much longer than many Teas having semi-double flowers.

T.

TEA ROSE SULPHUREA IN VASE.

(From a photograph kindly sent by Messrs. W. Paul and Son, Waltham Cross.)

occupies a position quite unique among hardy perennials at this time. Brilliance of colour and a certain freedom of flowering all belong to this beautiful hardy plant, which during recent years has hardly been seen at any exhibition in any quantity. Odd plants are seen sometimes, but they fail to attract, but a dozen or more well set with brilliant crimson-scarlet flowers is quite another matter, and not only attract but win admiration. The species is of fairly easy culture: indeed, a chief enemy is not cultivation but a certain definite fondness that the slug family possess for it. This is often true of the growth buds near the surface, and in winter the plant should be protected accordingly. Seeing the plant possesses much of the brilliant fire and colour of the scarlet Lobelia, it is worthy a place in all collections, whether in the rock garden or in the border of good things. A good gritty loam, one well charged with leafy matter rather than manure, suits the plant quite well. In exceptional instances the species may

#### PREPARING TO PLANT.

DR. DYER, an eminent agricultural chemist, in his report upon the constitution of certain Rose soils, procured from widely different localities, makes the following remarks:—"I am obliged, after careful study of the chemical results, to come to the conclusion that any common bond that may exist between the soils must be sought less in chemical resemblance or in abundance in any particular chemical ingredient, than in good mechanical and physical condition of the soil and good drainage." And all practical Rose growers admit that with careful preparation of the soil before planting considerable progress is made towards successful Rose culture.

The present moment is a good one to begin the necessary trenching where new plantations are contemplated. Fortunate is the individual who is able to form a new Rose garden by enclosing a portion of pasture land. Here one may have already the grass paths which are so cool and pleasant a feature of any rosary, and all that is required is to mark out the beds and have them trenched 2 feet to 3 feet deep, working in the turf in the operation.

I may say here I have no liking for the fantastic geometrical designs which are considered necessary by some whose business it is to draw out plans. I would rather have fairly narrow beds that admit of all necessary operations being performed without treading on the soil. Such beds would be not more than 5 feet wide and would take three rows of plants. Whatever the form of the beds may be, the one essential thing is to have them thoroughly and deeply trenched, and if at all waterlogged artificially drained.

Suppose the Rose garden is to be in part of a paddock, the only addition needful will be

ASTILBE CHINENSIS VAR. DAVIDII.

(A beautiful new *Astilbe*, 6 feet high, from China. Exhibited by Messrs. J. Veitch and Sons, Chelsea, at the Royal Horticultural Society, and given a first-class certificate.)

some well-decayed farmyard manure. Nothing can compare with this as a fertiliser if the material be well prepared by frequent turnings during the summer. Where reliance is placed upon artificial manures the results in the end are not satisfactory, as they tend to destroy the needful bacteria in the soil. Many growers find basic slag a very valuable phosphatic manure if applied in autumn to the lower spit of soil at the rate of  $\frac{1}{2}$  lb. to the square yard, but here again, unless it can be procured from a good source, the land would be better without the spurious article. Personally, I have great faith in bones for producing blooms of fine quality, and I think bone-meal is the best form in which to apply it.

The trenching, if done at once, will allow the soil five or six weeks to settle before the plants are fit for removal. It may seem a great task to trench 3 feet deep, but it pays to do the work well. In a dry season the plant will not suffer from drought, and in a wet one water can find a ready exit. In old gardens the preparation of new beds for Roses requires equally as much care and even more so. Soils constantly manured may be thought the best, but I am strongly in favour of some new sweet loam added in part if not entirely. Much may

The charming Tea and Hybrid Tea Roses now so largely planted are almost invariably budded on the seedling Briar, and as this is a deep-rooting stock deep trenching is desirable. Even on a gravelly soil it pays best to remove the gravelly subsoil and replace with better material. If the subsoil is in good condition the seedling Briar quickly sends its roots down, and it is owing to this fact that Roses upon this stock are so exceptionally fine in autumn. Even Hybrid Perpetuals that are ripening off on Manetti give handsome autumnal blossoms.

How marvellously has the aspect of our Rose gardens changed during the last twenty years. It is possible now by making a wise selection to have as brilliant a display in September as in June and July; in fact, many kinds are more beautiful now than they have been all the season. Beds of the glowing Griess an Teplitz, Mme. Eugène Resal, Coralina, &c., completely put in the shade the zonal Geraniums that have suffered so much from recent rains. It is scarcely necessary to say that planting should be done in fine weather. If the plants arrive from the nursery during a wet period it is much better to remove all foliage and heel them in in the shade, awaiting a fitting opportunity to plant.

be accomplished to render a soil, perhaps heavily charged with manure, fit for new plantations of Roses by the addition of chalk or lime; in fact, there are few soils that would not benefit considerably from an addition of one of these articles, and all burnt garden refuse should be freely admixed.

If standard Roses are planted singly by lawn or drive, large holes should be opened and good soil and manure put in. Also where climbers on walls or arches, or pillar Roses are planted, deep trenching is even more necessary in their case, seeing that they are permanent fixtures and cannot well be transplanted periodically. Soils vary so considerably in their nature that it is difficult to suggest what to do without inspection, but, as a rule, light soils should have clayey loam added and the manure obtained from the cow shed. If the soil is very shallow, a good layer of cow manure in place of some of the gravel subsoil is a good plan to adopt. Heavy soils benefit by the addition of gritty material, burnt earth, and well-decayed stable manure.

And, again, some good mixture should be prepared in advance, so that when planting each plant may receive a good shovelful among the fine roots. Potting loam, leaf-soil, and burnt earth in equal parts make a fine mixture. Roses so planted if lifted two or three years hence will be found to be a mass of fibrous roots.

Personally, I believe in occasional transplanting; in fact, where large quantities of standard Teas are grown, I would lift them every November and heel them in under a north wall, taking care to give them ample protection. By replanting in spring one has the satisfaction of seeing the trees escape injury by spring frosts and winter injury, when too frequently they would be killed outright if not removed. Dwarf Teas and Hybrids may be earthed up and will be found perfectly secure when unearthed in April, but in their case lifting every third or fourth year will impart new vigour to the plants.

PHILOMEL.

#### NEW AND RARE PLANTS.

##### A NEW ASTILBE A. CHINENSIS VAR. DAVIDII.

THIS new *Astilbe* was shown by Messrs. J. Veitch and Sons, of Chelsea, at the meeting of the Royal Horticultural Society on August 5, when a first-class certificate was awarded by the floral committee. It is one of the most handsome perennials introduced of recent years, and is one of Mr. Wilson's finds in China. We are beginning now to reap the fruits of his labours. This new *Astilbe* will probably become a popular garden plant. It is fully 6 feet high, and the tall pyramidal spikes of rose-purple flowers produce a very striking picture in the garden. Such a plant is happy in many places, by waterside and elsewhere, a bold group showing best the true value of the introduction.

#### USES OF BRITISH PLANTS.

##### VI. SAXIFRAGE.E.

(Continued from page 116).

**SAXIFRAGE** (*Saxifraga oppositifolia* and *S. umbrosa*).—These two species are cultivated. The former, an alpine plant, from North Wales to Scotland, is a pretty rock plant, and the latter is wild in the West and South-West of Ireland, and too familiar to need description.

*S. granulata* of meadows has small bulbs, suggesting the name, which have been used formerly in medicine.

**Gooseberry** (*Ribes Grossularia*) occurring wild in copses was introduced and cultivated in gardens in the reign of Edward I. (thirteenth century). It is the origin of all garden forms, which are now innumerable.

**Currants** (*Ribes rubrum*).—The red and *R. nigrum*, the Black Currant, was first cultivated in Edward I.'s reign. The name "Currant" was given to them from their resemblance in size to the Corinthian Grape or "Corinth" often called "Grocer's Currants." The red has produced a white variety, but the Black Currant has developed none. The leaves of this species have been used to adulterate tea leaves. Jams and jellies are the most important uses of these fruits, which are only slightly improved forms of the wild plants.

##### CRASSULACE.E.

**Orpine** (*Sedum Telephium*).—This plant bears clusters of rosy purple flowers and fleshy leaves. It occurs in hedge banks, &c. It has long been used in medicine, as in the "Bewe (a drunk) of Antioche" of the fourteenth century.

**Wall Pepper** (*S. acre*), a small tufted plant with star-like yellow flowers and minute fleshy leaves, growing on walls and rocks, is exceedingly acrid to the taste, hence its common name. It is an emetic, and has been used for ulcers, &c., as the bruised leaves will blister the skin.

*Houseleek* (*Sempervivum tectorum*).—The leaves of this plant have long been a familiar remedy for cuts and bruises, burns and scalds; but they have no real virtue beyond a slight astringency. It was always grown on roofs, not only in England but on the continent, under the idea that it protected the houses from lightning. Its favourite place is on a thatched roof, over which it can spread and into which the roots can penetrate easily. In the fourteenth century it was called *Sengrene* (i.e., "Evergreen") and *Jovis barba*. It was used in "an oyngement cold for schalldyng or brennyng," as well as in a preparation for leanness.

## LYTHRACEÆ.

*Loosestrife* (*Lythrum Salicaria*).—The purple Loosestrife is a familiar plant by watersides, bearing long spikes of purple flowers, the three forms of which have been elaborately described by Darwin. It is an astringent plant, and has been much used in Ireland by the peasantry for certain complaints requiring this property.

## ONAGRARIEÆ.

*Rose Bay* or *French Willow Herb* (*Epilobium angustifolium*) is a tall purple-flowered plant, a variety of which is often cultivated. The leaves have been used for the adulteration of tea. It is said that the young shoots make a good substitute for Asparagus. The hairy or silky seeds can be used for stuffing, but are of no value for weaving, as it has been tried mixed with cotton and found to be ineffectual.

*Evening Primrose* (*Enothera biennis*).—This is an importation from America in 1629, which escaped from cultivation and established itself in many places. It was formerly grown in the kitchen garden for its edible roots, which are wholesome and nourishing, somewhat resembling Parsnips. The generic name signifies "wine-catcher," because the roots were eaten with wine as olives are.

## CUCURBITACEÆ.

*Bryony* (*Bryonia dioica*).—This is a climbing plant, the male and female flowers being on distinct plants, the latter bearing red berries, both having green flowers. The root grows sometimes to an enormous size, and, though the juice is powerfully cathartic, the large quantity of starch might be utilised. The juice is poisonous, blister-

ing the skin. The French have even called it "Navet du Diable." It is often, but erroneously, called "Mandrake" in the country. It was called "Wylde nepte" or Nep in the fourteenth century, and used as a remedy for the "Morsowé" and as an ingredient of "Dwale," an anaesthetic drug taken before any operation. It was also used with mustard and honey to make the face "rody" or red.

## UMBELLIFERÆ.

*Sea Holly* (*Eryngium maritimum*).—This is a familiar seashore plant, with bluish green smooth leaves and flowers in heads and not umbels. The long roots were formerly used as a restorative, but they do not appear to have any real virtue. With sugar they have been made into sweetmeats. It is said that the "kissing confits" alluded to by Falstaff were composed of them, the young shoots have been eaten as Asparagus.

*Hemlock* (*Conium maculatum*).—This is one of our most poisonous wild flowers, easily recognised by its smooth and distinctly spotted stem and finely divided glaucous foliage. It grows from 3 feet to 5 feet in height; the roundish fruits have waved ridges upon them. It is much used by medical practitioners, being included in our Pharmacopœia. People have often been poisoned by eating the leaves as Parsley. The poison of this plant was used in ancient Greece for sentencees to death such as was administered to Socrates.

*Alexanders* (*Smyrnium Olusatum*).—The English name is apparently a corruption of the Latin, meaning "Blaek pot-herb." It was formerly cultivated as such, and is found wild about villages, monasteries, &c., where it was formerly grown. It was the young shoots and petioles of the leaves that were eaten as Celery is now, though probably not blanched. They were used for flavouring soups in the same way as Celery is sometimes used, especially in Malta, where it is never earthed up. The fruit is black, which suggested the name, and, like many other umbelliferous plants, it is carminative. It was called Stannerick and "Wild persile" and other names in the fourteenth century, being used for various remedies; thus the fruits, e.g., were taken for a "glaymyd," i.e., nauseated stomach.

GEORGE HENSLAW.

THE TALL OX-EYE DAISY (CHRYSANthemum ULIGINOSUM).

## AN AUTUMN FLOWER.

At this season one of the most beautiful flowers in the well-planted garden is Chrysanthemum uliginosum, which is shown as a group on the lawn, a purpose for which it is not often used. It stands out unfettered by neighbouring things, and makes a brave mass of white in September when the Tiger Lilies are in full splendour and the Aster make blue clouds in the woodland. We planted a lot of this Chrysanthemum in an old dry moat, but where the soil is moist; its growth is remarkable. A hundred flowers now wave in the winds. We planted a lot also close to the water edge, and there they have also thrown up sheafs of bloom. It is so hardy and strong and free in all ways that we should like to see it grouped more in gardens, and not confined to the mixed border.

## TREES AND SHRUBS FOR ENGLISH GARDENS.

## WEEPING CHERRIES.

A WEEPING habit accords much better with the flowers and mode of flowering of some trees than it does with that of others. In no instance, however, can it be said to heighten the natural beauty of trees, or add more to their grace, than it does in the case of the weeping Cherries. The beauty of the flowers, which in many instances are themselves drooping or pendent, seems especially to require the accompaniment of free graceful lines rather than anything in the shape of a stiff or erect mode of growth. Very few Cherries, however, in either their typical or selected forms, are other than graceful; and of the weeping ones it can in most cases be said that they merely accentuate that characteristic.

The use of weeping trees in gardens, like that of all plants which depart from the normal either in form or colour, requires restraint, and the more marked or violent the divergence is the more are these required. To the weeping Cherries, happily, these words scarcely apply. There are very few that, from considerations of beauty and fitness, could reasonably be overplanted. In the following notes I have given the names of the best of them, with a few descriptive words to each. There are three kinds of weeping Cherries, as of the weeping kinds of other genera: First, we have such a species as *Prunus pendula*, a natural weeper, which comes true from seed; second, there are pendulous forms of species that normally are erect, which have to be trained up, or budded on more or less lofty standards; third, there are dwarf or prostrate species, naturally shrubs, which, by being worked on standards of other sorts, are made into artificially weeping small trees.

The word "Cherry" is here made to apply to the old genera of *Cerasus* and *Padus*—the "Cherries" and "Bird Cherries"—but in accordance with modern usage the generic term "*Prunus*" is employed.

*Prunus acuta semperflorens* (All Saint's Cherry).—This interesting and pretty variety of a dwarf Cherry is noteworthy in two respects—it

has slender, pendulous branches, quite different from the Wild *Prunus acida*; and, secondly, it has the rare quality of continuing to flower from late spring to autumn. At the latter season fruits and flowers may usually be seen together on the branches. The flowers are white and single. I have not met with this little tree more than 6 feet to 10 feet high, and it is usually budded on standards.

*P. Avium pendula*.—The weeping variety of the Gean is perhaps less elegant than any of the weeping Cherries. The branches are perfectly pendulous, but stiff and straight, the effect consequently is somewhat formal. In some positions, however, this may be thought to be an advantage. In its foliage and in its single pure white flowers it does not differ from the Gean—a tree native of Britain. It should be budded on high stocks of the type.

*P. Chamaecerasus pendula*.—The Siberian Cherry, as this species has been termed, is a shrub with small, ovate or obovate, dark green glossy leaves. Its flowers are borne in May in short clusters, and each flower is less than 1 inch in diameter and white. The pendulous form when budded on standards makes a pretty, rather mop-headed little tree.

*P. Mahaleb pendula*.—The Mahaleb is well known for its remarkable profusion of pure white blossom and its free, graceful habit. In this variety the pendent character of the branches is not unduly marked, but is sufficient to add greatly to the beauty of the tree. It is not only one of the best of Cherries but of all flowering trees, and is as well adapted for planting in groups as it is when isolated as a single specimen. The flowers, which appear late in April or in May, are borne on short racemes and in such abundance as to envelope the tree in a snow-white mantle. Every garden should have at least one weeping Mahaleb. There is another weeping form of this species, introduced a few years ago from the continent. It is named "pendula Bonnini," but I have not had sufficient experience of it to be able to say quite definitely what its value is. But no doubt it flowers with the same profuseness as other forms of the Mahaleb, and as regards habit it is apparently the most distinctly pendulous of any. It is probably in this that its chief claim to notice consists.

*P. Padus pendula*.—A weeping variety of the common Bird Cherry will, no doubt, be an acquisition, but it is of too recent appearance here to say much about it. It is curious to note that there is a variety (*stricta*) with an exactly opposite tendency, branches and racemes being quite erect. *P. virginiana*, a nearly allied Bird Cherry from North America, is also represented by a pendulous form.

*P. pendula* (*Cerasus pendula rosea*).—The name "pendula," which so often does duty to distinguish a variety, is here a proper specific designation, having been given to this Cherry by Maximowicz, the well-known botanical traveller in North Asia. *Prunus pendula* is as

naturally pendulous in habit as the Babylonian Willow is, and it should, if possible, be obtained on its own roots. It is an early-flowering kind—probably the earliest of the Cherries—being in bloom as a rule soon after April comes in. The flowers are of a lovely shade of delicate rose, but are not large. They are, however, freely borne, especially after a hot, ripening summer and autumn. In the United States it succeeds even better than here, and by some authorities is regarded as the loveliest of Japanese trees introduced to that country. So much cannot be said of it in Britain, but it is well worth cultivation for its beauty and earliness.

*P. Pudlum* (Himalayan Cherry).—Like the

tion, and may be roughly described as a deciduous tree with very dark green shining foliage, like that of the Portugal Laurel, and producing in June racemes of dullish white flowers like those of the common Bird Cherry, but even more abundant. The weeping variety is rather symmetrical, even formal, in habit, but is a distinct and pretty tree. Both species and variety are in the latest-flowering group of Cherries.—B.

#### TREES AT HIGHCLERE CASTLE,

THE RESIDENCE OF THE EARL OF CARNARVON.

A LADY once wrote of this noble place: "Trees are its great glory." That is but partially true.

Certainly trees are here in immense abundance, and in the grandest and most perfect of forms, but the place owes very much of its grandeur to its extent, its beautiful undulations, its delightful expanses of verdure, and withal to its splendid keep. The area of the park, lakes, and the noble enclosed woods is some 3,000 acres in extent, and amidst other features includes the lofty Siddeon Hill, situate on the south, which is so splendidly wooded. It is the loftiest eminence, probably in all Hampshire, for Highclere is in the north-west division of that fine county.

The great tree feature of the place is its majestic Cedars, and with these grand rotund Beeches; Oaks are not numerous; Limes are plentiful, and much used in the formation of fine avenues. In the woods trees of all descriptions abound, and giant conifers bear testimony to the fitness of the soil for them; but this special reference is to the trees in the extensive pleasure grounds and portions of the park which are near the castle. A former Earl of Carnarvon is reported to have said that "trees were excrescences on the earth useful to pay debts with." That is not a view generally held happily of these glorious adjuncts to scenery and to human habitation; but possibly that belief may have had something to do with the planting of so many Cedars of Lebanon, as these do not offer for the payment of debts the same temptations that great Oaks do. Happily Highclere is in no danger of being shorn of any of its tree glories. They are in excellent keeping with the lofty castle, and are much cherished.

Two of these Cedars growing near the castle have interesting histories. They were raised from seed brought in a cone from Mount Lebanon by a Dr. Brooke in 1739. Out of several sown only two grew, and these probably then kept in pots and perhaps under glass for some years, were not planted until

A VARIETY OF THE MAHALEB CHERRY (*PRUNUS MAHALEB VAR. CHRYSOCARPA*) AT KEW.

preceding species, this Cherry is of a naturally pendulous habit, that character, however, being most marked in its lower branches. The specific name, which, to say the least, lacks elegance, is probably a native title for the tree. The species is very rare in this country, but in good years almost rivals the Mahaleb in the profusion of its flowers, which are white with a rosy tint. It is a true Cherry (*Cerasus*), and bears a very palatable fruit.

*P. serotina pendula*.—The "Rum Cherry" or "Wild Black Cherry"—for it is known in North America under both these names—is not one of the best or most popular of Cherries in this country. It belongs to the *Padus sec-*

1767, or nearly thirty years later. One of these trees has a massive bole 4 feet from the turf 20 feet 9 inches in circumference. It is some 120 feet in height, and has a great spread of branches. It is interesting to note that here nearly all the Cedars have assumed a pyramidal form, their massive limbs having gone erect from the trunks, though there are a couple of weeping habit. The second tree has a bole 3 feet from the ground 18 feet 6 inches, and one low branch, which has gone out horizontally, has a circumference of 7 feet. A batch of Cedars was raised in 1772 from a cone brought from Wilton House, Salisbury. These were planted in the year 1778. It is interesting to note that the stem growth of this batch was more rapid than was that of the

two before-mentioned specimens, for in 1832 they were distinctly larger round the bole, but since then the older trees have gone ahead, and are now much the finest. Some Cedars have been broken by heavy snowfalls; some not at all, and these latter are in form quite perfect specimens, not only great in height, but in spread of branch. There is in the pleasure grounds, which are just now being extended to nearly 40 acres, a grand tree of the Black Walnut (*Juglans nigra*). It has very handsome leafage. The Tulip Trees are very fine also. So, too, are the Sycamores. Pinuses of the more modern types are few, but there is a splendid *Picea cephalonica*, some 80 feet in height, and in the park Wellingtonias form very handsome conical objects.

A. D.

## ORCHIDS.

### TWO NEW NATURAL HYBRIDS.

LÉLIO-CATTELEYA PHILLIP STOKES (LÉLIO-CATTELEYA ELEGANS × CATTELEYA LEOPOLDI).

**A**STRIKING novelty. The flowers equal in size those of a good Lélio-Cattleya elegans, but their depth and brilliancy of colour alone attract attention. It is most interesting to note that in all dark L.-C. elegans and hybrids from them the influence of the Cattleya Leopoldi parent predominates. In nearly every case there is a substance and warmth of colouring in each flower clearly derived from the Cattleya parent. In the present hybrid the flowers might almost be termed self-coloured. The sepals, petals, and lip are wholly of a deep cochineal purple, darkest on the broad kidney-shaped anterior lobe of the lip. Both sepals and petals bear conspicuous spots of a still deeper shade, the greatest number being on the petals. The infolded side lobes are of soft carnation and overlap the anther cap, slightly turned upwards at their apices. The isthmus connecting the three lobes is remarkably short and narrow.

LÉLIO-CATTELEYA QUEEN ALEXANDRE (LÉLIO-CATTELEYA SCHILLERIANA × LÉLIA PURPURATA.)

A most interesting hybrid, now, like the above, in flower with Mr. R. H. Measures. The wonder is, considering the length of time that Lélio-Cattleya elegans, schilleriana, and Lélia purpurata have been imported and cultivated, that the presence of this and the preceding hybrid has not previously been known or suspected, as it is quite reasonable to suppose that as we have natural hybrids between Cattleya Leopoldi, Lélia purpurata, and Cattleya intermedia, those hybrids must in some cases, and as the two undermentioned now prove, have crossed between themselves and with the parent species. There can be no doubt as to the correctness of the parents ascribed, as fortunately flowers of the true L.-C. schilleriana were at hand for comparison. The plant is not large and has by no means attained the vigour it will do under the able management of Mr. Coles. The sepals and petals are both of a dainty shade of rose-lilac, just darkened on the clearly-cut edges. The petals, if anything, are the darker and further distinguished by a mass of nearly confluent pin-like dots of light amethyst, situated towards the apices. Crimson velvet describes the colour of the lip, but conveys only a poor idea of its richness. The lateral openings are reduced to mere slits, the anterior lobe appearing to be a continuation of the side divisions. The apices are simply expanded laterally and are tipped with deep crimson velvet, leading up to which from the soft white of the inner surfaces are numerous branching veins of dark rose. Externally the colour is the same except that a rose suffusion takes the place of the veins. Immediately beneath the apex of the column the colour on the median lobe assumes a broadly wedge-like shape, passing in a narrow stripe to the foot of the column. The flowers are of ideal shape, and as

a greater number are produced on a spike the hybrid should be well worth a good place, even in such a splendid collection of Orchids as that at the Woodlands.

#### CATTELEYA HARDYANA VAR. MAGGIE HODGSON.

It has never been the good fortune of the writer to meet with a handsomer form than this. Had this been the original form of Cattleya hardyana there could have been no confusion respecting its origin as a species or hybrid. The two parents (aurea and Warscewiczii) are both shown, and in a very remarkable manner. The sepals and petals are those of a good deep-coloured Warscewiczii, and beyond their fine shape and size are not particularly noteworthy. The lip, however, differs from all other hardyanas. For two-thirds of its length the colour is that of aurea, alternately marked with old gold and deep crimson, brilliant in colour and regularly disposed. The remaining and anterior portion is simply a solid mass of deep red-crimson, its brilliancy the more enhanced by the abruptness with which it is joined to the aurea portion. Encircling the whole of the lip is a delicate frill-like edge of light rose-lilac. The plant at present has but one lead, which carries four flowers.

#### LÉLIO-CATTELEYA ELEGANS.

In September of last year THE GARDEN issued a supplementary illustration, showing one of Mr. Measures' houses of L.-C. elegans, and a hurried visit during the second week in August was again well repaid by the numerous and splendid varieties then in flower. The variety Albion, by reason of its superior beauty, was the first pointed out. Near it is a magnificent specimen of an unnamed variety carrying twenty-eight flowers, which show up the splendid shape and colour of the named form. The sepals are very stout and the petals quite as thick, but the edges are strongly undulated. Both parts are of a deep purplish crimson shade, only exceeded by the colour of the lip, which on the central portion rivals that of a Morello Cherry, but at the extreme edge is several degrees lighter. A distinction not noticeable in other forms of elegans is that the apices of the side lobes are in no way reflexed, but project horizontally beyond the column.

#### VAR. R. H. MEASURES.

A superb variety with huge pseudo-bulbs, the leading one of which bears a spike and six flowers proportionately large. The sepals are a peculiar but very pleasing colour, soft cream yellow, tinged with green, tenderly touched with rose. The petals are flushed with rose and pencilled with darker lines, lip glowing Tyrian purple, dashed with fire-red. A broad stripe of the same colour passes from the front area to the foot of the column; with that exception the remainder of the tube's inner surface is soft white. On the outer side, soft rose tipped with red-purple.

A showy form near by was at once noticed, but though well worthy of the distinction, a varietal name has not yet been given.

#### KING EDWARD VII.

A huge flowered form, combining the size of L. purpurata with the substance of C. Leopoldi, the latter named parent being also evident in the numerous chocolate-maroon spots on the sepals and petals. The sepals are similarly coloured to those of R. H. Measures, but are delicately flushed with rose, not pencilled, chiefly on the central areas. The petals are almost wholly suffused with dark rose, lightest at the apices. In this variety, too, the lip is not so heavily crimped at the edges as is usual, gaining thereby an even greater appearance of solidity, heightened by its deep claret-crimson hue dashed with purple, almost sombre in shade. A broad stripe passes beneath the column, touched on either side with ochre-yellow. The remainder of the tube both inside and out is a soft rose flushed white, the apices only tipped with purple.

#### LÉLIO-CATTELEYA ELEGANS SYLVIA.

Though typical in shape, the flowers of this variety are of enormous size, exceeding the largest Lélia purpurata the writer ever saw. The sepals are of an indescribable shade of greenish yellow,

mixed as it were with rose—most attractive. The large boldly undulated petals have a similar ground colour centrally, but the outer portions are a warm carnation pink with rosy veins. The lip is very large. The front lobe is of the deepest wine crimson, approaching plum-purple. A broad isthmus still deeper in colour connects the front lobe with the remainder of the lip. The tube is soft rose externally, with stripe-like veins of magenta-purple. Nine flowers are carried on the spike. Near it is L.-C. elegans Rupert superba, now flowering for the first time. Except that it is larger and freer in colour, it is practically identical with the variety Rupert described in THE GARDEN of September 21, 1901, but that variety is quite eclipsed by the present form. Its colour may perhaps be best described as a blood red-purple, but at the same time of a brilliant hue. The spike bears eight flowers, and their enormous size and conspicuous colour render them very effective. Probably this and the preceding variety are the two finest forms of elegans known.

ARGUTUS.

## THE KITCHEN GARDEN.

### SPRING CABBAGES.

**N**OTHING new can be written I fear of this crop, but as both successes and failures are recorded in the pages of THE GARDEN, I ask the Editor's permission to note a few peculiarities of this useful vegetable. At the same time, I would like to make some brief remarks as to sowing in the autumn. I refer to "A. D.'s" note on page 137. With regard to the comments often made as to the plants bolting through early sowing, I find your well-known correspondent "A. D." says about 3 per cent. of the earlier sowings bolted, and I am glad to find the percentage was so small with him. Now such trials as he mentions are most interesting, as the writer of that note, unless I am much mistaken, travels about and sees a good many plots of early Cabbage, and is in a better position to note defects than the gardener who only sees his own and a few others of a like nature. For years my idea has been that much bolting happens through imperfect culture, probably through indifferent seed stocks, but more generally other defects. I am not sure either that "A. D." will agree with me or the majority of your readers. I will take poor seed stock first. Here I think I am on safe ground, as few vegetables of the Brassica tribe want more care in the seeding than Cabbage. Even this season, in our plot of, say, nearly 3,000 spring Cabbages, I could make out half a dozen varieties. I am aware it is an easy matter for seed to become mixed when being put up, but I fear it is in the growing season that most of the mischief is done, and to keep a good strain pure much care is necessary.

I now come to what I consider a more frequent cause of bolting, and that is planting weakly-drawn seedlings late in a loose open soil heavily manured. This excites a starved plant into growth and causes it to run prematurely. For some years I have given the spring Cabbage sown in July more space in the seed-bed, getting a sturdier plant; and another point I place even more importance upon is to plant in hard soil—land well trodden (not recently dug or manured); in fact, our first quarter of spring Cabbage for April cutting is always planted on the plot just cleared of spring Onions. As our soil is light the land is well rolled and trodden for the Onions and the plants are drilled in. Grown thus they make a firm short growth with ample fibrous roots, and are well able to stand extremes of weather. I firmly believe a rich root run at the time of planting is undesirable. It encourages a soft growth, and it is an easy matter to feed early in the year with fertilisers when new growth is active. It has often occurred to me how much better the plants are wintered in fields and market gardens compared to those in rich gardens—in fields there is less food and more exposure. My theory may be wrong, but last season I gave some half dozen

kinds a trial and did not act up to the advice given above, but gave a rich root run, and a more miserable lot of plants I have never seen—quite 50 per cent. bolted. I have also found too late sowing equally fatal. "A. D.'s" advice as to sowing in July is good, and a date between the 10th and 20th is safe, but the earlier one for the North. Even then dates cannot be relied upon, as in a dry season, unless given ample attention, seed takes much longer to germinate, and in a showery one growth is more rapid. Planting should be done earlier. I have referred to crowded plants, and I would always advocate planting in a small state in preference to starving them in a crowded seed-bed. I find we get much earlier Cabbage by using fertilisers early in the year than by rank manure at this season and entire freedom from running. From careful observation for the past thirty years I find we have earlier kinds (smaller and better) and better stocks—gains in the right direction.

G. W.

### THE CHINESE LIBOCEDRUS.

THE genus *Libocedrus* is popularly confused with *Thuja*, and one often finds, e.g., that nurserymen sell *Libocedrus decurrens*, the Rocky Mountain species, as *Thuja gigantea*, while true *Thuja gigantea* is passed off as *Libocedrus decurrens*. *Libocedrus* closely resembles *Thuja* in habit, but is easily distinguished by the character of the fruit and of the seeds. In *Libocedrus* the fruit is made up of either four or six scales; the lowest pair reflexed and minute; the next pair (middle pair) large, thick, and woody; the uppermost (inmost) pair, when present, coalesced into a median septum. The middle pair only is fertile, each scale bearing two seeds. The seeds are winged above and samaroid. In *Thuja* there are three to five pairs of scales in the fruit, of which either the two or three middle ranks or the lowest two pairs are fertile. Under each scale there are two or three seeds, which have either two lateral wings or are wingless. *Thujopsis* differs from *Thuja* in having five winged seeds on each fertile scale.

There are now known eight species of *Libocedrus*, the geographical distribution of which is remarkable, showing that in early geological times the genus was widely spread; indeed, a fossil species has been found in the Isle of Sheppey. Two species now occur in Chili and Patagonia, two species inhabit New Zealand, one species is peculiar to New Guinea and another to New Caledonia, one species occurs in Oregon and California, and another in China.

*Libocedrus macrolepis*, Bentham, has recently been introduced into cultivation in England by Messrs. James Veitch and Sons from seeds collected at Szemao, in Yunnan, by Mr. E. H. Wilson, when he was paying me a visit at that station in the autumn of 1899. The tree is very ornamental, and possesses most valuable timber, but it is doubtful if it will prove hardy in these islands, except in warm corners of south-western Ireland and Cornwall.

In southern Yunnan it is commonly planted in temple grounds, but it was observed and collected by me growing wild in ravines at Talang, where it occurs near water-courses. Logs of the tree are frequently dug up by the

natives in the forests close to the banks of streams, where it was buried by the action of floods years ago. It is this dug-up wood which is especially prized by the Chinese for making coffins of the most esteemed kind. There is a large trade in coffin wood at Mapai, in North Tonking, which is reported to be similarly dug up, but I have not been able either to verify the statement or to identify the species concerned. The *Libocedrus* grows to 100 feet high, assuming a graceful pyramidal form, and the bark is remarkably white in colour. The photograph reproduced is that of a tree of this species, which is growing in the military cantonment at Szemao.

Like *Cupressus* and *Thuja*, the *Libocedrus* is known to the Chinese as the *Po* tree, the hieroglyphic for which is composed of the sign for *tree* and the sign for *white*; and these trees are probably called white trees on account of the purity of the wood. Cypress and *Thuja* are early mentioned in Chinese annals, and it was the custom 2,000 years ago to plant these

trees around the tumuli where were buried the feudal princes. They were chosen as stately long-lived evergreen trees to symbolise the

lengthwise like a boat in shape, and are lanceolate and acute, the apex being free. The facial pair of leaves are flat, oblong, obovate, one-nerved and awned at the summit. The leaves are about one-third of an inch long. The cones are solitary, borne on lateral branches, and are elliptic-oblong, roundish in section, obtuse, and composed of six woody scales decussately opposite. The two outermost scales are minute and reflexed; the two middle scales are elongate, about seven-eighths of an inch long, erect and fertile, each bearing two seeds. The seeds are oblong, produced above into a large falcate wing, the seed and wing being together a little shorter than the scale.

There are specimens at Kew collected by Anderson at Hotha, in S.W. Yunnan; and others (No. 11,566 and A, B) collected by me at Talang and Szemao from wild and cultivated trees. At the latitude of Szemao (23°) it occurs at altitudes varying from 4,000 feet to 5,000 feet.

In the herbarium at Kew, on the same sheet with Anderson's specimen, is mounted a tiny barren branch of a *Libocedrus*, which was collected by Bourne in North Formosa. It is difficult to say whether this represents a mere variety of the Yunnan species or a new species. The leaves are more flattened, larger, and of a different aspect. Matsumura, referring to a specimen collected in the same part of Formosa, simply says "*Libocedrus sp.*,"<sup>†</sup> apparently not having good material. He calls it by the same Chinese name as Bourne, viz., *Hsiu-Lam*, adding another native name, signifying "yellow flesh tree." Bourne notes that it is the most valuable wood in Formosa. In South Formosa *Hsiao-Lam* is the name given to a species of *Machilus* with excellent timber.<sup>‡</sup>

Mr. H. B. Morse, who was formerly Commissioner of Customs at Tamsui, tells me that the *Libocedrus* there is a most beautiful wood, and promises on his return to China to send a specimen to Kew. As the Yunnan wood is very valuable I strongly recommend the planting of *Libocedrus macrolepis*, which is now procurable in warm corners

of Ireland and in the United States, where it may become of economic importance.

AUGUSTINE HENRY.

THE CHINESE LIBOCEDRUS MACROLEPIS IN THE MILITARY CANTONMENT AT SZEMAO.

(Recently given a first-class certificate by the floral committee of the Royal Horticultural Society when shown by Messrs. J. Veitch and Sons, Ltd., of Chelsea, who introduced it.)

belief in immortality, which was then, as now, craved by the human soul. The Lolos, who are the aboriginal inhabitants of Yunnan, hold the *Libocedrus* in high esteem, and call it the *Su* tree; and in their peculiar and ancient script it is figured as , which is probably a picture of a branchlet turned on its side. The Lolos say that there is a *Libocedrus* tree in the moon, and add, with some naivete, that if one could obtain and eat the seeds of this lunar tree immortality would be acquired.

*Libocedrus macrolepis* was originally described by Kurz as a new genus *Calocedrus*,<sup>\*</sup> because he supposed that its seeds were peculiar. They are like those of the other *Libocedrus* species; and in the "Genera Plantarum" (iii., page 426), Bentham referred the tree to its correct generic position. In habit it strongly resembles *Thujopsis*, and may be described as follows: —A tall tree, with white bark, flattened branches, and coriaceous leaves, which last are often glaucous. The leaves are decussately opposite and arranged imbricately in four vertical ranks. The lateral pair are folded

### CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

### COPPER BEECH HEDGES.

[To THE EDITOR OF "THE GARDEN."]

SIR,—I was pleased to find your correspondent "T." (August 16, page 109) having a good word for Beech hedges. We often find the Holly and the Yew largely used in gardens for this purpose, and while they are very ornamental and make capital hedges, they are not quite so good under all circumstances as the Beech or Horbeam.

\* *Journal of Botany*, 1873, page 193. *Cum tabula*.

† *Tokyo Botanical Magazine*, 1901, page 137.

‡ Henry, in *Trans. As. Soc. Jap.*, xxiv., supp., page 79, No. 593.

Some object to the Yew on account of its poisonous qualities, others to the Holly because it is more difficult to clip and looks untidy for some time after the clipping operation. Neither of these objections can be raised in regard to the Beech. Hence it is one of the best of our many hardy trees both for screens and hedges. One seldom meets with the Copper Beech used for this purpose. Now I think this is a mistake, for this variety will do equally as well for forming a good fence as the common green, and to my mind is far more ornamental. We have a fence of the Copper Beech dividing the kitchen garden from the pleasure grounds 138 yards long, 8 feet high, and from 4 feet to 5 feet through. It forms a perfect wall on either side, and in the spring is one of the most interesting features of the place. It would be useless planting the Copper Beech on a wet or heavy soil—a light soil suits it best. The hedge in question was planted about seventy years ago from seedlings raised by the then owner of the place, the Hon. and Rev. R. Wilson, father of the present Baroness Berners. The hedge is now in perfect health, and all that is necessary is an annual clipping. This should be done about the end of August, before the wood gets hard.

#### PLANTS FOR SUMMER EFFECT.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was assured the other day during my visit to THE GARDEN office that the staff were always ready and anxious to help their clients. I therefore venture to ask if you will get me cultural directions as to raising and growing of the following for planting out in summer in the garden. I want cultural directions as to raising and growing the following subjects: *Acacia lophantha*, *Solanum robustum*, *S. marginatum*, *Koniga (Alyssum) maritima*, *Artemisia arborescens*, *Amaranthus tricolor*, *Chamaepicea Diacantha*, *Cineraria maritima*, *Centaurea candidissima*, *Isoloma hirsuta*, *Solanum jasminoides*, and *Cassia corymbosa*.

ALPHA.

*Centaurea candidissima*.—Formerly this was propagated from cuttings in the spring for bedding the same season, but great care was required, as the woolly stems were apt to rot off, yet I have succeeded well sometimes. The best method, however, is to sow seeds. The seeds should be sown in August in pans or boxes, using any ordinary compost. Place on a shelf close to the glass in a cool greenhouse; if the seeds are good they germinate freely. Care must be taken that the soil does not get too dry. After they are well started they may be pricked off in pots or in the shallow boxes which are now so much in use. Kept well exposed to the light and as close to the glass as possible, in a cool greenhouse, they will be ready for potting early in February, and after they have made a start will do well in a frame or any light position where they can be protected from severe frost.

*Cineraria maritima*.—This may be propagated from cuttings in spring, but the stems are liable to rot. Short side shoots make the best cuttings, and they should only be put into the soil just deep enough to keep them firm. Seeds sown early in the year will make good plants for bedding the same season, or they may be sown in the autumn and treated the same as the *Centaurea*.

*Solanum marginatum*.—Propagated from cuttings in February will make good plants for bedding the same season. Plants taken up from the ground are difficult to keep through the winter, but a few grown in pots and kept in a cool greenhouse through the winter will give a lot of cuttings if put into a little extra warmth a few weeks before the cuttings are required. Cuttings succeed best where there is a moderate bottom heat and a cool surface; they should be kept close, and only moderately moist until rooted. *S. robustum* and *S. pyracanthum* require similar treatment. These Solanums may also be raised from seeds, which to get good plants should be sown the previous autumn, but it is difficult to get good seeds sometimes, and it is desirable to rely on cuttings.

*Solanum jasminoides*.—To make any effect in the garden one year old plants should be used; it is easily propagated from cuttings in the spring, and may be grown on in a moderate temperature until well established, after which the plants will do well in a cold frame or out of doors. It should be grown in a light sandy soil, and to flower it well it must be well exposed to the sun.

*Koniga (Alyssum) maritima*.—The ordinary form may be raised from seeds, which should be sown in pots early in the spring. The variegated variety is usually propagated from cuttings. A few plants kept in pots on a shelf in the greenhouse through the winter will give a lot of cuttings in the spring. They root freely in the ordinary propagating frame, and may be potted singly and stopped as soon as they require it. After the plants are well established they may be kept in a cool frame until required for planting out.

*Acacia lophantha*.—This may be raised from seeds sown early in the year and grown on in warmth; they will make good plants the same season, but for sub-tropical bedding one year old plants are best. The seeds should be soaked in water and sown as soon as they have swollen. Sometimes the seeds take several days to swell. If sown before they have been soaked they take a long time to germinate, and come up irregularly.

*Cassia corymbosa*.—This half-hardy shrub should be grown in the greenhouse, but established plants will flower well in the garden. It may be propagated from cuttings in the spring. Short side shoots from plants that have been cut back make the best cuttings, taken off close to the old stem. They should be put in singly in small pots, and require to be kept close with a good bottom heat. Grown on one season in pots they make good plants for flowering in the open border the following season. The large terminal corymbs of bright yellow flowers are most effective. The plants may be taken up in the autumn and will be more useful the following season.

*Amaranthus tricolor*.—This may be grown from seeds, which should be sown early in the spring and grown on in heat until well established. Though it does well planted out in a warm situation it is a very tender plant and must not be exposed until all danger of frost is over. It is best to pot the plants on and grow them under glass until the coloured foliage is well developed. A light sandy soil should be used, as a rich soil causes too vigorous growth and the coloured variegation will not be so good. It is only in a sunny position in the garden that it is effective. Seedlings vary.

*Chamaepicea Diacantha*.—This is a biennial, and may be raised from seeds. It is most effective as a foliage plant for bedding, and for this purpose the seeds may be sown in heat early in the spring, and will make effective plants the same season; but to flower them the seeds may be sown in July or August, and if protected during the winter they will flower the following season. C. Casabona requires similar treatment. These are now included in the genus *Cnicus*, and *Cirsium* is another.

*Artemisia arborescens* is a shrubby plant which may be propagated from cuttings taken from young shoots in the spring. It is hardy, but may be grown on in pots and planted out the following spring.

*Isoloma hirsuta*.—This is a gesneriaceous plant and rather tender, but may be used for summer bedding in a sheltered situation. The plants should be started early in the spring and grown on in heat, but later on they will do

as well in the greenhouse as in the open ground. In starting them they should be fully exposed to the sun; they will then bear removal to the open ground without suffering.—A. HEMSLEY.]

#### BOOKS.

**Vegetables and Flowers from Seeds.**\*—This is a most useful work, designed for those who live in tropical as well as temperate lands, and is a trusty guide. All the vegetables and flowers that we grow in our gardens are described and illustrated, and careful information given about their cultivation. The following chapter concerning the Mushroom will show how excellent this book is, both for the beginner and those with some knowledge of kitchen and flower gardening: "Mushroom (*Agaricus campestris*); German, *Champignon*; French, *Champignon*; Dutch, *Paddenstoel*; Spanish, *Seta*; *Seta de cardo*. It is needless to dwell on the merits of an esculent which is highly esteemed in the cookery of all European nations, especially as the Mushroom deserves to be prized quite as much for its nutritious qualities as for its delicious flavour.

The principles of successful culture may be gleaned from a moment's consideration of the conditions which favour the natural growth of this fungus in the pastures of the United Kingdom and other countries. Mushrooms are never found in open fields during winter or spring, and seldom in the early part of the summer. But as autumn approaches, and the nights remain still and warm, with the soil moist and warm also, this delicacy is freely produced. The night temperature which is most favourable to the Mushroom is about 60° F. (15° C.). Much above this register tends to make the buttons come small, and below 55° F. (13° C.) soon brings production to an end. Where a steady temperature of 60° F., combined with a suitable degree of moisture, naturally prevails, or can be easily maintained, the artificial culture of Mushrooms is a very simple business. It will merely be necessary to make a bed of prepared manure, impregnate this with spawn, cover with a layer of rich loam, protect with mats or clean litter, and wait the uprising of the crop. In the United Kingdom pastures are spawned in June. Gathering may begin in August and will probably end in September.

"The period of natural production is, however, too brief to meet the public demand. Mushrooms are wanted at breakfast, luncheon, or dinner in every week of the year. The continuous call for this dainty has created quite a large and lucrative business. From the catacombs of Paris enormous quantities are daily placed on the markets or supplied to the manufacturers of various

\* "Vegetables and Flowers from Seeds in Tropical, Semi-tropical, and Temperate Climates." By Messrs. Sutton and Sons.

A GOOD BED OF MUSHROOMS.  
(Reproduced from "Vegetables and Flowers from Seeds.")

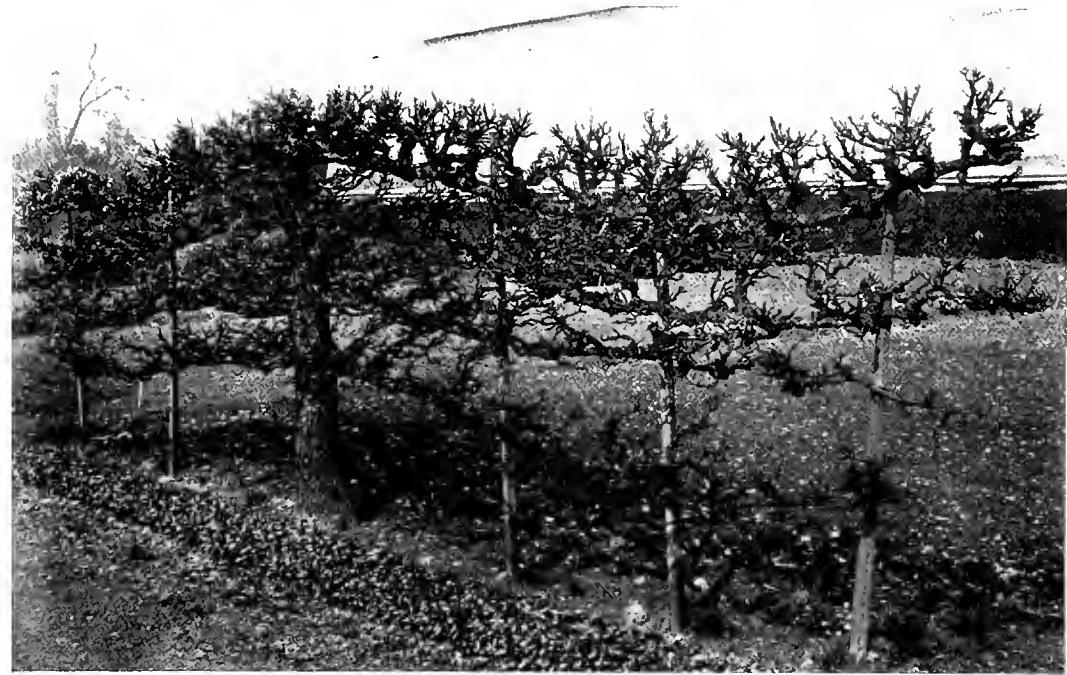

tempting articles of food. In England, cellars, dark sheds, and vacant buildings are successfully utilised for the crop. But the method of greatest interest is that of growing Mushrooms on open-air beds of manure, even in the depth of winter, without the aid of any building whatever. This should be a most suggestive procedure for countries or districts where it is possible to secure necessary materials, and unless these are available the attempt to grow Mushrooms will prove futile. Open-air beds must be carefully prepared to sustain a regular temperature for at least three months. To do this needs a considerable bulk of manure, and there is no better material than that which comes daily from the stables of well-fed horses. The manure should be stored on the floor of a dry shed, where it must neither become dry nor be allowed to ferment. When a sufficient quantity has accumulated it should be made into a large round or square bed, laid down evenly and trodden firm as the work proceeds. If too dry each layer may be sprinkled with water. In a few days the bed will become hot all through. It must then be broken up and remade, putting the outside portions into the centre to ensure equality, and again it must be trodden firm. A loose bed is useless for growing Mushrooms. This process is to be repeated every three or four days, and when ready the stuff will be dark, soft, and sufficiently damp to be cohesive. Finally it must be made up on a foundation of rubble to ensure free draughtage. When the plunging thermometer registers about 80° F. (27° C.) it is time to insert the spawn.

"Break each cake or brick into about six pieces and gently force each one into the manure 2 inches deep at intervals of 6 inches all over the bed. Close the manure tightly round the spawn and cover with a layer of rich fine loam, 2 inches or 3 inches deep, carefully firmed on to the manure. The bed must then be covered with sufficient litter or mats to retain an even temperature. In large gardens, which are equipped with every horticultural appliance, buildings having thick walls and substantial roofs are specially erected for growing Mushrooms.

"During high summer there is quite as much need for preventing the ingress of midday heat as there is for excluding cold during winter. This hint may be of some value in localities where unused buildings can be turned to useful account. The proper degree of moisture in a Mushroom bed is all-important. The manure should always be sufficiently damp to hold together, but it should not part with any of its water under pressure. A bed that is allowed to become dry will soon cease to be fruitful. Water when administered should be of the same temperature as the bed. In Northern India, the winter months, from September until March, are the most suitable for growing Mushrooms. As the fermenting material will raise the temperature inside a building a considerable altitude is necessary to get a sufficiently low initial temperature. In cooler countries this difficulty is not experienced. But the principles explained will in any case render it easy to form a judgment as to whether Mushrooms are possible of attainment."

## ESPALIER TRAINING OF PEAR TREES.

THE accompanying illustration of a Pitmaston Duchess Pear, grown as an espalier, reminds one of the old specimen trees trained in this way which used to be so commonly met with in nearly all our country gardens years ago. Why this system of training has gone out of favour and fashion of recent years it is difficult to say—certainly not through any fault or defect in the system itself—for better results both in

THE OLD ESPALIER PEAR PITMASTON DUCHESS IN THE CHISWICK GARDENS OF THE ROYAL HORTICULTURAL SOCIETY.

flavour and size of fruit are obtained from trees trained in this way than when grown as bushes or pyramids.

OWEN THOMAS.

between the rows frequently to keep down weeds and promote good growth.

### ONION SEED.

See that the heads are securely supported against wind and rain, and do not cut them till thoroughly matured.

### PEAS.

All late kinds have done remarkably well this year, and little difficulty should be found in keeping up a good supply for several weeks. The latest should have their tops taken off, which will induce the pods to swell rapidly. On light soils the roots should be kept well watered unless the wet weather continues.

### CARROTS.

Thin out the later sowings to about 3 inches apart and lift the early roots, or many of them will split and be worthless. In many places this crop is anything but satisfactory this season, and the later sowings will prove of much value.

### TOMATOES

growing outside should be kept free of all growths, and remove most of the leaves, exposing the fruit to the sun and air as much as possible. As soon as they show the slightest signs of colouring, cut and place them under glass to finish, when the flavour will be much improved. E. BECKETT.

*Aldenham House Gardens, Elstree, Herts.*

## THE INDOOR GARDEN.

### CALLAS

may be lifted and potted up, using a very rich compost of three parts turfy loam and one part dried cow manure, with an admixture of coarse sand. A considerable amount of the soil adhering to the roots may be reduced, so as to admit of moderately small pots being used. Pot firmly and provide thorough drainage, as these plants require liberal feeding and abundance of water when established. After potting they should be placed in a shady position and kept freely syringed to encourage root-action and maintain the foliage in a thoroughly healthy state.

### AZALEA INDICA.

The Continental-grown stock is now coming to hand, and should be potted up immediately it is received. Liberal drainage and sandy peat should be used and well pressed round the root-mass. When potted give a good watering, and shade until root-action has fairly begun. The syringe

## GARDENING OF THE WEEK.

### KITCHEN GARDEN.

#### POTATOES.

**N**O time should be lost in lifting the main crop. Unfortunately, owing to the continued rains and absence of sun, the disease is very prevalent in many places, and the longer the tubers remain in the wet ground the more likely is it to spread. Choose, if possible, fine weather for lifting the crop, and place under cover, but do not heap them together thickly. Look over the tubers once a week and remove all in any way affected, or the sound ones if they do not take the disease will certainly suffer in flavour. Burn up the haulm, bad tubers, and rubbish on the ground. The second-sized tubers should be placed thinly on shelves for next year's planting.

#### SPINACH.

This important crop will have to be well attended to at this season to ensure a regular supply throughout the winter. Several sowings should yet be made to make sure of this. So much depends on the kind of weather that is in store for us that no set dates can be relied on for making the principal sowing, but, generally speaking, the first and second weeks in September are about the time, for when the plants get too large they die off before winter. Before sowing give the ground a good dressing of lime, soot, and wood ashes, and make the ground moderately firm. Sow thinly, and thin out the earlier crops as soon as the first rough leaf is made. Good Spinach cannot possibly be grown when overcrowded.

#### ONIONS.

Complete the harvesting of all spring-sown crops as speedily as possible, and see that the bulbs are thoroughly dry before storing them away. Winter kinds sown last month should now be well up. Give a good sprinkling of soot and wood ashes and thin out to a moderate distance, as these will pass through a severe winter more safely when not left too thickly together. Run the Dutch hoe

should be used freely to keep the leaves fresh. Guard against insect pests, which are liable to attack this plant. Azalea mollis should be potted in a rich fibrous loam, peat, and sand, and plunged in cocoanut fibre or ashes. Similar treatment may be given to many of the hardy shrubs used for forcing.

#### LILIUM HARISSI.

When the bulbs are received they should be potted firmly in a rich, turf-like loam, with a dusting of coarse sand. Use clean, well-drained pots. Plunge the pots up to their rims in a cold frame in cocoanut fibre. Give little water until growth has well begun, after which more moisture will be required.

#### WATERING.

As the days become shorter and the nights colder, a drier atmosphere must be maintained and less water given to plants both at the roots and overhead. Watering is work which requires much judgment and experience on the part of the gardener. The grower who depends on elaborate mixtures possessing extraordinary virtues has much to learn. Good soil is important, but it can be completely spoiled by errors in watering. This, however, is not always recognised by the young gardener in charge; consequently one hears many complaints of the inefficiency of men with the watering-pot. Incessant watching to detect the requirements of various plants which differ widely in their demand for water alone can render a man perfect in this detail.

JOHN FLEMING.

*Wecham Park Gardens, Slough.*

### THE FRUIT GARDEN.

#### APRICOTS.

Now that the fruits even on late trees are gathered any necessary pruning should be done in preference to leaving it until the leaves have fallen. By pruning while the sap is active the wounds readily heal, and there is not so much likelihood of gumming, as is the case when the trees are pruned during their resting season. In the case of trees upon which spurs are either wholly or partially depended upon to supply the fruit, the fruit-bearing wood upon matured trees often gets too far from the wall and gets injured by frost. It also becomes crowded, while the fruit is not of the best quality. Spurs of this description should be now thinned and shortened back to reasonable bounds. The extent to which this may be safely carried out depends upon the condition of the spurs. If skilfully attended to, however, in a piecemeal way and yearly followed up healthy old trees with long spurs may be remodelled as it were by forming new back breaks and thus furnishing themselves with satisfactory spurs. Examine young wood laid in during the growing season, and thin it if found necessary. Should excessively wet weather set in remove the mulching material.

#### MORELLO CHERRIES.

Once the fruit is gathered remove the protecting nets and prune the trees. It is safer to accomplish this at this season than during winter or even early spring, as the trees are not so liable to gum if it is done now. Thin out weakly wood that can be replaced with strong growths and nail in young loose shoots, keeping them from 1 foot to 15 inches apart. Crowding of foliage weakens the trees and promotes inferior fruit. It is advisable at the present time to give any trees that have had an attack of black aphid, although none may now be found, a thorough washing with Quassia Extract, which will effect an efficient cleansing. Bush trees should receive similar treatment, but the side growths for next year's fruiting must not be left too thick or the centre of the trees will become weakened.

#### PROTECTING PEARS.

The tomtit often works great destruction amongst Pears by attacking them near the stem of the fruit, and when the skin is broken, even of late varieties, the wasp lends assistance, but according to my experience it does not commence an attack upon late kinds. The best way to protect

wall or dwarf trees is to net them, but a single ordinary fish netting is useless to exclude the tit, and if no closer kind is available it should at least be placed two-fold over the trees. Various other modes of protection are sometimes adopted, such as enveloping the fruits in muslin bags. Pieces of cardboard with a slit to a hole in their centre slipped over the stem of the fruit also form a good protection against tits. Our pyramid and bush trees are covered in by an iron framework clothed with three-quarter-inch wire netting, which defies birds of every description.

T. COOMBER.

*The Hendre Gardens, Monmouth.*

### SOCIETIES.

#### ROYAL HORTICULTURAL SOCIETY OF IRELAND.

A SPLENDID show was recently held in Merrion Square, Dublin. A record attendance was anticipated if the weather was auspicious; but, though brilliant sunshine prevailed after three o'clock, the earlier rain and lowering sky had a deterrent effect on would-be visitors. However, there was a fashionable gathering, and nothing could have been more pleasant than the couple of hours in the late afternoon, when the sun shone gloriously on the pretty gardens. The whole scene was gay with colour.

The exhibits this year largely exceeded those of last year, the respective numbers being 310 and 274. The quality, too, according to experts, was better than previously, so that the promoters of the show have good reason to be satisfied with the success of their latest venture, except in so far as the rain spoiled the attendance. There were three large tents set apart for the exhibits, and each presented a very attractive appearance, the arrangement of the flowers, plants, fruit, and vegetables being such as to show them to the best advantage. In one tent the nurserymen's exhibits were a source of much admiration. They comprised fine collections from Messrs. Ramsay, Ball's Bridge; Messrs. Watson, Clontarf; R. Hartland and Son, Cork; Messrs. Dickson, Newtowards; Hugh Dickson, Belfast; Messrs. M'Gredy, Portadown; Messrs. Drummond, Dublin; and the Royal Botanic Gardens, Glasnevin. In another tent was a mixed collection of vegetables, fruit, and flowers, amidst which the collection of Begonias and Gladioli from Messrs. Hartland, of Cork, commanded special attention. The show of Grapes was particularly fine, and the Peaches also presented a very tempting appearance. In the third tent there was a magnificent display of Sweet Peas. The challenge cup presented by William Watson and Sons, Clontarf Nurseries, for Dahlias, &c., was won by R. W. Booth; the challenge cup presented by Lord Ardilaun for Dahlias, &c., by Lady Frances Doyne; and the challenge cup presented by R. Hartland and Son, Lough Nurseries, Cork, by Lord Ashtown. Medals for exhibits by nurserymen were recommended as follows:—The Botanic Gardens, Glasnevin; D. Ramsay and Son, Ball's Bridge (for a very fine group of Palms, Ferns, &c.); M'Gredy and Sons, Portadown; Watson and Sons, Clontarf; Hartland and Son, Cork; and Drummond and Sons, Dublin.

The judges were Mr. Black and Mr. Hamilton for fruit and vegetables; Mr. Gumbleton and Mr. Crawford for cut blooms, and Mr. Burbidge for plants and extras. The secretary, Mr. Walter Keating, jun., was an energetic and indispensable official.

The following were some of the principal prize winners:—

Group of Liliaceae and flowering plants, twelve, each different (Ferns excluded).—First, F. A. Millar, Esq., Windsor House, Monkstown (gardener, Mr. D. Colahan); second, David Drummie, Esq. (gardener, Mr. Thomas Byrne). Exotic Ferns, six, each different.—First, F. A. Millar, Esq.; second, David Drummie, Esq., J.P., Bellevue, Booterstown.

Dahlias, show of fancy only, stand of twenty-four blooms, not less than twelve varieties.—First, Hamilton Stubler, Esq., Moyne, Durrow (gardener, Mr. P. Flanagan); second, Lord Cloncurry, Lyons (gardener, Mr. William Rigg).

Dahlias, Cactus, stand of twenty-four, not less than twelve varieties. A challenge cup, value £5, and first prize presented by Lord Ardilaun. Cup to be won three times before becoming the property of the winner. The society adds second and third prizes.—First, Lady Frances Doyne, Wells, Gorey (gardener, Mr. James Mitchell); second, Lord Ashton, Woodlawn, County Galway (gardener, Mr. Andrew Porter); third, Lord Cloncurry, Lyons (gardener, Mr. William Rigg).

Dahlias, Cactus, twelve sprays, three blooms in each, each spray to be a distinct variety, and Dahlia foliage only to be used. The general effect and method of staging to be taken into consideration as well as the quality of the flowers. A challenge cup, value £5, presented by Messrs. William Watson and Sons, Clontarf Nurseries, Dublin, to be won three times before becoming the property of the winner. Money prizes presented by the society.—First, R. W. Booth, Esq., Victoria House, Dalkey (gardener, Mr. J. A. Cavanagh); second, Lady Frances Doyne (gardener, Mr. James Mitchell); third, Lord Cloncurry (gardener, Mr. William Rigg).

Roses, stand of twenty-four blooms, not less than twelve varieties.—Second, Edmund D'Olier, Esq., Knocklum, Bray (gardener, Mr. J. Harvey).

Roses, stand of twelve blooms, not less than six varieties.—First, David Drummie, Esq., Bellevue, Booterstown (gardener, Mr. Thomas Byrne); second, Captain Mark Maunsell, Oakley Park (gardener, Mr. John Ahern); third, Lord Ashtown.

Roses, Tea, stand of twelve blooms, not less than six varieties.—First, Edmund D'Olier, Esq. (gardener, Mr. J.

Harvey); second, F. A. Millar, Esq., Windsor House, Monkstown (gardener, Mr. Denis Colahan); third, David Urioum, Esq. (gardener, Mr. Thomas Byrne).

Gladioli, stand of twelve spikes, not less than six varieties.—First, Lord Dunleath, Ballywalter Park, County Down (gardener, Mr. E. H. Cole); second, Lieutenant-Colonel Jervis White (gardener, Mr. William Fitzgerald).

Pelargoniums, zonal, in single trusses, stand of twelve, not less than six varieties.—First, Mrs. T. Aliaga Kelly, 64, Upper Leeson Street (gardener, Mr. John Toner); second, David Drummie, Esq.; third, W. H. Odium, Esq., and W. W. Goodbody, Esq. (gardeners, Mr. C. Pilgrim and Mr. J. Doherty).

Begonias, double tuberous, stand of thirty-six separate blooms, in at least eighteen varieties. Challenge cup, value £7, presented by Messrs. Richard Hartland and Son, the Lough Nurseries, Cork, with money prizes added by the society, the cup to be won three times before becoming the property of the winner.—First, Lord Ashtown; second, R. Hamilton Stubler, Esq. (gardener, Mr. P. Flanagan).

Collection of hardy cut flowers (annuals and biennials excluded), to be shown in vases which will be provided by the society. Space not to exceed 16 feet by 4 feet. Prizes presented by Lord Ardilaun.—First, Right Hon. Lord Plunket, Old Connaught, Bray (gardener, Mr. W. Webster).

Asters, any variety, stand of twelve blooms. Prizes presented by Messrs. William Drummond and Sons, Limited.—First, Reginald T. Harris, Esq.; second, David Urioum, Esq.; third, Mrs. T. Aliaga Kelly (gardener, Mr. John Toner).

Carnations or Picotees, stand of twelve bunches, three sprays of one variety with foliage to form a bunch, at least six varieties, Malmaisons excluded.—First, Surgeon-General T. Beaumont, Palmerston Park (gardener, Mr. John M'Linden); second, Lord Cloncurry (gardener, Mr. William Rigg). First-class certificate of merit: Mrs. Armstrong, for seedling Carnation; to H. A. Smallman, Esq., for seedling Picotee; to Mr. W. E. Gumbleton, for seedling new Dahlia Collaret President Viger.

Twelve bunches Sweet Peas, twelve distinct varieties named, to be shown in vases, which will be provided by the society, with first prize a bronze medal, presented by Messrs. Toogood and Sons, Royal Seed Establishment, Southampton. Money prizes presented by the society.—First, Henry J. R. Bigges, Esq., Duncarrin, Eglington Road; second, Lord Dunleath, Ballywalter Park, County Down (gardener, Mr. E. H. Cole); third, Captain D. C. Palmer, Clonlost, Kilucan (gardener, Mr. M. Forde).

Dahlias, show, stand of twenty-four blooms, not less than eighteen varieties. First prize, silver medal.—First, Messrs. Hugh Dickson, the Royal Nurseries, Belfast.

Dahlias, Cactus, stand of twenty-four blooms, not less than eighteen varieties. First prize, silver medal.—First, Messrs. William Watson, Clontarf Nurseries; second, Messrs. Alexander Dickson and Son, Newtowards; third, Messrs. Hugh Dickson.

Roses, stand of forty-eight blooms, not less than twenty-four varieties. First prize, silver medal.—First, Messrs. Alexander Dickson and Son; second, Messrs. Hugh Dickson; third, Messrs. M'Gredy and Sons.

Gladioli, stand of twenty-four spikes, each different. First prize, society's silver medal.—First, Messrs. Richard Hartland and Sons, the Lough Nurseries, Cork; second, Messrs. M'Gredy and Sons, the Nurseries, Portadown.

Stand of Grapes, six bunches, three varieties, two bunches of each. Merit to consist in size of berry, symmetry of bunch, and finish. First prize, society's silver medal.—First, the Marquis of Downshire, Hillsborough Castle, County Down (gardener, Mr. Thomas Bradshaw); second, Lord Ashtown (gardener, Mr. Andrew Porter); third, Lady Emily Bury, Charleville (gardener, Mr. Robert M'Kenna).

Grapes, white (Muscat), two bunches.—First, the Marquis of Downshire; second, Lord Ashtown; third, W. H. Odium, Esq. (gardener, Mr. C. Pilgrim).

Grapes, white (any other variety), ditto.—First, Lady Emily Bury (gardener, Mr. Robert M'Kenna); second, Mrs. Meade, St. Michael's, Alesbury Road (gardener, Mr. J. Colgan); third, Mrs. R. Hamilton, Shanganagh Castle, Shankhill (gardener, Mr. Alexander Morton).

Grapes, black (Hamburg), ditto.—First, Mrs. Meade; second, the Marquis of Downshire; third, W. H. Odium, Esq.

Grapes, black (any other variety), ditto.—First, the Marquis of Downshire; second, Mrs. Meade; third, W. H. Odium, Esq.

Melon, green or white fleshed.—First, Lord Ashtown; second, Lady Frances Doyne (gardener, Mr. James Mitchell).

Collection of vegetables, twelve distinct kinds only, to be exhibited in trays or on staging 5 feet by 4 feet (for quantities see rules), with first prize, silver medal, presented by Messrs. Toogood and Sons, Royal Seed Establishment, Southampton; money prizes presented by the society.—First, Lord Ashtown; second, Captain C. C. Palmer (gardener, Mr. M. Forde); third, Mrs. Blacker (gardener, Mr. George Bogue).

Collection of vegetables, six distinct kinds only, to be exhibited in trays or on staging 3 feet by 3 feet (for quantities see rules), with first prize, bronze medal, presented by Messrs. Toogood and Sons, Royal Seed Establishment, Southampton; money prizes presented by the society.—First, Sir John Dillon, Bart. (gardener, Mr. William Campbell).

#### EXTRAS.

Botanic Gardens (gold medal), for a superb general collection of rare and beautiful Palms, Orchids, Pitcher Plants, Camass, Rice, &c.; also fine specimens of Trichinium Mangeli.

C. Ramsay and Sons, the Royal Nurseries, Ball's Bridge (silver medal), a decorative group of Palms, Ferns, &c., enlivened by Cacti, Gladioli, Dahlias, Lilies, and Bell-flowers, fresh and well grown; also well-arranged floral wreaths, bouquets, &c.

Messrs. M'Gredy and Sons, the Nurseries, Portadown (silver medal), a brilliant collection of single and double tuberous-rooted Begonias, tastefully arranged with Maiden-hair, Asparagus, and lace-like Gypsophila, and also some fine stands of show Roses in good condition.

Miss Watson, Clontarf Nurseries (silver medal), a very notable exhibit of Hollyhocks, Cactus and Pompon Dahlias, and Carnations; the brilliancy of colour and the freshness of these shapely blooms were much admired.

Messrs. Hartland and Sons, Long Nurseries, Cork (silver medal), an extensive exhibition of single and double tuberous Begonias, well staged. This group was made much more brilliant by zonal Pelargoniums, Gladioli, and blue Delphiniums, daintily arranged with Gypsophila.

Messrs. Drummmond and Sons, Limited, Dawson Street, Dublin (silver medal), a very comprehensive collection of choice hardy plants, trees, shrubs, Sarracenia, &c.

#### NATIONAL SWEET PEA SOCIETY.

##### CLASSIFICATION OF VARIETIES.

FOR a considerable period the committee of this society has been of the opinion that it was desirable to formulate some scheme of classification, and at the recent most successful show this was demonstrated in a very forcible manner. It was apparent that the growers were not in harmony in regard to the colours of many varieties, while some which were staged in one special colour class were also represented in another which should have been totally dissimilar. It was obvious that some remedy for such an anomalous state of affairs was essential, and it was procurable only by an election of varieties which classified them under specified colours.

At a meeting of the executive committee held on July 29 it was resolved that classification papers be printed and distributed amongst members of the committee, as well as growers of repute, whether they were members of the society or not. It was clearly seen by the committee that the date of distribution was fully late, as many varieties were so far past their best that some of the colour and form characteristics were rapidly failing. The necessity for the work was, however, so very imperative that this disadvantage had, perforce, to be overlooked, and the committee relied upon the wide knowledge of those beautiful flowers, known to be possessed by the gentlemen who filled in the lists. Nor was this confidence misplaced. It was speedily found that there was a strong opinion in favour of the best varieties, and it was only when we came to unimportant and often variable varieties that any material divergence of opinion was manifest.

The committee is convinced that the varieties which occupy the first, second, and third places under the several colour headings—and to which the votes each received are attached—are the best of those in general cultivation. Several varieties, like Dorothy Eckford and Countess Spencer, would have received many more marks had they been known, and to this fact alone must be attributed the positions they occupy in the accompanying tables. The committee desire it to be fully understood that this is its first attempt at classification, and that it was made late in the season, in consequence of which it may be subject to expansion, and general improvement in future seasons. Many growers have asked for lists of the best twelve, twenty-four, and thirty-six varieties to be embodied in the schedule of next year's show, and these the committee will prepare in due course, though their necessity is reduced by the appended tables.

It will be observed that in each case a certain number of varieties are above and a certain number below the line; the latter are there placed either because they have been superseded by others above the line, or because they are not sufficiently well known for an authoritative opinion of their merits to be expressed. One or two sorts that were inserted in the election papers have been excluded because absolutely nothing was known about them. Growers are assured that any variety they consider misplaced this year will find its proper level in the classification of the Sweet Pea that, it is hoped, the National Sweet Pea Society will annually undertake.

As the annual meeting of the society will not be held until January there was a clearly expressed desire that the results of the work of the committee be published early so as to enable the seed merchants to include them in their catalogues in the form of recommendations to those who are, by their positions, proved to be of superior merit. The committee therefore request the co-operation of the gardening Press, which has done so much to further the interests of the society, to add to its kindness by giving publicity to this election.

##### CRIMSON.

27 Salopian. 24 Mars. 15 Firefly. Cardinal.

Brilliant. Duchess of Edinburgh. Ignea. Invincible Scarlet and Invincible Carmine: For the purposes of this classification and for exhibition these two are considered synonymous.

##### ROSE AND CARMINE.

23 Prince of Wales. 20 Her Majesty. 18 Mrs. Duggdale. Royal Rose. Lord Kenyon. Lord Rosebery. Splendour. Colunist.

Adonis. Fashion. Novelty. Ovid. Princess Beatrice. Eliza Eckford. Miss Hunt.

##### PINK.

24 Prima Donna. 23 Lovely. 19 The Hon. F. Bouvierie. Countess of Lathom. Princess Beatrice. Countess Spencer. Katherine Tracey.

Mrs. Gladstone. Peach Blossom. Royal Robe. Isa Eckford.

##### ORANGE SHADES.

21 Gorgeons. 20 Lady Mary Currie. 19 Miss Willmott. Chancellor. Countess of Powis. Oriental. Lady Penzance. Meteor. Orange Prince.

##### BLUSH.

21 Duchess of Sutherland. 14 Modesty. 9 Countess of Aberdeen. Sensation.

Fairy Queen. Lemon Queen. California. Blushiong Beauty.

##### PICOTEED EDGE.

18 Lottie Eckford. 14 Maid of Honour. 11 Golden Gate. Butterfly.

##### STRIPES AND FLAKES—RED AND ROSE.

25 America. 18 Aurora. 18 Mrs. Joseph Chamberlain. 13 Pink Friar.

Gaiety. Coronet. Mikado. Queen of the Isles. Invisible Striped.

##### STRIPES AND FLAKES—PURPLE AND BLUE.

20 Princess of Wales. 19 Senator. 15 Grey Friar. Wawona.

Janana. Midnight. Columbia. Purple Striped. Striped Celestial.

##### YELLOW AND BUFF SHADES.

25 Queen Victoria. 24 The Hon. Mrs. Kenyon. 21 Mrs. Eckford. Lady M. Ormsby-Gore. Primrose. Venus. Golden Gleam.

Gleam of Brockhampton.

##### BICOLORS.

19 Triumph. 17 Little Dorrit. 14 Blanche Ferry. Prince Edward of York. Countess of Shrewsbury. Jeannie Gordon. Duke of York. Earliest of All.

Lady Beaconsfield. Empress of India. Painted Lady. Apple Blossom. Bronze King. Lady Skelmersdale. Delight. For the purposes of exhibition Blanche Ferry and Earliest of All are considered synonymous.

##### BLUE.

26 Navy Blue. 24 Countess Cadogan. 22 Captain of the Blues. Emily Eckford. Baden Powell.

Imperial Blue. Grand Blue. Mme. Carnot.

##### MAUVE.

17 Dorothy Tennant. 10 Admiration. 6 Fascination. Violet Queen. The Queen.

##### VIOLET AND PURPLE.

15 Duke of Westminster. 12 Duke of Sutherland. 11 Duke of Clarence.

Monarch. Indigo King. Purple Prince. Waverley. Black Purple.

##### MARONE AND BRONZE.

24 Othello. 23 Black Knight. 22 Stanley. Shahzada. Boreatton.

##### LAVENDER.

25 Lady Grisel Hamilton. 22 Countess of Radnor. 19 Lady Nina Balfour. New Countess.

Princess May. Celestial. Creole.

For the purposes of this classification and for exhibition Countess of Radnor and New Countess are considered synonymous.

##### WHITE.

27 Blanche Burpee. 26 Sadie Burpee. 24 Emily Henderson. Dorothy Eckford. Mont Blanc.

Mrs. Sankey. Queen of England. Alba magnifica. White. White Eagle.

FANCIES (THOSE WITH MORE THAN TWO DISTINCT SHAPES). 6 Lottie Hutchins. 4 Stella Morse. 3 Coquette. Duchess of Westminster. Duchess of York. Gracie Greenwood. Mrs. Fitzgerald.

Dolly Varden. Ramona. Alice Eckford. Captain Clarke. Carmen Sylva. Etna. Rising Sun. Vesuvius. Crown Jewel. Emily Lynch.

##### MAGENTA.

7 George Gordon. 7 Captivation. 5 Calypso.

##### CERISE.

9 Coccinea.

The total number of growers whose ideas are embodied in these tables is twenty-seven. Other classification papers were received subsequent to the abstracts being made, but though these could not be included a glance through them proved that in all the main features they were confirmatory of the results already obtained.—Horace J. Wright, Hon. Gen. Sec., 32, Dault Road, Wandsworth.

##### PRESTON AND FULWOOD.

SEPTEMBER 3, 4, AND 5.

THROUGHOUT Lancashire the chief subject for comment for some time past has been the historic function known as the Preston Guild, and to show the importance of this gathering the Royal Lancashire Agricultural and the Preston Horticultural Society had arranged their exhibitions side by side in Moor Park during the Guild week. The Right Hon. the Earl of Derby, K.G., is the Guild Mayor and President of each society, and assisted by Lady Derby and family throughout the week showed the keenest interest in the various departments, and on the opening day Lady Derby presented the Guild medals to the successful exhibitors. Previous to the opening grave doubts were felt as to the safety of the tents, but by judicious management they remained intact, which was more than those of their neighbours in the Agricultural ground did.

##### PLANTS.

For a group of plants, 300 square feet, arranged for effect, Mr. W. Troughton had the premier lot with excellent specimens. There were Adiantums in variety, *Lilium lancifolium*, and *Francoa ramosa* in pyramids, showing to advantage. Other flowering plants included *Rondeletias*, *Begonias*, *Campanulas*, *Cannas*, &c. For a group of foliage plants, staged for effect, the same exhibitor secured the coveted award with well-grown Palms, Ferns, &c. For two Tree Ferns the leading award went to the same exhibitor.

For a group of 200 square feet, nurserymen excluded, Mrs. Calvert (gardener, Mr. W. Haynes) led with a well-arranged lot, Adiantums, Palms, and Crotons being freely used, the only flowering plant being *Lilium lancifolium* album; second, J. B. Dixon, Esq., with greater variety, but lacking in arrangement; third, E. K. Brown, Esq. (gardener, Mr. W. J. Weaving), with rather too flat a mass of greenery.

For three double Pelargoniums, H. Dewhurst, Esq. (gardener, Mr. G. Morgan), led; and for the tricolors J. B. Dixon, Esq., was the winner.

The first prize for six British Ferns was won by J. B. Dixon, Esq.; for three, J. Ashworth, Esq., took the lead;

and for the single, J. B. Dixon, Esq., scored again with a good *Osmundia*.

For six exotic Ferns, J. B. Dixon, Esq., was well to the fore, his *Adiantums* being very good; J. Hull, Esq., was second. For three varieties, Mrs. Calvert had the leading lot.

For a specimen Tree Fern, J. Hull, Esq., was first.

For a single Palm, J. B. Dixon, Esq., was well to the fore; second, Mrs. Calvert.

For six foliage and flowering plants, J. B. Dixon, Esq., was first with fresh plants; second, J. Hull, Esq. For three Dracenas, J. B. Dixon, Esq., again had the best.

For one Orchid, C. Parker, Esq., won with a good *Oncidium*.

##### FRUIT.

For two bunches of black Grapes, J. Revill, Esq. (gardener, Mr. R. Raynor), Fleetwood, was first with large bunches, but somewhat lacking in colour; second, J. Hull, Esq.

For two bunches of white Grapes, the Right Hon. Earl of Lathom (gardener, Mr. B. Ashton) won with good bunches; second, Mr. J. Cham.

For a green-fleshed Melon, C. R. Brown, Esq. (gardener, Mr. J. W. Weaving), Preston, won with *Cringle Hybrid* and for a scarlet-fleshed with Windsor Castle.

For three Tomato plants, H. Dewhurst, Esq. (gardener, Mr. G. Morgan), won with well-fruited plants; second, J. B. Dixon, Esq.

For a collection of fruit, six dishes, the Earl of Lathom (gardener, Mr. B. Ashton) had the premier lot with white and black Grapes, Peaches, Nectarines, Melons, and Figs.

For a collection, Mr. B. Ashton won with a good lot, including Peaches, Nectarines, Plums, Pears, Cherries, and Currants.

For six Kitchen Apples, Mr. Thomas Guy won with Lord Suffolk.

For three varieties of cooking Apples, Messrs. T. Guy and E. Ashton were placed as named.

For three varieties of dessert Pears, J. Smith, Esq., was the winner.

For six dessert Apples, Mr. B. Parker was successful.

For twelve Plums, James Garside, Esq., led.

For a dish of Cherries, Mr. B. Ashton won with a good lot.

##### CUT FLOWERS.

In the open class, Mr. W. N. Wood secured the chief award for a single bouquet, and for that of Roses the winners were Messrs. P. W. Heyes, W. N. Wood, and J. Morley.

For a table of cut flowers, Mr. W. Troughton had the best, *Lilium longiflorum*, *L. lancifolium*, *roseum* and *albus*, being very effective. Other good bunches were *Phloxes*, *Chrysanthemums*, *Gladioli*, *Dahlias*, *Sweet Peas*, &c.; second, Mr. T. R. Hayes, Keswick, including *Phloxes*, *Gladioli*, *Poppies*, *Lilies*, &c. The remaining prize went to Mr. P. W. Heyes.

Mr. W. Troughton secured the first award for twenty-four *Cactus Dahlias*, with bright blooms.

For six bunches of stove and greenhouse flowers, Mr. C. Parker won with choice Orchids.

##### VEGETABLES.

These were of high excellence throughout. Messrs. B. Ashton, W. Bailey, J. Smith, H. Dewhurst, R. Cock, B. Ashton, and W. Benson were most successful.

##### NON-COMPETITIVE.

Many exhibits of great interest were staged. These brightened up the show considerably.

Mr. H. Middlehurst had a fine display of Sweet Peas of good substance and colour and immense bulbs of *Lilium Harrisii* 15 inches in circumference.

Mr. W. Shand, Lancaster, contributed a fine display of cut flowers, *Lobelia Queen Victoria* being brilliant.

Mr. H. Bulmer, Blackburn, had cut Carnations.

Messrs. Little and Ballantyne, Carlisle, had a charming bank of herbaceous cut flowers, Roses, &c.

Mr. T. R. Hayes, Keswick, a very good display of hardy Heaths, well flowered and tastefully arranged.

Mr. Isaac Titterington, Preston, showed cut Roses, Violas, Begonias, and herbaceous cut flowers.

Mr. James Saul contributed plants in pots of Pyrethrums, *Phloxes*, *Pansies*, *Violas*, &c.

Mr. T. O. Walker showed a variety of rock and alpine plants.

A certificate of merit was awarded a new Heath, shown by Mr. T. R. Hayes.

Gold guild medals were awarded to those exhibitors who gained most points in the various sections. Nurserymen: Plants.—Mr. W. Troughton, large medal; Mr. H. Winwood, Ashton, small medal; Mr. W. N. Wood, large medal; Mr. W. Troughton, small medal for cut flowers. To gardeners: Plants.—J. B. Dixon, Esq., large medal; H. Dewhurst, Esq., small medal. Fruit.—Mr. B. Ashton, Cut Flowers.—Mr. R. Moss Preston. Vegetables.—Mr. B. Ashton.

Silver Banksian medal for the best exhibit in the show.

—Mr. W. Troughton for his first prize group.

Mr. C. Parker received a certificate of merit for a new *Cypripedium Curtissii ashtonense*.

Mr. E. Payne carried out in a most satisfactory way the secretarial duties.

##### ROYAL HORTICULTURAL SOCIETY.

##### SCIENTIFIC COMMITTEE.

PRESENT: Dr. M. T. Masters (in the chair), Messrs. Gordon, Odell, Drury, Hooper, Saunders, Bowles, Worsley, Dr. M. C. Cooke, Revs. W. Wilks, and G. Henslow, hon. sec.

*Lavender, imprimé*.—Mr. Wilks showed spray of a new selected Lavender, having dark purple corollas and calyx. The scent was also stronger than that of the old form. He observed that the white Lavender was devoid of scent. Mr. Bowles observed that this new kind was somewhat like the dwarf form of Lavender.

*Galls*.—Mr. Odell showed specimens of various galls on the following plants: *Poterium Sanguisorba*, galled by *Eriophyes sanguisorbae*; *Polygonum amphibium*, galled by

*Cecidomyia persicariae*; Oak, *O. sessiliflora* and *O. pedunculata*, galled by gall-wasp, *Aphelinus gemmiae*; *Salsifragilis*, galled by *Nematus gallicus*; bud galls on *Campnula glomerata*.

*Abelia rupestris* (?) *phyllotaxis*. He also showed three stems of this plant having opposite leaves, whorls of threes and whorls of fours on separate shoots.

*Pyrethrum aureum var. "Staghorn."*—Mr. Drury exhibited a plant of this variety raised by Messrs. Storrie, Dundee. It is characterised by a distinct tasselling or cresting of the main and lateral apices, precisely as obtained so frequently in Ferns. This form of variation is extremely rare in phanerogams, the only instance known to the exhibitor being the crested form of *Asparagus plumosus*, in which case it is correlated with extremely Fern-like foliage. In the Pyrethrum shown the leaves are distinctly pinnate, with stipitate pinnae precisely on Fern lines, as are the terminal. It is stated to be so far fixed that 80 per cent. of the seedlings are true after five years' cultivation.

*Malformations*.—Mr. Corderoy sent examples of Wheat-ear, Antirrhinum, in which no flowers were present, but short branches covered with minute green bracts occupied their position. A briar which bore a yellow variegated stem, but the leaves upon it were entirely green, an unusual combination for which no reason could be assigned. Lathyrus latifolius with green flowers. These apparently had received some check, so that although nearly fully formed, the flowers dropped. The stamens had full-sized anthers, which did not dehisce, the styles were arrested much below the anthers, and the stigmas were immature. As the flowers of Honey-suckle sometimes exhibit a similar appearance late in the season, it may be attributable to the late cold month of July.

*Silker-leaf disease*.—Mr. Worsley exhibited the grafted portion of the stem of a Peach or Plum showing the decayed condition of the centre. He observed that below the graft the dead part decreased by degrees downwards, till in the roots there was none. His impression was that the disease (sterenum, according to Professor Perceval) proceeds upwards and downwards. The specimen was sent to Professor Perceval for further examination.

*Onions and caterpillars*.—Mr. J. Walker, Thame, sent some foliage, up on which Mr. McLachlan reports as follows: "The larva is that of some Noctuid moth, and probably of *Mamestra brassicae*, which will feed on nearly everything, from Oak to grass. At the present time hand-picking, where the plants are attacked, would perhaps be best, or a good spraying with some of the paraffin preparations. Earlier in the year—say two months earlier—repeated spraying with arsenical or paraffin preparations might save the young plants. At this season the attacks will probably not do very much harm, as the Onions will be well on towards maturity. One can hardly prevent the depositing of eggs, because the moths fly from a distance; the thing is to preserve the young plants by rendering the foliage distasteful by means of spraying as before mentioned. Even this is uncertain, because the larva may move on to the Onions from some other contiguous crop that may have been gathered, such as Cabbage, &c." Some doubts were expressed as to the desirability of using arsenical preparations, in case it might be absorbed by the Onions, when eaten in the early stage.

*Physianthus and moths*.—Mr. Henslow exhibited flowering sprays of this plant from Cape Town, in which nearly every flower had retained a grey moth, by the prothecis having caught between the anthers, which are fixed to the stigmatic head in Asclepiads. They either died from starvation or were picked off by bats, which are aware of their constant presence in these flowers.

*Pelargoniums with secondary tubers*.—In allusion to the illustration lately received of *Lemnaceum*, with secondary tubers below the first, Mr. Henslow showed specimens of small tuberous-rooted species from barren slopes of Table Mountain, in which similar secondary tubers were found below those from which the foliage and flowers proceeded. He suggested that they might be water reservoirs in this particular case, as the plants were in full flower in the dry season. Such tubers occur in plants (as species of *Erodium*) in the North African deserts.

*Phototropism*.—Mr. Henslow described an experiment to illustrate the effect of light in connexion with gravity, &c. Mustard seed was grown on a thin layer of cotton wool, kept moist, on a perforated tea-tray, suspended under an inverted flower-pot, raised upon a support so that the Mustard was illuminated only from below by means of a sheet of white paper. Gravity had no effect upon the germinating radicles. If any protruded through the holes they at once turned back, and with all the rest were entwined in the wet wool. Phototropism thus entirely superseded gravity. When the tin was suspended horizontally, the hypocotyls with the green cotyledons curved downwards; those on the circumference, being more strongly illuminated, curving more rapidly than the cluster in the middle. When the tin was suspended vertically, after two or three days all the seedlings curved downwards in the direction of both light and gravity, phototropism overcoming negative geotropism, or apogeotropism. These terms, of course, only describe the movements of the hypocotyls as "towards the light," or in "opposition to gravity," or "away from the earth." They are not "forces." The experiment suggested the possibility of different degrees of illumination being the primary influences in causing the upward growth of the stem and the downward growth of the root. It may be remembered that aerial roots of Ivy protrude on the less illuminated side, irrespective of gravity. So, too, the radicle of Mistletoe grows towards the bough on which the seed is fixed, so that as the direct light from the sky is greater than the reflected light from the soil, the shoot-end of a plant grows upwards and the root-end downwards. Gravity, however, is believed to act upon the root-tip, as Darwin and Dr. Francis Darwin explain, unless it be overcome by the presence of water, manure, &c. The stem, by growing upwards in opposition to gravity, puts out mechanical tissues to support itself under the influence of gravity, which always tends to pull it down, and has acquired a permanent tendency to rise, as shoots laid horizontally

will rear their tips perpendicularly if kept in total darkness. Similarly, it is presumably possible that the root-tip has become sensitive to gravity as a secondary effect. As far as the germination of spores can throw light upon primitive conditions, it has been found that the first cell-plate laid down the unicellular spore of Ferns and *Equisetum* is approximately in a plane at right angles to incident light, and that the most illuminated half lays the foundation of the stem. Again, the dorsiventrality of the prothallium of a Fern, and the development of the rhizoids upon the under side, are determined by different degrees of illumination, and not by gravity.

#### DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.

The Floral Committee, at a meeting on August 20, awarded first-class certificates to Mr. T. E. Houtvester, Utrecht, for *Palargonium Zonalis* Mr. H. Martinet, and to Mr. J. J. van Cruijningen, Haarlem, for *Fuchsia Turt Otto von Wernigrode*. Certificates of merit were given to Mr. J. Th. v. d. Berg, Zutphen, for a single Dahlia President Viger as a new plant. A botanical certificate was awarded to Mr. H. H. Willink van Calden, Bruckell, for *Lepidostemon pentstemonoides*, and to Mr. C. J. Kikkert, Haarlem, for *Epiphyllum Medusa* as a rare plant.

#### NATIONAL DAHLIA SOCIETY.

SEPTEMBER 2.

FIRST-CLASS certificates were awarded to Cactus Dahlias: W. F. Balding, yellow centre, shading off to light chrome (Stredwick); F. A. Wellesley, rosy crimson (Shoemsmith); Ianthe, base of petal buff, shading to rosy pink (Burrell); Mabel Needs, crimson, shaded carmine (Mortimer); Winsome, white (green); Eva, pure white (Stredwick); Etta, lilac, suffused with buff (Stredwick); H. J. Jones, primrose centre, shading to rosy pink (Stredwick); Vesuvius, yellow ground, striped crimson (Stredwick).

Show Dahlias: Henry Clark, creamy white, edged deep lilac (Keynes); Pompon Elsa, white (Turner); Single Snow-drop, white, lemon ring in centre (Cheat).

#### SPECIAL AWARDS.

Silver medal for best bunch of Cactus Dahlias in trade classes: Messrs. Stredwick and Son for Miss F. Stredwick.

Silver medal for best bunch of Cactus Dahlias in amateur classes: Mr. P. W. Tulloch for Mrs. Mawley.

Bronze medal for best new show or fancy Dahlia: Messrs. Keynes, Williams and Co. for Henry Clark.

Williams's Memorial Medal was awarded to Mr. L. McKenna for twelve bunches of Cactus Dahlias (amateurs).

Silver medals for single Dahlias were awarded to Messrs. J. Cheal and Sons, Mr. F. W. Seale, and Mr. J. F. Hudson.

#### NON-COMPETITIVE EXHIBITS.

Silver-gilt medals to Messrs. Cannell and to Hobbies Limited.

Silver medal to Messrs. Cutbush and Sons.

Bronze medal to Messrs. Jones and Sons.

Vote of thanks to Messrs. Barr and Sons and to Messrs. Smith Bros.

**Grape Reine Olga.**—I am writing of this Grape under the above name, not being able to put my hand on the volume of the Royal Horticultural Society's Journal, where an interesting account of it appears, together with a faithful representation of a Vine and crop on Mr. Will Taylor's house at Hampton. Now that its adaptability for outdoor culture has been proved, and it is probable that many will be giving it a trial, I should like to note two points in connexion with its successful culture. It wants plenty of room—that is, individual shoots should be left further apart than is usually the practice with outdoor Vines; they should be stopped both in the case of shoots and laterals as with indoor Vines to allow the bunches plenty of light and air; also, as bunches invariably are very thickly set with berries, they require thinning. Dust with sulphur if any sign of mildew appears.—E. BURRELL.

**Early Chrysanthemums.**—The moist and sunless weather of the past summer has had the effect of causing many plants in the hardy flower garden to come into flower much later than usual, but the Chrysanthemums appear to be very good this year. The moist weather has promoted growth so much so, in fact, that quite a large number of what were smaller pieces than usual at the time of planting are now plants of large size. Strange though it may appear, some of the varieties are already flowering profusely, and in my own case much earlier than is usual. That ideal border variety, Mme. Marie Masse, is indeed a picture at the present time. The plants are a veritable mass of blossom, and there are plenty of side shoots to keep up a continuous display for quite a long time to come. The catalogue description of its colour—lilac-mauve—is hardly correct, it is a far more pleasing shade than that. The habit of this plant is branching and sturdy; the height rarely exceeds 2½ feet.

Horace Martin, last season's lovely yellow sport from Crimson Marie Masse, is going to revolutionise the market culture of yellow early Chrysanthemums. I have a large batch of the yellow sport growing side by side with the chestnut crimson-coloured parent, and the two sorts make a most effective contrast. Just now the colour of Crimson Marie Masse is particularly rich and striking, and those who have previously complained of the descriptive name of this variety being a misnomer would at the moment have to recall their words. As the flowers age they become paler, until in the end they pass to a good bronze. Quite one of the prettiest sports is Robbie Burns. This is a sport of which comparatively little is known, yet it is a pleasing flower. It is catalogued as a salmon-pink colour, but there is a shade of cerise in the flowers, and as a whole the flower is very distinct. The creamy-white blooms of Ralph Curtis represent another sport, and of the five sorts here described the last-named appears to be the most vigorous. The flowers of Mme. Marie Masse and its sports are developed on a splendid length of flower-stalk, so that each one may be used for cut flower purposes without disbudding. A pretty free-flowering Pompon in flower at the time of writing is Mme. Ed. Lefort. The colour is old gold and crimson, and the florets are fimbriated.—D. B. CRANE.

**A gale in Scotland.**—A gale of unusual severity was experienced in Scotland on the 3rd inst., a velocity of seventy-three miles an hour having been registered. The wind rose with startling rapidity, and little could be done to save anything exposed to its force. Chrysanthemums, Dahlias, pot Strawberries, and Hollyhocks have been greatly damaged. In flower gardens exposed to the south, whence the first intermitting gusts of the wind came, Geraniums, Antirrhinums, and other plants were snapped off and carried away. Among vegetables Peas have suffered most, the haulm being twisted in every conceivable way and torn from supports. Cauliflowers and Broccoli also have been much damaged. Of fruit the Apple crop has suffered most severely, all kinds, early and late, being blown to the ground. It may be possible to save the best of such sorts as Warner's King and Mère de Ménage, but King of the Pippins and others of that class are still so small as to be worthless. Trees have greatly suffered, large-leaved kinds such as the Sycamore and the Walnut having lost the greater part of their foliage. In many cases the foliage is quite browned. This is the third gale that has passed over the country since June, and by far the worst.—R. P. B.

**Chirita sinensis.**—This pretty Gesneriad is at the present time flowering freely in the Begonia house at Kew, where it shows to advantage among surrounding plants. It is an old inhabitant of our gardens, having been introduced by the Royal Horticultural Society's collector, Mr. Fortune, in 1844, from China. Although the flowers are very pretty they are not the only attraction the plant possesses, for the thick, fleshy, hairy leaves are prettily marbled and veined with grey. The flowers are borne twenty or so together in panicles on stems 9 inches high. In colour they are lilac with two yellow lines in the throat and two reddish brown blotches on the inner side of the topmost petal. The flowers are of good size, being about 1½ inches long and over half an inch through. It succeeds in a warm greenhouse, but thrives better if a little more heat can be given during the early stages of its life. Propagation is by leaf cuttings. If the leaves are laid on Cocoanut fibre and the veins cut through in several places a plant will spring from every cut. Light soil should always be used for potting.—W. DALLIMORE.

**Lobelia cardinalis hybrida.**—Where this is wanted to be grown in a dry or sunny position, the following is a good plan: Sink a 12-inch pot in the ground, make it water-tight with clay, fill it up with rubble, rough earth, and water. Then plant three Lobelia plants round the edge, but above, not in the pot. They soon root into the moist earth. Treated in this way some plants from seeds sown last year are now wonderfully strong, some being 4 feet 6 inches in height instead of only 2 feet.—WINIFRED SPURLING.

# THE GARDEN

No. 1609.—VOL. LXII.]

[SEPTEMBER 20, 1902.

## BULB GROWING IN ENGLAND.

### AN INCREASING INDUSTRY.

**F**OR many years Holland has so enjoyed the monopoly in the production of Hyacinths, Daffodils, Tulips, &c., that the whole class is known as Dutch bulbs, but this name is somewhat misleading. As long ago as 1856 Charles Turner, of Slough, published a catalogue of about 200 varieties of Tulips which he grew and tested for twelve years. For many years a grower at Norwich received first prize from English-grown bulbs at the Norwich Horticultural show for Daffodils in the open class.

There was a time when Lily of the Valley crowns were all imported, but now they are grown by the acre near the King's home at Sandringham. Spalding, Wisbeach, Holbeach, and Ditton now produce tons of Narcissi bulbs of all varieties, but it was not till quite recently that the culture of Hyacinths in England became a success.

Hyacinths have been cultivated for over a century, but they all seem to have been imported, at any rate we cannot hear of the successful propagation and raising of Hyacinths anywhere except at Terrington St. Clement, Norfolk. As the bulb contains an embryo flower, it is necessary that the soil in which the cultivation of bulbs is attempted be of the right chemical and mechanical constituency. The soil of Holland consists principally of sand of a saline character. Much labour is expended in applying suitable manure to it for bulb growing. Terrington St. Clement (Mr. W. J. Belderson's) is situated in the marshland district, a rich fertile tract, which it is said the Romans gained from the sea. The Saxons were so attracted by the extraordinary fertility of the soil that they remained there in force. The survey taken by the Norman Conqueror shows that the present towns were in existence in the days of Edward the Confessor.

It is now secured from the ravages of the sea by artificial banks, the inner rampart being attributed to the Romans. Some writers are of opinion that this tract of the Isle of Ely was originally firm and dry land. Strong evidence in support of this idea is the great number of trees found below the surface which do not grow in marshy districts, their roots standing in the firm earth below the alluvial soil. On cutting the channel called Dounham Ean Furze bushes were found

17 feet below the surface, also Nut trees pressed down flat, with Nuts firm and sound near them. The alluvial soil is one of the richest tracts our country possesses, and capable of producing almost any crop that agriculturists or horticulturists can desire.

Several times the whole country has been flooded. On September 1, 1613, the sea overflowed all marshland. In March of the next year it was covered with fresh water, and again on September 13 and 14, 1671, all marshland was flooded by the violence of the sea. Such is a brief description of the formation of the soil of the district that is now producing Hyacinths as well as other bulbs equal to and in some cases better than imported ones. The Dutch soil is wanting in humus and needs much addition of manure to grow good bulbs. This is not required by the marshland soil.

The propagation of the Hyacinth is effected by hybridising to obtain new varieties, and by offsets for perpetuating older or distinct kinds. Some sorts, such as General Pelisier, produce a large number of offsets, others are shy in this respect. To rapidly produce bulblets cultivators scoop out the bottom of full sized bulbs as soon as they are lifted in July; these are dipped in sand and then laid on a shelf in a warm and dry greenhouse. In a short time a number of bulblets appear between the leaves of the parent bulb. In the autumn these are planted, and when dug up the next year the old bulb consists of a few withered leaves with a quantity (from twenty to forty or fifty) of bulblets, ranging from the size of a Broad Bean to bulbs so minute that they can scarcely be handled. These are sorted from the soil and planted again in September or October. The second year a few small flowers are produced, allowing the careful cultivator to rectify any mistakes in naming which may have taken place in the drying sheds. The after culture consists of planting and taking up annually until a saleable bulb is produced capable of bearing such flowers as they did last year when blooms from Terrington bulbs beat all competitors at a Yarmouth school competition.

There is no reason why we should buy Dutch bulbs from Holland when we can support British industry by purchasing English grown ones, and it will be an advantage to the producer of the flowers, as he can get bulbs free from disease and under fair conditions capable of bearing grand flowers.

Of course the Hyacinth culture in England is quite in its infancy, still those who last year purchased bulbs are pleased, as the stock of

"number ones" is being rapidly reduced. The primary object of Hyacinth culture in England is, of course, the production of bulbs, but in the interval a quantity of flowers are borne which are disposed of in provincial markets. Marshland is famous for its flowers. It has been said that the best blooms coming into Covent Garden market are grown at Terrington. Certain it is that Narcissi, Tulips, and Snowdrops generally command the highest market price. Narcissi are grown by the acre. These are generally plucked before properly expanded, placed in a warm house in troughs of water, and forced open by keeping the house or shed to a high temperature. This method prevents damage to the flowers in plucking, as being undeveloped they are not easily bruised, and also ensures the cleanliness of the flower. Often the blooms are plucked several days before going to market. If the public were wise they would purchase in the immature state. Tulips are forced by the acre in the open ground.

The greenhouses used to cover them are constructed by movable lights 6 feet by 4 feet, laid on rafters and bolted down. As many spans are erected as required in one batch. Independent hot-water boilers with screened wrought iron pipes are used to maintain a good heat, and in a few weeks a mass of flower fills the house. As soon as these are cut the houses are moved over another batch of Tulips. Snowdrops are an important bulbous crop in this locality, the flowers are good, and the bulbs are often sold at a higher price wholesale than best Dutch bulbs are making retail.

### KEW NOTES.

#### INTERESTING PLANTS IN FLOWER.

*BEGONIA ANGULARIS*, *Clematis meyeniana*, *Clian-*  
*thus Dampieri* and varieties, *Gardenia Rothmannia*,  
*G. Thunbergia*, *Hedychium gardnerianum*, *Lilium sulphureum*, *Lisanthus russelianus*, and *Melocactus communis*.

*Palm House.*

*Faradaya splendida* and *Ixoras* in variety.

*Succulent House.*

*Sansevieria æthiopica.*

*Range.*

*Æschynanthus grandiflora*, *Amazonia calycina*,  
*Begonia* (various species), *Gladiolus natalensis*,  
*Hæmanthus coccineus*, *Hippeastrum Bagnoldi* var.  
*gillesiana*, and *Senecio (Kleinia) Galpini*.

*Greenhouse.*

*Angelonia salicariæfolia*, *Begonia coccinea*,  
*Campanula isophylla* var. *Mayi*, *C. Loreyi*,  
*Cuphea micropetala*, *Datura fastuosa* varieties,  
*Hidalgoa Wercklei*, *Lantana salvifolia*, *Liriope spicata*, *Nierembergia filicaulis*, *Solanum integrifolia* var. *inermis*, and *S. Melongena* in fruit.

*Rock Garden.*

*Calceolaria mexicana*, *Chelone Lyoni*, *Corydalis thalictrifolia*, *Habenaria ciliaris*, *Lobelia sessilifolia*, and *Satureja montana*.

*Herbaceous Plants.*

*Argemone grandiflora*, *Aster* (various species), *Convolvulus Cantabrica*, *C. tenuissimus*, *C. mauritanicus*, *Coreopsis* (various), *Dahlia coccinea*, *D. variabile* and others, *Hollyhock* *J. Bennett-Poë*, *Kniphofia* (various species and varieties), *Mirabilis jalapa*, *Gerbera punicea*, *Polygonum* (various), *Rudbeckia* (various), *Sunflowers* (various), *Veronica exaltata*, *V. spicata*, and *Venidium Krausii*.

*Orchid House Wall.*

*Abutilon megapotamicum* and *Capparis spinosa*.

*Shrubs in Arboretum.*

*Arbutus Unedo*, *Calluna vulgaris* and varieties, *Clematis* (various), *Clerodendron trichotomum*, *Clethra acuminata*, *C. alnifolia*, *C. alnifolia* var. *tomentosa*, *Hypericum* (various), *Lonicera japonica* var. *halleana*, and *Rhododendron ferrugineum* var. *myrtifolium*.

## NOTES OF THE WEEK.

## FORTHCOMING EVENTS.

September 22.—Meeting of the Floral and Executive Committees of the National Chrysanthemum Society.

September 23.—Royal Horticultural Society, meeting of committees, Drill Hall, Westminster; committee meeting of National Dahlia Society.

October 7.—Royal Horticultural Society, meeting of committees, Drill Hall, Westminster; National Chrysanthemum Society's Show, Royal Aquarium (three days); National Chrysanthemum Society, meeting of Floral Committee; meeting of Scottish Horticultural Association.

October 20.—Meetings of National Chrysanthemum Society's Floral and Executive Committees.

October 21.—Royal Horticultural Society, meeting of committees, Drill Hall, Westminster.

October 28.—Croydon Chrysanthemum Show (two days).

October 29.—Kent County Chrysanthemum Show at Lewisham (two days); Highgate Chrysanthemum Show (three days).

**Articles on bulbs.**—The following articles have been crowded out of the present number, but will appear later: The Alderborough Anemones, The Tulips, and Dwarf Bulbous Irises.

**Great Fruit Show at the Crystal Palace.**—A full report of this show, held on Thursday under the auspices of the Royal Horticultural Society at the Crystal Palace, will appear next week.

**Poor Potato crops.**—Not for many years have the prospects of Potato growers been so bad as this year; in many districts not more than half the usual quantity of tubers will be gathered. Except in the North the Potato disease has been, and continues to be, very prevalent, and if the present wet weather continues the prospects of an improvement are not bright.

**Terrible storm in Kent.**—A storm of great severity passed over the Maidstone district last week, and wrought terrible havoc amongst the Hops. In many cases the fruit crops are entirely ruined. Even hard Pears were cut by the hailstones, all trees were stripped of their foliage, and Potato and root crops washed out of the ground. Colonel Warde, the member for the Medway Division, who resides at Barham Court, Teston, suffered severely. No fewer than 1,650 panes of glass in his greenhouses were smashed, and nearly all his outdoor fruit stripped from the trees. The leaves were stripped from 2,000 Chrysanthemum plants standing out of doors. Colonel Warde's gardener is Mr. G. Woodward, the most skilful fruit grower probably in Kent, who is generally the most successful prizetaker at the annual fruit show held at the Crystal Palace. Another property owner at Teston has lost 6,000 Peaches and nearly 400 bushels of Apples and

other fruit. At Wateringbury a brewer has very little left of his sixty acres of Hops, which were regarded as among the finest in the country. Messrs. Buinyard and Co., Royal Nurseries, Maidstone, write: "In view of the disastrous storm that has passed over this district and ruined the fruit prospects of so many growers, we should be glad if you would state that our nurseries entirely escaped the hail, though 1½ inches of rain fell in one hour."

**Notes from Baden-Baden.**—Whether it is from the changes in temperature or from natural causes, *Silene Hookeri* has entirely changed its beautiful delicate flesh colour—as figured in the *Botanical Magazine* to a beautiful deep rose. It is a plant for the alpine house, but well worth any care bestowed on it. The roots do well for several years, and the singular shaped flowers attract attention at once. There is a small but very bright and deep-coloured yellow *Clematis* from Tibet, which looks very promising: it must, of course, be seen after a year or two when in full perfection to judge exactly as to its merits. *Lilium Brownii* var. *leucanthum* is a very striking plant; it is perfectly hardy and very easy to grow. The bell-shaped very large flowers are white, with a yellow inside, and exhale a strong perfume. *Clematis paniculata* has small sweet-scented white flowers, but their small size is compensated for by their abundance: it is a very ornamental plant. Another *Clematis* from Tibet looks very promising, even small plants (seedlings of spring) have half-a-dozen brilliant deep yellow flowers, which contrast well with the blackish green foliage.—MAX LEICHTLIN, *Baden-Baden*.

**Mersina and Messina.**—**A correction.**—Mr. A. F. Christmann, Mersina, Asia Minor, writes: "I notice in THE GARDEN of May 3, page 288, that you mention that Mr. W. Liehe's address is Messina. This is an error. Messina is in Sicily, whilst Mr. Liehe is at Mersina, a small town on the south-western coast of Asia Minor (Adana Vilajit)."

**Fruit growing in California.**—Mr. Charles Howard Shinn, Inspector of Experiment Stations in California, has sent an interesting pamphlet about fruit tree experiments at or near the southern coast range station. It is freely illustrated, and fruit growers here can get many useful hints from these records of carefully conducted experiments.

**National Dahlia Society.**—A committee meeting will be held at the Drill Hall, Buckingham Gate, Westminster, S.W., on Tuesday next, at 12.45 p.m., for the purpose of awarding certificates to seedling Dahlias. Entries will be received by the hon. secretary at the Drill Hall, before 11.30 a.m., on the morning of the meeting. The committee will meet again (by kind permission of the Horticultural Club) in the club room at the Hotel Windsor, Victoria Street, S.W., on the same date, at 4 p.m. Agenda for second meeting: Exhibition arrangements (1903); other business.—J. F. HUDSON, *Hon. Sec.*

**Mr. Joseph Cheal**, who has recently returned from a trip to America and Canada, in speaking of the latter country to a representative of the *Sussex and Surrey Courier*, said his impression was most favourable. "There are on all sides evidence of prosperity and progress. I had thought the long cold winter almost an insuperable barrier, but the Canadians assure me it is not so bad as we imagine. Though the frosts are very severe, the wood of the fruit trees is so well ripened that it escapes uninjured, and the air is so dry as not to be unpleasant to human beings."

**University College, Reading.**—The next session will commence on Thursday, October 2. The horticultural course extends over forty weeks, thirty weeks of the ordinary college session and ten additional weeks. By this arrangement students need not remain away from the garden for any length of time. The courses of study in horticulture are arranged to meet the special needs of students preparing for the certificate granted by the Oxford and Reading joint committee, the examinations of the Royal Horticultural Society, County Council instructors

in horticulture, &c. Mr. William H. Patterson, late of Swanley Horticultural College, Kent, is the lecturer on horticulture. The college garden for practical work is situated in the London Road, Reading, and has been placed at the disposal of the college by the kindness of Mr. Alfred Palmer, J.P., of Wokefield Park, Berks.

**A cottage show at Warley.**—A most successful cottage flower show was held on the 4th inst. for the parishes of Great and Little Warley, at Warley Place, through the kindness of the president, Miss Willmott. This is the fourth year of this annual show, and showed an advance in interest and enthusiasm on the previous years. The schedule was a very full one, containing ninety classes, none of which lacked competitors; in fact, so keen was the competition in some classes that extra prizes had to be given. As many as ten, eleven, and fourteen entries were entered in some classes. The vegetables of the cottagers were of a very high order of excellence, and called forth the praises of the judges, Messrs. Walker, Douglas, Page, and Foster. In a spacious marquee provided by Miss Willmott was arranged in the centre a fine group of Lilies, Palms, and various other flowering and foliage plants, and on tables round the sides was staged a very fine collection of fruit and another of vegetables from the gardens of Warley Place. These three items were arranged under the superintendence of Mr. Preece, the gardener. In another part of the marquee and forming a fitting setting to the prizes in kind, was a very handsome bank of Dahlias and coloured foliage arranged by Mrs. Berkeley. The rest of the space round was crowded with the exhibits of vegetables and fruit of the cottagers and amateurs. Two other smaller tents were provided, and contained the floral exhibits in the way of cut flowers, pot plants, and collections of wild flowers and wild fruits. These also contained the handi-craft exhibits of carpentry and ironwork, and housewifery exhibits. Mr. Russell, the nurseryman, filled one end of one of the tents with a fine group of ornamental hardy shrubs, and Mr. Leonard Brown occupied a good space in one for an exhibit of spikes of Gladioli. There were three decorated dinner tables for competition. A fourth table was also decorated by Mrs. Green, of Harold Wood. The chief prize given by the president for a collection of vegetables, flowers, and fruit, and consisting of a piece of silver plate, was well won by Mr. Allen, Mr. Wallis being second, the second prize being 20s. The first prize for the best cultivated garden (prizes by the president) was won by Mr. Allen. Mr. J. Hanch was first for the best cultivated allotment (prizes by Colonel Whittington), Mr. Wallis was first for the prettiest garden (prizes by Mr. W. Robinson), and Mrs. Felton was first for the prettiest window (prizes by the president). In the class for a collection of vegetables for cottagers there were eight entries—first, Mr. Shepherd; second, Mr. Shelley; third, Corporal Dunn; extra prize, Mr. F. C. Cook. During the afternoon various sports were held—walking the greasy pole, chasing the pig, slow bicycle race, jockey race, donkey race, and others of a more or less amusing character. The band of the Essex Regiment was in attendance and added much to the afternoon's pleasure. The famous gardens of Warley Place were also at liberty to be viewed by all visitors to the show, this great treat and privilege having been most graciously accorded by Miss Willmott, than whom there is no more interested worker in the improvement of the gardens of the cottagers in the two parishes. The weather was perfect, and so the visitors proved numerous, many coming from a distance and from Brentwood and around. Thus everything conspired to make the show a success, and to encourage the president, committee, and the secretary (Colonel Whittington) to persevere in their efforts for the improvement of the gardens round and about them.

It is, however, all parishes that are blessed with such a real lover of gardening as Miss Willmott.—Contributed. [We are very pleased to notice so interesting an exhibition. Such exhibitions have a great influence for good in the villages and small towns, as we mentioned in our leader of last week.—ED.]

**Astilbe chinensis var. Davidii.**—Very few plants indeed—certainly none of the numerous array of hardy subjects gathered together at the Drill Hall on the 5th ult., and described in THE GARDEN, page 104—attracted anything like so much attention as this remarkable plant when exhibited by the Messrs. Veitch. Many times the fine example was referred to as the “best new plant for many a day,” and when to this we may add the word “hardy” with the fullest confidence, we have in the above not merely a first-rate novelty, but one that will create in the open garden a feature undreamt of hitherto. In its praise we can hardly say enough. Its vigour, its free flowering, and its adaptability to the peculiarities of the British climate were all seen at a glance in the fine plant shown on the occasion. Hitherto its colour in the hardy plant garden has been quite rare, and indeed in this respect is only approached by one small group, viz., the Willow Herbs or Lythrum, but these do not impress one with their importance, and the foliage in particular is not interesting. The advent, therefore, of this fine Astilbe is all the more welcome. Free in growth, and not slow in any extreme degree, it should not be long, even though the plant may not come true from seeds, before a fairly good stock is obtainable, and additional importations may also be expected. In any case, so good and distinct a subject will not want admirers. What a fine effect a bed would make set out upon the lawn, where depth and quality of soil was assured, or again at no great distance from the water the effect would also be good. If one may venture to criticise so good a plant, it is to say that the apparently natural close gathering of the erect inflorescences is not for good—a wider spread of these would have been infinitely more telling. Doubtless to this the well-known reply will be promptly forthcoming that “every good quality is not possible in the individual subject, and the plant is good enough as it is.” With which I heartily agree. The plant is an acquisition.—E. JENKINS.

**Exochorda Alberti.**—The best known species of Exochorda is that figured on page 161 of THE GARDEN, viz., grandiflora, which merits every word that has been said in its favour as a delightful spring flowering shrub. There is, however, a second species (E. Alberti), which, though perhaps not quite equal to the other, is a decidedly pretty flowering shrub. It was discovered in Turkestan nearly twenty years ago by M. Albert Regel, son of the last Dr. Regel of St. Petersburg Botanic Garden, where it was first of all sent, and gradually made its way into cultivation. On April 14, 1894, Exochorda Alberti received an award of merit from the Royal Horticultural Society. The main points of difference between the two species from a garden point of view is that E. Alberti forms a more erect shrub of sturdier and denser growth and of more regular outline, while the flowers are somewhat smaller and closer arranged than in those of E. grandiflora. Added to this the flower racemes of E. Alberti are more erect than those of the other. Being robust in growth it may prove of value for planting where the more delicate E. grandiflora does not thrive.—T. [Our experience is that E. Alberti does not flower so freely as E. grandiflora.—ED.]

**Olearia Haastii.**—While opinions may differ regarding the question as to which is the finest of all the Olearias, I do not think there can be much doubt about which is the best and most generally useful of the hardy species. This position one would claim with some confidence for O. Haastii, which has also the merit of flowering at a season when shrubs are scarce, and it is thus even more appreciated than if it flowered at a time when other hard-wooded plants were plentiful. Its leaves, glossy above and white beneath, are also pretty. Then when at its best it is charming with its masses of white flowers, which almost cover the whole bush. Unfortunately, it suffers soon from rain, and its flowers get a dingy white. Yet one can appreciate that purity when it is with us, and in dry weather it remains some time perfect. The best bush I have

here is one which is grown on a dry rock garden facing south-west. It is kept down to some extent by cutting back, but this season it is some 6 feet high and about 5 feet through. It has been a little later than usual, and was only at its best at the end of August and the beginning of September. O. Haastii is easily propagated by means of cuttings—S. ARNOTT, Carsethorn, by Dunmurry, N.B.

**Rose Longworth Rambler and the season.**—For some years I have found this one of the best of my pillar and climbing Roses, as it has hardly ever failed to bloom both profusely and for a long period during the season. This year, however, it has been less satisfactory than usual, and I cannot account for this except on the assumption that the season has not been suitable for it. Unfortunately, it is a Rose little grown in this district, and I have thus had few opportunities of observing its behaviour for myself elsewhere. The enquiries I have been able to make, however, have led me to believe that my experience is not singular, but I should be glad to hear how it has done this season with others. It is now finer than it has been this year before, the warmer weather at the end of August having suited it. On the other hand, Mme. Isaac Pereire, which is usually a poor early season Rose on a light soil, but which makes up for this in autumn, has been better early in the summer than I have ever seen it before in my garden. These notes of observation will help us in allotting such Roses to the position in which they will flower best in average years.—S. ARNOTT, Rosedene, Carsethorn, N.B.

**Gomphia Theophrasta at Kew.**—Although the genus Gomphia is a large one and contains many species which from descriptions must be very interesting, very few are in cultivation, and those are rarely found outside botanical collections. At the present time the species under notice is in flower in the Palm house at Kew, and is decidedly showy. It is found wild in Mexico, where it is said to make a large bush or small tree, and was first introduced into European gardens by Mr. Linden. At Kew the specimen in flower is about 8 feet high, with a straight stem crowned with a large head of dark green leathery leaves with undulated and serrated margins. In point of size the largest measures 2½ feet to 3 feet in length and 6 inches to 7 inches in width, the petioles being reduced to a very short, thick stalk 1 inch long. The flowers are yellow and three-quarters of an inch across, and are borne in large terminal panicles 1 foot or so high and wide. It thrives under the same treatment as the ordinary stove plant, and is worth obtaining by those who prefer a collection of rare and interesting plants rather than large quantities of commoner things which are to be found in almost every garden.—W. DALLMORE.

**How to get good herbaceous Phloxes.**—In the recent notes on the above perennials one method of planting is omitted that I have always found very satisfactory for large beds, viz., grouping of the different sections. The massing of certain colours of one particular section makes a very fine display for a time, but at its best affords but a short season, and if the beds are in a prominent position they are practically flowerless for the greater part of the year, unless other things are plunged amongst the Phlox. Given large beds, anything say over 15 feet in diameter, I like to have bold alternate clumps of both the suffruticosa and accussata sections, and carpet all intervening spaces with subnata and its varieties. By this means the beds are bright for four months beginning in June, and in spring the glorious carpet of colour afforded by the alpine section shows in admirable contrast against the young growths of the taller members of the family. Deep tilth, good holding manure, and a heavy surface mulching are absolutely essential for success with all the suffruticosa class. If intending planters do not know the different varieties it is well to get a little information as to heights and colours so that the grouping may be effective. Also, if time permits, I should strongly recommend the removal of decaying pips. These pips are so thickly set on

the trusses of bloom that those towards the base or rather towards the exterior of the truss are not able to push out and develop unless their fellows in front of them that have served their purpose are removed. Naturally, the opportunity given for a second lot of flowers means a much longer display.—E. BURRELL.

## CARPETING PLANTS FOR BULBS.

MANY of our brightest and best spring flowering plants are bulbous, and make scarcely any foliage until March, the ground is therefore bare all the winter if they are planted alone. To remedy this defect I always use some dwarf-growing plant as a carpet in the beds where Tulips, Hyacinths, and such like plants are grown; this gives a greater variety of colour, and some beautiful combinations may be formed. For instance, Tulip Chrysolora (which is the best of the golden yellow kinds) rises out of a mass of blue Aubrietia; the double form of Arabis alpina (which has quickly become a general favourite) forms a snow-white carpeting for Tulip Couleur Cardinal, whose rich purplish red tints of stem and flower show to advantage when thus associated; white Hyacinths look well on a groundwork of Myosotis dissitiflora, especially if the variety Dyerae is grown, as this has much larger flowers than the type; pink and red Hyacinths may be planted among single white Arabis, if a good dwarf form of the latter plant is selected; Scilla sibirica also looks well among white Arabis, and both flower well together. A good strain of yellow Polyanthus makes a suitable ground work for Tulip Duchesse de Parme, or for Hyacinth La Perouse; but arrangements may be multiplied indefinitely according to individual tastes, and the above are merely given as illustrations. Some of the dwarf Wallflowers are occasionally used in this way, and do well if the planter remembers that they increase during the winter, and must consequently be planted very thinly or the Tulips will be smothered.

Narcissi are not used here for spring bedding in the ordinary sense of the term, as they require planting early in September before the summer occupants of the beds are removed, they are therefore grown in other places where they need not be disturbed, and where bare ground is not so objectionable; they may, however, be carpeted over, although for the benefit of the bulbs I would advise the removal of the carpeting plants as soon as they have flowered. N. Golden Spur or any of the deep yellows may be mixed with Erica carnea; N. Duchess of Westminster may have a carpeting of double pink Daisy; N. Empress may have a groundwork of double-red Daisy; N. Grandee (bicolor grandis) would flower in time for blue Aubrietia; N. poeticus and Aubrietia Leichtlinii would come in well together; and any green carpeting plant such as Saxifraga hypnoides, S. Camposii, S. muscoides atropurpurea, S. Rhœi, Phlox amoena, and various others may, of course, be used with any of them. The flowers of the Narcissi stand out individually when the bulbs are planted about 9 inches apart, and the carpeting plants effectually hide the bare appearance of the beds. With Narcissi the order of planting must be reversed; it is not safe to move Aubrietias and several other plants of this class until after the middle of October; the Narcissi must therefore go into the ground first, and their positions be marked with a peg so as to avoid disturbing them afterwards.

Beds of Tulips, Hyacinths, Scillas, &c., generally have the carpeting plants put in

first; the bulbs are then put in between them on a dry day about 15 inches or 18 inches apart. The planter uses a blunt dibber,  $1\frac{1}{2}$  inches in diameter, with a hole bored through it 6 inches from the bottom to admit of a cross peg, and thus ensure the bulbs being placed at a uniform depth; the soil is filled in firmly with the end of the dibber and no further attention is needed until the plants flower.

The above notes are given in the hope that they may encourage others to commence growing spring flowering hardy plants. The following short lists of plants suitable may also be found useful.

#### PLANTS FOR CARPETING.

*Aubrieta deltoidea*, selected blue, A. d. Hendersonii, A. d. Leichtlinii, A. d. variegata, *Arabis albida* flore-pleno, *A. alpina*, Daisy double pink, double red, and double white, *Erica carnea*, Golden Feather (*Pyrethrum*), *Heuchera hispida* (Richardsoni), *Myosotis dissitiflora*, M. d. Dyerei, M. d. alba, *Phlox amena*, *P. divaricata*, *P. Newry Seedling*, *Polyanthus white*, *P. Wilson's blue*, *P. yellow*, *Saxifraga Campsis*, *S. hypnoides*, *S. muscoides atropurpurea*, *S. Rhei*, *Violas Blue King*, *Bullion*, *Cliveden Purple*, *Croft House White*, *Duchess of Sutherland*, *Robinson's Standard*, *Skylark*, and *Waldsteinia trifolia*.

#### BULBS FOR SPRING BEDS.

*Hyacinths* White La Grandesse, Grand Vainqueur, Gigantea (blush), Robert Steiger, Charles Dickens, Norma, and Macaulay (red), Grand Lilas, La Peronne, and Czar Peter (blue), *Tulips* (single) Chrysolora, Cottage Maid, Coeur Cardinal, Duchesse de Parma, Elegans, Keizer Kroon, Golden Crown, Picotee, Pottebakker (white), *Proserpine*, Royal Standard (striped), Retroflexa, Stanley, Vermilion Brilliant, White Swan (Messrs. Pearson), and Wouverman. *Tulips* (double) Le Candeur, Murillo, Rubra maxima, and Tournesol. *Narcissus* Ard Righ, bicolor Empress, bicolor grandee, bicolor J. B. M. Camm, Emperor, Glory of Leiden, Spur, Henry Irving, nanus, obvallaris, Golden P. R. Barr, Incomparabilis Beauty, I. Sir Watkin, I. Queen Bess, Leedsii Duchess of Westminster, L. amabilis, Barri conspicua, and Poeticus ornatus.

W. H. DIVERS.

*Belvoir Castle Gardens, Grantham.*

#### THE WALL GARDEN IN SEPTEMBER.

THOUGH summer is over and hardy flowers are becoming scarce, there are numerous instances in rock gardens as well as in wall gardens of bright flowers being actually at their best during September. A very pretty example of this is furnished by the accompanying illustration, which depicts a wall garden in September. I was allowed to photograph it by the kindness of Sir Warwick Morshead at Tregaddick, near Bodmin. The portion illustrated is a retaining wall about 6 feet high,

and it is now exceptionally gay with flowers. At the bottom in the foreground will be noticed a mass of white Heather in full bloom contrasted with the mauve flowers of *Linaria Cymbalaria*, and above that bold masses of the red Valerian (*Centranthus ruber*). The very slight shade afforded by the red Valerian allowed Ivies and Ferns to flourish next to it. A great feature of this wall consists of some judiciously introduced annuals such as *Eschscholtzia*, which are now in full bloom and form a pleasing contrast to the flowers of numerous *Antirrhinum* in red and purple shades of colour. *Sedums*

flowers at this time of the year are particularly welcome, and when they have a chance of at least partly drooping over the wall they show to double advantage; the greyish foliage, too, forms a pleasing contrast to the scarlet blossoms, and a great boon is that the plant when once established will take care of itself and flourish even in a very dry spot. Another plant of great merit for the wall garden is

*Plumbago Larpente*, whose bright cobalt blue flowers are now at their best. In a properly made wall garden there should be a fair amount of good light earth behind the stone.

*Plumbago Larpente* will send its rhizomes under ground to a great length, and its flowers will almost suddenly appear peeping out from the chinks and fissures of the wall where least expected. Much less rampant in its growth but exceedingly pretty as a wall plant is

*Lippia repens*, the pale green foliage and clusters of light pink blossoms being just now very attractive. Another pink flower blooming for the second time is

*Frankenia hirsutus*. This, however, does not thrive so well on a wall fully exposed to the sun as in a partly shaded position.

*Enothera pumila*, with its small, yellow flowers and its dwarf habit also makes a good wall plant flowering this month, and the same might be said of the perennial

*Antirrhinum glutinosum*, which still has its large white flowers open, displaying them against some belated blossom of blue *Campanula portenschlagiana*. I may here also mention a pink

*Convolvulus*, well suited to the wall garden in the west of England. Its flowers are now at their best; they are of a bright rosy pink and about the size of a florin. If planted on the top of a wall next to some bushes it will speedily climb over the bushes and spread itself out rather quickly. This plant must, of course, be restricted in its growth, but for quickly covering a rough wall or stony bank it has no equal. In winter it dies down altogether, and no foliage is visible till about May. An exceedingly neat and pretty wall plant now still in full bloom in the west is

*Asteriscus maritimus*.

It is not hardy in the northern counties, nor is it quite hardy in the southern counties, but it thrives well in Torquay, Helston, Penzance, and other places. But even where it is not hardy this plant should be grown, for it is an easy matter to take cuttings. These strike very freely, and if protected would ensure plenty of flowers for the following year. The deep yellow blossoms almost resemble miniature Sunflowers, but they are only a few inches above the ground, most attractive, and quite the size of a florin.

Among *Sedums*, *S. caeruleum* is just blooming a second time, its delicate blue flowers being singularly pretty. Also *S. kamtschaticum* and *S. middendorfianum*, which were mentioned last month as being in bloom, have not yet lost their beauty.

#### GOOD WALL PLANTS NOW IN BLOOM.

I will now mention plants in bloom at the present time (middle of September) in other wall gardens. One of the best plants for a position similar to that occupied by the Carnations mentioned above as growing on the top of walls is

*Zauschneria californica*. The bright scarlet

WALL GARDEN IN THE GROUNDS OF SIR WARWICK MORSHEAD, AT TREGADDICK, BODMIN, CORNWALL.

(From a photograph taken in September by Mr. F. W. Meyer).

*Acena buchananum* is attractive in the wall garden, not so much on account of its flowers as its beautiful glaucous foliage. When the large crimson globular heads of flowers of the peculiar *Acena microphylla* are allowed to mingle with the former the effect is very striking.

Elmside, Exeter.

F. W. MEYER.

## TREES AND SHRUBS.

### TRANSPLANTING EVERGREEN TREES AND SHRUBS.

PRACTICAL men engaged in garden making frequently carry out planting operations, through force of circumstances, at times and seasons that would be considered unwise by those of more limited experience. It will probably be more expensive in the matter of labour to do work at what may be termed unseasonable times, but otherwise there is not so much risk as many suppose. I have moved evergreens in summer, but there was a good supply of water and mulching material, and the men were accustomed to the work and knew the importance of damping the foliage and keeping the bark fresh by every available means until root action commenced. The latter process will begin at once when the soil is moist and warm, and as soon as the fibres lay hold of the soil the tree is safe, so that really a tree moved in summer, if well cared for, quickly establishes itself in its new position.

There is, of course, a best time, or what is generally considered to be a best time, for the average planter to move evergreens, and this I should say is from the middle of September to the end of October in autumn, and from the middle of March to the end of April in spring. In the latter season it may be as well not to move anything during a spell of very drying March winds, although this objection might be obviated by the use of damp canvas or sacking round the roots, where they could be placed and firmly fixed in position by watering. Every year, even when the work is done at the best planting season, many things die from neglect. The critical time for things planted in autumn is in the spring, when the harsh drying winds set in. The trees may look fresh and green during the winter, and the mind of the casual observer may be lulled to rest for a time by appearances; but the roots have scarcely made any move, and are certainly not in a condition to bear up under adverse circumstances without help. This is the time when the water-pot, the syringe, or the hose over the foliage will do so much good, and unless this help is given the collapse is usually sudden and complete. I have often talked this over with people who had planting done, and they have said, "Oh, I am sure the trees have been well watered." Self-deception is so easy, especially to those who do not care to over exert themselves, who would rather wait for Providence to send the showers and temper the winds to the shorn lamb or the moved tree with lacerated roots. Some there are who think you are needlessly fussy when stress is laid upon the value of the hose and syringe over the foliage in bright, sunny weather, when the roots are trying to get a firm grip of the soil. But it is in the observance of small details that success is assured. One person may plant a tree as well as another, and yet one fails and the other succeeds. The reason is success is based upon the study of details and in their careful execution. And among evergreens there are several matters, small in themselves perhaps, but which bear importantly upon the success of the work. It is necessary to save as many roots as possible, and not only to save them during the process of lifting, but to protect and care for them until they are covered with soil and made firm in their new position. In taking up a tree or shrub of any size, begin far enough from the trunk and dig a deep trench round before the soil enclosing the roots is inter-

fered with. Then gradually reduce the ball until the movable limit has been reached. Of course, a tree or shrub with spreading branches will have had these tied in securely before the soil round the roots is touched. To move large trees requires proper tackle, but I have moved many trees and shrubs up to half a ton in weight with a very simple contrivance made of sheet iron, strengthened by transverse bars of flat quarter-inch iron. When completed the skid would be about 3 feet square, and fitted with two iron rings at each end for passing a cord through to secure the stem of the tree, and to which a horse could be hitched on occasions if necessary. When the tree was ready for removal the stem was pulled on one side, the sheet iron skid thrust under the bottom, the tree lowered upon it and secured with a cord, and afterwards a horse or man could be employed to move it, or, if the ground was rough or it had to be moved along a gravel road, a long-handled trolley on low wheels we used to find very handy. Of course, in moving very large trees more expensive tackle would be necessary, but the size generally moved could be easily and quickly carried anywhere with the simple contrivance named above, and any country blacksmith could make it or something on the same lines.

I believe in watering trees in and making the soil firm round the roots, they get established sooner; it is necessary also to secure the trees from swaying, which, if it occurs, will prevent their re-establishment. It is desirable, too, in moving a tree from a sheltered place to an exposed one to place a screen of some kind as a shelter for the first season till the tree has got acclimatised. Those who plant and leave things to Nature very frequently fail, and deservedly so. If the trees have to be purchased, buy as near home as possible when well-rooted plants which have been regularly transplanted can be obtained. If taken from nurseries where transplanting is neglected, failures must be expected, even with the best attention.

E. HOB DAY.

### TENDER SHRUBS AND TREES.

YOUR articles on "Tender Shrubs and Trees in the South-West" have greatly interested me, inasmuch as when laying out a small garden (about 1½ acres) here nearly five years ago I planted many of the species mentioned, although in some cases quite unaware that they had been tried anywhere in England in the open air. A few notes may be useful for comparison, and may indicate possibilities for those who have not the advantage of a Cornish soil or climate. The following plants suggested by your lists have been tried here without winter protection, and I am convinced that a very small percentage of the losses sustained can be wholly attributed to frost or cold. Soil and moisture are the two elements of uncertainty which have played the greater part in checking the growth of many tender but desirable shrubs. Where a name is inserted without comment it signifies that the species is alive and apparently healthy, but since this garden is small and so recently formed few shrubs have yet attained or been allowed to attain any considerable height.

*Benthania fragifera*.

*Boronia elatior*, *megastigma*, and *elliottiana* all failed, the soil quite unsuitable.

*Buddleia Colvillei*, *variabilis*, and *globosa* all free flowering; *variabilis* is already 20 feet in height.

*Callistemon rigidus* not quite so hardy as *Metrosideros*, but flowers fairly.

*Camellia reticulata*, *Sasanqua*, and *japonica* also grown.

*Cantua buxifolia* very healthy, but has not yet flowered.

*Carpentaria californica* flowers freely.

*Caryopteris Mastacanthus* very free.

*Ceanothus* sp. (?) flowers well, but Lemoine's variety (*Gloire de Versailles*) was lost.

*Citrus trifoliata* hardy, but has not yet flowered; *japonica* has fruited once and is hardy.

*Clerodendron trichotomum* and *fetidum* free; but *Balfouri* naturally failed.

*Clethra arborea* and *C. alnifolia* have both failed through unsuitable soil, although the latter is alive.

*Cytisus racemosus*, *Ardoini*, *purpurens*, and others all doing well.

*Daphniphyllum glaucescens*.

*Datura sanguinea*.

*Desfontainea spinosa* doing now, but twice tried unsuccessfully.

*Diosma gracilis* and *ericoides* flower well.

*Edwardsia grandiflora*.

*Embothrium coccineum* has been twice tried unsuccessfully. I would gladly like to know what conditions it requires.

*Eriostemon buxifolium* has not been tried, but a plant received under the name *densifolium* has flowered and is hardy.

*Escallonia* have not had a fair trial. An inferior plant of *philippiana* stood out four years, and the species seems hardy.

*Encalyptis citriodora* is somewhat cut back in winter.

*Eucryphia pinnatifida* has failed.

*Fabiana imbricata*.

*Fremontia californica* dies off in summer when apparently healthy, exactly as described by your correspondent.

*Grevillea robusta* is cut back in winter, but comes up again.

*Habrothamnus* (*Cestrum*) *elegans corymbosus* has not been tried.

*Hakea suaveolens*, *H. laurina* has not been tried.

*Illicium religiosum* (= *anisatum*).

*Indigofera floribunda*.

*Lagerstroemia indica* very healthy, but has not yet flowered.

*Leptospermum bullatum* flowers freely.

*Libonia floribunda*.

*Melaleuca densa* and *styphelioides*.

*Metrosideros floribunda* very free flowering.

*Mitraria coccinea* failed; situation unsuitable.

*Nerium Oleander*, several of Lemoine's hybrids.

*Pawlownia imperialis*.

*Pentstemon cordifolius*.—Under this name I have twice received what I believe to be some other species, so I hesitate to claim success for the true one. Mine has not the climbing habit, and the flowers are not very bright in colour.

*Philesia brixifolia*.—The soil is unsuitable for this plant; it lives but does not increase.

*Piptanthus nepalensis*.

*Pittosporum Tobira*.

*Polygal oppositifolia* is a fine free-flowering bush; *grandiflora* has not been tried.

*Solanum crispum* rampant; *jasminoides* good.

*Sparmannia africana* is cut in winter, but springs again and has flowered.

*Bignoni* and *Tecomas*, *tweediana*, *radicans*, *speciosa*, *capreolata*, *rosea grandiflora*, *variabilis*, and *Smithii* are growing; but *Stans* and *jasminoides* have failed.

*Berberidopsis corallina*.

*Bongainvillea glabra* killed by frost; *sanderiana* cut but recovering.

*Cassia corymbosa* very late this season, but always flowers profusely after dying back in winter.

*Chorizema Chandleri* flowers winter and summer very freely.

*Clematis indivisa lobata*.—The best *Clematis* I have grown is *Nellie Moser*; *davidiana*, now in flower, is interesting.

*Cianthus puniceus* and *magnificus*.

*Diplacus glutinosus* very free, and is coming up self-sown.

*Hibbertia dentata* lately lost, but was badly placed.

*Hydrangea scandens* untried.

*Schizophragma hydrangeoides* is grown successfully.

*Kennedyia monophylla*. I have not tried *nigricans*.

*Lapageria* on a north wall; I am now trying it under shade of very thick trees.

*Lasiandra maerantha* always cut back in winter, but springs again and nearly always flowers in November.

*Mandevilla suaveolens* grows very freely, but has not yet flowered.

*Physianthus albens* flowers freely, but has not fruited.

*Pueraria thunbergiana* has not flowered.

*Rhodochiton volubile* flowered profusely the first year, but died in hot summer weather when apparently quite healthy.

*Rhynchospermum jasminoides* very free flowering.

*Sollya heterophylla* apparently quite hardy, but was lost last year in a bad position.

*Stauntonia latifolia*.

*Streptosolen Jamesoni*, tried many times, but always killed in winter.

*Swainsonia galega*; *folia alba*.

*Tacsonias*.—These were tried, but had not a good position and failed.

I might of course add many names to this list, e.g., *Cephalanthus occidentalis*, *Colletia horrida*, *Abutilons*, &c. Two are specially worth mentioning—*Manettia bicolor*, free flowering out four years, and *Asparagus Sprengeri*, quite hardy here; but I have referred only to such plants as were suggested by reading the lists published in your last four numbers under the signature "S. W. F."

(Mrs.) MARION GWYTHERNE-WILLIAMS.  
*Belvedere, St. Lawrence, Isle of Wight.*

## ROUND ABOUT A GARDEN.

### BIRDS IN SEASON.

In gardening you should always look ahead and decide early what kind of birds you would like to have, according to the season. In winter you can make arrangements for the various kinds of tits and nuthatches in spring by putting up nest boxes with holes graduated in size according to their intended occupants; but it is a mistake to put perches under the holes. None of these birds need a perch, for they fly straight at the hole with the accuracy of a bullet, but the vulgar sparrow immediately recognises the utility of a perch for his clumsy approach, and the courage of the tomtit is of no avail against the clinching argument of the sparrow's beak. If, however, you put all the boxes at such a level that you can easily reach them and inspect them, the sparrows will have sense enough to leave them alone.

### THE MULTIPLYING STARLING.

Besides providing for the tits, you can, if you like, nail larger boxes high up on the stems and branches of big trees, where they will be occupied in due time by starlings, who will reward you with a great deal of fizzing song almost all the year through. Moreover, since starlings like each other's company, you can put a number of boxes in one tree; but most people may think that, in view of the Cherries, they have quite enough starlings about the place already. Like the rook and the sparrow, the starling represents a dominant type of bird under existing conditions, and wherever he gains a foothold he quickly multiplies.

### UNINVITED GUESTS.

Many birds need no special arrangements to induce them to patronise your garden. If you grow Strawberries and Currants you will have plenty of blackbirds and thrushes, while if there are any hawfinches in the neighbourhood you may confidently look for them among your green Peas. You may not actually see them, however carefully you look, because the hawfinch, though handsome, is shy and breakfasts very early in the morning; but you will see remarkable evidence of his appetite in the empty pods ripped open from end to end, and at the same time you will almost certainly see a dapper little warbler very busy among the rows. For so small and dainty a bird he does an amazing amount of mischief to the Peas.

### BULLFINCH OR GOOSEBERRY?

Another charming bird which, earlier in the year, will invite himself to gardens where Gooseberry bushes grow is the bullfinch, and you may travel in many lands without seeing anything in bird life prettier than a fine cock bullfinch as he sits glowing like a "pigeon's-blood" ruby, in a budding Gooseberry bush. In addition both he and his wife, an inseparable couple, exhibit such delicate contrasts of black and grey and white,

while their call note is so soft and plaintive, and his song so sweetly confidential, that you have hardly the heart to drive them "out of it." Yet you must make your choice between bullfinches in budding time and Gooseberries in season.

### PLANT AND BIRD AFFINITIES.

Fortunately there are some plant and bird affinities which do not conflict with the base utilitarianism of the kitchen garden. If you sow the blue Cornflower freely in some wild corner it will not only tint the place with a haze of blue from June until October, but will also surely attract thither in August any goldfinches which have reared families in the neighbourhood, and anyone who is not satisfied to see their yellow-barred wings flickering all together among the blue, as they make trapezes of the swaying stalks, must be hard to please. Later, if the gardener can be induced to overlook the fact that the Godetias are "over," their ripe seed pods will attract the travelling redpolls; and, although the dark crimson foreheads of these tiny birds scarcely relieve them of the appearance of dull coloured, undersized linnets, their absurd tameness and engaging ways make generous compensation. You may stand over a clump of fruiting Godetia and watch the redpolls at your very feet performing prodigies of acrobatics, as they hang upon the seed pods and force them open.

### TREES THAT BIRDS DISLIKE.

In spring the same redpolls will come to your Larches; and, indeed, so long as the Larch has leaves it is the happy hunting-ground of many small birds, chiefly tits and warblers, which studiously avoid and manifestly dislike other trees that are commonly planted with the Larch, such as the Austrian Pine. Indeed, in this case the Larch is usually merely the "nurse" of the Pine, and is removed so soon as the latter is strong enough to stand by itself. If the birds were consulted, however, it would be the Austrian Pine which should go. They probably dislike this Pine for the same reason that they avoid the Privet, because so few insects feed upon it, and its close set leaves are real "needles."

E. K. R.

## NOTES ON HARDY PLANTS

### CARNATION GEORGE MACQUAY.

REFERRING to a note by Mr. Watts about this Carnation I was pleased to see it, as it was raised in my garden. At the time we compared it with all the whites known, and found it enormously more vigorous and better. Thinking that the recent additions might have made a difference, I tried all the new whites I could hear of and did not find one quite so good, and most were far inferior in endurance, vigour, and beauty. Therefore I hope that George Macquay will be one of those Carnations that men will not let die out. I have no doubt it has many defects from a "florist's" point of view, but I never knew any of them to think what is for us the main point—the effect of a flower in the open air.

W. R.

### ARABIS ALBIDA FL.-PL.

This plant is really *A. alpina* fl.-pl., but it is certainly a free and almost perpetual bloomer from spring until late autumn. Neither the individual flowers nor the spikes are so fine as they are in spring, when, if well grown, they are about equal to white Stocks. It is not at all troubled by thrips here as in Worcestershire, and has been very healthy all the summer. I am hopeful that it will prove a good "wall garden" plant, as it has so far done well on a double wall here, although it was not planted until late in spring. It has, however, grown freely during the

summer, and has prettily veiled with green foliage, enlivened with flowers, the rough wall on which it is planted. I anticipate that it will be very beautiful in spring. It is almost absurdly easy to propagate by cuttings. I inserted a number of these in June in light soil under a handlight, well watered and shaded them for a week or so, and had very few failures.

### HEUCHERA SANGUINEA × HEUCHERA CYLINDRICA.

As Mr. Goodwin remarks on page 166, this is an acquisition; and one would be glad to have a convenient name for it. I believe it was raised by the Rev. C. Wolley Dod, from whom I received it. If so, I hope that he will give it a name of some kind. I find it is much the same as *H. zabeliana* in my garden, but I imagine from what I have seen that dry gardens such as those possessed by Mr. Goodwin and myself are not the best for developing the beauties of the Heucheras.

### DIANTHUS PANCICI.

THIS is one of the tall-growing Dianthus that attracts the attention of visitors who do not know the very varied character of the genus in the way of habit and flower. Even on a dry soil it has reached a height of fully 4 feet here, and has borne on each of its straight and comparatively slender stems a head of bright crimson-purple flowers. The leaves form a low tuft of grassy foliage, but there is very little in the way of leafage on the stems. It is rather a difficult plant to treat so as to keep its flowers from bearing down the tall stems in stormy weather, and it seems to be most satisfactory to provide it with a "host" plant in the way of a shrub through which its flowers can rise. It has looked well this season through the foliage of the variegated Broom.

### ROSA WICHURIANA.

I LOOK upon this as one of the most charming of all the small-flowering single Roses, and I have not yet seen any of the hybrids raised from it to equal the original in the beauty of its glossy foliage, the charm of its pretty single flowers, and the fragrance which it possesses in so marked a degree. It takes up a great deal of room if growing on the rockery or on a grassy bank, in either of which positions it looks remarkably well, and it is more suitable for small gardens if trained as a pillar. This year it has been unusually late, and I had not a flower until about the last day or two of August. *R. wichuriana* is valuable because of its late flowering, as well as for its beauty, and its blooms stand frost better than those of many other Roses.

### INULA ROYLEANA.

THIS promises to be a decided acquisition to the garden of hardy flowers, and, although my only plant, received from Baden-Baden last autumn, was injured, it is now most showy and attractive with its large orange-yellow flowers. The accident to the plant has prevented my judging its full height with certainty, but it is evident that here we have a plant worthy of taking high rank among the bright and attractive Inulas.

S. ARNOTT.

*Rosedene, Carsethorne, by Dumfries, N.B.*

### DIANTHUS CYCLOPS.

UNDER the above name a beautiful Dianthus is, and has been for some time past, flowering here (Rothesay). It is one of the best of the hardy Pinks, and is well worth growing where there is a rockery or herbaceous border. It does not appear to be very common, as I cannot find it mentioned in some of the catalogues of the large firms. It is mentioned in the Kew List of herbaceous plants published in 1895, but I find no mention of it in the present edition. It is given in the Kew List as of garden origin, but I think myself that it is only

a variety of *D. Caryophyllus*. The flowers are about 2 inches in diameter, and are of a delicate rose with a dark crimson centre, the edge of the flower being delicately cut. It can be propagated by seed or by cutting, but the best way of getting good plants is by layering. It is a good plan to layer a plant and leave the layers where they are to flower, as in this way good clumps are formed. It enjoys a fairly sandy soil, and seems to do best in a south-west position on the rock garden, although the herbaceous border suits it, providing other plants do not encroach. The best plants here are in that position, and they have been a picture since June, being simply covered with bloom, as many as forty flowers being out on a plant at one time. It has proved perfectly hardy here, having stood out all last winter.

*Rothsay, N.B.*

G. M.

### NATURALISING BULBOUS PLANTS IN GRASS LAND.

The plants that may be used for beautifying grass, woodland, and such places are many. As the object in planting bulbs freely amongst grass is to get quite a natural effect, one must seek to reproduce the simple groups seen in woodland and field. There must be no round rings, straight lines, or formal curves; but the bulbs should be planted as suggested in the accompanying illustrations.
